Organic/Regenerative Farming vs. Conventional Farming
By Dawn Lawless, King’s Highway Elementary, Coatesville, PA

Standard Statement(s): To explain pest control

Content Objective(s): To identify and compare different methods of pest control used by conventional and organic/regenerative farmers

Assessment Strategies: Worksheet (to be completed while at website)

Background/Introduction to Topic:
Regenerative farming as developed and practiced by the Rodale Institute (on their 333 acre farm near Kutztown University, PA) is a step beyond organic farming. Their focus is soil regeneration. They use practice the following techniques: composting, crop rotations, and cover cropping. Organic and regenerative farming is viewed as being more environmentally friendly because there are no synthetic chemicals, growth hormones, or genetically modified organisms.

Procedures:
Have students visit www.kidsregen.org (this is the children’s website from the Rodale Institute). Click on “action steps” on the left hand side of the screen. Allow students the opportunity to complete all 10 action steps (10 steps to a healthier you and healthier planet) On question #4, which allows students to learn why organic foods are a safer and healthier alternative for you and the environment, have them click on Farmer Phil says this and Farmer Fred says that (at the bottom of the screen). This will allow students to compare conventional agriculture to organic/regenerative agriculture. Five quotes are given by either a conventional farmer or organic/regenerative farmer describing farming methods. Students check a box in one of the two columns. When complete, have them print out the page, put their name on it, and give it to you to check. At the bottom of that question, have students click on Quiz: What kind of farmer is this in the field? The attached worksheet should be completed by them as they proceed through the activity on the website.

Conclusions:
By growing healthy soil, you can grow healthy plants that are less susceptible to pest damage. Organic and regenerative farming is less damaging to the environment.

Farming and IPM

1. What is the definition of regenerative farming?

2. Compare and contrast Farmer Fred’s farm to Farmer Phil’s farm. How do they look different (be sure to mention the health of the water and soil)?

3. Farmer Phil uses synthetic chemicals, growth hormones and genetically modified organisms. What are they? List 3 ways these methods can be harmful to our health and the health of our planet.

4. How can companion planting reduce the need for pesticides?

5. The conventional farmer used mono-cropping. What potential problems could that create?
