the outlet at this time. Fluctuations in water levels during the fall and winter should be kept to a minimum.

Fishes

Brook trout (squaretail)	Minnows
Lake trout (togue)	Fallfish (chub)
Lake whitefish	Common shiner
Round whitefish	Redbelly dace
White sucker	Blacknose dace
	Pearl dace
	Freshwater sculpin

Physical Characteristics

Area - 1332 acres	Temperatures
	Surface - 65° F.
Maximum depth - 134 feet	120 feet - 49° F.

Suggested Management

Harrington Lake provides ideal conditions for lake trout and should be managed for this species. Spawning facilities for brook trout and other stream spawning fish such as salmon are poor.

A large whitefish population provides necessary forage fish for the lake trout. It is felt that other species of forage fish or game fishes other than those already present would be detrimental to the fishery. Prohibiting the use of fish as bait would help minimize the danger of future introductions of undesirable fish. No stocking is recommended.

Because of the present fishery in Harrington Lake, no fishway is recommended for the dam at
