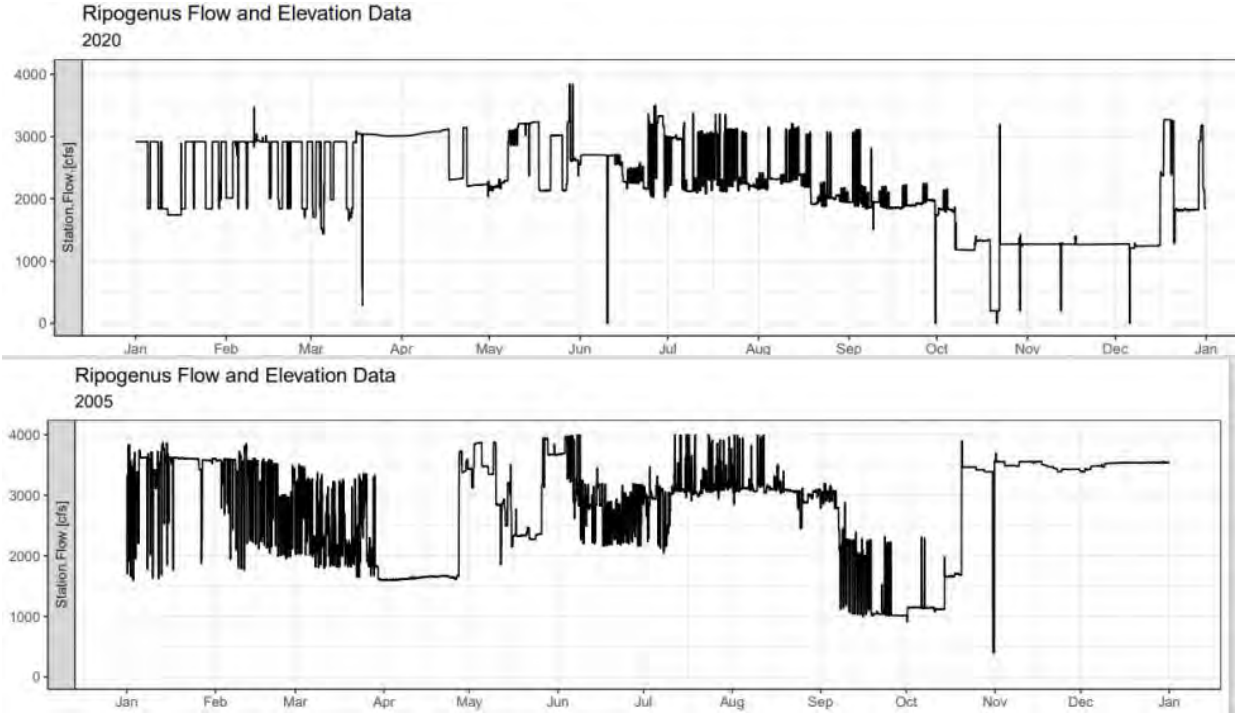
The two referenced USGS Gages are on the North and South Branches of the Penobscot River. The Licensee is confused as to the location of its dams. There are no North Branch of the Penobscot River (North Branch) dams. However, there are Dole Brook dams below Dole and Long Ponds. The Dole Brook dams are in fact

[2] The License requirement to reduce flow from September 16 -October 15 to enhance the drawdown of the North Twin impoundment has been abandoned.

"regulated" by very small dams. The minimum flow at Dole Pond is 15 cfs, while the hydro control imposed by the Dole Pond Dam and subsequent "ponding" could delay downstream flow. Calling this system "regulated" seems extreme, and it is not in any sense material.

Instead of "working though" any constraints caused by two insignificant Dole Brook Dams, HDR evaluated other sites NOT representative of topographical, vegetative and climate conditions found in the West Branch region. The Seboeis drainage is also on the lee side of the Appalachian Mountain range while the West Branch drainage is on the windy side of the mountain. Kulik (1990)[3] examined various variables that influence rainfall and subsequent run-off. There is no indication that HRC considered these variables and other variables. The choice of Seboeis River is rather strange. The period of USGS record begins in 2018 and continues through the drought years and ends in 2022.

"*With the exception of the Millinocket Lake Storage Development (located on Millinocket Stream), all the Projects' developments are located on the West Branch."*



As a mat er of record, Millinocket Stream flows into the West Branch. The present confluence with the West Branch is at the Millinocket Facility. Historically, Millinocket Stream joined the West Branch just below Shad Pond and above the Dolby Impoundment.

System Setting
5.2.11 Load Shape - "*However, GLHA indicates that the System is currently operated on a store-and-release schedule where flow is more constant throughout the day*."

Despite the Licensee's position that nothing has changed in 25 years, HDR's own graphic presentation demonstrates peaking operation occurred daily during summer and early fall periods. While the Licensee's at empt to capture market driven energy prices is understandable, the failure to acknowledge and include

[3] Kulik, B. 1990. A method to Refine the New England Aquatic Base Flow Policy. Rivers, Vol. I, No. 1. Pp 8-22.

known frequent peaking events is a significant error. The Tables below from appendix A, (repeated here for convenience) are a graphic demonstration of McKay Station daily peaking events as well as outage flows.

"*The load shape defines the daily schedule of relative power demand using a duration in hours within each period in the peak, secondary-peak, and off-peak periods. To represent a typical generalized load shape, the peak period was defined as the period starting at hour 6:00 am lasting 16 consecutive hours*"

These sentences essentially describe peaking operations and not the "nothing has changed" stable base flows repeated in the Licensee's many filings. The logical conclusion is that the Operation Model is designed for extreme variation in daily flows resulting from peaking operations. Such flows are not environmentally friendly.

5.2.1.3 Forecast Set-Up Condition

"*The Operations Model Forecast Set-Up Condition requires two inputs: a number of forecast days and an accuracy of the forecast. The number of days is how many days the Operations Model can "look ahead" in the inflow hydrology file to calculate how much water the system is going to receive in the defined days ahead. The Baseline scenario was set up to look seven days ahead with 100*

*percent accuracy. By setting the Baseline scenario with a seven-day look ahead, the Operations Model will, as in real life, attempt to release more water ahead of high runoff periods, thus building usable storage to avoid or reduce spill."*

The inflow hydrology file seems to be based on historic hydrological conditions, rainfall, drought, etc. As these are variables, there must be some degree/percentage of certainty. The Licensee stated that the model could be "run" at 90% and 110% of forecasted seven-day conditions. This seems to be a narrow band as it is impossible to predict rainfall or lack of rainfall for a week In Maine's mountainous summer climate! The Licensee makes reference to "*release more water ahead of high runoff periods"*. The Ripogenus Impoundment is typically at or below 938ft before mid-April or after midmid-June and with 3-4 bcf of available storage, preemptive use of storage would seem unnecessary. While unstated, this goal appears to be related to Penobscot Mills Project's Impoundments.

Additionally, the model seems to focus on spill conditions, rather than low flow conditions. In many cases spill conditions are unavoidable. It is the stakeholder goal to avoid low flow events (less than 2200 cfs) that impact fish and aquatic communities as well as boating opportunities. The HDR model should be adjusted to allow for a guaranteed yearlong 2200 cfs McKay Station base flow that would be protective of fish and aquatic communities, Article 406 the Holbrook Bypass Channel salmon reproductive needs, as well as all recreationists.

5.2.2.5 Plant Operation. • Powerhouse Operation Type – *This condition specifies what type of scheduling logic is to be used for each powerhouse. The CHEOPS™ Daily Average Run-of-River plant logic was applied for the Ripogenus and North Twin developments as it best represents current operations.* ***This logic attempts to follow the simulated operational requirements without "peaking" within the day.*** *The peaking logic, if applied, would generate as much power as possible during the defined peak periods and reduce generation during off-peak periods to only equal required minimum flows, which does not reflect the current operations*.

As shown in the above Tables (Rip flow and elevation data 2022, 2005), the Licensee routinely operates in a peaking mode. Thus, by definition, the model logic is operating with a faulty assumption.

.5.2.3.2 Target and Minimum Elevations . *Ripogenus Project Table 5-5 show the target and minimum reservoir elevations simulated for the Operations Model for the Ripogenus Development. Target elevation data reflects the trend of the historical operations for years 2010 through 2021. Minimum elevation data is based on the target minimum elevation provided by GLHA*.

The Table below incorrectly starts with a Ripogenus Impoundment elevation of 939 ft. This is much below the Licensed full pond elevation of 941.69 ft. As a default, the model reduces the lake elevation by January. In effect, meeting the models elevation goals results in draining the Ripogenus Impoundment annually with West Branch outflow equaling inflow at some point in January. If this is not the case, where is the storage needed to provide minimum spawning and incubation flows after January 1st? Is the Licensee proposing to drawdown the impoundment to 913.6 ft annually? Great Northern Paper search of various regional databases found that January – March inflows would be in the 200 cfs range. Under this scenario, enhancement measures provided by Article 406 would be eliminated, and a river wide environmental disaster would result. Salmonid incubation, fish and aquatic communities would be devastated. Additionally, 2022 data should be included.

**Table 5-5. Ripogenus Development target elevation curve.**

| Date | Elevation (feet, NGVD 29) |
|---|---|
| **Target Elevations** | |
| Jan 1 | 928.6 |
| Mar 1 | 923.7 |
| Apr 1 | 921.6 |
| May 10 | 939 |
| Jul 1 | 939 |
| Oct 15 | 928.8 |
| Dec 31 | 928.6 |
| **Target Minimum Elevations** | |
| Jan 1 | 913.6 |
| Dec 31 | 913.6 |

As noted above Table 5.5 lists the Ripogenus target elevation at 939 ft. rather than the Licensed full pond elevation of 941.69ft. This obfuscation makes no sense as there are no Rip Dam over-topping issues, and other Licensee impoundments are brought to full pond at spring runoff. In this iteration the Licensee is at empting to hide almost 3 feet of elevation and 4 bcf of storage. To suggest that a competent hydro system operator such as Great Lake Hydro America would willingly lose 4 bcf of storage and the accompanying loss of head is insulting to the agencies, stakeholders and FERC staff. FERC should request that the Licensee require HDR to re-run all modeling using the historic and logical Ripogenus Impoundment full pond elevation of 941.69 ft.

VERIFICATION SCENARIO GRAPHICAL RESULTS - BASELINE SCENARIO GRAPHICAL RESULTS

In order to produce the graphic material shown in At achments One and Three, HDR must have the Licensee's historical flow, elevation, and gate change records for the four licensed ponds and the five additional storage ponds included in the 2004 Storage Project Setl ement process. These data should be made available to the agencies, stakeholders and FERC staff.

While most modeling events for the referenced period extended into 2022, the 2021 and 2022 modeling scenarios are strangely missing in the graphical results presented in At achments One and Three. All parties involved are aware that these were "dry years". Graphical results depicting drought years would demonstrate the model's validity or project its weakness.

Some graphical presentations need scale modification for readability, the 200 or 500 cfs scales makes it difficult to determine if some of the lower minimum flow requirements are being met. Various model outputs appear to account for McKay Station 1000 cfs minimum flow and 1422 cfs spawning and incubation flow requirements. However, providing flows necessary to meet Article 406 flow requirements was sporadic and apparently by chance. Provisions for Storage elevation requirements are included but when there are competing uses involved, elevation versus flow, it appears that shoreline nesting requirements (though July 15) outweigh fisheries and aquatic communities' requirements.

If my understanding is correct, there are no April empirical inflow data for Storage Projects impoundments, as access is remote. This glitch is understandable. Dam gates cannot be lower if vehicle access is blocked by the snow pack. Thus, HDR was left to simulate April and early May Storage Project inflows. The accuracy of April flows and elevation in remote storage projects is questionable. The initial April flow and elevation drives HDR's model in many cases. This is another example of the need to use USGS North Branch flow records (typical available in early April)

The Figures in At achment One and Three are strikingly similar. Summer outlet flows were typically lower than those set in the Storage Project Set lement Agreement. Ragged stream and Duck Brook (AKA Ripogenus stream), the outlet of Harrington Lake, both provide major salmon spawning and nursey habitat. These are the Storage Project impoundments outlets most often subject to low flows in simulations. Under the Operations Model's output critical juvenile salmonid production is lost.

8.0 Summary

*"The Operations Model was developed based on information available at the time of this report."*

Data from the drought years of 2020-2022 is missing in many instances. The failure to use USGS North Branch flow records is disturbing. There are many faulty assumptions. Thus, the above statement is simply the Licensee's opinion.

<u>Summary of requests needed to correct the Operations Model</u>

The above discussion provides proof that an independent peer-reviewed water management is needed. HDR cannot be faulted for following the Licensee instructions and alternately cannot be expected to act independently.

Should FERC decide that an independent water management plan/operation model is not needed, the Licensee needs to request HDR to:

1) Run modeling exercises with McKay Station in a Peaking mode, then repeat the modeling with the inclusion of downstream facilities
2) Use the historical Ripogenus full pond elevation of 941.69 **ft in all modeling**

**3) HRC use of 2020-2022 "drought years" data is sporadic. HDR states that a 23-year data set is used. These 2020-2022 low participation data should be included in all analysis. The absence of 2020-2022 data artificially increases low elevation records favorable to tabular values e.g., annual winter Ripogenus Impoundment elevations would be significantly lower had 2020-22 draught years been included.**
**4) Confirm the lack of dams on the North Branch and revisit the development of instream flows in the West Branch drainage system with a focus on the North Branch USGS gauging Station.**
**5) Disconnect McKay Station and West Branch flows from North Twin Project flow and elevation needs. The Ripogenus system should not have to mitigate for downstream energy market driven excessive (North Twin Impoundment) drawdowns.**
**6) Provide the agencies and stakeholder tabular information on Storage Project impoundment flow, elevation and gate changes.**
**7) Include the historic Great Northen Paper Water Use Plan data (1970-1999) along with the NDT and Burris reports.**
**8) November-April flows below McKay Station do not appear to be correlated to (low) winter Ripogenus Impoundment elevations and the lack of inflow. The apparent lack of outflow needs to be addressed.**

**Thank you for the opportunity to comment and suggest major changes. An unbiased and functional Operations Model is needed to balance and give equal consideration to competing uses.**

Subject: **Special Request Regarding Concerns of Maine Council of Trout Unlimited with Respect to the Determination on Requests for Study Modifications and New Studies for the Ripogenus and Penobscot Mills Hydroelectric Projects (P-2572 and P-2458)**

Dear Secretary Bose:

On behalf of its six chapters and over 2,000 members, Maine Council of Trout Unlimited (TU) submits our concerns regarding the FERC Determination on Requests for Study Modifications and New Studies for the Ripogenus and Penobscot Mills Hydroelectric Projects dated September 19, 2023. While the Integrated Study Process does not provide for comments at this juncture, we respectfully ask that the Commission provide additional guidance to Brookfield based on the requests TU details in this letter. On its present course, the projects will remain uniformed in key areas until late in the process or (worst case) not provided making any determination of new terms and conditions for future projects arbitrary.

**Background**

The project Pre-application Document (PAD) stated that "GLHA maintains that a full suite of new studies is not needed, that the vast body of information on which today's certifications and licenses are soundly based and should be relied upon for these relicensings."[1] The nongovernment organization (NGO) stakeholders took exception to this statement stating "Brookfield is required to provide FERC with information in the PAD and PSP referencing either relevant and recent existing studies or proposing new studies that address a number of subject areas including: Fish and Aquatic Resources, Recreation and Land Use, Aesthetic Resources and Tribal Resources. Instead, Brookfield relies on dated, unavailable, or non-existent studies or directs stakeholders to search for the information themselves at other agencies or on the Internet."[2] The Study Plan Determination recommended 20 studies.[3] The Initial study Report Meeting and stakeholder comments followed as did FERC ISR Comments.[4] Brookfield subsequently submitted its Responses to Comments on the Initial Study Report and Requests for New or Amended Studies.[5] FERC approved additional studies and study modifications but did not provide guidance on the Historical Ops Data Assessment Study and the Ops Model Study.[6] TU's specific concerns are

[6] FERC Determination on Requests for Study Modifications and New Studies for the Ripogenus and Penobscot Mills Hydroelectric Projects dated September 19, 2023.

stated/restated in the paragraphs that follow. These also bear on the Ops Model Technical Workshop that Brookfield has scheduled for December 5 and 6.

**Key Issues**

The object of the study phase of the relicensing process is to obtain a baseline of current information based on the best science available upon which to base relicensing decisions later in the process. On the current course, significant concerns stand to delay or defeat this objective.

The December 5 and 6 Operations Model Technical Workshop[7] should be to inform stakeholders as to the current information that will form the basis of future discussion. Brookfield announced that the workshop would be held "***in person***" in Millinocket despite the fact that a number of the stakeholders: "would like to see the workshop moved to Bangor and supported by teleconference for those who can't be there in person. This includes USFWS, NOAA, BPL, TU, American Whitewater, Appalachian Mountain Club, Chesuncook Camp Owners Assn., Ed Spear and Sarah Sindo. This is a significant percentage of possible participants. We think that this would encourage stakeholder participation and be the best and most workable for all concerned: Brookfield, contractors, agencies, NGOs and individuals."[8] We have included the text of my November 1, 2023 email as Attachment A. American Rivers has since expressed its support of this as well. Brookfield has not responded, and TU still sees no reason or justification to hold the meeting "***in person***" in Millinocket as this will discourage stakeholder attendance, and holding it without a teleconference option will discourage participation. This will only serve to delay provision of information and make resolution of critical terms and conditions of the new license more problematic that it already promises to be. **TU asks that the workshop be held in Bangor and teleconferencing be provided using state-of-the-art teleconferencing technology.**

The announcement states that "The purpose of the workshop is to further explain the model inputs, calibration, and verification." When TU asked at the ISR Meeting how the low water levels of Ripogenus Lake occurred in two back-to-back years, the Brookfield response was that they were dry years and they were following the Ops Model. A key part of using the Ops Model is the monthly targets that are input. These are the ones that Brookfield uses. How target flows were determined was not explained and TU asked that information be provided in its ISR Comments.[9] Since we do not see this being specifically addressed in the workshop agenda, **TU asks that the basis for the monthly target lake levels be explained in detail at the workshop.**

[7] Ripogenus Hydroelectric Project (FERC No. 2572-133), Penobscot Mills Hydroelectric Project (FERC No. 2458-247) Notice of Operations Model Technical Workshop dates October 26, 2023.
[8] Email from Steve Heinz to Randy Dorman of November 1, 2023, Re: Ripogenus & Penobscot Mills Hydroelectric Projects: Notice of Operations Model Workshop.
[9] Maine TU Council ISR Comments dated July 5, 2023, page 11.

TU asked for explanations of differences in operations over the winters of 202 and 2021 compared with those of the subsequent winter that filled Ripogenus-Chesuncook Lake. American Whitewater asked for specific Ops Model runs.[10] This will be nearly six months ago by the time the workshop is held. **TU asks that these model runs be presented and explained on the afternoon of day two of the workshop, or at least used as examples when explaining the workings of the ops model.**

Further review of the record by TU did not find a copy of the current water management plan that attaches to the current license. **TU asks that a copy of the Water Management Plan be provided at the workshop and its relationship to the current Ops Model be explained.**

Other specific concerns are detailed below.

**Specific Concerns**

<u>Historical Ops Model Study</u>.

1. FERC commented on what was presented at the ISR Meeting: "The results of the Historic Operations Study were presented during the ISR meeting. The presentation included graphical representations of lake levels and flows through the Ripogenus and Penobscot Mills Projects' developments. GLHA filed the operations data in electronic format on May 22, 2023, along with the ISR Meeting Summary. To assist us and other stakeholders in comparing actual operational releases to the licensed releases, as well as better understanding the details of how the projects are operated, please revise the excel spreadsheets for each of the projects' developments to correlate the historical hourly flow data with the licensed flow requirements at the time."[11]

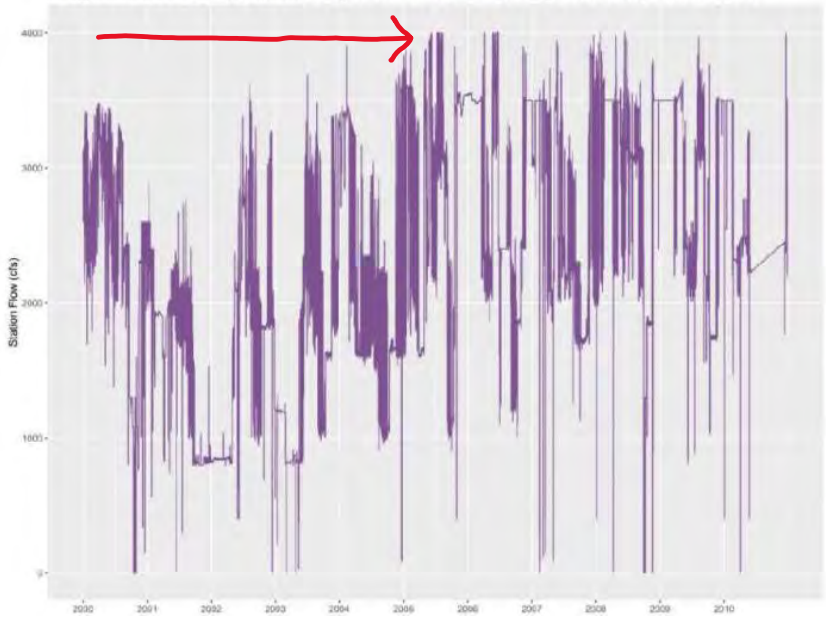
SAMPLE

Brookfield responded: "GLHA provided a detailed description and graphics of required Project operations in the Pre-Application Document (PAD) as well as the Initial Study Report (ISR)… GLHA believes that the Operations Model will be the appropriate tool to evaluate current and potential alternative operating scenarios in relation to water availability and allocation in support of issuing the new licenses."[12]

TU Comment: FERC did not comment on this in its FERC Determination on Requests for Study Modifications and New Studies. TU supports the FERC request. Correlating historical hourly flow data with licensed flow requirements on an hourly basis to provide additional clarity to what it has already presented to this point.

[10] American Whitewater and Appalachian Mountain Club Comments on Initial Study Report and Request for Further Study for the Ripogenus Hydroelectric Project (P- 2572) and Penobscot Mills Hydroelectric Project (P-2458) dated July 6, 2023, page 13 and subsequent.



[11] Staff Comments on the Initial Study Report and Initial Study Report Meeting Summary dated July 6, 2023, page A-2.

[12] Brookfield Responses to Comments on the Initial Study Report and Requests for New or Amended Studies dated August 7, 2023, page B-1.

TU Request: **That Brookfield provide graphical representations of lake levels and flows as well as historical flow data as Excel Spreadsheets per the FERC request at the workshop.**

2. TU Comment: "The figures showing hourly McKay Station flows based on generation data show flows of 4000 cfs, especially Figure 12 below. These exceed the 3500 cfs hydraulic capacity of McKay Station [Pre-application Document dated June 11, 2021, page 4-14.] When queried at the ISR Meeting, the Brookfield response was the flows were not completely accurate and a range of variability was not available. This continues to cast doubt on the results of the analysis."[13] Further analysis indicates that the figure is even more misleading than TU originally thought because the upper limits of the hourly flow values appear to be truncated at 4000 cfs and are actually worse than the graph provided depicts. Brookfield goes on to validate the ops model using circular logic that is not valid. TU submits that while Brookfield was the organization that proposed both the Historical Ops Model Study and the Ops Model Studies as replacements for studies requested by NOAA fisheries, Brookfield has not justified this replacement. Additional rationale for this conclusion is provided in subsequent paragraphs.

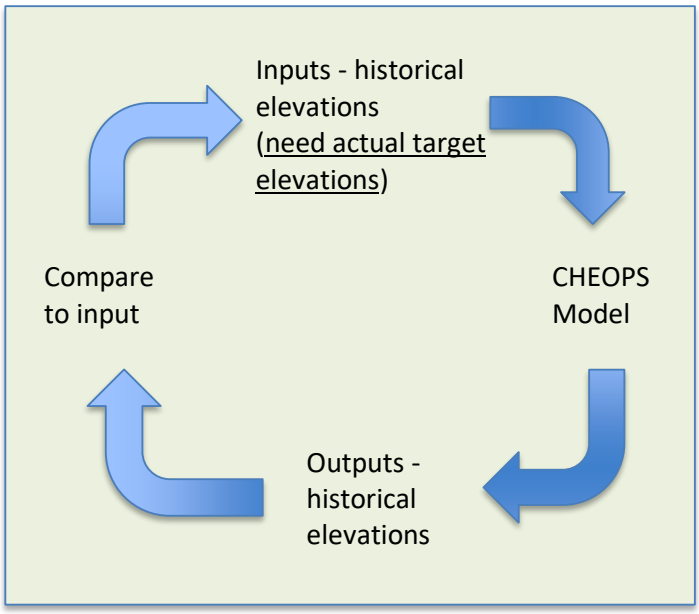
**Figure 12. Estimated hourly flows from McKay Station, 2000-2010**

Brookfield Response: Includes the statements "… the Projects' existing licenses do not require the maintenance of flow data (e.g., for the past 20 years), and hence, the development of the requested historical data set has been both a labor-intensive activity, as well as dependent upon available data, which appears to include some anomalies or outliers. "Also, "In addition, GLHA notes that the observations associated with the comments (i.e., flows greater than 3,500 cfs) appear to be limited to the data between 2004 and 2013."[14]

TU Reply: The first statement is immaterial. Since Brookfield proposed the studies, Brookfield should have the data to defend them. If the observations associated with comments that are obviously incorrect didn't persist, then why were they used?

TU Request: **That Brookfield provide a rational explanation of why the hourly flow estimates at Ripogenus are so obviously at the workshop.**

Ops Model Study



1. FERC Comment: "During the ISR meeting, and as documented in the ISR Meeting Summary, Maine TU raised concerns regarding the results of the validation run of the Operations Model. Maine TU indicates that, for the calendar year 2020, the modeled results do not line up well with the actual reported impoundment levels and releases for the Ripogenus Project. To address concerns about the CHEOPS

[13] Maine TU Council ISR Comments dated July 5, 2023, Appendix A.
[14] Brookfield Response to Comments on the Initial Study Report and New Study Requests, page Appendix B-32.

model and to improve the outcome of the second year of the study, which involves developing alternative operating scenarios to model, GLHA raised and the group discussed the concept of GLHA establishing a working group for the operations modeling. Establishing a working group could be beneficial to this process. If such a group is established, a technical work session could be convened to familiarize the members of the working group with the CHEOPS model, including how it works, as well as the models' assumptions and limitations. Such an approach could help to improve understanding of the model and ensure that all reasonable alternatives identified by stakeholders are modeled during the second year of studies."

Brookfield Response: "The Operations Model Study Report will be updated to include additional descriptions of the application of daily target elevations at the Ripogenus, North Twin, and Millinocket Lake Storage developments in the verification scenario as well as how the model utilizes target, spill and minimum elevation inputs during scenario execution. Additionally, expanded discussion will be added to the Operations Model Study Report to describe the simulated versus actual allocation of water between the Ripogenus and North Twin developments for the calendar year 2020 and 2021. GLHA is planning to convene an Operations Model Technical Conference with interested stakeholders to explain how the model was developed (including model inputs), how the model was calibrated and verified, how the model will be used in the relicensing process, and the framework for requesting alternative operating scenarios. GLHA anticipates conducting the technical conference in fall 2023. Subsequently, GLHA will evaluate reasonable alternative operating scenarios requested by stakeholders with results provided to stakeholders in early 2024 and filed with FERC in the USR by April 22, 2024."

TU Response: Operations models can be challenging to validate to historical data, especially when 1) trying to model a whole system of reservoirs as they are, and 2) the data needed to do this correctly likely does not exist. The most critical issue with their verification is the use of the "daily varying target elevations" for Ripogenus Lake and others. It appears that those "daily varying target elevations" are in fact historical elevations, and historical elevations were used as an input to the model, and then compared the output to those same elevations for verification.

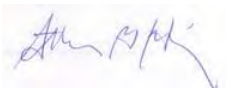
To avoid this circle, actual target elevations must be used as the input. Those targets changed year to year (based on snowpack, forecast rain, etc.), but it appears that Brookfield did not document that. This would mean that there is no record of those historical targets and thus they cannot be used to verify the model. Brookfield specifically states that "(note for Ripogenus, North Twin, and Millinocket Lake Storage developments, the target elevation shown on the figures is the historical elevations).[15] (sic)

TU Request: That **Brookfield at least provide some example runs at the workshop from those requested by American Whitewater or TU demonstrating how daily varying target levels were determined.** The joint of

[15] Brookfield Responses to Comments on the Initial Study Report and Requests for New or Amended Studies dated August 7, 2023, page B-32.

American Whitewater and the Appalachian Mountain Club is included as Attachment D for convenience. Examples will have to be used to illustrate, why not use those requested months ago by stakeholders?

2. Brookfield Comments:" The Operations Model Study Report will be updated to include additional descriptions of the application of daily target elevations at the Ripogenus, North Twin, and Millinocket Lake Storage developments in the verification scenario as well as how the model utilizes target, spill and minimum elevation inputs."[16]



TU Response: **TU asks that discrepancies noted in its ISR comments[17] be addressed specifically at the workshop.**

**Summary of Request and Conclusion**

The Historical Ops Model Study and Ops Model Studies that Brookfield proposed to replace studies proposed by NOAA Fisheries failed to validate the Ops Model, and are therefore not credible. The workshop provides the opportunity for Brookfield to provide additional information to demonstrate that its conclusions are valid and these studies were appropriate replacements for those proposed by NOAA. Failing this, these studies have been shown to be works of sophistry rather than science.

Maine TU Council appreciates the Commission's attention to our requests regarding these important projects and hopes that the Commission will act to acquire the information needed to enable the Commission to balance project harms and benefits.

Respectfully,

Stephen G. Heinz
Maine TU Council FERC Coordinator

# Attachment A

Dear Randy,

Stakeholders have been exchanging emails since Cate's announcement and a number of us would like to see the workshop moved to Bangor and supported by teleconference for those who can't be there in person. This includes USFWS, NOAA, BPL, TU, American Whitewater, Applachian Mountain Club, Chesuncook Camp Owners Assn., Ed Spear and Sarah Sindo. This is a significant percentage of possible participants. We think that this would encourage stakeholder participation and be the best and most workable for all concerned: Brookfield, contractors, agencies, NGOs and individuals.

TU uses a Meeting Owl to teleconference its Maine TU Council Meetings with great success.

Thank you for your consideration.

Respectfully,

Steve
781-4762

## Appendix A

**Historic Operations Data Assessment Study**

**General Comments**

The study does not work with the Historic Operations Data Assessment Study and Operations Model Study to inform the relicensing as intended by the SPD:

> "GLHA would use the existing operations information, along with GLHA's proposed Water Quality Study, Historical Operations Data Assessment, and Operations Model, to assess the Projects' effects on the hydrology in the West Branch and mainstem Penobscot River [section 5.9(b)(4)" [SPD, page B-42].

The study does not provide details of why the Ripogenus-Chesuncook Impoundment was so severely dewatered during the summers of 2020 and 2021.

It should also be noted that the possible license violation reported by TU [TU letter dated May 12, 2022, Subject: Maine Council of Trout Unlimited Comments on the Minimum Flow Excursion Report dated April 28, 2022 for the Ripogenus Project (P-2572)] is still under active investigation by FERC Compliance: "Commission staff are actively working on this proceeding, and response has not yet been issued regarding this matter." [email Andrea Claros to Steve Heinz RE: Pending West Branch Possible License Violation dated June 8, 2023]

**Specific Comments**

Page A-1 The study does not effectively meet its objectives:

> "The goals and objectives of the study are to compile relevant historic operations data for the Projects to allow stakeholders to better understand historical operations of the Projects and associated water management objectives in support of the relicensing of the Projects."

The information contained in the ISR does not do that. How flows are managed for the Ripogenus Project remain unknown and explained by Brookfield as controlled by use of the CHEOPS model, a proprietary 'black box.' This cannot be used as rationale for avoiding informed discussion of how the projects are actually operated.

The study uses the term "waste flow" to label all non-station flows. This includes fishing flows of 100 cfs released using the sluiceway that are fishing flows. Another term should be used.

The study does not answer key questions: why was the Ripogenus-Chesuncook drawn so far down in both 2020 and 2021? Why are peaking operations being conducted as indicated by the attached study?

TU requests OPs Model runs documenting the inputs used to determine McKay Station flows including Ripogenus - Chesuncook Impoundment level elevation and a detailed description of the information used to determine the target impoundment levels:

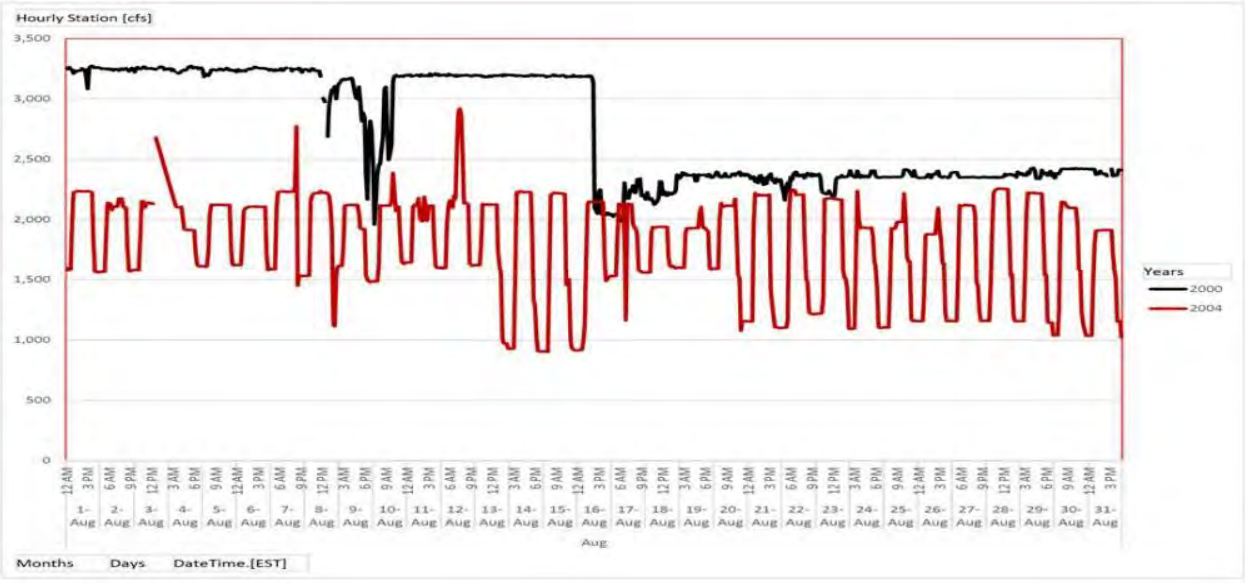
1. October 16, 2019, December 20, 2019, March 4, 2020
2. October 16, 2020, December 20, 2020, March 4, 2021
3. October 16, 2021, December 20, 2021, March 4, 2022

October 16, 2021 was when Brookfield reduced spawning/incubation flows to 1100 cfs, March 4, 2022 was when they further reduced them to 800 cfs, December 20 is a rough mid-point. [Brookfield letter dated April 28, 2022, Ripogenus Project (FERC No. 2572-ME); Minimum Flow Excursion] The CHEOPS model alone cannot explain why in the first two timeframes, Brookfield made no effort to fill the reservoir while in the last timeframe it obviously did.

Page A-27 "Over the 23-year period, the Ripogenus impoundment was refilled to or near full pond elevation by late spring for 17 of the 23 years. The 6 years in which the impoundment elevation was not refilled to or near full pond elevation occurred during dry water years in 2001-2004, 2015-2016, and 2021 (Figures 7 and 8)." It is acknowledged that impoundment levels were unacceptably low during the summer of 2020 as well. Over time, it has become increasing difficult to refill the impoundment. A more aggressive approach to water management is needed. One was taken to full the reservoir over the winter of 2021 to 2022.

Page A-33 The figures showing hourly McKay Station flows based on generation data show flows of 4000 cfs, especially Figure 12 below. These exceed the 3500 cfs hydraulic capacity of McKay Station [Pre-application Document dated June 11, 2021, page 4-14. When queried at the ISR Meeting, the Brookfield response was the flows were not completely accurate and a range of variability was not available. This continues to cast doubt on the results of the analysis.

**Figure 12. Estimated hourly flows from McKay Station, 2000-2010**



Page A-60 “The Ripogenus and Penobscot Mills Projects are operated as a combined system using the same system-wide rule curve as described above that has been used since the 1970s.” This does not explain how the Ripogenus-Chesuncook Impoundment was dewatered during the summers of 2020 and 2021 with any specificity, or aid in determining how this might be avoided in the future.

**Hourly Flow Data Comments**

The time delay between the request for the flow data and its submission by Brookfield underlines the need for a USGA flow gage and impoundment level gauge be installed for the Ripogenus Project. The flow gauge should be located immediately below Ripogenus Gorge in the Little Eddy vicinity.

It has been an open issue if project operations have changed since project ownership passed from Great Northern Paper. Increased peaking was reported by MDIFW in its PAD comments: “In addition, there is concern that the West Branch of the Penobscot River below McKay Station is managed as more of a peaking operation with flows exceeding 3,000 cfs during the day and 1,800 cfs or less in the evenings. Flow changes of this magnitude in a short period of time can dewater areas of the river and result in a loss of macroinvertebrate diversity and habitat, as well as cause direct mortality. MDIFW believes the summer drawdowns and peaking operations were not fully anticipated in the review of the current license and therefore the water management plan may need to be refined. This study, along with the requested lake elevation and flow data, will provide information about the degree, frequency, and possible impacts resulting from the drawdowns and changes in flow. [MDIFW letter October 8, 2021, Re: MDIFW Comments and Study Requests for the Ripogenus Hydroelectric Project (FERC No. 2572) and Penobscot Mills Hydroelectric Project (FERC No. 2458), pages 35 and 36.]

Brookfield provided hourly flow data requested by MDIFW and other agency filings with the ISR Meeting Report. A preliminary analysis of August and November data performed by the National Marine Fisheries Service indicated that operations have changed and that peaking is occurring. The following example

demonstrates this, many of the graphs making the comparison show 2000 flow patterns were more stable than subsequent years. This is consistent with what TU has been told through anecdotal reports.

Current studies confirm that such release practices affect both macro-invertebrate communities and fish. “The degree of hydropeaking, proximity of unregulated tributaries, and distance from the dam have been shown to have a large influence on the ultimate abundance and diversity of aquatic macroinvertebrates. [The ups and downs of hydropeaking: a Canadian perspective on the need for, and ecological costs of, peaking hydropower production, K. E. Smokorowski; Hydrobiologia (2022) 849:421–441, page 429.] “… hydropeaking operations do have negative effects on fish populations, particularly smaller bodied species or life stages, the ultimate effect on fish populations is determined by degree of hydropeaking…” [Id., page 431.] This is consistent with the results of the Stranding Study and underlines the need for a Ramping Study to determine optimal flow levels and ramping rate to achieve them to minimize or eliminate negative effects of flow changes.

TU also notes that it is well established that when flows change abruptly, fishing is disrupted for about an hour while fish readjust to the new flow. Peaking effectively takes two hours from a full fishing day, decreasing the recreational use of the resource. This is inconsistent with the world-class fishery described in the last license application for the Ripogenus Project.

# Attachment C

## Appendix B

**Operations Model Study**

**General Comments**

For the reasons explained below, the Operations Model Study does not satisfy FERC's rationale for the study: "GLHA would use the existing operations information, along with GLHA's proposed Water Quality Study, Historical Operations Data Assessment, and Operations Model, to assess the Projects' effects on the hydrology in the West Branch and mainstem Penobscot River [section 5.9(b)(4)" [SPD, page B-42].

**Specific Comments**

1. **The use of "Daily changing target elevations" (instead of the prescribed operational targets) at Ripogenus, North Twin, and Millinocket Lake Storage in the Verification scenario needs to be clearly defined, explained, and justified.**

   The report states that "Daily changing target reservoir elevations to simulate historical operations for the Ripogenus, North Twin, and Millinocket Lake developments." for the Verification scenario (page B-27). Only in the notes for Attachment 1 does the report clarify that "for Ripogenus, North Twin, and Millinocket Lake developments, the target elevation is the historical end of day elevation reported by GLHA from the historical operations in NGVD29."

   The clarification that the "Daily changing target reservoir elevations" refers to the "historical elevations" should be mentioned and more clearly explained within the body of the report and not in an appendix note. Without further explanation, we conclude that this decision was made to make the model simulations appear more accurate than they would have been should the actual operational targets have been used.

   Furthermore, historical elevations were only used at three of the developments, while the Baseline operational targets were used at all other developments. Why use historical elevations at some but not others? This inconsistency requires explanation.

   Lastly, because **historical** elevations were used instead of **target** elevations, the results for the Verification scenario do not support the conclusion that "the Operations Model compares well to historical data, characterizes system operations, and is appropriate for use in evaluating the effects of alternative operating scenarios on generation, reservoir levels, and outflows from the System" (page B-102). **Target elevation curves are one of the most important elements of reservoir operations. Excluding these targets from the Verification Scenario means the model was not in fact evaluated for its ability to characterize system operations, but for its ability to simulate historical conditions using those historical conditions as a primary input.** In other words, by using historical elevations as an input to the model and then concluding that the simulated output elevations are reasonably accurate compared to those same historical elevations is circular logic: the same proposition occurs as both a premise and a conclusion—the argument validates itself.

2. **The report concludes the model is verified based on historical elevations, but contains insufficient comparisons of historical and simulated reservoir elevations.**

The start of Section 6.1.1 states that "The Verification scenario established in the Operations Model followed the historical operating requirements of the System by simulating daily changing target elevations to match historic elevations, historical reported spillway flows, and unit outages to simulate historical daily turbine operations" (page B-92).

However, the report does not include any quantitative evaluation of model accuracy in terms of simulating reservoir elevations. Tables 6-1 through 6-5 and Table 6-6 provide bases for evaluating model accuracy for simulating power generation and release flows, respectively. A similar comparison is not provided for reservoir elevations.

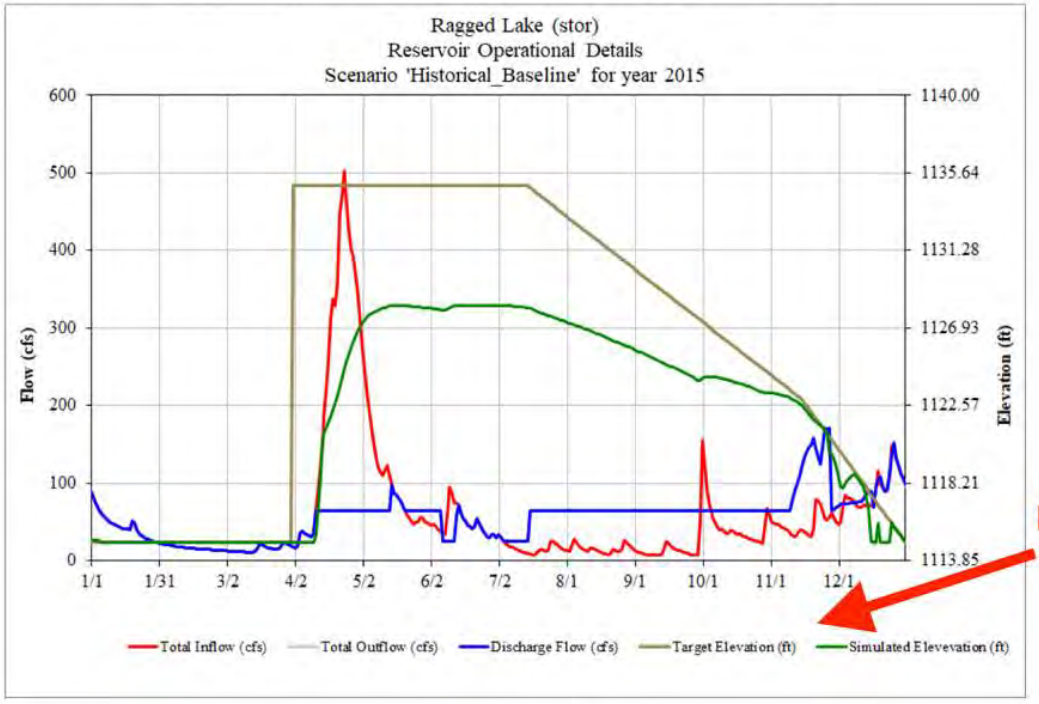
Example: Table 6-1 McKay Station [ISR page B-94]

**Table 6-1. McKay Station Verification generation comparison.**

| Year | Historical Generation (MWh) | Simulated Generation (MWh) | Difference between Historical and Simulated (MWh) | Percent Difference between Historical and Simulated (%) |
|---|---|---|---|---|
| 2015 | 211,964 | 228,520 | 16,556 | 7.81% |
| 2016 | 218,799 | 221,628 | 2,829 | 1.29% |
| 2017 | 220,978 | 221,141 | 163 | 0.07% |
| 2018 | 242,539 | 238,860 | -3,679 | -1.52% |
| 2019 | 256,618 | 240,347 | -16,271 | -6.34% |
| 2020 | 229,420 | 238,917 | 9,497 | 4.14% |
| **Average** | **230,053** | **231,569** | **1,516** | **0.66%** |

**Presumably, the conclusion that the model was verified in terms of simulating historical elevations was based on the graphical comparisons in Attachment 1. However, none of those figures includes the historical elevation for comparison against the simulated elevation.** These figures only include the target and simulated elevations. Only the figures for Ripogenus, North Twin, and Millinocket Lake developments include the historical elevation, but only because the historical elevations were used in place of the target elevations. In other words, the figures for these developments may include the historical elevations, but they are labeled as "Target Elevation," which makes it challenging for the reader to make the comparison of historical vs simulated elevations.

**Figure Attachment 1-10. Verification simulated Ragged Lake operations 2015.**



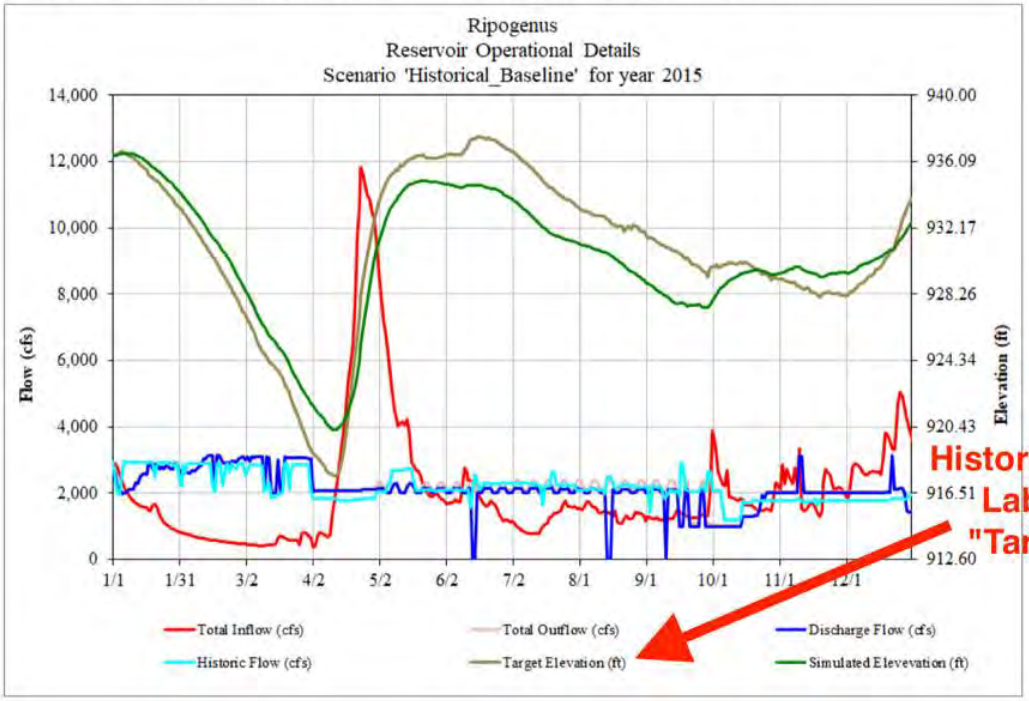


**Figure Attachment 1-11. Verification simulated Ripogenus operations 2015.**

To justify the conclusion that the model can simulate historical elevations in addition to power generation and release discharge, the report should include a quantitative comparison for reservoir elevations similar to Tables 6-1 through 6-6 and graphical comparisons that include both the historical and simulated elevations.

**3. The Operations Model Study fails to explain the derivation of the primary target elevations or why operations deviated from those targets in previous years, especially for the Ripogenus development.**

The report states that "At Ripogenus Dam, the impoundment water elevation is based on an annual rule curve that has prescribed weekly elevations that are used as a guideline to set the pond level based on the time of year. GLHA uses these elevations in conjunction with the storage available in the upstream storage ponds along with snowpack estimates in the winter months and forecasted precipitation to determine operations to maintain adherence to the rule curve" (page B-54). The target elevation curve is then provided in Table 5-5.

**Given the importance of these target elevations, a more detailed explanation for how these target elevations were identified is warranted.** For example, why lower the pool to 921.6 ft NGVD29 on April 1, why not 922 ft? What is the basis for 921.6 ft on April 1, as well as each of the other target elevations, orange highlighting supplied?

**Table 5-5. Ripogenus Development target elevation curve.**

| Date | Elevation (feet, NGVD 29) |
|---|---|
| **Target Elevations** | |
| Jan 1 | 928.6 |
| Mar 1 | 923.7 |
| Apr 1 | 921.6 |
| May 10 | 939 |
| Jul 1 | 939 |
| Oct 15 | 928.8 |
| Dec 31 | 928.6 |
| **Target Minimum Elevations** | |
| Jan 1 | 913.6 |
| Dec 31 | 913.6 |

Furthermore, the report does not discuss reasons for why the historical operations deviated from these targets. In some cases, notably in 2020 and 2021, the operational decisions that led to low reservoir levels in the Ripogenus had negative impacts on the shoreline community. Figure 1 below shows the Verification Scenario figures from Attachment 1 with the target rule curve superimposed (thick red line supplied). This figure clearly shows in what years and seasons the historical reservoir elevations deviated from the Baseline target, most notably in 2018 and 2020, areas of concern circled in orange for clarity.

**Figure Attachment 1-11. Verification simulated Ripogenus operations 2015.**

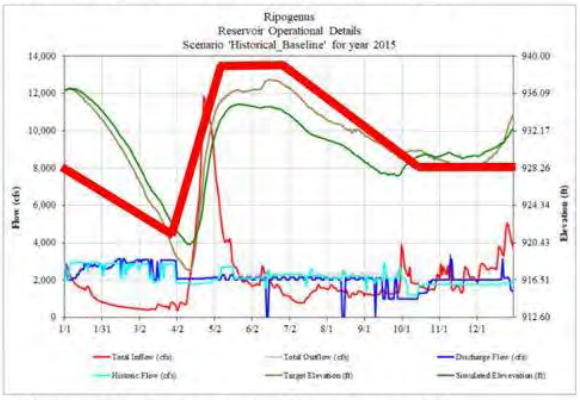

**Figure Attachment 1-29. Verification simulated Ripogenus operations 2016.**

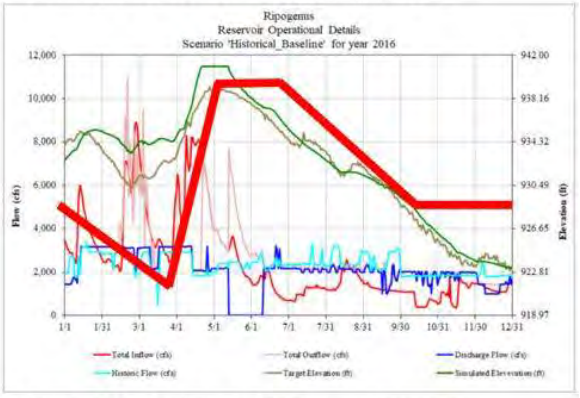

**Figure Attachment 1-47. Verification simulated Ripogenus operations 2017.**

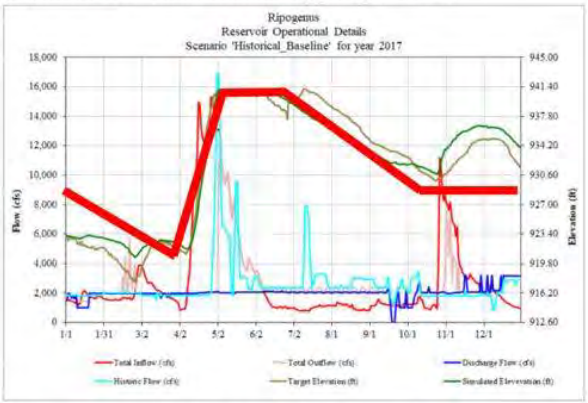

**Figure Attachment 1-65. Verification simulated Ripogenus operations 2018.**

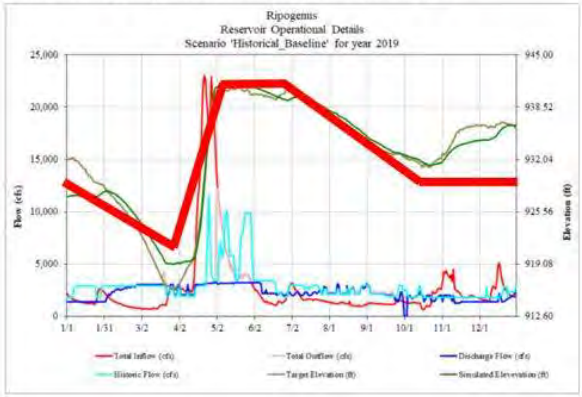
**Figure Attachment 1-83. Verification simulated Ripogenus operations 2019.**



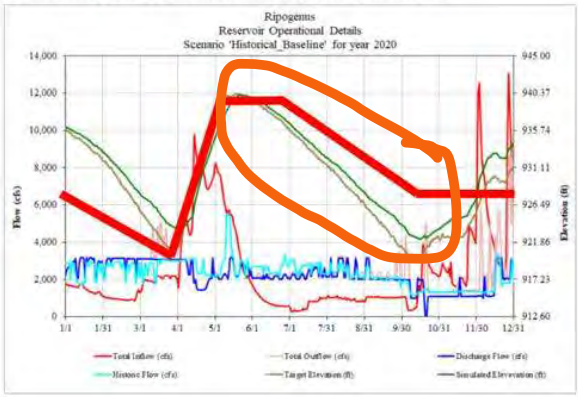


**Figure Attachment 1-101. Verification simulated Ripogenus operations 2020.**

**4. The Operations Model Study Report does not explain how this model will be used to develop and compare alternative operations.**

The report concludes that "the Operations Model…is appropriate for use in evaluating the effects of alternative operating scenarios on generation, reservoir levels, and outflows from the System" (page B-102).

It is not clear how those alternatives will be developed and evaluated. Given the historical negative impacts of the Ripogenus operations, especially in 2020-2021, the development and comparison of alternative operations is a critical component of the relicensing process in order to ensure the next license contains operational constraints to minimize those impacts.

**Summary of Requests**

TU requests that the Operations Model Study be resubmitted modified as described below as provided by (18 CFR 5.15(d)) paragraphs (c)(1)–(4) "(1) Approved studies were not conducted as provided for in the approved study plan;"

That the report include a clear **definition, explanation, and justification of using "Daily changing target elevations" at Ripogenus, North Twin, and Millinocket Lake Storage in the Verification Scenario**. This revision must explain how the use of historical elevations in place of target elevations at these developments supports the conclusion that the model "…compares well to historical data, characterizes system operations, and is appropriate for use in evaluating the effects of alternative operating scenarios on generation, reservoir levels, and outflows from the System" when it did not include a central component of the operational rules (namely the target elevations) in the Verification Scenario.

That the report **include quantitative (tabular) comparisons between historical and simulated reservoir elevations** for the Verification Scenario, and that **historical elevations be added and clearly labelled to the graphical comparisons in Attachment 1**.

That the report **explain: 1) the basis for the target elevations used for the Baseline Scenario (e.g., Table 5-5) and 2) reasons that historical operations led to major deviations from those target elevations** (e.g., late-summer draw down of Ripogenus in 2018 and 2020).

That Brookfield **specify the format required for requesting alternative target levels or other operational rules** to be simulated using the Operations Model. Note that such requests are NOT subject to the July 6 ISR Comment deadline.

At the ISR Meeting, "Randall Dorman (GLHA) said he anticipates that GLHA will convene a working group to develop alternative operating scenarios, and noted that alternatives should be based on study results and that stakeholders should be prepared to describe the reasoning behind any alternative request." [ISR Meeting Report, page 4]. Request that **details relating to the function of this group be published no later than with the Updated Study Report**. This would include: a plan and schedule detailing how this model will be used to evaluate alternative operating scenarios, who will participate in that process, and over what timeline.

# Attachment D

**Model Run #1**
**Upper Gorge Bypassed Reach Minimum Flow**

This model seeks to increase the minimum flow on the West Branch below Ripogenus Dam

| | Dates | Flow (cfs) released from Development | Remarks | Start Hour | End Hour |
|---|---|---|---|---|---|
| Current | 7/1-9/30<br>10/1-6/30 | 100 cfs<br>None (12 cfs) | Provide 100 cfs bypassed reach flow below Ripogenus Dam from sluiceway or other gate from 7/1-9/30 reduced to 12 cfs from 10/1-6/30 | 24 hours | - |
| Alternative | Year Round | 400 cfs | Provide continuous minimum flow of 400 cfs in bypassed reach below Ripogenus Dam to support aquatic habitat and recreation. Minimum flow would also augment flow in the event McKay Station outage, reducing stranding downstream | 24 hours | |

**Model Run #2**
**Upper Gorge Bypassed Reach Whitewater Releases**

This model run seeks to provide opportunities for scheduled whitewater releases in the Upper Gorge below Ripogenus Dam

| | Dates | Flow (cfs) released from Development | Remarks | Start Hour | End Hour |
|---|---|---|---|---|---|
| Current | None | None | No scheduled whitewater releases are currently required in the Upper Gorge | - | - |
| Alternative | 5/1-10/1 | 1000 cfs | Provide flow of 1000 cfs in the Upper Gorge below Ripogenus Dam for 4 hours one weekend day each week to support whitewater boating in the Upper Gorge and below McKay Station. Flow below McKay Station would remain unchanged from current license requirements. | 1000 | 1400 |

**Model Run #3**
**Millinocket Stream Flow Restoration**

This model run seeks to eliminate pumping from Millinocket Lake to North Twin.

| | Dates | Flow (cfs) released from Development | Remarks | Start Hour | End Hour |
|---|---|---|---|---|---|
| Current | Year Round | 60 cfs or inflow if less | Millinocket Stream inflows are pumped from Millinocket Lake to Ambajejus Lake by two pumps with a combined hydraulic capacity of 244 cfs..Millinocket Lake levels fluctuate 6.2 feet. | 24 hours | 24 hours |
| Alternative | Year Round | All inflow | Restore flows to Millinocket Stream by discharging all inflow from Millinocket Lake Dam, stabilizing lake levels and restoring natural flow regime. | 24 hours | 24 hours |

**Model Run #4**
**Millinocket Stream Whitewater Releases**

This model run seeks to provide opportunities for scheduled whitewater releases in Millinocket Stream

| | Dates | Flow (cfs) released from Development | Remarks | Start Hour | End Hour |
|---|---|---|---|---|---|
| Current | None | None | No scheduled whitewater releases are currently required from Millinocket Lake Dam into Millinocket Stream | - | - |
| Alternative | 6/1-10/1 | 600 cfs | Provide flow of 600 cfs from Millinocket Lake Dam into Millinocket Stream for 4 hours one weekend day each week to support whitewater boating on Millinocket Stream | 1000 | 1400 |

**Model Run #5**

**West Branch Below Stone Dam Minimum Flow**

This model run seeks to establish a minimum flow for the West Branch below Stone Dam

| | Dates | Flow (cfs) released from Development | Remarks | Start Hour | End Hour |
|---|---|---|---|---|---|
| Current | - | None (3 cfs) | Currently there is no minimum flow requirement on the West Branch below Stone Dam | - | - |
| Alternative | Year Round | 400 cfs | Restore flows to the West Branch below Stone Dam by discharging a continuous minimum flow of 400 cfs through new gate structure or powerhouse to benefit aquatic habitat and recreation | 24 hours | 24 hours |

**Model Run #6**

**West Branch Below Stone Dam Whitewater Releases**

This model run seeks to provide opportunities for scheduled whitewater releases in the West Branch below Stone Dam

| | Dates | Flow (cfs) released from Development | Remarks | Start Hour | End Hour |
|---|---|---|---|---|---|
| Current | None | None | No scheduled whitewater releases are currently required from Stone Dam into the West Branch | - | - |
| Alternative | 5/1-10/1 | 2300 cfs | Provide flow of 2300 cfs from Quakish Lake over Stone Dam for 4 hours one weekend day each week to support whitewater boating on the West Branch below Stone Dam | 1000 | 1400 |

Washington, DC 20426

**Subject:** **Ripogenus Hydroelectric Project (FERC No. 2572-133)**
**Penobscot Mills Hydroelectric Project (FERC No. 2458-247)**
**Updated Notice of Operations Model Technical Workshop**

Dear Secretary Bose:

Great Lakes Hydro America, LLC (GLHA), Licensee of the Ripogenus Hydroelectric Project (No. 2572) and the Penobscot Mills Hydroelectric Project (No. 2458) (collectively referred to as the "Projects"), herein is providing an updated notification of the date and location for the upcoming Operations Model Study Technical Workshop to be hosted by GLHA.

**Background**

On June 11, 2021, GLHA filed the Notices of Intent and a Pre-Application Document (PAD), which initiated the formal relicensing proceeding to obtain two separate new licenses for the continued operation of the Projects through FERC's Integrated Licensing Process (ILP). On March 23, 2022, GLHA filed the Revised Study Plan (RSP), and on May 13, 2022, FERC issued the Study Plan Determination (SPD). Pursuant to the RSP and as approved and modified by FERC's SPD, GLHA performed first season study activities in 2022 with available results provided in the Initial Study Report (ISR) filed with FERC on April 24, 2023. Subsequent to filing the ISR, stakeholders filed comments on the ISR and new study requests, and on September 19, 2023, FERC issued the second SPD.

On October 26, 2023, GLHA filed a letter with FERC providing notification that GLHA would be hosting a 2-day, in-person Operations Model Technical Workshop on December 5-6, 2023 at GLHA's office located in Millinocket, Maine. To date, several stakeholders have expressed interest in attending the workshop, but requested that it be located in Bangor, Maine, for greater convenience for non-local attendees. No attendees to date have requested that the workshop be held in Millinocket. Additionally, representatives of the local whitewater boating community indicated that there is a national whitewater boating conference occurring the week of December 4, 2023, creating a conflict with the planned workshop dates of December 5-6, 2023.

Based on the requests for a modified meeting date and location and to allow for participation in the workshop by interested stakeholders, GLHA has modified the workshop date and location as further described below.

**GREAT LAKES HYDRO AMERICA, LLC**
1024 Central Street, Millinocket, ME 04462
T +1 207.723.4341 F +1 207.723.4597 brookfieldrenewableUS.com

**Operations Model Technical Workshop**

Pursuant to the RSP and FERC-issued SPDs, GLHA developed an operations model designed to evaluate alternative operating scenarios in support of the ongoing relicensing of the Projects. During the May 2, 2023 ISR Meeting, GLHA described how the operations model was developed, calibrated, and verified.

Building off the information presented during the ISR Meeting, GLHA will be hosting a 2-day, ***in-person*** Operations Model Technical Workshop. The purpose of the workshop is to further explain the model inputs, calibration, and verification. During the workshop, GLHA will describe how the model is being used in support of the relicensing, how to request alternative operating scenarios, and how to interpret the model results. All stakeholders interested in learning more about the operations model are invited to attend this workshop.

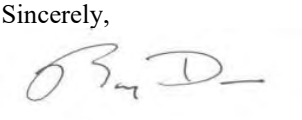
The workshop will be held ***in-person*** at the **Maine Department of Environmnetal Protection (MDEP) Office located at 106 Hogan Road, Suite 6 (3rd Floor) in Bangor, Maine** over two consecutive days, on January 10 and 11, 2024.

In order to plan accordingly, GLHA respectfully requests stakeholders who plan on attending the workshop RSVP by contacting Cate Russell at Cate.Russell@hdrinc.com or (207) 239-3792 at your earliest convenience but no later than January 3, 2024.

The anticipated agenda for the workshop is provided below.

### Wednesday, January 10, 2024 (9:00 AM to 4:00 PM)

1. Logistics, Safety, and Introductions (9:00 – 9:15)
2. Meeting Purpose (9:15 – 9:30)
3. Relicensing Schedule (9:30 – 9:45)
4. Overview of Projects (9:45-10:30)
5. Overview of the Operations Model (10:30 – 12:00)
6. Lunch (12:00 – 1:00)
7. Model Hydrology (1:00 – 1:30)
8. Model Verification (1:30 – 2:00)
9. Overview of Model Interface and the Operations Baseline (2:00 – 4:00)



### Thursday, January 11, 2024 (9:00 AM to 12:00 PM)

1. Overview of Requests for Alternative Operating Scenarios (9:00-10:00)
2. Overview of Interpreting Model Run Results (10:00-12:00)

November 17, 2023

Dear Secretary Bose,

Via Electronic Filing

Re: November 13, 2023. Ripogenus Hydroelectric Project (FERC No. 2572-133) Penobscot Mills Hydroelectric Project (FERC No. 2458-247) Updated No. ce of Operations Model Technical Workshop.

The Licensee's November 13, 2023 Filing notifies the agencies and stakeholders of the shift in the meeting site from Millinocket to Bangor and changes the workshop dates to January 10th and 11th 2024. However, the Licensee continues to insist on in-person attendance. This filing requests that the Licensee provides some method of remote attendance.

The scheduled workshop is intended to discuss the Licensee's Operation Model first filed on April 24, 2023. The model and its logic, data set(s) used, and output will be key to the balancing of uses when FERC staff and Maine Department of Environmental Protection develop a draft license including a 401 Water Quality Certification. My Filing of November 8, 2023, lists several issues contained in the Operation Model as presented.

Throught-out the ongoing licensing process the Licensee has provided remote conferencing capabilities. The January workshop is no different than past presentations; in fact, it is perhaps the most important. In my case, a winter trip to Bangor from Sarasota, Florida is an impossible burden to overcome. Without remote conferencing, distant stakeholders and possibly agency staffs are being purposely excluded.

I have been an active participant in the ongoing licensing process. Without remote access, I will be denied the opportunity to participate and possibly question the logic and input used in simulations presented in the Operations Model.

Thank you for the opportunity to request remote access to the January workshop.

Edward Spear

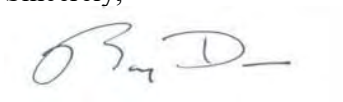
***Via eFiling***

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, NE
Washington, DC 20426

**Subject:** **Ripogenus Hydroelectric Project (FERC No. 2572-133)**
**Penobscot Mills Hydroelectric Project (FERC No. 2458-247)**
**Response to the Maine Council of Trout Unlimited's "Special Request"**

Dear Secretary Bose:

Great Lakes Hydro America, LLC (GLHA), the Licensee of the Ripogenus Hydroelectric Project (No. 2572) and the Penobscot Mills Hydroelectric Project (No. 2458) (collectively referred to as the "Projects"), herein files with the Federal Energy Regulatory Commission (FERC or Commission) responses to the November 9, 2023 "Special Request" filed by the Maine Council of Trout Unlimited (TU).



Formally commencing with GLHA's June 11, 2021 filing of the Notices of Intent and a Pre-Application Document (PAD) for the Projects, GLHA and the relicensing stakeholders have been engaged in routine consultation and studies through the Commission's stepwise Integrated Licensing Process (ILP). Whereas GLHA appreciates that stakeholders may file various comments on the Projects' dockets throughout the proceeding, in lieu of responding to each filing, GLHA is leveraging the defined ILP filings (e.g., study reports and license applications) to address applicable comments. GLHA believes that this approach is consistent with the Commission's ILP and provides an organized and systematic means of addressing comments applicable to the proceeding (e.g., the correspondence log to be included in the Draft License Application will document all of the correspondence).

However, based on recent filings (e.g., TU's November 9th "Special Request"), it appears that stakeholders may be misinterpreting information provided to date, as well as misunderstanding the relicensing process moving forward. In addition, a number of TU's "Special Request" comments appear to be repetitive to previous comments for which GLHA has responded. Whereas GLHA does not believe that it is necessary to provide the level of detail previously filed with the Commission and distributed/communicated to stakeholders in response to such comments, given that not all stakeholders may be reviewing the relicensing filings and responses to date, through this response, GLHA is identifying those comments that are incorrect and/or previously addressed.

Concurrent with this filing, GLHA is providing a copy of this response to all parties listed in the attached distribution list. In addition, parties can download an electronic copy of this filing from FERC's eLibrary system at https://www.ferc.gov/ferc-online/elibrary by conducting a search using the docket numbers P-2458 and/or P-2572.

If you have any questions regarding this filing, please contact me by phone at (207) 775-5605 or by email at randy.dorman@brookfieldrenewable.com.

Sincerely,

Randall Dorman, Licensing Manager
Brookfield Renewable

cc: Relicensing Distribution List

Enclosed: Response to the Maine Council of Trout Unlimited's "Special Request"

January 5, 2024

Ms. Kimberly D. Bose
Secretary Federal Energy Regulatory Commission
888 First Street, N.E.
Washington, D.C. 20426

**Via online submission to: http://www/ferc.gov**

Subject: **Response to Brookfield Comments Regarding Maine TU Council's Special Request and Concerns with Respect to the Determination on Requests for Study Modifications and New Studies for the Ripogenus and Penobscot Mills Hydroelectric Projects (P-2572 and P-2458)**

Dear Secretary Bose:

On behalf of its six chapters and over 2,000 members, Maine Council of Trout Unlimited (TU) submits this response to the Great Lakes Hydro America, LLC (Brookfield) letter dated December 19, 2023.

**Background**

Following the Initial Study Report Meeting and stakeholder comments,[1] Brookfield submitted its Responses to Comments on the Initial Study Report and Requests for New or Amended Studies.[2] FERC approved additional studies and study modifications but did not provide guidance on the Historical Ops Data Assessment Study and the Ops Model Study.[3] TU stated its specific concerns in its comments that also addressed the Ops Model Technical Workshop that Brookfield was scheduled for December 5 and 6;[4] Brookfield subsequently rescheduled the Workshop for January 10 and 11, 2024 in Bangor, but did not accommodate the request that "**teleconferencing be provided using state-of-the-art teleconferencing technology."**[5] This issue is time-critical.

**Time-critical Issue**

The Brookfield response to the request for a teleconference ("TU Comment #2") was: "…Based on past experience of GLHA's consultant, this will be a very technical two-day workshop and it is important that participants have a thorough understanding of the materials upon completion of the workshop. In order to achieve this goal, GLHA believes it is important that the workshop participants attend in person, as compared to a hybrid setting that would combine in-person and virtual participation and the associated distractions. Based on the responses to date, it appears that the in-person workshop will have a number of participants and GLHA looks forward to helping achieve the goal of the workshop."

[1] Staff Comments on the Initial Study Report and Initial Study Report Meeting Summary dated July 6, 2023.
[2] Brookfield Responses to Comments on the Initial Study Report and Requests for New or Amended Studies dated August 7, 2023.
[3] FERC Determination on Requests for Study Modifications and New Studies for the Ripogenus and Penobscot Mills Hydroelectric Projects dated September 19, 2023.
[4] Special Request Regarding Concerns of Maine Council of Trout Unlimited with Respect to the Determination on Requests for Study Modifications and New Studies for the Ripogenus and Penobscot Mills Hydroelectric Projects dated November 9, 2023.
[5] Brookfield letter of November 13, 2023, Subject: Ripogenus Hydroelectric Project (FERC No. 2572-133) Penobscot Mills Hydroelectric Project (FERC No. 2458-247) Updated Notice of Operations Model Technical Workshop.

While it appears that there will be a number of persons present at the Workshop, others will be unavailable to attend ***in person*** limiting stakeholder participation**.** The weather forecast for the western Maine mountains for January 9 and 10 predicts over a foot of snow that will prevent two of the participants in last May's ISR Meeting from safely traveling to participate in the workshop. Regardless of the Brookfield contractor's previous experience, teleconferencing providing both audio and video capability is the de facto standard for meetings involving multiple organizations and relatively large travel distances which is certainly the case here. Given the pervasive use of teleconferencing during and subsequent to the COVID 19 pandemic, Brookfield's explanation is simply not credible.

**Issues NOT Addressed by Brookfield Comments**

TU reiterated the obvious shortcomings of the Ops Model Study and Historic Operations Data Assessment Study in detail in its November 9, 2023 letter. These included problems in explaining hourly flows and data used to verify the Ops Model. These remain unanswered and apparently will remain so until the Updated Study Report.

**Other Issues**

The Brookfield response addressed other aspects of the TU letter that will be addressed in sequence. Shading is used to highlight TU responses to Brookfield comments and improve readability.

**TU Comment #1**

"The project Pre-application Document (PAD) stated that "GLHA maintains that a full suite of new studies is not needed, that the vast body of information on which today's certifications and licenses are soundly based and should be relied upon for these relicensings." The nongovernment organization (NGO) stakeholders took exception to this statement stating "Brookfield is required to provide FERC with information in the PAD and PSP referencing either relevant and recent existing studies or proposing new studies that address a number of subject areas including: Fish and Aquatic Resources, Recreation and Land Use, Aesthetic Resources and Tribal Resources. Instead, Brookfield relies on dated, unavailable, or non-existent studies or directs stakeholders to search for the information themselves at other agencies or on the Internet."

Brookfield Response

"GHLA does not understand the comment or appreciate the timing of the comment…"

**TU Response**

The point is that Brookfield did not enter into the relicensing by providing information required by the Pre-application Document, and has worked to avoid and/or delay addressing the information requirements needed to develop appropriate terms and conditions for the new license. Refusal to provide teleconferencing for the Workshop is another example of Brookfield making the process needlessly difficult for effective stakeholder participation.

**TU Comment #3**

The announcement states that "The purpose of the workshop is to further explain the model inputs, calibration, and verification." When TU asked at the ISR Meeting how the low water levels of Ripogenus

Lake occurred in two back-to-back years, the Brookfield response was that they were dry years and they were following the Ops Model.

Brookfield Response

"Based on the comment, there appears to be a misunderstanding of the purpose of the CHEOPS model (i.e., operations model) and how the model is used and will continue to be used. The Operations Model was not (and is not) used to influence Project operations or water levels, as that is not the intended use of the Operations Model. Instead, the Operations Model is a customized software tool used to evaluate and inform a wide range of physical and operational constraints on a hydroelectric facility or system. Using historical hydrology representative of the Project area, the model analyzes long-term water allocation associated with potential changes to the operation and physical configuration of the hydroelectric system. Whereas this information was presented during the May 2023 Initial Study Report (ISR) Meeting, it is possible that the hybrid nature of the meeting hindered the communication of this information to all of the meeting participants. This is an important aspect to the relicensing proceeding and, thus, this information will be presented again and in more detail during the January modeling workshop."

**TU Response**

We understand that Brookfield is using the Ops Model for planning purposes and to evaluate the impacts of various physical and operational constraints on the system. However, we maintain that Brookfield has caused confusion around the use of the model based on their statement during the ISR meeting that the drawdowns in 2021 and 2022 were the result of them "following the model." This statement suggests that model was being used for real-time operational decisions, which we don't believe is the case. To determine how much or little water can be released at various project nodes on any given day, which requires considering a variety of inputs, conditions, and the operator judgments and priorities. Brookfield has not been clear how those decisions are made. What model or other quantitative basis is there for making real time operational decisions?

Brookfield is raising chicken-egg questions with its explanation of how water is managed throughout the watershed. TU and other stakeholders are little better informed now than when the Initial Study Report was presented last May. It remains to be seen if the workshop will improve the situation.

Additionally, it is unreasonable to blame any confusion on the hybrid nature of the ISR Meeting. That a multi-million-dollar concern like Brookfield Renewable cannot do better than the crude setup it deployed at the last minute at that meeting is not believable. Maine TU Council routinely conducts its Board Meetings using a Meeting Owl. The technology provides both audio and video and has been completely reliable. This causes one to question whether Brookfield is acting in good faith.

**TU Comment #4**

"A key part of using the Ops Model is the monthly targets that are input. These are the ones that Brookfield uses. How target flows were determined was not explained and TU asked that information be provided in its ISR Comments. Since we do not see this being specifically addressed in the workshop agenda, TU asks that the basis for the monthly target lake levels be explained in detail at the workshop."

Brookfield Response

"As discussed during the May 2023 ISR Meeting, operations model inputs are defined and described in Section 5 of the Operations Model Logic and Validation Report provided as Appendix A of the ISR filed with FERC on April 24, 2023. Additionally, consistent with the purpose of the January workshop, GLHA intends to further explain the Operations Model inputs including the monthly impoundment elevation

targets that are used in the model. The model inputs are used to define the Baseline Scenario to represent the current operation of the Projects. As presented, the model inputs are based on license-required operations, or absent of license required operations (i.e., Ripogenus Impoundment), are based on typical operations."

**TU Response**

TU looks forward to Brookfield's explanation at the Workshop.

**TU Comment #5**

"TU asked for explanations of differences in operations over the winters of 2020 and 2021 compared with those of the subsequent winter that filled Ripogenus-Chesuncook Lake."

Brookfield Response

"Under normal inflows, the Ripogenus Project is operated such that the storage in the impoundment is utilized the meet the downstream flow and pond level requirements through mid-fall, at which time the whitewater boating flow requirements and pond level requirements at the North Twin Development end. Through the fall and early winter, the impoundment elevation is typically relatively stable. Starting early winter, the Ripogenus Project is operated to draw down the Ripogenus Impoundment to create storage for the spring freshet, which refills the impoundment in a normal year by late spring and then the annual cycle repeats.

During the winter of 2020, low inflows in the spring prevented the impoundment from fully refilling. Although GLHA utilizes indicators such as snowpack estimates, the drought conditions that were experienced in spring 2021, which contributed to the lack of refill in the spring of 2021, cannot be predicted. Due to the lack of refill in spring 2021 and the required downstream flow requirements, the Ripogenus Impoundment decreased to elevations of approximately 20 feet below normal full pond by the fall 2021, which is the elevation typical for the late spring drawdown. Due to these conditions, outflows from the Ripogenus Project were limited to minimum flows and eventually reduced below minimum flows (per agency approval) during the winter of 2021 to facilitate the refill of the Ripogenus impoundment in the spring 2022. As presented during the May ISR Meeting, as well as in the various additional relicensing meetings and filings, GLHA operates the system to balance the various license requirements and water interests associated with the larger Penobscot River watershed."

**TU Response**

The Brookfield response is oversimplistic. It is acknowledged that 2020 and 2021 were dry years – there were other dry years that did not result in the failure of the operator to fill Ripogenus-Chesuncook-Caribou Lake. What has never been explained with any specificity is how Brookfield determined that max generation during the winters preceding the summers of 2020 and 2021 made sense in terms of the Ops Model or Rule Curve or compared those parameters with the parameters used in determining the flows that finally filled Ripogenus-Chesuncook-Caribou Lake during the winter of 2021-2022. Unless the reasons for past problems are determined, they must be expected to recur.

**TU Comment #6**

"American Whitewater asked for specific Ops Model runs. This will be nearly six months ago by the time the workshop is held. TU asks that these model runs be presented and explained on the afternoon of day two of the workshop, or at least used as examples when explaining the workings of the ops model."

Brookfield Response

"Consistent with the ongoing study, during the Operations Model Workshop, GLHA and the stakeholders will review the schedule for submitting alternative operating scenario requests. GLHA will review the alternative operating scenario requests collectively, and subsequently run the requests using the model and then present the results. In the event that certain requests are the same or similar, GLHA may elect to run a select number of requested scenarios to avoid duplication. Each requested scenario is required to be accompanied by justification for the scenario (i.e., based on existing information, including study results) and an indication of the resource it is intended to support. American Whitewater has participated in similar modeling studies and understands this process."

**TU Response**

TU hopes that the American Whitewater requests are honored, and renews its request that they be covered at the Workshop

**TU Comment #7**

"Further review of the record by TU did not find a copy of the current water management plan that attaches to the current license. TU asks that a copy of the Water Management Plan be provided at the workshop and its relationship to the current Ops Model be explained."

Brookfield Response

As presented on multiple occasions, the "1991 Water Use Plan" is a misnomer in that as compared to a "management plan" that resulted from the previous licensing, the document was the licensee's proposed operation alternative prior to issuance of the existing license. As with every license issued by FERC under the Federal Power Act, license provisions supersede a licensee's proposals. Therefore, although the "plan" was the licensee's proposal for operating the Projects and portions of the "plan" were incorporated into the Projects' 1996 FERC Licenses, this "plan" (i.e., the licensee's proposal) is not the way the Projects are currently operated. The one exception is that the Water Use Plan is used as the basis for determining recreational flows from McKay Station at the Ripogenus Project. As indicated in Article 402 of the Ripogenus License, "The recreational flow for each month from May through September shall be determined on the first day of each month. This determination shall be based on an analysis of Total Available Water, as described in the Water Use Plan presented in the application for new license filed December 17, 1991, pages 10-14 of the Water Use Plan, Volume VII…"

A description of the history of the development of the "Water Use Plan" and its role in the existing license is provided in Section 5.5.1 of the Historic Operations Data Assessment Study Report provided as Appendix A of the ISR filed with FERC on April 24, 2023. This summary is repeated below. In support of the Projects' 1991 License Application, the Projects' previous licensee developed an operations model to determine whether and how the various agency and interest group-requested mitigation."

**TU Response**

The Licensee's current water management of the Ripogenus Project remains confusing. The Licensee appear to approach water management as a system wide issue rather than by individual facilities. Such a tactic ignores the environmental and recreation goals of the Ripogenus Project and creates confusion. Figures provided in an Appendix B of the April 2023 filing demonstrate that peaking flows grossly exceed the required minimum whitewater flow. The Stakeholders have identified major errors in the Operation Model of April 2023, and this adds to the confusion. Is the Ops Model the proposed management of the

Ripogenus Project? If this is the case, then changes from current to proposed operation need to be detailed and lake elevation and McKay Station flow targets provided.

The Licensee calls the 1991 Water Use Plan (WUP) a misnomer, as with many of the Licensee's statements during the process, it is simply their opinion. The Licensee continues to dismiss the WUP even though it was the foundation of the 1996 FERC License. The Licensee continues to argue that various License Articles altered lake level and flow goals presented in the WUP. The Licensee neglects to explain which, if any, Ripogenus License imposed conditions invalidate the WUP. The Licensee would have FERC believe that May-September whitewater and July-September Upper Gorge flows place and undue burden on Ripogenus-Chesuncook-Caribou Lake storage. Nothing could be further from the truth. Current peaking operation extend well beyond boating flow guarantees in both in time (13 hours) and flow (3500 cfs). The actual cost of Article 402 requirements is approximately 0.7 BCF or 6-7 inches of Ripogenus Impoundment head. In reality, it is the shift to peaking operations that defeats the WUP or any other empirically derived water management plan.

The 1996 FERC Ripogenus Project License provides the Licensee a great deal of operating flexibility. GNP could not do as they wished with storage, they needed hydro for co-generation. The Licensee has no such constrains. As a result, the Licensee moved from stable base flows into a peaking mode. It is disingenuous for the Licensee to repeatedly rebuff the WUP, and then blame in shift in operation on the minimal loss of storage resulting from 1996 License Article requirements.

TU's initial request remains valid. Please provide the current water management plan as it relates to the Ripogenus Project, noting refinements and modification from the 1996 FERC License application. Although the Licensee argues the WUP is obsolete they continue to direct readers to the WUP. The question at hand is "where is the current daily Licensee's water management plan" and how is it different the WUP? TU has attached Section 5.5.1 of the Historic Operations Data Assessment Study Report and the Water Management Plan as a convenience.

**TU Comment #8**

FERC commented on what was presented at the ISR Meeting: "The results of the Historic Operations Study were presented during the ISR meeting. The presentation included graphical representations of lake level and flows through the Ripogenus and Penobscot Mills Projects' developments. GLHA filed the operation data in electronic format on May22, 2023, along with the ISR Meeting Summary. To assist us and other stakeholders in comparing actual operational releases to the licensed releases, as well as better understanding the details of how the projects are operated, please revise the excel spreadsheets for each of the projects' developments to correlate the historical hourly flow data with the licensed flow requirements at the time.

Brookfield responded: "GLHA provided a detailed description and graphics of required Project operation in the Pre-Application Document (PAD) as well as the Initial Study Report (ISR)… GLHA believes that the Operations Model will be the appropriate tool to evaluate current and potential alternative operating scenarios in relation to water availability and allocation in support of issuing the new licenses."

TU Comment: FERC did not comment on this in its FERC Determination on Requests for Study Modifications and New Studies. TU supports the FERC request. Correlating historical hourly flow data with licensed flow requirements on an hourly basis to provide additional clarity to what it has already presented to this point.

Brookfield Response

"As discussed and presented on multiple occasions, GLHA has recorded and maintained the data required by Projects' existing licenses. Upon the initial requests for the historical operational data, which

the Projects' licenses do not require maintaining, GLHA communicated the challenges of developing this operational dataset. Although this was a significant effort, based on the best information, GLHA developed the requested dataset.

Regarding how this dataset compares to the compliance flow at a given point in time, GLHA has provided comprehensive descriptions of the license-required flows in the documents filed to date. However, it is nearly impossible to recreate historical hourly flow requirements for the period of interest, as many of the flow requirements, specifically those for the Ripogenus Project, were developed in consultation with agencies and/or are based on an evaluation of inflows on a weekly basis. Additionally, at times flows are modified in consultation with agencies to support required maintenance activities or in response to low inflows.

As indicated previously, although the historical operational dataset has been developed and distributed, GLHA does not believe critiquing or further evaluating the historical operations data will inform current operations or the New Licenses. Instead, GLHA continues to emphasize that the Operations Model will be the appropriate tool to evaluate alternative operating scenarios in relation to water availability and allocation for the benefit of resources of interest in support of issuing the New Licenses. In addition, as discussed during the May 2023 ISR Meeting, and to be further presented during the January 2024 model workshop, this data does not influence the accuracy or functionality of the model."

**TU Response**

Brookfield's response only make sense when taken completely out of context. NMFS PAD Comments requested a suite of functionally oriented studies: Indicators of Hydrologic Alteration Model, River Temperature in West Branch and Mainstem Penobscot River Study, and Future Flow and Water Temperature Scenarios/Climate Change Study that FERC rejected [SPD, pages B-38 to B-49] that had the potential to provide the information needed to determine terms and conditions of the new license of a functional basis. Brookfield proposed the Ops Model Study and Historic Operations Data Assessment Study in their stead that FERC accepted. That the information needed to explain the methodology used to manage flows and water levels for the Ripogenus and Chesuncook Mills Projects was not required to be maintained is immaterial in this context. The result is that we are headed toward a conclusion of the study phase of the relicensing without the functional information needed to determine enforceable terms and conditions for the new license, a situation perfect for the licensee, intolerable to the stakeholders.

**TU Comment #9**

"The figures showing hourly McKay Station flows based on generation data show flows of 4000 cfs, especially Figure 12 below. These exceed the 3500 cfs hydraulic capacity of McKay Station [Preapplication Document dated June 11, 2021, page 4-14.] When queried at the ISR Meeting, the Brookfield response was the flows were not completely accurate and a range of variability was not available. This continues to cast doubt on the results of the analysis." Further analysis indicates that the figure is even more misleading than TU originally thought because the upper limits of the hourly flow values appear to be truncated at 4000 cfs and are actually worse than the graph provided depicts. Brookfield goes on to validate the ops model using circular logic that is not valid. TU submits that while Brookfield was the organization that proposed both the Historical Ops Model Study and the Ops Model Studies as replacements for studies requested by NOAA fisheries, Brookfield has not justified this replacement. Additional rationale for this conclusion is provided in subsequent paragraphs.

Brookfield Response: Includes the statements "… the Projects' existing licenses do not require the maintenance of flow data (e.g., for the past 20 years), and hence, the development of the requested

historical data set has been both a labor-intensive activity, as well as dependent upon available data, which appears to include some anomalies or outliers. “Also, “In addition, GLHA notes that the observations associated with the comments (i.e., flows greater than 3,500 cfs) appear to be limited to the data between 2004 and 2013.”

TU Reply: The first statement is immaterial. Since Brookfield proposed the studies, Brookfield should have the data to defend them. If the observations associated with comments that are obviously incorrect didn’t persist, then why were they used?”

Brookfield Response

“Based on these comments, it appears that TU is confusing the Historical Operations Data Assessment with the Operations Model Study. These are two separate studies and serve very different purposes. The Historical Operations Data Assessment was performed in response to stakeholder requests for historical data. The Operations Model Study is directly related to the development and future use of the model. GLHA believes that it is important that stakeholders appreciate the difference between these studies and how the study results will be used in the proceeding. Whereas this information was presented during the May 2023 ISR Meeting, it is possible that the hybrid nature of the meeting hindered the communication of this information to all of the meeting participants. Given the importance of this difference to the relicensing proceeding, the difference between these two studies will be further discussed during the January modeling workshop.

As communicated previously, and in response to Comment #8, the Historical Operations Data Assessment provides the best historical operational data available. The dataset represents the raw data to be reviewed by the relicensing stakeholders. This study is unrelated to the model being developed or other studies requested by others.

As indicated in the Historic Operations Data Assessment Study Report, outflows from McKay Station are calculated from generation (kilowatts) and the differential in headpond and tailrace elevations. The headpond and tailrace elevations are measured by transducers. In 2020, the tailrace transducer was identified to be in poor condition and was replaced. GLHA periodically inspects and maintain/replaces the headpond transducer(s). Additionally, in early 2020, GLHA implemented updates to the program that calculates station outflows, which removed sources of variability in the previous program and improved the overall consistency and accuracy of the calculated station outflows. As indicated previously, GLHA does not believe that the proceeding will benefit from further evaluation of historical data that does not influence current operations or the future license requirements.”

**TU Response**

The Historical Ops Model Study and Ops Model Study should be complementary, and is it reasonable for TU to ask that the studies be consistent. Brookfield was able to convince FERC to adopt its studies over those proposed by NMFS. As it currently stands, the model has not been validated and Brookfield’s statement above confirms TU’s contention that Brookfield lacks the data to do so.

**TU Comment #10**

FERC Comment: “During the ISR meeting, and as documented in the ISR Meeting Summary, Maine TU raised concerns regarding the results of the validation run of the Operations Model. Maine TU indicates that, for the calendar year 2020, the modeled results do not line up well with the actual reported impoundment levels and releases for the Ripogenus Project. To address concerns about the model and to improve the outcome of the second year of the study, which involves developing alternative

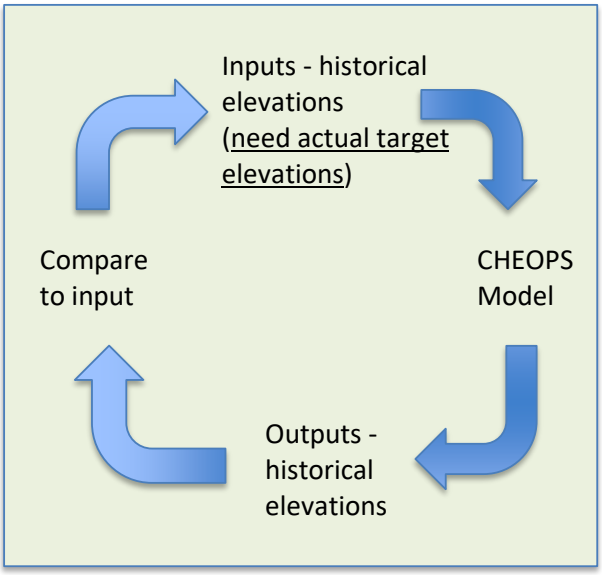
operating scenarios to model, GLHA raised and the group discussed the concept of GLHA establishing a working group for the operations modeling. Establishing a working group could be beneficial to this process. If such a group is established, a technical work session could be convened to familiarize the members of the working group with the CHEOPS model, including how it works, as well as the models' assumptions and limitations. Such an approach could help to improve understanding of the model and ensure that all reasonable alternatives identified by stakeholders are modeled during the second year of studies."

Brookfield Response: "The Operations Model Study Report will be updated to include additional descriptions of the application of daily target elevations at the Ripogenus, North Twin, and Millinocket Lake Storage developments in the verification scenario as well as how the model utilizes target, spill and minimum elevation inputs during scenario execution. Additionally, expanded discussion will be added to the Operations Model Study Report to describe the simulated versus actual allocation of water between the Ripogenus and North Twin developments for the calendar year 2020 and 2021. GLHA is planning to convene an Operations Model Technical Conference with interested stakeholders to explain how the model was developed (including model inputs), how the model was calibrated and verified, how the model will be used in the relicensing process, and the framework for requesting alternative operating scenarios. GLHA anticipates conducting the technical conference in fall 2023. Subsequently, GLHA will evaluate reasonable alternative operating scenarios requested by stakeholders with results provided to stakeholders in early 2024 and filed with FERC in the USR by April 22, 2024."

TU Response: Operations models can be challenging to validate to historical data, especially when 1) trying to model a whole system of reservoirs as they are, and 2) the data needed to do this correctly likely does not exist. The most critical issue with their verification is the use of the "daily varying target elevations" for Ripogenus Lake and others. It appears that those "daily varying target elevations" are in fact historical elevations, and historical elevations were used as an input to the model, and then compared the output to those same elevations for verification. To avoid this circle, actual target elevations must be used as the input. Those targets changed year to year (based on snowpack, forecast rain, etc.), but it appears that Brookfield did not document that. This would mean that there is no record of those historical targets and thus they cannot be used to verify the model. Brookfield specifically states that "(note for Ripogenus, North Twin, and Millinocket Lake Storage developments, the target elevation shown on the figures is the historical elevations).15 (sic)

TU Request: That Brookfield at least provide some example runs at the workshop from those requested by American Whitewater or TU demonstrating how daily varying target levels were determined. The joint of American Whitewater and the Appalachian Mountain Club is included as Attachment D for convenience. Examples will have to be used to illustrate, why not use those requested months ago by stakeholders? Brookfield Comments:" The Operations Model Study Report will be updated to include additional descriptions of the application of daily target elevations at the Ripogenus, North Twin, and Millinocket Lake Storage developments in the verification scenario as well as how the model utilizes target, spill and minimum elevation inputs."

TU Response: TU asks that discrepancies noted in its ISR comments be addressed specifically at the workshop.



Brookfield Response

"As indicated previously, during the Operations Model Workshop on January 10-11, 2024, GLHA will further explain the Operations Model inputs including the impoundment elevation targets that are used in the Baseline scenario as well as those used in the Verification scenario. GLHA believes that it will be important for the workshop participants to understand these concepts upon completion of the workshop. The Operations Model Baseline scenario inputs are based on license-required operations, or

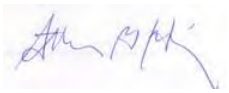
absent of license-required operations (i.e., Ripogenus Impoundment), are based on typical operations as this scenario represents current operations of the Projects. For example, the target elevations for Ripogenus Impoundment in the Baseline Scenario are based on typical operations informed by an evaluation of historical operations data. The Baseline Scenario is the control in which all alternative operating scenarios evaluated by the model are compared against. GLHA looks forward to the workshop and further conversations related to the model. (Underlining supplied for clarity)

**TU Response**

Brookfield is declining to address key failures of water management that have occurred under its ownership. Brookfield is unable to validate the model using studies that it proposed because it does not have the data required to validate it and could only appear to validate the model by using circular logic: the same proposition occurs as both a premise and a conclusion—the argument validates itself. If these issues are left unaddressed by the new license, the reasonable expectation is for the same problems including the dewatering of Ripogenus-Chesuncook-Caribou Lake to continue to occur, and given the instability brought on by climate change, for the dewaterings to increase in frequency and magnitude.

**Summary**

Brookfield fails to substantively address a number of the concerns voiced in Maine TU Council's Special Request Regarding Concerns of Maine Council of Trout Unlimited with Respect to the Determination on Requests for Study Modifications and New Studies for the Ripogenus and Penobscot Mills Hydroelectric Projects.



TU reiterates its prior requests, especially the most time critical:

- **That the Workshop employ state-of-the-art teleconferencing technology to include stakeholders who will otherwise not be able to participate**
- That the specific shortcomings of their studies detailed in Maine TU Council ISR Comments dated July 5, 2023 and reiterated in its Special Request Regarding Concerns of Maine Council of Trout Unlimited with Respect to the Determination on Requests for Study Modifications and New Studies for the Ripogenus and Penobscot Mills Hydroelectric Projects be specifically addressed at the workshop to the extent possible. To do otherwise endorses continuing delay establishing the information baseline needed for the new license.

It is apparent that major changes to project operations will be required for both projects to address obvious problems that lax terms and conditions of the current license permitted in a failed attempt to keep Great Northern Paper's mills open. Examples are the dewatering of five miles of the main stem of the West Branch of the Penobscot River below Stone Dam and the fish kills that have been regularly occurring below Ripogenus Dam incident to generator trip events, something that FERC Compliance is already working to improve on in the short term.

Maine TU Council appreciates the Commission's attention to these comments on these important projects and hopes that the Commission will act to acquire the information needed to enable the Commission to balance project harms and benefits. This will prove to be impossible unless enforceable terms and conditions regarding Ripogenus-Chesuncook-Caribou Lake levels and flows at Ripogenus Dam are determined.

Respectfully,

Stephen G. Heinz
Maine TU Council FERC Coordinator

## 5.5 Description of Project Operations

### 5.5.1 Project Operations prior to 1996 Licenses

FERC issued original licenses for the Projects in 1968, under which the Projects were operated until issuance of the current licenses on October 22, 1996. The 1968 license for the Penobscot Mills Project did not contain articles related to the operation of the Project. The 1968 license for the Ripogenus Project included two articles related to the operation of the Project.

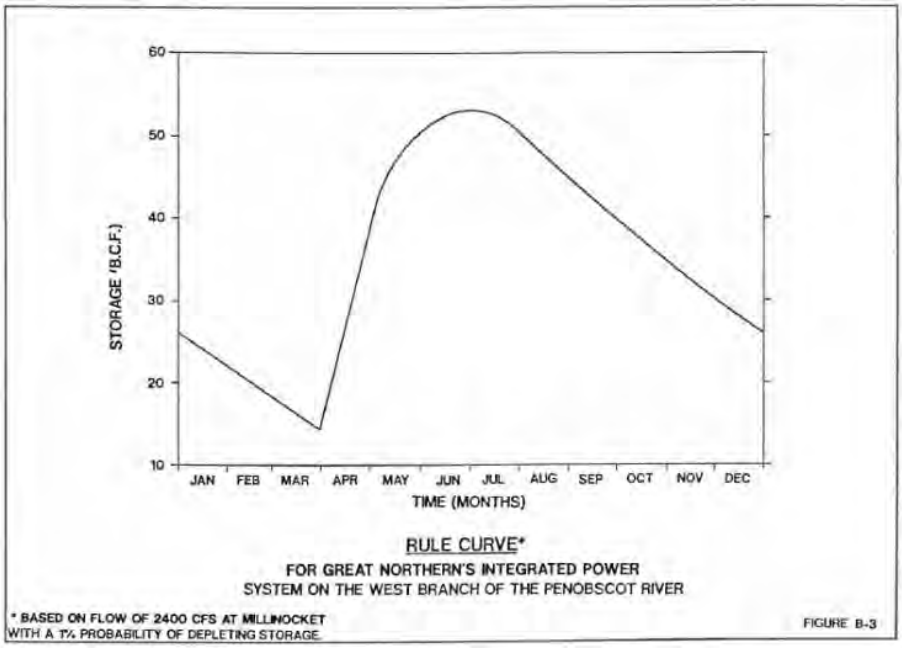
- Article 32 required that the Project operate in such a manner so as to provide an outflow during the flood season which, when combined with the runoff of the intervening area

between the Ripogenus Project and the North Twin Development, will not cause an outflow that would exceed the spillway capacity of the North Twin Development.

- Article 33 required that the Project operate to provide a minimum flow of 200 cfs[2], as long as any storage remains in Ripogenus Lake, in the West Branch immediately below McKay Station and, following consultation with the Maine Department of Inland Fisheries and Wildlife (MDIFW) and the U.S. Fish and Wildlife Service (USFWS), take such steps as may be necessary to protect the fishery resources in the river channel between the dam and McKay Station.

Although operations data is not available for the period under the 1968 license, a description of how the Projects were typically operated is provided in the 1991 License Application filed with FERC in support of obtaining new licenses for the Projects in 1996, which is summarized below.

Under the 1968 licenses, McKay Station generated 40 Hz power into the local power grid (to power the Millinocket and East Millinocket paper mills), with loads supplied by the grid being mostly large groundwood grinder motors where loads varied significantly during the grinding process. Due to the large size of these loads relative to the 40 Hz system, the system was prone to frequency upsets when the load changes occurred. Individual hydro governor controls on each hydro unit sensed the change in frequency when the load on a grinder motor changed and adjusted generator outputs in terms of flow and generation to compensate for the change and achieve a new balance. These frequency changes and governor responses made it impossible to maintain instantaneous flows at all 40 Hz hydro generators, particularly at McKay Station, which was the first station to respond to a frequency upset. (GNNC 1991).



Under the 1968 licenses, the previous licensee operated the integrated power system (Ripogenus impoundment and other storage impoundments, located upstream and downstream) on an annual storage cycle. These storage impoundments have a total usable storage capacity of 58.7 billion cubic feet (BCF), of which the Ripogenus impoundment provides 30 BCF (51% of the total) and were drawn down during the year to provide controlled downstream flows. The spring runoff was used to replenish storage in the impoundments. Water was withdrawn at a controlled rate from the

[2] The 1991 License Application indicates that the Project was typically operated to voluntarily maintain a minimum flow of 500 cfs (verses the required 200 cfs) below McKay Station to protect salmon redds during the incubation period.

storage impoundments during the year to provide maximum sustained base-load energy in accordance with the system-wide rule curve, to provide storage capacity for the following spring, and to address additional system constraints (GNNC 1991).

Given that the Projects operate as a system, there was no Project-specific rule curve for the Ripogenus Project; rather the Project was operated using a system-wide rule curve (as shown in Figure 4 below, which was extracted from the 1991 License Application). The system-wide rule curve was a statistical curve based on providing an average daily flow of 2,400 cfs at Millinocket, with a 1 percent probability of running out of storage. The amount of available storage within the storage system was monitored continuously and operation of the entire system was adjusted, as necessary, to maintain overall storage conditions within close proximity to the level indicated on the system-wide rule curve (GNNC 1991).

**Figure 4. West Branch Penobscot River System-Wide Rule Curve (from 1991 License Application)**

The annual cyclic system of operating these storage projects provided flood control during high flow periods by storing the majority of the runoff, while providing a more even distribution of water flow throughout the West Branch over the course of the year. Even when the impoundments were filled to capacity and water was spilled, the maximum discharge was greatly reduced in

magnitude and delayed in time until peak flows from the downstream, unregulated rivers subsided (GNNC 1991).

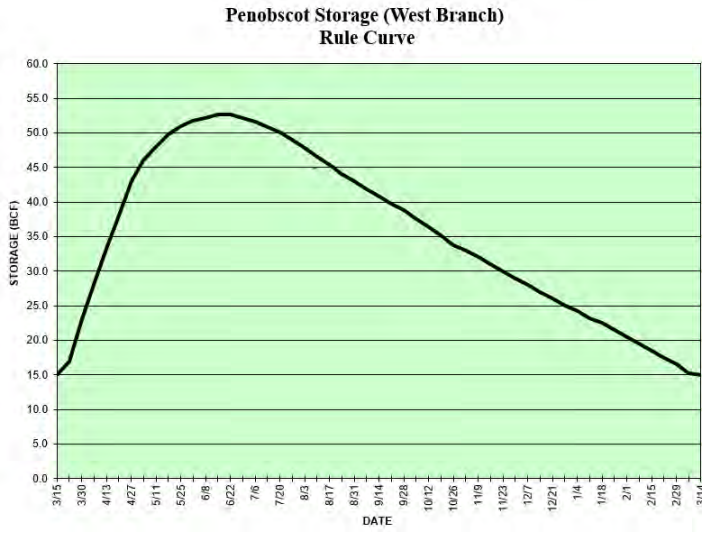
The 1991 License Application indicated that from 1970 to 1985, the Ripogenus impoundment had been drawn down approximately 16.5 feet on average with the greatest drawdown being 30.6 feet below normal full pond elevation to provide controlled flows downstream and provide sufficient storage capability to capture spring runoff. Since McKay Station became operational in 1953, the maximum the impoundment was drawn down was nearly 42 feet, briefly, during an extremely dry (drought) year. Prior to 1970, the flow in the West Branch was also used for log driving (GNNC 1991).

*Water Use Plan*

In support of the Projects' 1991 License Application, the Projects' previous licensee developed an operations model to determine whether and how the various agency and interest group-requested mitigation measures, enhancements, or changes in Project operations (which sometimes conflicted with each other) could be implemented at the Projects. A report describing the development of the operations model and the resulting Water Use Plan (i.e., the Licensee's proposed operations alternative) was provided in Volume VII of the 1991 License Applications for the Ripogenus and Penobscot Mills Projects. The purpose of the model and associated evaluations was the following:

- Identify and rank the existing and potential uses of water at the Projects;
- Determine the available water for use to meet the agency and interest group requests, which were specified during the consultation process;
- Analyze existing flow data to identify available water during a wet year and a dry year;
- Determine the inflow to the impoundments on an annual basis; and
- Define a range of normal available water that the Projects would operate within.

The Water Use Plan provided in the 1991 License Application proposed to implement adjustments to the previous system management to provide enhancements to the environmental resources while maintaining efficient operation of the hydroelectric system. Although the adjustments had a negative impact on generation, the adjustments did not require a change to the system rule curve, which was based on total system storage. Instead, the Water Use Plan, with its total available water



curve, was to be used to supplement the rule curve to meet various water use requirements in that area.

The 1991 Water Use Plan (i.e., the licensee's proposed operation alternative) was developed prior to issuance of the Projects' existing licenses and was the ***basis*** for the operational requirements included in the Projects' 1996 FERC Licenses. However, as compared to the Water Use Plan, the Projects' current operations are defined by the requirements of the Projects' licenses. Therefore, the 1991 Water Use Plan is not a "management plan" consistent with other management plans resulting from a relicensing proceeding. The one exception being that the Water Use Plan is used as the basis for determining recreational flows from McKay Station at the Ripogenus Project. As indicated in Article 402 of the Ripogenus License, "*The recreational flow for each month from May through September shall be determined on the first day of each month. This determination shall be based on an analysis of Total Available Water, as described in the Water Use Plan presented in the application for new license filed December 17, 1991, pages 10-14 of the Water Use Plan, Volume VII…*"

### 5.5.2 Project Operations under 1996 Licenses, as Amended

The Ripogenus and Penobscot Mills Projects are operated as a combined system using the same system-wide rule curve as described above that has been used since the 1970s as shown in Figure 5 below.

PROJECTS
(FERC Nos. 2572 and 2458)

GREAT NORTHERN NEKOOSA CORPORATION

## ABSTRACT

In response to agency and interest group comments received during second-stage consultation, Great Northern Nekoosa ("Great Northern") developed a model of its entire hydro system. This model produced the Water Use Plan, a significant re-regulation of Great Northern's entire reservoir and hydro-generation system to meet, wherever possible, the resource use and management goals identified by agencies and private groups in second-stage consultation.

Although not required to do so, Great Northern has been operating its system, on a trial basis, according to the Water Use Plan since Spring 1991. While the results of this trial demonstrate that the Water Use Plan is feasible as described in this report, they also indicate that further modification cannot be accommodated without imposing unacceptable impacts on the Water Use Plan or on the economic viability of Great Northern.

By considering the total storage volume above Ripogenus Dam, the model showed that Great Northern could meet the goals of: stable summer recreation flows and spawning and incubation flows for salmon on the West Branch below McKay Station; relatively stable summer water levels in the North Twin impoundment; a fall drawdown of North Twin for lake trout incubation and winter water levels to protect lake trout spawning; and a continuous minimum flow of 2,000 cfs below Millinocket. In order to provide these benefits, the Ripogenus impoundment would continue to be drawn down. Also, Great Northern is proposing to provide leakage flows in the Back Channel, and is proposing to maintain the minimum flow in Millinocket Stream at 20 cfs. Where Great Northern had originally proposed a year-round minimum flow of 50 cfs in the Upper Gorge, it now proposes 100 cfs for the months of July, August, and September to accommodate plans for an adult salmon fishery, and proposes only leakage flows for the remainder of the year. For recreational boating, Great Northern proposes to set as a goal a summer (May 1 to September 15) flow of at least 2,000 cfs below McKay Station for normal months, and at least 1,800 cfs during wet or dry months.

GREAT NORTHERN NEKOOSA CORPORATION

SUMMARY OF THE WATER USE PLAN FOR THE RIPOGENUS AND PENOBSCOT MILLS PROJECTS

Great Northern Nekoosa Corporation ("Great Northern") is in the process of relicensing its Ripogenus and Penobscot Mills Projects. During initial and second-stage consultation, various state and federal agencies and interest groups identified mitigation measures, enhancements, or changes in project operations that they believed should be implemented by Great Northern or by the Federal Energy Regulatory Commission ("FERC") as conditions of new licenses for the projects. Working with its consultant, Stone & Webster Engineering Corporation ("Stone & Webster"), Great Northern developed a model of its hydro system to determine whether and how these sometimes conflicting agency water use requests could be implemented.

This report describes the development of that model and presents the Water Use Plan that has been developed by Great Northern. It supplements an oral presentation to environmental agencies and interest groups in Bangor, Maine on February 25 and 26, 1991 and discussions with them at various times since then. A preliminary plan was provided to the agencies and interest groups on April 26, 1991. Additionally, follow up meetings were held on June 28, 1991 and October 7, 1991 with the Maine Department of Environmental Protection ("MEDEP"). All comments received since then have been incorporated into this report. As described below, the Water Use Plan has been analyzed in detail to determine whether

it meets Great Northern's power requirements and to determine whether additional environmental enhancements or mitigation measures requested by the agencies could be accommodated. As revised, the Water Use Plan meets Great Northern's requirements and some additional agency requests, but cannot be modified to predictably accommodate further agency requests without imposing unacceptable impacts on the Water Use Plan or on the economic viability of Great Northern.

**Introduction:**

The starting point of the study was the present method of operating the Great Northern hydro system. As described in the second-stage consultation draft of Great Northern's license applications, the hydro system is managed on the basis of a historically-derived rule curve to maximize sustained power generation to Great Northern's pulp and paper mills in Millinocket and East Millinocket. Lake levels are not controlled for nonpower purposes, and the only minimum flows that are provided are 200 cfs below McKay Station, 20 cfs below Millinocket Lake Dam, and 2000 cfs at Millinocket. Until this study was conducted, Great Northern did not propose to make any other changes in project operations during relicensing.

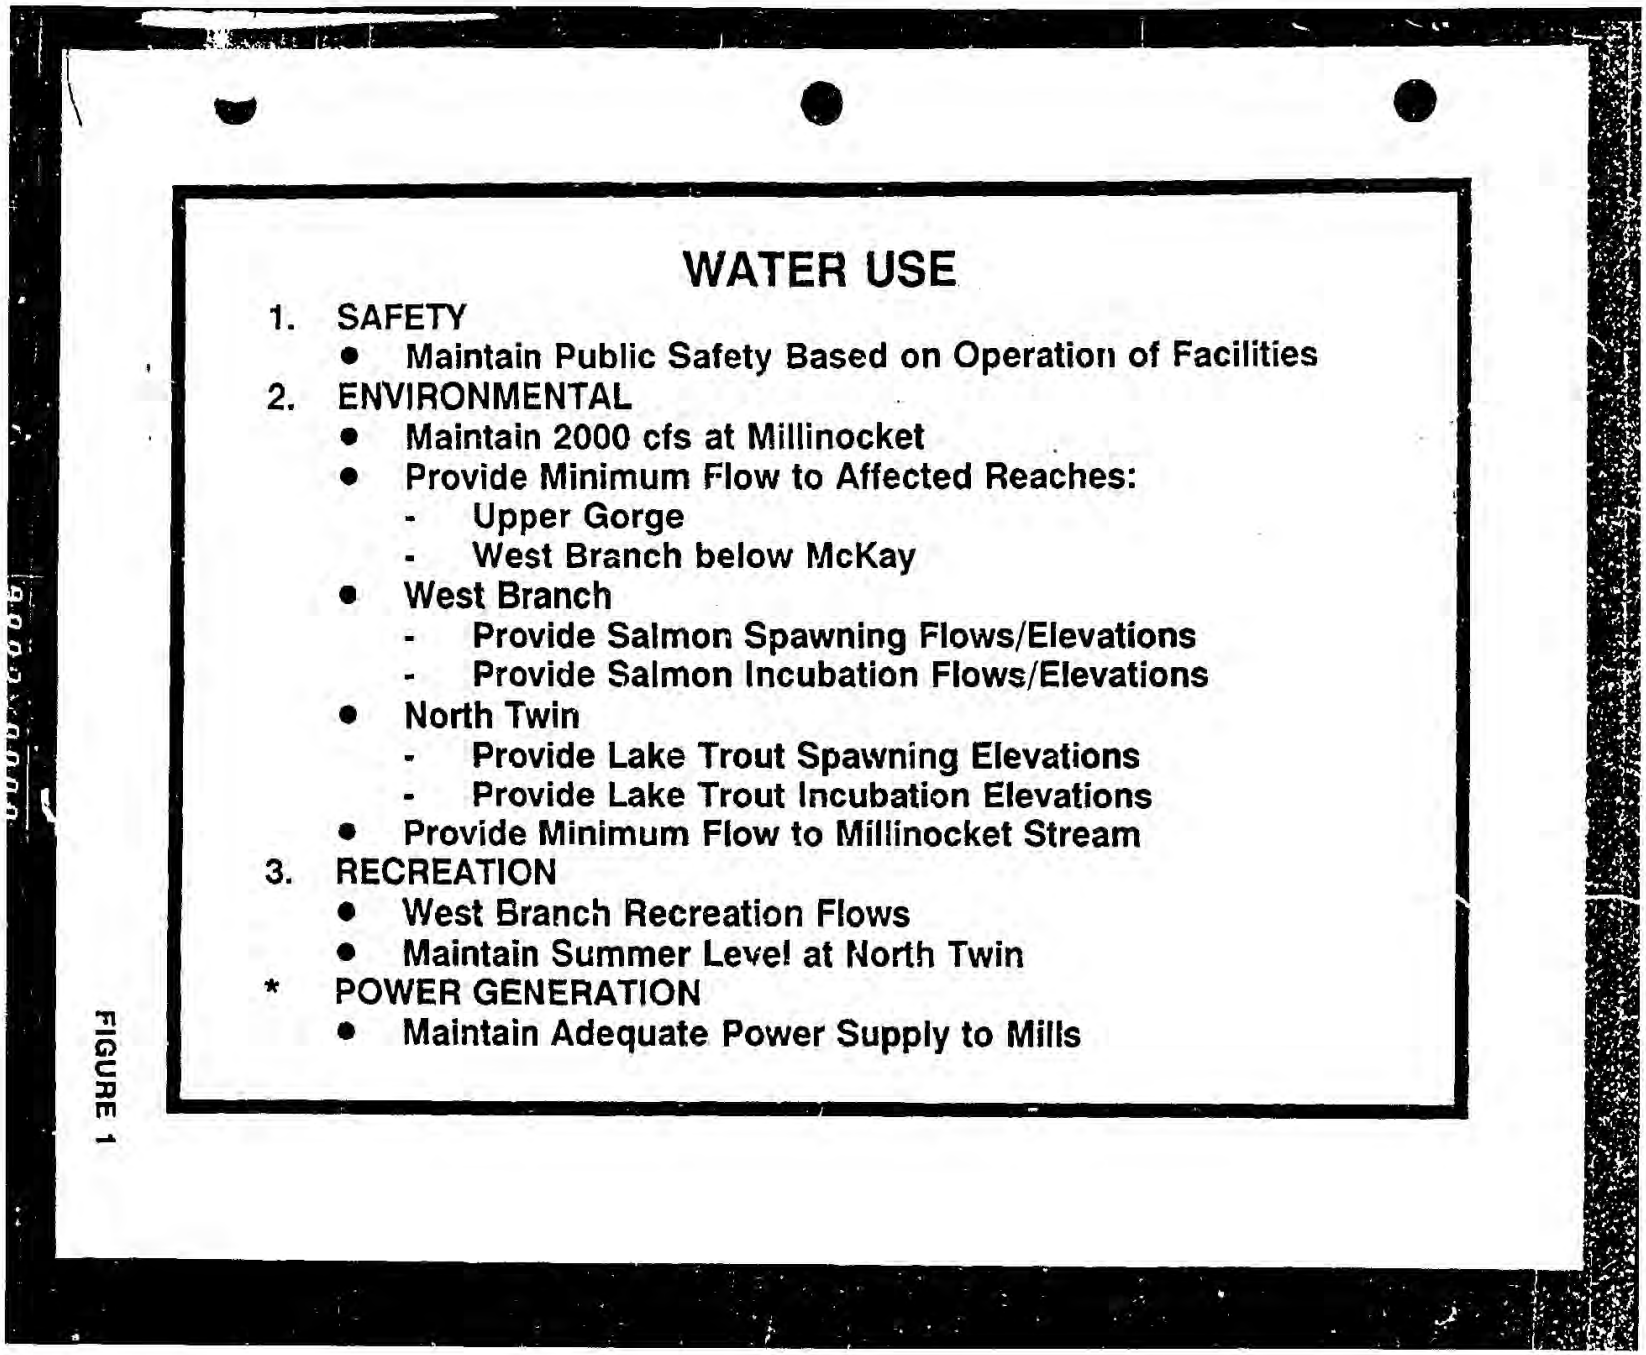
Given this existing situation, the purpose of the study was to identify and rank the existing and potential uses of water at the Projects, to determine the available water for use to meet the agency and interest group requests which were specified during the

consultation process, to analyze existing flow data to identify available water during a wet year and a dry year, to determine the inflow to the impoundments on an annual basis, and to define a range of normal available water that the Projects would operate within. The next step was to determine a Water Use Plan that addresses the agency and interest group requests, and the last step was to examine the power impact of that Water Use Plan to determine whether the net available power generation would be adequate to support Great Northern's operations.

Summary of Results:

At the outset, the first working tool was a comprehensive matrix that would identify all the requests that have been made for use of the water. This is represented in Table 1. The table identifies the water bodies, the agency request, the reason for the request, and the time period (during the year) for the request. The right hand column gives an indication of what the model outcome results are relative to the various requests during a normal water year.

To summarize the information in Table 1, what follows are brief descriptions of the conclusions of the water use study. The detailed discussion that follows the description of the water use model will further explain the basis for the conclusions of the study.



WATER USE
1. SAFETY
• Maintain Public Safety Based on Operation of Facilities
2. ENVIRONMENTAL
• Maintain 2000 cfs at Millinocket
• Provide Minimum Flow to Affected Reaches:
- Upper Gorge
- West Branch below McKay
• West Branch
- Provide Salmon Spawning Flows/Elevations
- Provide Salmon Incubation Flows/Elevations
• North Twin
- Provide Lake Trout Spawning Elevations
- Provide Lake Trout Incubation Elevations
• Provide Minimum Flow to Millinocket Stream
3. RECREATION
• West Branch Recreation Flows
• Maintain Summer Level at North Twin
* POWER GENERATION
• Maintain Adequate Power Supply to Mills

FIGURE 1

At the Ripogenus impoundment, an agency request was for relatively-stable water levels. The reason for more stable water levels was the enhancement of wildlife, wetlands, recreation, and aesthetics. There was also a conflicting agency request to maintain current operations providing downstream fishery and recreational benefits. The relevant time periods were: wildlife from May 1 to July 15; wetlands, recreation, and aesthetics from May 1 to September 30. The last column indicates a minus in that area, which means that the Water Use Plan cannot satisfy this request without jeopardizing other uses and benefits.

For the West Branch below McKay Station, agencies, MEPRO, and private boaters had recommended 2400 to 3600 cfs for recreational flows from May 1 to October 15. Table 1 indicates a plus in that area, meaning that this request can be satisfied, in the manner and to the extent discussed in detail below.

For the salmon fishery the request was to release the ABF minimum flow or to perform an IFIM study; the time period covered runs from June 15 to September 30. Table 1 indicates a plus in this area. Again, the results are discussed in detail below.

For salmon spawning and salmon incubation the agencies have requested Great Northern to maintain certain interrelated flows and elevations. The time periods identified are October 15 to November 15 for spawning and November 16 to June 7 for incubation. Table 1 indicates a plus in that area.

In the Upper Gorge, Great Northern had proposed 50 cfs during the entire year. The agencies had requested minimum flows of 100 cfs from July 1 to September 30 and 50 cfs during the remainder of the year to enhance the salmon fishery. Table 1 indicates a plus in that area as further explained below.

Looking at the North Twin and Millinocket Lake impoundments, the agencies and Save Our Scenic Lakes had requested relatively stable water levels, for the same reasons as at Ripogenus. The time period is May 1 to July 15 for wildlife, and May 1 to September 30 for wetlands, recreation and aesthetics. Significantly, Table 1 indicates a plus in these areas for North Twin.

The agencies requested a drawdown limit at North Twin to protect lake trout spawning and lake trout incubation. They identified periods of October 15 to November 5 for spawning, and November 6 to May 1 for incubation. Significantly, Table 1 indicates a plus in that area as well.

In the Back Channel, there was a request for 350 to 500 cfs to provide year-round salmon habitat. In Millinocket Stream, 60 to 80 cfs were requested to provide year-round salmon habitat. The model indicates a minus in both areas. Provision of these minimum flows would undermine the viability of the Water Use Plan in meeting other requests for water uses; but this result is further explained below.

0000-0000

And, lastly, on the West Branch a minimum flow of 2000 cfs was requested on the basis of year-round, water quality and migratory fishery considerations. As discussed in more detail below, Table 1 indicates a plus in that area.

What this summary highlights is that all of the requests for water distributions or flow to achieve mitigation or enhancements are interrelated. Providing water for one purpose may facilitate one enhancement or mitigation measure and conflict with still others. The flow model enabled Great Northern to identify the linkages and to develop a Water Use Plan that satisfied the most important agency requests, while still meeting Great Northern's electrical requirements. The internal reviews demonstrate clearly that meeting some agency requests cannot be accomplished without imposing unacceptable economic costs on Great Northern or requiring major changes in or abandonment of, the enhancement or mitigation measures that can otherwise be provided.

Prioritizing Water Uses:

After identifying each requested water use, it was necessary to prioritize them to rank conflicting agency requests and operating requirements. This is illustrated by Figure 1.

RIPOGENUS AND PENOBSCOT MILLS PROJECTS
WATER USE

| Waterbody | Agency Request | Reason | Time Period | Model Outcome |
|---|---|---|---|---|
| Ripogenus Impoundment | "relatively stable" water levels | wildlife<br>wetlands, recreation, aesthetics | 1 May - 15 July<br>1 May - 30 Sept. | [redacted] |
| West Branch Flow | 2,400 - 3,600 cfs | rafting | 1 May - 15 Oct. | |
| | ABF or Study | salmon fishery | 15 June - 30 Sept. | |
| | maintain flow/ elevation | salmon spawning<br>salmon incubation | 15 Oct. - 15 Nov.<br>16 Nov. - 7 June | |
| Upper Gorge Flow | 100 cfs<br>50 cfs | salmon fishery<br>salmon fishery | 1 July - 30 Sept.<br>1 Oct. - 30 June | |
| North Twin & Millinocket Lake Impoundments | "relatively stable" water levels | wildlife<br>wetlands, recreation, aesthetics | 1 May - 15 July<br>1 May - 30 Sept. | |
| | drawdown limit | lake trout spawning<br>lake trout incubation | 15 Oct. - 5 Nov.<br>6 Nov. - 1 May | |
| Back Channel | 350 - 500 cfs | fishery habitat | year-round | |
| Millinocket Stream | 60 - 80 cfs | fishery habitat | year-round | |
| West Branch | 2,000 cfs instantaneously | water quality | year-round | |

TABLE 1

The first -- and overriding -- priority is safety: whatever Water Use Plan is developed must continue the existing levels of flood control and maintain public safety based on proper operation of the facilities and compliance with FERC safety requirements. Any plan that does not ensure safe operation and flood control would be unacceptable to both Great Northern and FERC.

The second ranking was providing environmental benefits. This would lead to continuing to maintain the 2000 cfs at Millinocket; providing minimum flows to the affected reaches in the Upper Gorge, in the West Branch below McKay, and in Millinocket Stream, if possible; and providing salmon spawning flows and salmon incubation flows in the West Branch. Similarly, meeting the environmental priority at North Twin would lead to providing water elevations for lake trout spawning, as well as, for lake trout incubation following the spawning season.

The third priority was meeting agency requests relating to recreation. Thus, consistent with the first two priorities, the plan would provide West Branch recreation flows, and would maintain the relatively stable summer levels at North Twin.

The final -- and for Great Northern and the State of Maine's economy and job market, overriding -- consideration is power generation. In other words, having set forth these three ranked agency and interest group goals of what a Water Use Plan is going to try to provide to meet agency requests, it is necessary to come

0012 0000

back to power generation and make sure that the licensee, Great Northern, can still maintain adequate power supplies to the mills. Stone & Webster and Great Northern have completed an analysis with the power generation model which confirms that this Water Use Plan is achievable.

Based on this information, Great Northern believes that during normal water years it will be able to maintain these commitments as it files its applications for new licenses. As explained below, the Water Use Plan must be modified slightly during dry and wet years.

**Period of Record:**

The Water Use Plan described below has a study review period of 1976 to 1990, which provides 15 years of detailed hydrologic data. That period of record reflects the most current record of Great Northern's present mode of operation of the entire system. Ten years of historical data is an absolute minimum requirement for hydrologic analysis. Looking at the mass inflow curves for the 15 years analyzed here, Stone & Webster has identified both very wet years and very dry years. Moreover, the available water study discussed below also determines the wettest and driest weeks of the 15-year period. This use of the 15-year period of record and the wettest and driest individual weekly analysis confirms the validity of the 15-year period of record used in the analysis.

0943 0880

Total Available Water:

Previous discussions of Project operations have centered on the system rule curve at Millinocket. The rule curve represents the total system storage at a given point in time. With information on total storage that is available, certain flows have historically been maintained at Ripogenus and Millinocket. This curve will still be used to determine flow releases.

Many of the water use requirements considered in this Water Use Plan are in the Upper West Branch of the Penobscot River in the vicinity of Ripogenus Dam and McKay Station. To meet various water use requirements in this area, it was necessary to supplement the hydro system rule curve, which is based on total hydro system storage, including storage at the North Twin and Millinocket Lake impoundments. The water in these impoundments is not available to satisfy requirements in the Upper West Branch. Therefore, it was necessary to come up with a means of defining available water in the Ripogenus and upstream impoundments that could be used to satisfy the various requests.

The concept of "total available water" at Ripogenus Dam meets this requirement. Total available water is defined as the storage volume that is available at the end of the week, plus the discharge volume released during the week. Adding these two quantities, which have been recorded separately in the past by Great Northern, gives the total amount of water available to meet the various requirements during a given week. The total available water at

00000000

Ripogenus Dam had not been recorded in the past and one of the objectives of this study was to develop this information.

Figure 2 represents the total available water at Ripogenus. It includes the water that is being held in the upstream storage impoundments and Ripogenus Dam, showing a year's data from January to December. The data presented in the curve is based on average weekly data; each point is average weekly available water in this case.

The "wet year" data represents the individual wettest weekly data for each week during the study period of 15 years. The "dry year" data represents the results of a similar type analysis of the driest weekly data for each week during the study period. The range of "normal" available water highlighted in blue represents the expected available water during normal hydrologic conditions. It is defined as the range between x-s and x+s, where "x" is the mean value and "s" the standard deviation. Based on a statistical analysis, total available water would be expected to be within this "normal" range two-thirds of the time, and outside this range one-third of the time. Because the wet and dry years are constructed with data from all 15 years in the period of record, they represent more extreme conditions than any historical wet or dry year.

**FIGURE 2**

To illustrate the use of this concept with recreational flow requirements, if the total available water at the beginning of a month were within this band of normal available water, and if that month fell between the beginning of May and mid-September, then recreational flows of 2000 cfs or higher would be released during that month. If total available water were above this band or below this band, the Water Use Plan would prescribe a recreation flow of at least 1800 cfs. The details of these particular recreational flows are discussed further in this report in the section entitled, "Details of Water Use Plan."

Mass Inflow Data:

Figure 3 is a mass inflow curve which examines, from another perspective than storage and discharge, what water is available for use. Figure 3 looks at the calculated inflow to the Ripogenus impoundment from January through December for each year during the period of record. The historical inflow to the Ripogenus impoundment is determined on a weekly basis. Inflow data are added on a weekly basis to get a cumulative inflow total through the year and this data is plotted out through the end of the year. As expected, the curves show there is a great variability in the inflow of the impoundments from year to year. This explains why Figure 2 shows a band of normal available water. Due to the variability of the mass inflow, it is necessary to project some band of normal available water to operate in.

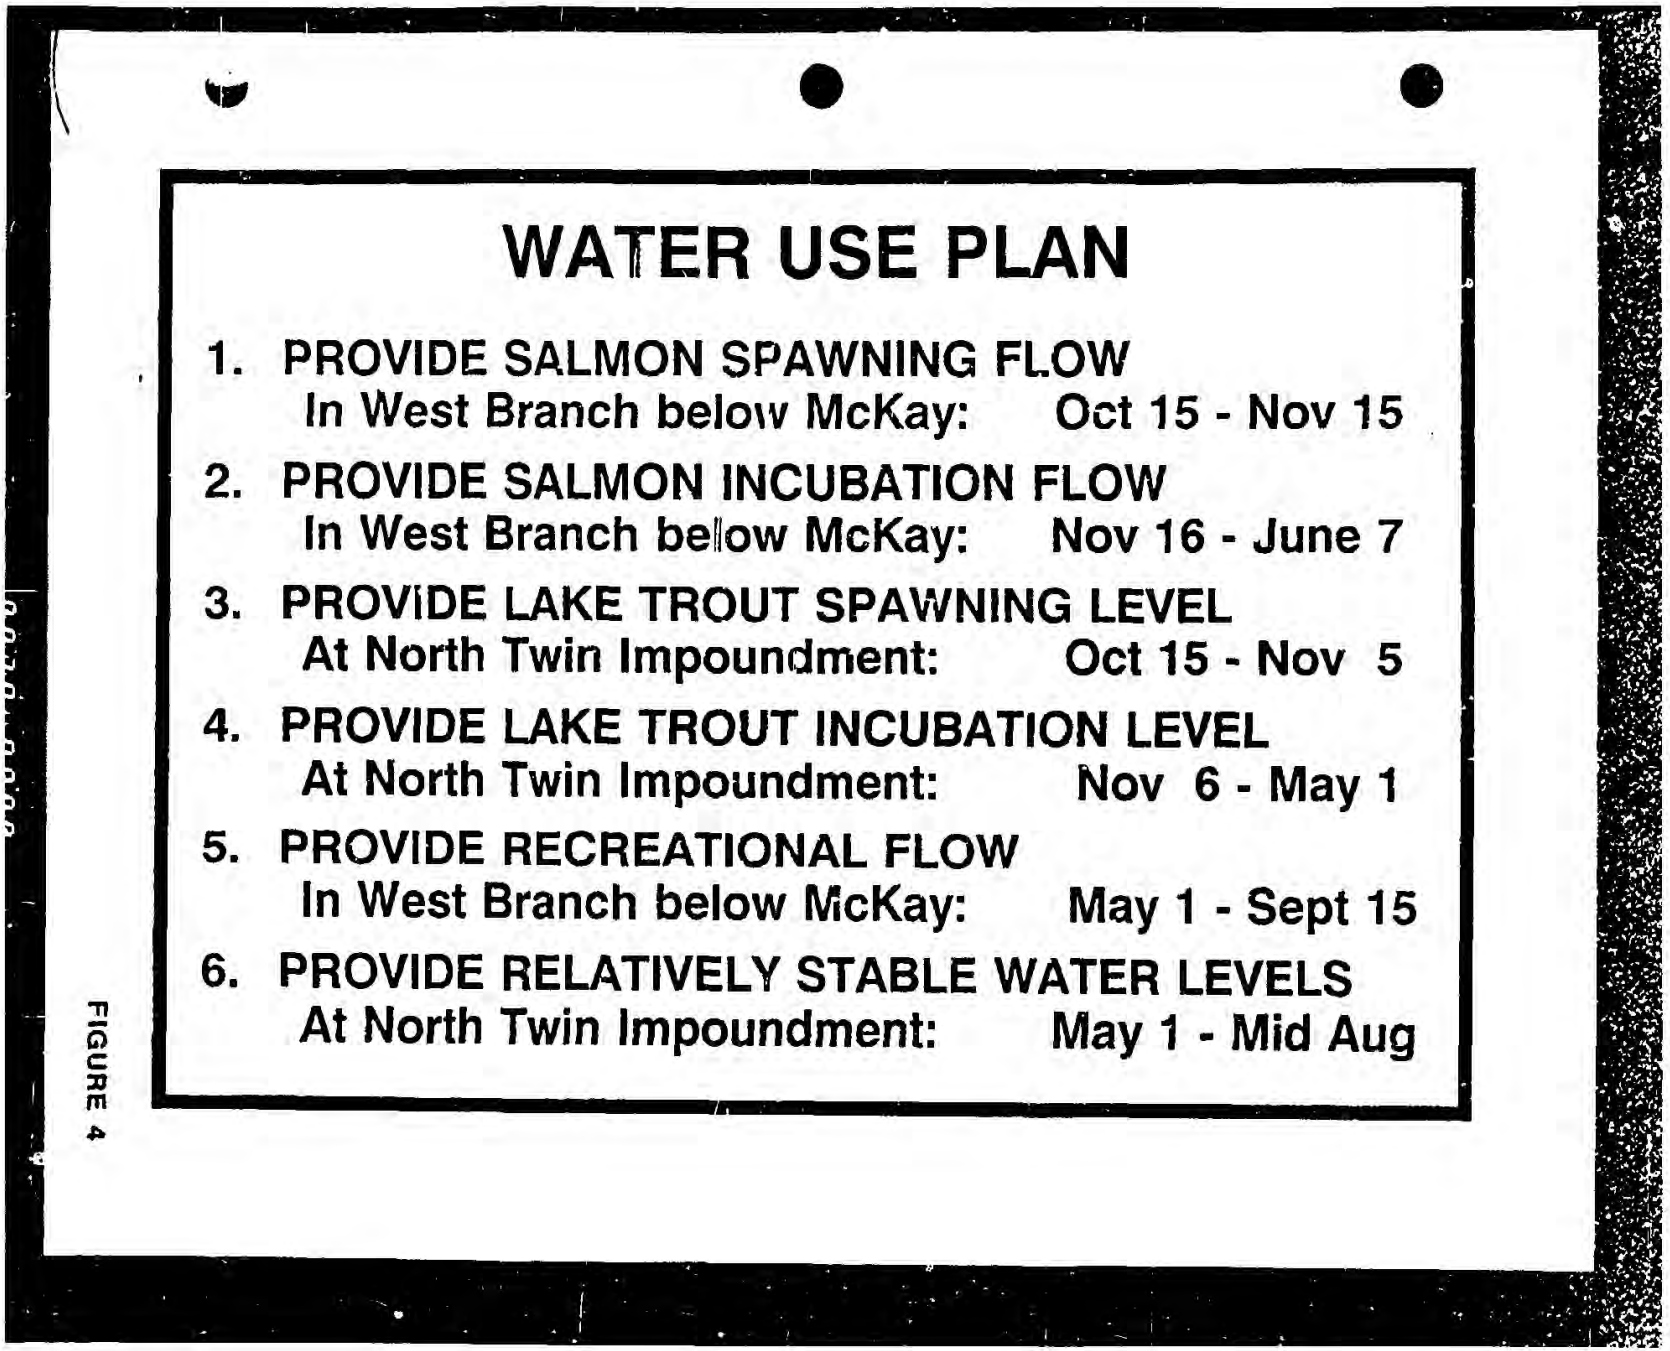
**FIGURE 3**

Figure 3 shows that the reservoirs have reached their peak elevation for the year during early June. At that point the initial storage for that year, in terms of the spring runoff, is known. The plots show that there is a great variation in terms of the total available inflow from year to year. Thus, in May, there is a range of 35 billion cubic feet (bcf). This variation increases to 45 bcf in July, 55 bcf in October, and 65 bcf in December.

The lines plotted on Figure 3 are the individual yearly curves, and in some cases as one moves through the summer, there can be a wet period towards the end of the year and the curve goes up steeply. There are also periods when there is a drop-off in the runoff and the corresponding inflow due to the summer being dry; as a result, the total annual inflow would come out relatively lower. This illustrates why it is impossible to make a predictive determination, before the end of the year, whether the upcoming period will be wet, dry, or normal.

Proposed Water Use Plan:

The Water Use Plan based on these inputs is outlined on Figure 4. The Plan provides salmon spawning flows in the West Branch below McKay from October 15 to November 15, and maintains an incubation flow from November 16 to June 7. The Plan also provides a lake trout spawning elevation in the North Twin impoundment from October 15 to November 5 and then maintains at least that elevation during the incubation season from November 6 through May 1.



WATER USE PLAN
1. PROVIDE SALMON SPAWNING FLOW
In West Branch below McKay: Oct 15 - Nov 15
2. PROVIDE SALMON INCUBATION FLOW
In West Branch below McKay: Nov 16 - June 7
3. PROVIDE LAKE TROUT SPAWNING LEVEL
At North Twin Impoundment: Oct 15 - Nov 5
4. PROVIDE LAKE TROUT INCUBATION LEVEL
At North Twin Impoundment: Nov 6 - May 1
5. PROVIDE RECREATIONAL FLOW
In West Branch below McKay: May 1 - Sept 15
6. PROVIDE RELATIVELY STABLE WATER LEVELS
At North Twin Impoundment: May 1 - Mid Aug

FIGURE 4

No changes are proposed for Millinocket Lake, which will be used as needed to provide a supply of water for North Twin to maintain the Water Use Plan benefits. The Plan would provide spring and summer recreational boating flows on the West Branch below McKay, and would provide relatively stable summer water levels at the North Twin impoundment.

Included in the Water Use Plan but not shown on Figure 4 are provisions for minimum instantaneous flows of 100 cfs in the Upper Gorge to provide fishing opportunity from July 1 to September 30, 400 cfs below McKay Station, and 20 cfs in Millinocket Stream. As indicated by Table 1, this last flow was proposed by Great Northern; the earlier agency request (made prior to the Water Use Plan) for higher flows cannot be satisfied. These flows have no significant impact on the overall water use analysis, because in general, the flows modeled in the Water Use Plan are well above these numbers.

The change from the second-stage consultation draft that is most immediately apparent is that the plan intends to maintain a lake trout fishery in the North Twin impoundment. In order to accomplish this goal, the minimum flow in Millinocket Stream must be maintained at its historical level of 20 cfs, as currently prescribed in the Penobscot Mills license, to make better use of that water in the North Twin impoundment to maintain the lake trout fishery.

Figure 5 shows the historical and the revised outflow from the Ripogenus impoundment based on the typical conditions in the period studied. The historical Ripogenus outflow for the period of study is shown in blue. Historically, in the spring there are relatively high flows, dropping off into the late summer, coming back up with a relatively high flow period due to the fall rains and the leaves coming off the trees which results in increased runoff.

The proposed revised Ripogenus outflow is shown in red. For this typical data set, a recreational flow of 2400 cfs is shown from the beginning of May to the middle of September. The 2400 cfs is illustrative only and was derived from the water that is typically available during this period. The flow of 2400 cfs is greater than the minimum flow of 2000 cfs identified for rafting flows in a normal month.

Following the recreational season, there is a period from September 16 through October 14 when there is a need to control the outflow from McKay Station so that the downstream North Twin impoundment can be drawn down to provide enhancements at that impoundment. For the typical conditions shown on Figure 5, the outflow from Ripogenus was reduced to 2000 cfs during this period, but this flow is illustrative only and will depend on storage and rainfall conditions, as well as, system maintenance requirements each year.

◇ REVISED OUTFLOW

**FIGURE 5**

From October 15 through November 15 Great Northern proposes reduced flows out of Ripogenus, typically 1300 to 2000 cfs, which would provide the salmon spawning flow below McKay Station. This flow will confine spawning to the deeper, more protected channel areas that can be protected against freezing during the ensuing winter. Prior to the start of each salmon spawning season, Great Northern will establish the flow range that will be provided during that spawning season. During the salmon incubation period (typically November 16 to June 7), Great Northern proposes to maintain incubation flows in the West Branch downstream of McKay Station. These flows will be established based on actual flows occurring during the preceding salmon spawning period and will typically equal or exceed the salmon spawning flows.

Although the plot is based on typical weekly data, these flows would be maintained as closely as possible on a 7-day-a-week, 24 hours a day basis during that period, provided storage is available upstream of Ripogenus Dam. However, as discussed below, these are not intended as instantaneous flows and cannot be provided on that basis.

McKay Station generates 40 cycle power into a power grid which is essentially an island. Loads supplied by this grid are mostly large ground wood grinder motors (8000 hp each at East Millinocket Mill) whose load varies significantly during the grinding process. Due to the large size of these loads relative to the entire 40 Hz system, the system is necessarily prone to frequency upsets when these load changes occur. Individual hydro governor controls on

each hydro unit sense the change in frequency when the load on a grinder motor changes and adjust generator outputs in terms of flow and generation to compensate for the change and achieve a new balance. These frequency changes and governor responses make it impossible to maintain instantaneous flows at all 40 Hz hydro generators, particularly at McKay Station, which is the first station to respond to a frequency upset. McKay Station's governor controls are designed to be more sensitive in order to provide the required compensation and to keep the 40 Hz electrical system in balance. These changes are of short duration, typically lasting 5 to 15 minutes. For these reasons it will be possible to regulate flows below McKay Station pursuant to the Water Use Plan only to an hourly average.

As developed on the following figures, the flow after spawning season is critical in terms of providing sufficient inflow to maintain both the North Twin elevation for the lake trout fishery and the required minimum flows at Millinocket.

Figure 6 shows the historical and the revised discharge from the North Twin development downstream from Ripogenus. Again, the historical data shows relatively high quantities of available water during the spring period as the impoundment fills. Flows come down during the summer and come up again in the fall.

The proposed revised mode of operation would provide, on average, relatively higher flows during the winter and early spring. There would be relatively lower discharges during the summer in order to maintain the impoundment at a relatively stable level. Of course, the 2000 cfs minimum flow at Millinocket is maintained at all times.

At the end of the summer period, there would be an increase in discharge from North Twin, which is required to draw the impoundment elevation down for lake trout spawning. After the increase in discharge during the drawdown period at the end of the summer, the outflow will be maintained relatively lower than historically during the spawning season at North Twin, and, depending on inflow, will increase somewhat throughout the rest of the year.

**FIGURE 6**

Figure 7 is a plot of impoundment elevations at North Twin based on the typical data set. It shows that with the historical operation, North Twin would have been drawn down coming into the spring, filled during the spring runoff into early summer, and drawn down again during the late summer coming into the fall.

The Water Use Plan shows a drawdown to a reasonably low elevation to allow lake trout spawning. Flows would then be adjusted in order to maintain at least this elevation through the incubation period which extends to May 1 of the following year. Then, as the spring runoff takes place, the impoundment would be brought up to a relatively stable elevation that will be maintained during the summer. Full pond elevation at North Twin is approximately 492 ft. (USGS). The summer elevation shown in Figure 7 is approximately 490.5 ft. This does not mean that Great Northern does not attempt to fill North Twin; it does. The 490.5 ft. elevation is based on using the typical data set. The pond would be filled up to full pond during wet years, and to well below the 490.5 ft. elevation during dry years. Great Northern would normally maintain some available volume at North Twin to allow for storage of normal seasonal precipitation events. The operating plan concept would remain the same in all years.

**FIGURE 7**

Figure 8 shows the interaction between the Ripogenus discharge and the operation of North Twin to maintain the lake trout fishery. The figure shows that there is an overlap at the end of the recreational period, from mid-September to mid-October, when continued high recreation flows below McKay Station would conflict with the need to complete the drawdown of the North Twin impoundment for the spawning season. As a result, because the discharge from Ripogenus is the majority of the inflow into the North Twin impoundment, it will be necessary in some years to limit the discharge of water from Ripogenus by mid-September, at the latest, in order to draw North Twin down to maintain the lake trout fishery.

Figure 8 also shows that there is a critical time during the salmon spawning season in the West Branch. During the spawning season below Ripogenus, flows are brought down to approximately 1800 cfs in this typical case. At the same time, a minimum discharge of 2000 cfs must be maintained at North Twin at all times to provide for minimum flow requirements downstream, and North Twin's reservoir elevation must be maintained constant. In summary, as the elevation is maintained for the fishery at North Twin, the required outflow at North Twin is always interacting with this discharge from Ripogenus during that same part of the year.

REVISED RIP OUTFLOW
HIST N.TWIN OUTFLOW
REV N.TWIN OUTFLOW

FIGURE 8

Two aspects of the flow plan can not be completely represented by the typical conditions as shown in Figures 5 through 8. First, the continuation of high recreational flows out of McKay Station, after mid-September, would make it difficult to draw down the North Twin impoundment safely for spawning season. Because North Twin is downstream of Ripogenus, it is difficult to lower North Twin's elevation while high rafting flows are being released into the North Twin impoundment. In addition, the increased spillage at North Twin and further reduction of Ripogenus pond level due to the extension of recreation flows beyond mid-September would contribute to an appreciable loss of power to Great Northern. Therefore, although the agencies and MEPRO have requested that recreational flows continue into October, this request cannot be met: no commitment can be made beyond mid-September. At that point, it would be necessary to look at the flows from Ripogenus and the lake levels in Ripogenus and North Twin to determine flows at both locations to permit salmon and lake trout spawning to take place safely. For this reason, the Water Use Plan established September 15 as the date that the commitment on recreational flows would end.

Second, in order to provide a safe rate of drawdown at North Twin, from its summer level to its spawning elevation, the drawdown would have to start in mid-August. This would provide an average drawdown rate of 1.5 ft/wk or less and a maximum drawdown rate of no more than 2.0 ft/wk in any single week during the drawdown period, from mid-August to mid-October. To keep the summer elevation constant until the end of August would increase the

0033.0000

drawdown rate by almost 30 percent, well beyond the maximum historical drawdown rate of 1.6 ft/wk at North Twin.

Power Impact Analysis:

Figure 9 is a schematic of the power system at Great Northern. Having looked at the water use requirements, the water use flows, and the total available water, and having developed the Plan, Stone & Webster and Great Northern studied the operation of Great Northern's power system to determine whether the Water Use Plan can still satisfy the power requirements of the mill.

Figure 9 illustrates how complicated the Great Northern system is. The system has capacity available in hydro, cogeneration, condensing, and purchased power. The mill has both a 60-cycle load and a 40-cycle load. The 60-cycle power can be supplied from purchased power, condensing, cogeneration, and hydro. The 40-cycle power can be supplied from hydro, cogeneration and condensing. There is no way to purchase 40-cycle power. The hydro at McKay Station and Weldon Station, a portion of Millinocket, and a portion of Dolby are on the 40-cycle side, while 60-cycle generation is located at North Twin, Millinocket, Dolby and East Millinocket.

ELECTRICAL SYSTEM
STEAM SYSTEMS

FIGURE 9

On the supply side it is important to note that the mills require both 40 and 60-cycle power, and all the 40-cycle power must be used internally. It is impossible for Great Northern to sell 40-cycle power. Also, 89 megawatts of the hydro system is 40-cycle power that is directly tied to the mill load, which severely limits the operational flexibility of the power system, which must closely follow that mill load. There are 37 megawatts of hydro on the 60-cycle side.

On the demand side, given the sources of supply, the power system must maintain minimum flows, electrical system requirements, and the steam demands of the mill. All of these components are interrelated.

The power analysis determines the historical generation and sustained capacity of the hydro system. It then takes the proposed use of the system in the future pursuant to the Water Use Plan, analyzes it with the new flows, and determines the net change on the hydro system generation. This is the first step.

The analysis must then take the net change on the hydro system and analyze the reducing (cogeneration) power, the condensing steam supply, and the Bangor Hydro-Electric purchased power supply. Taking those sources available to Great Northern, including the complex interactions among them, the analysis determines whether the power system can adequately maintain the load to the mills.

Since the Water Use Plan has to maintain safety requirements and also incorporate measures which provide environmental and recreational benefits, some impact on power generation would be anticipated. Therefore, a negative impact on power generation would be expected.

Based on flow simulations of the 15-year period studied (1976-1990), the hydropower generation has been evaluated under the Water Use Plan. The degree of impact varies by year, depending on station characteristics and on available water conditions. The energy impact is discussed further in Section 1.5.1 of Exhibit H. The energy loss has a negative impact on Great Northern's operation. However, the adverse impact of the Water Use Plan is not solely economic. Meeting the commitments spelled out in the report greatly constrains Great Northern's operational flexibility and eliminates all capacity and operating reserves at certain times; it also tightly constrains when downtime and maintenance outages can be taken in the entire thermal and hydro system.

Details of Water Use Plan:

As the preceding discussion illustrates, this is a fully-integrated Water Use Plan. It identifies all of the requests made throughout the consultation period by the various agencies and special interest groups. It looks at all power demands, all available power supplies, and integrates all of these factors in a single flow/level management plan. The actual Water Use Plan is summarized in Table 2. Table 2 also provides the model outcome in greater detail than what was given in Table 1.

RIPOGENUS AND PENOBSCOT MILLS PROJECTS

TABLE 2

1. Ripogenus Impoundment Water Levels.

The first agency request was for relatively stable water levels in the Ripogenus impoundment. This was requested as an enhancement to wildlife, wetlands, recreation, and aesthetics during a time period from May 1 through September 30. Recognizing that this is indeed an integrated water use model and that all components are interconnected, the analysis determined that there are some things Great Northern can do and some things it cannot. Because Ripogenus is the principal source of water for the entire Great Northern hydro system, lake level controls at Ripogenus are inconsistent with fish management goals at Ripogenus and virtually all other benefits created by the Water Use Plan. Therefore, no lake level controls are possible or desirable there. As a result, the Plan proposes no specific change in the lake level management at Ripogenus or the other water bodies upstream of Ripogenus: there will be no significant change in the management of Ripogenus Dam and the small upstream storage impoundments. The limited modifications to the level of the Ripogenus impoundment are shown on Figure 10.

**FIGURE 10**

Although the Water Use Plan does not allow a significant change in operation of the Ripogenus impoundment, consultation with the United States Fish and Wildlife Service ("USFWS") and the Maine Department of Inland Fisheries and Wildlife ("MeDIFW") continued after second-stage consultation concerning the influence of drawdown on the surrounding wetlands. This is discussed in Exhibit E. Similarly, agency comments concerning recreational access to and use of the Ripogenus impoundment are addressed in Exhibit E in the final application.

2. Recreational Flows in the West Branch.

The agency and MEPRO request for recreational flows in the West Branch, was for 2400 to 3600 cfs from May 1 to October 15. The Water Use Plan meets this request by providing recreational flows of at least 2000 cfs downstream of McKay Station during normal months, and at least 1800 cfs during other months. Except as limited by public safety concerns or environmental requirements, these flows will be maintained from May 1 to September 15.

This is a significant improvement over the current situation, where there is no minimum recreational flow. Moreover, surveys of whitewater boating customers (discussed in Exhibit E) prove that the public's enjoyment of the rafting trip is not adversely affected

even if flows drop as low as 1800 cfs. In any event, these flows will ensure an adequate and satisfying raft trip.

As in the case of the Ripogenus impoundment, agency, MEPRO, and AWA comments regarding access to McKay Station, use of the put-in site, access fees, and take-out facilities are addressed in Exhibit E.

3. System Maintenance and Control Period.

From September 16 through October 14, Great Northern proposes a minimum flow of at least 400 cfs in the West Branch downstream of McKay Station. While actual flows are expected to exceed this level under most conditions, this period provides the ability to balance the hydro system before the critical lake trout and salmon spawning seasons. It is also during this period that Great Northern needs to control the outflow from McKay Station so that the downstream North Twin impoundment can be drawn down to provide enhancements at that impoundment, and to permit maintenance of the hydro and transmission systems.

4. Fishery Flows in the West Branch.

The agency request on West Branch flows is to maintain flow and elevation for spawning from October 15 to November 15, and for salmon incubation from November 16 to June 7. The Water Use Plan accomplishes

this by lowering the flows in the West Branch to narrow the spawning area between October 15 and November 15. During the incubation period, from November 16 to June 7, flows will be established based on actual flows occurring during the preceding salmon spawning period and will typically equal or exceed the salmon spawning flows. This will ensure that the redds remain protected.

This combination of spawning and incubation flows represents a distinct improvement over historical flow patterns. The flows are based upon 10 years of observation by Great Northern's fishery biologists of where spawning salmon actually constructed their redds.

5. Fishery Flows in the Upper Gorge.

The agencies requested Upper Gorge flows of 100 cfs from July 1 to September 30 for the salmon fishery and 50 cfs from October 1 through June 30. In the Upper Gorge, the Water Use Plan calls for providing the 100 cfs from July 1 to September 30. Leakage will be provided the balance of the year. This proposed minimum flow should be evaluated in conjunction with Great Northern's proposal to provide juvenile salmon habitat downstream of the McKay Station. This proposal replaces Great Northern's earlier proposal to release 50 cfs to provide habitat for juvenile salmon in the Upper Gorge. Juvenile habitat will be provided by the utilization of a now-

bypassed side channel downstream at Holbrook. This is discussed in Exhibit E.

6. Outage Flows Below McKay Station.

During any outage, Great Northern proposes to provide a minimum flow of 400 cfs in the West Branch downstream of McKay Station immediately after the outage to protect biological resources of the area. While not technically an "instantaneous" minimum flow, this flow will be provided by automating the station supervisory controls to permit release of flow directly into the river at McKay Station. Except during the period from September 16 to October 14, the biological minimum flow would not extend for a period greater than three consecutive days. Great Northern proposes to supplement the short-term biological minimum flow with releases from the dam to provide the following river flows during each pertinent season.

a. Recreation Season.

During the period May 1 to September 15, Great Northern proposes a recreational flow of 1,800 cfs during daylight hours in the West Branch downstream of McKay Station as soon as possible after the start of the outage. During the period May 1 to September 15, once the 1,800 cfs recreation outage flow has been established, Great Northern will release a ramped flow of 1,000 cfs during the

nighttime hours. The providing of these flows should have no significant impact on whitewater rafting on the lower river below Abol Bridge.

b. System Maintenance and Control Period.

During the period September 16 to October 14, Great Northern proposes a minimum flow of 400 cfs in the West Branch downstream of McKay Station. This will allow the North Twin impoundment to be drawn down to protect lake trout spawning and allow for system maintenance.

c. Salmon Spawning Period.

During the salmon spawning season (typically October 15 through November 15), Great Northern proposes a flow at least equal to the annual spawning flow range as soon as possible after an outage.

d. Salmon Incubation Period.

During the salmon incubation period (typically November 16 to June 7), Great Northern proposes a flow equal to or greater than 1300 cfs as soon as possible after an outage.

7. North Twin Impoundment Levels.

Moving to the North Twin and Millinocket Lake impoundments, the agency request was for relatively

stable water levels for wildlife, wetlands, recreation, and aesthetics from May 1 until September 30. As discussed above, Great Northern will provide relatively stable levels in the North Twin Impoundment from May 1 through August 15.

The drawdown limit for lake trout spawning will be reached by October 15 and maintained until November 5. To provide for lake trout incubation from November 6 to May 1, lake levels will be maintained above the spawning level. Thus, unless it is unable to maintain the 2000 cfs minimum flow, Great Northern will not draw North Twin down below that October 15 point and will build the lake level through the winter months, until the spring runoff refills the impoundment.

A critical component of this part of the Water Use Plan is that Great Northern must always maintain the 2000 cfs release, which takes priority. If there is not adequate inflow, North Twin may not reach the near full-pond elevation. Rather, the relatively stable summer level may be somewhat less than full pond.

In sum, the lake level will be brought down before the start of the spawning season on October 15. It will be held constant for three weeks, and then, through regulation, maintained above that elevation until the next spring fill.

8. Flows in the Back Channel.

In the Back Channel, the most recent agency or interest group request, as a result of the Second-Stage Consultation, was between 350 cfs and 500 cfs year-round for salmon habitat. Based upon the modelling effort as well as the cost of a significant spill to the Back Channel, Great Northern is not proposing any flows in the Back Channel. As indicated in all previous consultation meetings with the agencies, and as stated in the draft application, it is too costly to make such releases. Also, recognizing that this is an integrated Water Use Plan, providing the flows in the Back Channel would have an adverse impact on the ability to provide incubation flows for salmon on the West branch and stable lake levels in North Twin Lake, especially in dry years. A higher release from North Twin during dry periods would require a correspondingly higher spawning flow in the Upper West Branch. As the salmon spawning flow is increased, it becomes more likely that there would not be enough water available to maintain the incubation flows. This would have a negative impact on the salmon spawning.

9. Millinocket Stream.

In Millinocket Stream, the agency request was for between 60 and 80 cfs to protect salmon habitat year-round. The proposal in the Water Use Plan is 20 cfs. Again, recognizing that this as an integrated Water Use Plan, the 60 to 80 cfs in Millinocket Stream pursuant to

these agency requests would have an adverse impact on the ability to maintain lake level elevations at North Twin.

10. Flows Below Dolby.

Finally, the agencies have requested continuing the 2000 cfs minimum flow in the West Branch to maintain water quality year-round. This is also a condition of the corporate charter and of the license for Project No. 2458, each of which require a flow of 2000 cfs at Millinocket as long as water remains in storage upstream. The Water Use Plan proposes no change in that minimum flow at Millinocket.

Agency Consultation:

After the Water Use Plan was presented to the agencies and interest groups at meetings on February 25 and 26, 1991, a written report describing the plan was provided to all attendees on April 26, 1991. Only the National Park Service, the Maine Professional River Outfitters, and the Save Our Scenic Lakes Association provided written comments. These are discussed below.

Notwithstanding the lack of written comments from the other agencies, the Water Use Plan was discussed at numerous consultation meetings held after February 26, 1991. Minutes from these meetings are included in Exhibit E. This final version of the Water Use Plan reflects those discussions, including discussions held with the DEP on October 7, 1991.

1. Determination of "Wet" Versus "Dry" Years.

As requested by The National Park Service ("NPS"), Great Northern has clarified the Water Use Plan to indicate that the recreational flow for each month from May through September 15 will be made on the first day of each month. This determination will be based on an analysis of Total Available Water, as described in the Water Use Plan. The determination of "wet", "normal", or "dry" will remain constant during the month based on the first day of the month classification. The appropriate minimum recreational flow will be based on the Total Available Water determination.

The National Park Service also expressed concern over the time during which the Total Available Water would not be within the normal range. As discussed in the plan, the Total Available Water has a probability of being within the normal band 68 percent of the time and a probability of 32 percent of being outside this range. This distribution is based on the assumption that the available water can be approximated as a normal distribution.

The 15 years of historical data show the following occurrences:

| | |
|---|---|
| dry period | 21% |
| normal period | 61% |
| wet period | 18% |

This distribution shows a deviation from the normal distribution due mainly to 2 very dry years in the data set. For a longer period or record, it is anticipated that the data distribution would be expected to approach that of a normal distribution.

MEPRO indicated that it would prefer that the determination of whether dry or normal or wet conditions exist be made annually in June rather than monthly. MEPRO's concerns with monthly flow determination are, however, unfounded. As Great Northern demonstrated in the Water Use Plan and in the consultation meeting on February 25, 1991, the great variability in mass inflow volume makes it impossible to forecast flows for the entire rafting season. If Great Northern were required to do this, it would necessarily have to adopt a more conservative approach to deal with this variation. This would result in more "dry" year flows, and a greater likelihood of lower recreational flows throughout the summer.

Monthly determinations will affect the availability of rafting flows from September 1 to September 15, but the ultimate determinant remains Total Available Water, which is beyond anyone's control. The recreation interests will have available the determinations on the first of May, June, July, and August to make a judgement about likely September 1 conditions. As Great Northern

has explained in detail in the Water Use Plan and at the February 25 meeting, the need to draw the North Twin impoundment down prior to lake trout spawning makes it impossible to guarantee rafting flows after September 15. This would be true regardless of how often rafting flows are determined.

Contrary to MEPRO's fears, monthly flow determinations will reduce the frequency of lower flows because, as noted above, such determination would be less conservative than a single determination in June.

2. Frequency of Low Flows.

MEPRO indicates that it understands that two-thirds of the data from the 15 years of operation at Ripogenus was used for establishing the normal range of flows. This is not correct. In fact, each week of the entire 15 year data set is used in the analysis and two-thirds of this entire data set makes up the normal band.

In reply to the National Park Service's request that "Georgia-Pacific ['Great Northern'] should outline the circumstances that would require the curtailing of recreational boating flows out of Ripogenus after mid-September," Great Northern must first re-emphasize that its Water Use Plan has attempted to accommodate conflicting agency requests affecting this time period. For the West Branch below McKay Station, the request was

for recreational boating flows from May 1 to October 15. For the North Twin impoundment the request was for relatively stable water levels from May 1 to September 30, and for North Twin's elevation to be drawn down by October 15 to protect lake trout spawning.

Since safety is the highest priority of the Water Use Plan, and providing environmental and recreational benefits are respectively lower priorities, the safe drawdown of North Twin to protect lake trout spawning is the first consideration. In order to provide a safe rate of drawdown at North Twin, from its summer elevation to its spawning elevation, it was shown in the Water Use Plan that the drawdown of North Twin would have to start by mid-August.

The next step was to see if recreational boating flows could be released from Ripogenus, while North Twin was being drawn down, without affecting either the drawdown of North Twin or power generation, which is the overriding consideration for Great Northern. In running flow simulations of each of the 15 years in the data set it was shown that, under certain conditions, North Twin could not be drawn down in time without an appreciable loss of power at North Twin, in terms of forced spillage, caused by the release of recreational boating flows during the drawdown period at North Twin.

In 1981, for example, there was a large increase in natural inflow to North Twin during the drawdown period. A flow simulation performed for 1981 showed that large quantities of water had to be spilled at North Twin, during its entire 9 week drawdown period, so that minimum boating flows could be maintained at Ripogenus until October 15. It is because of these circumstances that Great Northern has established September 15 as the date that the commitment on recreational flows will end. The period from September 16 through October 14 has been set aside as the "System Maintenance and Control Period." It is during this period that Great Northern needs the ability to control flows, downstream of McKay Station, in order to balance the hydro system before the critical lake trout and salmon spawning seasons. In any event, it is clear that at least 96 percent of the paying rafting customers take their trips prior to September 15. Therefore, the impact of reduced flows after September 15 will be quite limited. Moreover, Great Northern will cooperate with rafting outfitters to attempt to identify in advance whether recreational flows will be available after September 15, thereby enabling the outfitters to reschedule or avoid scheduling trips that would have inadequate flows.

3. Clarification of Outage Flows.

In response to requests from the National Park Service and Maine Professional River Outfitters, Great

Northern has clarified the outage flows that will be released below McKay Station. These specific flows are described in the Water Use Plan.

4. Stable Water Levels.

In conjunction with the discussion of stable water levels in the Water Use Plan, the following is a response to the official comments from the Save Our Scenic Lakes Association ("SOSLA"). To the extent possible, the proposals outlined in the Water Use Plan addressed the initial concerns of the SOSLA. The SOSLA in its letter dated June 17, 1991, which provided comments on the preliminary Water Use Plan, stated that it was encouraged by the results of the modeling to enhance recreational use of the impoundment. From reading SOSLA's letter it is apparent that there may be some confusion regarding project operation and the Water Use Plan. In the first instance, SOSLA states that Great Northern should continue the modeling effort to address the issue of project impoundment drawdown for maintenance. Drawdown of the impoundment level does not result from normal maintenance but is in fact required to provide minimum flow downstream and to create storage capability to store the spring runoff. Great Northern, with the exception of very few occurrences and none in recent years, has not drawn down the level of the North Twin impoundment for maintenance at the project.

The SOSLA also asks that Great Northern reconsider its minimum flow proposals for the Back Channel and Millinocket Stream. Increased flows in these two reaches would reduce Great Northern's ability to provide relatively stable lake levels at North Twin, which was SOSLA main concern.

5. **Trial Implementation of Water Use Plan.**

In order to determine whether the Water Use Plan will be viable in practice, as opposed to in a model, Great Northern has operated its hydro system to the Water Use Plan since May 1991. This trial run has shown that the Plan, as described here, is viable if it is not modified further. The Plan imposes significant operational constraints, not only on the hydro system, but on the entire Great Northern power system and thus on the manufacturing processes as well. These constraints go beyond the increased cost of power, and include loss of necessary generating reserves, system instabilities, and tightly constrained scheduling of maintenance downtime for power generation equipment, the transmission system, and papermaking machinery. While Great Northern is confident that it can meet the commitments contained in this Plan, it cannot satisfy requests for additional flows in the Back Channel, Millinocket Stream; nor can it provide flows from McKay Station on an instantaneous basis. Any such requirements would destroy the viability

of the Water Use Plan and the Millinocket and East Millinocket Mills.

6. Issues Raised by the Maine Department of Environmental Protection.

In a post-consultation meeting request, the Maine Department of Environmental Protection (MEDEP) requested a meeting be held to present the Water Use Plan and to discuss two issues: (1) the littoral zone in the Ripogenus-Chesuncook-Caribou impoundment; and (2) flows in the "Back Channel" at Millinocket. The MEDEP was interested in limiting the drawdown of the Ripogenus impoundment to the extent possible, and introducing flows in the "Back Channel".

The Water Use Plan was presented to the MEDEP on October 7, 1991. The presentation demonstrated that the ability to drawdown the Ripogenus impoundment must be maintained in order to provide flood control benefits and the water needed to meet the downstream environmental and recreational benefits. The lack of available drawdown would waste water that could be stored for subsequent beneficial release and would result in much larger flow variations due to the inability to use the reservoir for the regulation of flow. It was demonstrated that the proposed operational plan, which continues the existing drawdown mode of the Ripogenus impoundment, would need

to be continued in the future to maintain the downstream salmon and lake trout fisheries and recreational flow enhancements.

The presentation also discussed in detail the interaction between the salmon spawning flow, the North Twin minimum flow release, and the North Twin drawdown for lake trout spawning. As discussed at the meeting, the Ripogenus discharge normally makes up a majority of the North Twin impoundment inflow, and during some dry periods would provide nearly all of the North Twin inflow. Therefore, further increases in the North Twin discharge to support flow in the Back Channel would result in corresponding increases to the required salmon spawning flows upstream at the Ripogenus project. As the spawning flow is increased, it becomes more likely that there will not be enough water to maintain the salmon fishery during the entire incubation season since there will not be enough inflow and available storage to meet the flow requirements. It was demonstrated that further releases from North Twin to support flow in the Back Channel could not be achieved without an associated adverse environmental impact to the proposed salmon and lake trout fisheries and recreational flow enhancements.

The environmental impacts that can result from these two issues, as discussed above, are demonstrated on Figures 11 and 12.

**FIGURE 12**

Figure 11 is a graph of the Ripogenus outflow and it demonstrates what can happen to the salmon fishery if there is no water available to maintain the incubation flow below Mckay Station. The revised outflow, shown in red, drops off abruptly towards the end of February to a level far below the spawning flow which was set on October 15. This reduced flow during the incubation season would endanger the salmon fishery. There are two reasons why there would not be adequate water available for incubation flows at Ripogenus; first, the restriction on the drawdown of Ripogenus would simply limit the amount of water that could be drawn from storage to maintain flows; and second, the higher flows being released from Ripogenus during the year to allow releases in the Back Channel would cause the reservoir to drop more rapidly resulting in less water being available in storage at the start of the spawning season. In these cases, there would not be adequate storage available to supplement the low available winter inflows to maintain the salmon fishery.

Figure 12 is a graph of the North Twin Pond elevation. The revised elevation, which is shown in red, demonstrates what would happen at North Twin once the outflow from Ripogenus is restricted. North Twin's elevation immediately falls below its spawning elevation,

and the lake trout fishery is compromised in order to maintain the minimum flow downstream.

There are also two aspects of flow regulation which would have an impact on energy production and on the other water uses due to minimum flow requirements. First, in order to discharge water into the Back Channel, one or more waste gates must be opened at Stone Dam. The gates are manually operated and it would be necessary to set the gate openings so that they would release the required minimum flow for normal headpond conditions. To account for daily lake level fluctuations and accuracy of gate settings, it would be necessary to set any gate opening so that the average outflow down the Back Channel would be approximately 35 cfs higher than the minimum outflow required since the actual discharge varies based on the head on the gate and the opening set by the operator. This flow regulation effect would require an additional average flow rate of 35 cfs from the upstream North Twin impoundment in order to meet the minimum flow requirements at the Back Channel.

Second, the weekly average outflows used in the modelling of the discharge from the North Twin impoundment and from Millinocket Mill are assumed to be equal in the Water Use Plan. Historical flow records show that weekly average outflows from North Twin and Millinocket are approximately equal, but that an average

daily variation of plus or minus 130 cfs exists under normal conditions. This daily flow variation is due inpart to mill power demands and the 40/60 Hz load balance and is expected to increase with the implementation of the constraints of the Water Use Plan. The control equipment used to establish and regulate the flows through the project facilities also has a normal range of sensitivity that needs to be accounted for in the flow regulation. This daily flow variation means that in order to supply a certain minimum flow to Stone Dam, it is necessary to release a weekly average flow from North Twin that is greater than that minimum flow. This flow regulation requirement is not considered explicitly in the current modelling work and Great Northern believes it can meet the requirements of the proposed plan. However, any increases in minimum flow from the North Twin impoundment would push the model beyond its predictable limit. The work completed to date indicates that with increased flow there would be significant adverse impacts in both the fishery and recreational flow provisions of the Water Use Plan and the energy losses.

**Conclusion:**

The process of modelling Great Northern's hydro system to develop this Water Use Plan has shown that it will be possible to alter the operation of the Ripogenus and Penobscot Mills Projects to meet numerous agency requests for environmental enhancements

without imposing an unacceptable economic penalty on Great Northern's manufacturing operations. The modelling exercise also shows, however, that some agency requests, particularly those relating to flows in the Back Channel, cannot be met without destroying the Water Use Plan and having an unacceptable economic impact.

Great Northern is aware of no other modelling effort of similar scope or complexity. This Water Use Plan accomplishes the best achievable balance of often conflicting agency and licensee goals, and in so doing, certainly achieves the "equal consideration" mandated by the Federal Power Act.

**Rescheduled Operations Model Technical Workshop**

Dear Secretary Reese:

Great Lakes Hydro America, LLC (GLHA), Licensee of the Ripogenus Hydroelectric Project (No. 2572) and the Penobscot Mills Hydroelectric Project (No. 2458) (collectively referred to as the "Projects"), herein is providing notification of the rescheduled date for the upcoming Operations Model Study Technical Workshop to be hosted by GLHA.

The workshop will be held ***in-person*** at the **Maine Department of Environmental Protection (MDEP) Office located at 106 Hogan Road, Suite 6 (3rd Floor) in Bangor, Maine** over two consecutive days, on January 31 and February 1, 2024.

In order to plan accordingly, GLHA respectfully requests stakeholders who plan on attending the workshop RSVP by contacting Cate Russell at Cate.Russell@hdrinc.com or (207) 239-3792 at your earliest convenience but no later than January 26, 2024.

The anticipated agenda for the workshop is provided below.

## Wednesday, January 31, 2024 (9:00 AM to 4:00 PM)

1. Logistics, Safety, and Introductions
2. Meeting Purpose
3. Relicensing Schedule
4. Overview of Operations Model
5. Hydrology
6. Lunch on your own
7. Overview of Projects and Operations
8. Model Verification
9. Overview of Baseline Scenario

Debbie-Anne Reese,
January 21, 2024
Secretary
Federal Energy Regulatory Commission 888 First Street, N.E., Room 1A
Washington, DC 20426

**Subject:** Ripogenus and Penobscot Mills Hydroelectric Projects (P-2572 and P-2458) Comments on Maine TU Council's Response to Great Lakes Hydro America filing of December 19, 2023 and issues raised by the Operaı ons Model and the Proposed January 30, 2024 Workshop.

Dear Secretary Reese: Via Electronic Filing

This filing is made as an addendum to Mr. Steven Heinz's filing of January 5, 2004. We live in an age of remote communicaı ons that has become a part of the everyday workplace. The Licensee has refused the very reasonable request for remote access to the rescheduled January 30 – February 1, 2024, Workshop. Therefore, I am expanding on comments made in my November 8, 2023, filing. These comments concern input data and logic used in the Operaı on Model (Ops model) presented in the Licensee's April 24, 2023, filing.

The Licensing of the above referenced Projects uses the Integrated Licensing Process. The Licensee states "GLHA believes that the ILP will be the most effecı ve and efficient process for these proceedings" (Pre-Applicaı on Document 1-0). The effecı veness and efficiency of the process is unknown at this time. What is known are the communicaı on difficulı es the stakeholders have had geı ng their quesı ons and concerns to the Licensee, and more importantly, receiving the Licensee's responses. The Licensee's December 19, 2023, response references "*24 separate studies to evaluate the Projects' impacts*". To my knowledge, none of these studies incorporated stakeholder requests concerning locaı ons and methods, and "rouı ne consulta. ons" (Randall Dorman 19, 2023 letter to FERC) are lacking. As a result, the only method of communication in responding to the Licensee's filings, is additional filings. While some filings may seem redundant and probably are redundant, FERC filings are the only instrument available to the stakeholders. There are many environmental and recreational issues. There is no indication that stakeholder questions and concerns are being heard. The case in point is the soon to be rescheduled Operation Model workshop, a key focus, perhaps the major focus of these two relicensing events. The Operations Model is the Licensee's study, and it is their prerogative to schedule when and where to hold a workshop. Remote communications are not being provided and the present schedule excludes me, other stakeholders, and perhaps agencies from distant locations. If the stakeholders and agencies

cannot participate in the Ops Model workshop, in effect we are removed from the licensing process of the two referenced Licenses.

The Licensee states that the Ops Model is a tool that can be used to determine if various storage, flows, and environmental goals can be met under various climate and hydrologic conditions. While this is a reasonable goal, input data e.g. estimated flows and impoundment elevations are flawed. As a result, figures and tables presented in Appendix B (April 24, 2023, Filing) have little or no bearing on actual flow and elevation outcomes.

As noted before, HDR expended a great deal of effort in developing the Operations Model. Regarding errors, omissions, and logic issues, I find fault with the logic and input of data that were the responsibility of the Licensee.

The errors or omissions in data use and logic are listed below.

The Licensee uses North and South Branch Gaging Stations in Appendix B, Section 4.0 Hydrology (Figure 4.1) but has gone at great lengths to avoid the use of the non-impounded North Branch
of the Penobscot River (North Branch) USGS gaging station flow records in other cases. Rather than use local and reliable stream flows, the Licensee spends a number of pages attempting to justify the use of the USGS Grindstone Gaging Station on the East Branch of the Penobscot River (East Branch) and its tributary Seboeis River to develop an estimate of tributary flow into the Storage Project (P2634). Both locations are on the lee side of the Appalachian Mountain range and would likely receive greater participation. Both rivers have impoundments. The East Branch is heavily impounded, and headwater flow is provided from the St John River drainage (though the Lock Dam diversion). The Seboeis River drainage is small and the period of record, five years, is short.
There is a dam on Sawtelle Brook and a structure on Jerry Brook (see Google Earth), tributaries to the Seboeis River. These are small but never-the-less provide hydraulic control.

One of principle attributes of Ops Model runs presented as figures in Appendix B is spring inflow into the storage ponds. As Storage Project spring gate setting requires manning (at some point during spring thaw), gate openings and pond elevations are known and provide some empirical data. Should the Licensee continue to insist on the use of flawed estimates of inflow rather than empirical recorded USGS North Branch flows, some error statement associated with East Branch and Seboeis Rivers flow estimation should be included.

The Licensee continues to use 939 ft as the Ripogenus full Pond Elevation. The Licensed full Pond elevation is 941.6. If the Licensee's position is that the 941.6 ft full pond elevation contains risks unacceptable at the corporate level, FERC should be notified of these risks. Upon receipt of the Licensee's full pond policy, FERC can incorporate this restriction into the new Ripogenus Project License. It is difficult to imagine a water management plan and hydroelectric market driven operations that gives up almost 3 BCF of storage associated with a dam designed to meet the Possible Maximum Flood.

The Licensee refers to snowpack surveys. No information is provided as to annual spring snowpack/"water on the ground" surveys. If the Licensee is using these data, then collection methods dates, and location should be provided. More importantly, the Licensee should explain how snowpack information is currently incorporated into a "rule curve" as well as how it was included in the Ops model.

5.2.3 Operational Settings

5.2.3.1 Spill Elevations

I understand that this is a model and certain conditions and rules are necessary. However, "*spill is set to occur at times during periods when the pond level is below full*" makes no sense. When available storage exists, why would the system operator preemptively release valuable water before the forecasted event occurs? Even in the most extreme rain event, it takes hours for pond elevations to rise, more than adequate for the system operator's response. This is NOT how the system was historically operated!

8.0 Model Summary and Conclusions

**Storage Pond – "***The Operations Model utilizes a single rule set for the Storage Ponds (Appendix B-9) for every year, where actual operations vary from year-to-year depending on actual conditions and timing of access".* What is a "single rule set"? If this rule set was defined earlier, I remain confused as to the development of parameters and how this rule is applied. For example, regarding Canada Falls and the downstream South Branch of the Penobscot River, was the river flow derived from the USGS (South Branch) Gage Station or were outflows derived from a universal inflow model?

Any water management plan will inherently contain conflicts caused by competing goals. In the case of the Storage, Ripogenus, and Penobscot Mills Project License Articles provide explicit requirements that conflict with elevation, flow, and environmental goals. A difficult challenge. I understand that model runs presented in Appendix B are simply examples. The Holbrok Bypass Channel (Article 406) and stable base flows were the prime fish and aquatic communities' goals of the 1996 Ripogenus Project licensing procedure. I found no reference or attempts to include Article 406 flow needs in iterations presented in Appendix B. Furthermore, It is clear that Article 406 Holbrook Bypass Channel flow requirements cannot be met during "normal" or "dry water years" under the Licensee's stated goal of continuing its extreme (daily 3500 cfs, 12-16 hour) peaking operation. The historic and projected violations of the Ripogenus Project's Article 406 should be acknowledged, and alternate Landlocked salmon spawning and incubation habitat(s) investigated now, rather than later.

The Licensee has stated they can and will produce various model runs set to meet a variety of conditions. If logic and input data are not corrected the value of these iterations is lost. Any flow model must demonstrate which fish and aquatic communities' needs can or cannot be met under various operational flows and impoundment drawdown scenarios. As stakeholders are

DRAFT

being denied remote access, their understanding of the modeling process, questions, and concerns will remain outside of the collaborative process.

Thank you for the opportunity to comment.

**Subject:** **Ripogenus Hydroelectric Project (FERC No. 2572-133)**
**Penobscot Mills Hydroelectric Project (FERC No. 2458-247)**
**Operations Model Technical Workshop**

Dear Secretary Reese:

Great Lakes Hydro America, LLC (GLHA), Licensee of the Ripogenus Hydroelectric Project (No. 2572) and the Penobscot Mills Hydroelectric Project (No. 2458) (collectively referred to as the "Projects"), herein is providing notification of the opportunity for stakeholders to participate in the upcoming Operations Model Study Technical Workshop via a virtual option.

Consistent with the previous notices regarding the workshop, the workshop will be held *in-person* at the Maine Department of Environmental Protection (MDEP) Office located at 106 Hogan Road, Suite 6 (3rd Floor) in Bangor, Maine over two consecutive days, on January 31 and February 1, 2024.

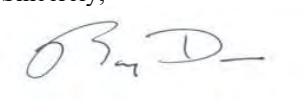
Given the purpose, format, and duration of the workshop (i.e., educate the relicensing participants on the technical aspects of the operations model), GLHA continues to recommend that stakeholders attend the workshop in person, and hopes that those individuals who have indicated that they will attend the meeting in person will do so in lieu of attending the workshop virtually.

**In order to plan accordingly, GLHA respectfully requests stakeholders who plan on attending the workshop in person or virtually RSVP by contacting Cate Russell at Cate.Russell@hdrinc.com or (207) 239-3792 at your earliest convenience but no later than January 26, 2024.**

The anticipated agenda for the workshop is provided below. GLHA will work to complete presentation of the Day 1 information on January 31st as scheduled; however, as necessary, information from Day 1 may carry over to February 1st.

**Wednesday, January 31, 2024 (9:00 AM to 4:00 PM)**

1. Logistics, Safety, and Introductions
2. Meeting Purpose
3. Relicensing Schedule
4. Overview of Operations Model
5. Hydrology
6. Lunch on your own
7. Overview of Project and Operations
8. Model Verification
9. Overview of Baseline Scenario



**GREAT LAKES HYDRO AMERICA, LLC**
1024 Central Street, Millinocket, ME 04462

Subject: Comments on historic and contemporary Salmon fishing quality in the West Branch Penobscot River (FERC No. P-2572-133)

I am writing to express my opposition to what I understand to be the current peaking operating mode occurring in the West Branch Penobscot River downstream from McKay Station. By way of background, I am familiar with the historical fishery occurring in this river. I attended the University of Maine at Orono (UMO) from 1967-1973 and was employed under a contract involving the US Fish and Wildlife Service and the Migratory Fish Research Institute (MFRI) at UMO from 1974 until 1977. While under the auspices of the MFRI I authored a report entitled "Mattawamkeag River Studies: 1. Biological and physical factors bearing on restoration of Atlantic Salmon in Mattawamkeag River, Penobscot River System, Maine and 2. Effects of Sevin, a spruce budworm insecticide on fish and invertebrates in the Mattawamkeag River in 1976". I actively fished the West Branch Penobscot River below McKay Station many times annually from 1971 until I left the State of Maine in 1977. This time period predates the development of what is now a vibrant recreational whitewater rafting/boating industry in this river.

Upon departing Maine I moved to New York and was employed as a fisheries biologist for 39 years by the New York State Department of Environmental Conservation (NYSDEC) until my retirement in 2016. During my tenure at NYSDEC I held various positions, the last being as Chief of the Bureau of Fisheries in the Division of Fish, Wildlife and Marine Resources. Professionally I interacted with fisheries personnel frequently, often those from the Northeast United States. Through those interactions and a focus on coldwater fisheries (salmon and trout for example) during significant portions of my career, I became quite familiar with the types and quality of coldwater fisheries available in various Northeast states. Hyperbole can often be used to emphasize a point; however, it is not hyperbole to state that the Atlantic Salmon (landlocked) population and fishery of the West Branch Penobscot River downstream of McKay Station was exceptional among fisheries for that species in the Northeast States. The ecosystem and its management regime supported a self-sustaining, wild salmon population that provided high quality fishing opportunities throughout the open-water angling season. By way of contrast, seasonal (parts of the spring and fall) fishing

opportunities for primarily stocked (hatchery reared) Atlantic Salmon in portions of rivers associated with lakes such as Lake Champlain or Lake Ontario are more common, though special in their own right. I do not state or imply that I am an expert on the current state of the ecosystem or fishery present in the West Branch Penobscot River. I have however read many of the filings to FERC pertinent to P-2572 and see the following as critical stakeholder issues and concerns.

The Salmon Population and fishery. Individuals familiar with the contemporary fishery contend in letters to FERC that the fishery has declined in quality relative to that of earlier years. If present in the voluminous filings, I did not see one letter along the lines of "the fishery is better than it used to be". Salmon growth rates, which have declined per Edward Spear's letter of September 27, 2023, and overall abundance are apparently not what they once were. Total angling effort in recent years remains unquantified as there are no statistically valid estimates of angler effort and catch. Unfortunately this precludes the ability to say that this fishery now supports X days of angler effort annually that in turn leads to Y dollars of economic impact to local communities and to the State of Maine. The ability to make statements of this nature can be a powerful tool in protecting aquatic resources.

It is possible however to make reasoned inferences about the current quality of the Salmon fishery based on information contained in several comments provided to FERC. Creel survey data obtained from 1979-1987 for the McKay Station to Abol Bridge reach are presented in a letter submitted by Edward Spear on July 6, 2023. Creel surveys are employed to obtain estimates of angler effort and catch by systematically obtaining counts of anglers, conducting contact interviews to obtain data from all anglers on fish caught including those kept and those released, and expanding those data to account for days that were not sampled by the creel survey clerk. The mean catch of Salmon (fish kept plus those released) was just over 11,000 fish per year from 1979-1987. Included in that number was an average of 1,317 legal sized fish per year that were retained (creeled) by anglers. On a per angler basis, the overall mean catch rate was 1.79 salmon per angler day or 0.49 salmon per angler hour during this time interval.

Angler catch and effort information were obtained in 2021 and 2022 on a voluntary basis from anglers reporting trip data in survey boxes deployed at various sites downstream from McKay Station (Maine Department of Inland Fisheries and Wildlife {MEDIFW}, comments to FERC June 29, 2023). Angler survey boxes are a management tool, dependent upon voluntary cooperation, designed to detect trends over time. Those self-reported data tend to have a positive bias towards more successful anglers (MEDIFW, same comments). The reported catches of Salmon in 2021 and 2022 were 0.76 and 0.99 fish per hour respectively. The catch rate for 2021 reflects an apparent typo. Based on the tabular data presented in that comment letter however, the actual catch rate for Salmon in 2021 should have been 0.56 fish per hour (864 Salmon

reported caught in 1,545 hours). It is worth noting that based on the 2021 and 2022 data, the fishery described functioned as a virtual “no-kill” with only one fish reported as kept or creeled, and about 20% of the reported catch being 16 inches or larger. A “no-kill” fishery (in practice or in regulation) should maximize the overall catch rate as legal harvest is minimized, and should also favor retention of larger fish in the overall population. Contrast that with more than 1,300 legal size Salmon kept on average annually from 1979-1987.

Although angling regulations, sample sizes, and the data collection methodologies cited above differ between time periods, other quantitative catch and effort information is not apparently available. The data are consistent with observations from various persons submitting comments that the fishery, particularly for larger fish, has declined. What happened? One possible explanation is the difference in overall operating procedures in current as opposed to prior times when McKay was integral to the operation of two nearby paper mills. Whereas daily flows through McKay were relatively stable many years ago, now it is more common for daily pulsing of flows to occur nominally to facilitate whitewater boating recreation (Maine Council of Trout Unlimited comments filed May 12, 2022). I believe that a return to the more stable flows (and attendant impoundment water level management) of prior years would be beneficial to the Salmon fishery of the West Branch Penobscot River downstream from McKay Station, could easily accommodate the vibrant whitewater recreational boating industry while also providing electricity to consumers.

Thank you for the opportunity to provide comments on these important matters.

Subject: Support for installation of a stream flow monitoring gauge for the West Branch Penobscot River (FERC No. P-2572-133)

I am writing to express my support for the installation of a flow monitoring gauge in the West Branch Penobscot River downstream of, but in close proximity to McKay Station. The need for a gauge was identified, for example, in a filing by the Maine State Council of Trout Unlimited dated November 9, 2023. Key attributes of such a gauge should include independence from the license applicant, real time data accessibility (ie. internet accessibility) and installation/maintenance by an entity with demonstrated expertise in such matters. The logical choice for siting, installing, and operating a stream flow gauge is the United States Geological Survey (USGS). According to the USGS there are currently 16 stream flow gauges in the Penobscot River Basin but none on the West Branch. In my opinion a seventeenth is needed, as noted above.

Stream flow gauges provide valuable information to the regulatory community, natural resource agencies, and to various user groups including anglers and boaters. In New York for example, USGS gauges at multiple locations in portions of the Delaware River system downstream of New York City Department of Environmental Protection water supply reservoirs provide real time flow, and in some instances water temperature data. Such data have been crucial in fine tuning reservoir releases during periods of thermal stress to protect cold water fisheries, plus advise prospective anglers, boaters and other recreational users of current conditions.

I am uncertain if anomalies in McKay Station flow data that were previously determined from electrical generation attributes have been fully resolved. Regardless, I strongly support actions to effect the installation of a gauge as described above, preferably in the near term.

Thank you for the opportunity to provide comments on this important matter.

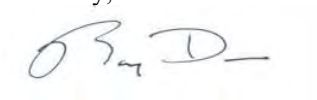
**Subject:** **Ripogenus Hydroelectric Project (FERC No. 2572-133)**
**Penobscot Mills Hydroelectric Project (FERC No. 2458-247)**
**Fifth Study Progress Report**

Dear Secretary Reese:

Great Lakes Hydro America, LLC (GLHA), Licensee of the Ripogenus Hydroelectric Project (FERC No. 2572) and the Penobscot Mills Hydroelectric Project (FERC No. 2458) (collectively referred to as the "Projects"), herein files with the Federal Energy Regulatory Commission ("FERC" or "Commission") the Fourth Study Progress Report for the relicensing of the Projects. The Projects are located on the West Branch of the Penobscot River and Millinocket Stream in Piscataquis and Penobscot counties, Maine.

The current licenses for the Projects were issued on October 22, 1996 and expire on September 30, 2026. On June 11, 2021, GLHA filed the Notices of Intent and Pre-Application Document, which initiated the formal relicensing proceeding to obtain two separate new licenses for the continued operation of the Projects through the Commission's Integrated Licensing Process (ILP). On March 23, 2022, GLHA filed a Revised Study Plan (RSP) for the Projects, and the Commission issued the Study Plan Determination (SPD) on May 13, 2022. GLHA performed study activities in 2022 with available results provided in the Initial Study Report (ISR) filed with FERC on April 24, 2023. Subsequent to the filing of the ISR, stakeholders filed comments on the ISR and new study requests, and on September 19, 2023, FERC issued the second SPD. GLHA performed continued study activities in 2023 for which available results will be provided in the Updated Study Report (USR) to be filed with FERC by April 22, 2024.



Pursuant to the RSP, GLHA herein submits the Fifth Study Progress Report for the period from November 1, 2023 through January 31, 2024 for the Projects. The enclosed table (report) provides a list of the required studies and associated status of progress, as well as any modifications to the approved methodologies.

Concurrent with this filing, GLHA is providing a copy of this letter to all parties listed in the attached distribution list. A copy of the Fifth Study Progress Report can be downloaded from FERC's eLibrary system at https://www.ferc.gov/docs-filing/elibrary.asp by conducting a search using the docket numbers p-2458 and/or p-2572.

FIFTH STUDY PROGRESS REPORT

| Ripogenus Hydroelectric Project (FERC No. 2572)<br>Penobscot Mills Hydroelectric Project (FERC No. 2458)<br>Fifth Study Progress Report<br>(November 1, 2023 through January 31, 2024) | | | |
|---|---|---|---|
| **No.** | **Study** | **Status** | **Modifications to Methodology** |
| 1a | Water Quality Study – Impoundment Lake Trophic Assessment | Study completed as required in 2022 with study results provided in the ISR. | None. |
| 1b | Water Quality Study – Downstream DO/Water Temperature Assessment | • First season study activities were completed as required in 2022 with study results provided in the ISR.<br>• Based on comments during the ISR Meeting and pursuant to FERC's SPD issued September 19, 2023, additional water temperature data was collected at three monitoring sites in the West Branch downstream of Stone Dam in June and July 2023.<br>• Data collected in 2023 will be provided in the USR. | None. |
| 1c | Water Quality – Benthic Macroinvertebrate Assessment | • First season study activities were completed as required in 2022 with study results provided in the ISR.<br>• Additional macroinvertebrate data was collected in 2023 at two locations in the West Branch downstream of Stone Dam.<br>• Data collected in 2023 will be provided in the USR. | None. |
| 1d | Water Quality – Impoundment Aquatic Habitat Assessment | Study completed as required in 2022 with study results provided in the ISR. | None. |
| 1e | Water Quality – Riverine Aquatic Habitat Assessment | Study completed as required in 2022 with study results provided in the ISR. | None. |
| 2 | Instream Flow and Habitat Assessment of West Branch below Stone Dam | Study completed as required in 2022 with study results provided in the ISR. | None. |

| Ripogenus Hydroelectric Project (FERC No. 2572)<br>Penobscot Mills Hydroelectric Project (FERC No. 2458)<br>Fifth Study Progress Report<br>(November 1, 2023 through January 31, 2024) | | | |
|---|---|---|---|
| **No.** | **Study** | **Status** | **Modifications to Methodology** |
| 3 | Fish Assemblage Survey Study | • First season study activities completed in 2022 with study results provided in the ISR.<br>• Pursuant to FERC's SPD issued September 19, 2023, GLHA will perform a fish assemblage survey at the Ripogenus Project in the spring of 2024 (likely late May or early June pending suitable field conditions).<br>• Data collected during the spring of 2024 will be provided in a USR supplement. | None. |
| 4 | Fish Stranding Study | • Study completed as required in 2022 with study results provided in the ISR.<br>• Additional information specific to the Fish Stranding Mitigation Study and the McKay Station Ramping Study is provided below. | None. |
| 5 | North Twin Impoundment Tributary Access Survey | Pursuant to the RSP and SPD:<br>• Based on the consultation with MDIFW, tributary surveys were performed in mid-July 2022, but the fall 2022 survey could not be performed due to wet weather and high impoundment elevations.<br>• The fall tributary survey was performed in early November 2023.<br>• Data collected in 2023 will be provided in the USR. | None. |

**GREAT LAKES HYDRO AMERICA, LLC**
1024 Central Street, Millinocket, ME 04462

| Ripogenus Hydroelectric Project (FERC No. 2572)<br>Penobscot Mills Hydroelectric Project (FERC No. 2458)<br>Fifth Study Progress Report<br>(November 1, 2023 through January 31, 2024) | | | |
|---|---|---|---|
| **No.** | **Study** | **Status** | **Modifications to Methodology** |
| 6 | Upstream American Eel Passage Assessment Study | • First season study activities were completed as required in 2022 with study results provided in the ISR.<br>• Based on comments received during the ISR Meeting and the FERC SPD issued on September 19, 2023, GLHA performed nighttime eel observations and electrofishing surveys at the Dolby, Millinocket, North Twin, and Millinocket Lake Storage Developments.<br>• From mid-July through September 2023, 5-7 nighttime eel observation events were conducted at each dam .<br>• In July/August 2023, one nighttime electrofishing survey was performed downstream of the Millinocket, North Twin, and Millinocket Lake Storage dams. Due to high water conditions throughout the late summer and fall, after consultation with USFWS, MDMR, PIN, and MDIFW, further attempts to conduct additional electrofishing surveys were suspended in October.<br>• Data collected in 2023 will be provided in the USR. | • Heavy precipitation coupled with planned unit outages for maintenance during the summer of 2023 resulted in high flows in the rivers and spill conditions at the dams limiting the ability to perform nighttime eel observations and electrofishing surveys. Although there were fewer surveys than anticipated, the monitoring completed in 2023 allowed GLHA to gain a good understanding of juvenile American eel presence and behavior at the Penobscot Mills Project. |
| 7 | Desktop Downstream Eel Passage Route and Survival Study | Study completed as required in 2022 with study results provided in the ISR. | None. |

|---|---|---|---|
| **No.** | **Study** | **Status** | **Modifications to Methodology** |
| 21 | USGS Gage Feasibility Study | • GLHA will complete the study as required in consultation with the MDIFW and USGS with results anticipated to be provided in the USR. | None. |
| 22 | McKay Station Ramping Study | • In early September 2023, GLHA consulted with MDIFW to identify the window of time in which the study could be performed in consideration of the fish spawning season. MDIFW indicated the study should be performed after September 30 but prior to October 15, 2023. Due to the high precipitation events, in combination with the scheduled maintenance activities at McKay Station, which resulted in one or more turbine units were unavailable from early September through October 2023, GLHA was not able to perform the field activities during the designated time period. GLHA has notified the parties that requested the study of this schedule update.<br>• GLHA will consult with MDIFW to determine the timeframe to perform the study in 2024 and will consult with MDIFW and TU on the schedule and methods for the study field activities.<br>• Subsequent to completion of the required study activities, GLHA will file the results with FERC. | None. |
| 23 | Fish Stranding Mitigation Evaluation Study | • GLHA will complete the required fish stranding mitigation evaluation study subsequent to the completion of the McKay Station Ramping Study and will file the results with FERC when available. | None. |

Federal Energy Regulatory Commission
888 First Street, NE
Washington, DC 20426

**Subject:** **Ripogenus Hydroelectric Project (FERC No. 2572-133)**
**Penobscot Mills Hydroelectric Project (FERC No. 2458-247)**
**Operations Model Technical Workshop Follow-up**

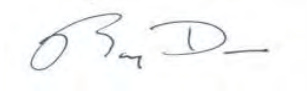
Dear Acting Secretary Reese:

Great Lakes Hydro America, LLC (GLHA), Licensee of the Ripogenus Hydroelectric Project (No. 2572) and the Penobscot Mills Hydroelectric Project (No. 2458) (collectively referred to as the "Projects"), herein provides follow-up information related to the Operations Model Study Technical Workshop that occurred on January 31 and February 1, 2024.

On January 31 and February 1, 2024, GLHA conducted an Operations Model Study Technical Workshop in Bangor, Maine. The workshop was attended by interested stakeholders either in-person or via MS Teams. A list of the workshop participants is enclosed.

During the workshop, GLHA presented detailed information supported by PowerPoint slides associated with the Operations Model that has been developed to support the relicensing of the Ripogenus and Penobscot Mills Projects. A copy of the PowerPoint slides presented during the workshop are enclosed.

At the close of the workshop, GLHA reviewed the process for stakeholders to request alternative operating scenarios to be evaluated by the Operations Model. To facilitate requests, GLHA has enclosed an Alternative Operating Scenario Request Form. GLHA requests that stakeholders interested in submitting alternative operating scenarios to be evaluated by the model do so by completing the enclosed form describing the requested alternative and justification for the request (the justification for the request is required for the scenario to be evaluated). **GLHA requests that stakeholders file the alternative operating scenario requests with FERC by March 6, 2024.**



Subsequently, GLHA will file with FERC the model run results and schedule a virtual meeting with stakeholders to discuss the model run results. The schedule for the filing of the results and meeting with stakeholders to discuss the results will be dependent on the number and complexity of scenarios requested by stakeholders.

Concurrent with this filing, GLHA is providing a copy of this letter to all parties listed in the enclosed distribution list. Parties can download an electric copy of this filing from FERC's eLibrary system at https://www.ferc.gov/ferc-online/elibrary by conducting a search using the docket numbers P-2458 and/or P-2572.

Subject: Comments on Interim Plan for Aquatic Resource Protection during McKay Station Outages submitted by Great Lakes Hydro Associates to FERC (FERC No. P-2572-133)

Dear Acting Secretary Reese:

I am writing to comment on aspects of the interim measures proposed by Great Lakes Hydro Associates (GLHA) via a letter to FERC dated January 19, 2024. I recognize the significance of the term "interim." Overall, I saw little in GLHA's proposals that would solve the actual problem: how to avoid rapid flow reductions in the event of a unit outage. In earlier filings to FERC, GLHA contends that outages due to events such as lightning strikes are unforeseeable and beyond their control. While the latter point is wholly understandable, I consider it not credible to contend that unplanned outages are unforeseeable. Predicting when some acts of nature, damaging lightning strikes for example, will occur may well be impossible with present technology; however, recognizing that such events will occur is fundamental to operating many systems. For example numerous fish hatcheries and facilities such as hospitals have backup generators with transfer switches designed to quickly restore functions dependent upon line power. They are regularly tested (exercised) to help ensure functionality. I cannot say if this approach is beyond the realm of the doable for McKay Station, though I expect there are numerous experts who can. Determining the applicability of such a system to McKay Station may be a worthwhile interim measure given the re-licensing timetable.

I recognize that the Maine Department of Inland Fisheries and Wildlife (MEDIFW) recommended that GLHA "mitigate" for salmonid and macroinvertebrate mortalities through monetary penalties for low flow occurrences. One definition of mitigation I read, admittedly on the internet, states "reducing risk of loss from the occurrence of any undesirable event." I realize there are likely other definitions. A monetary fine or penalty sounds more like compensation to me than mitigation. Furthermore, there is no logical basis for GLHA proposing that no more than 5 "unplanned excursions" would be subject to mitigation (compensation). Would a 6$^{th}$ event in a year, however unlikely, not be harmful to the aquatic resources? I prefer to see measures implemented that would be capable of preventing rapid flow reductions that in FERC's words ".. have resulted in

adverse effects to aquatic life not anticipated at the time of licensing, as demonstrated by the numerous fish and macroinvertebrate strandings reported to us." (FERC letter to GLHA dated August 22, 2023).

Other measures mentioned by GLHA include transmission line maintenance and several technical upgrades to improve system reliability. Although continuation of an ongoing transmission line maintenance program is certainly reasonable it does not seem like it would move the needle much in terms of reducing the likelihood of an unplanned outage. If there are technical upgrades to existing McKay Station infrastructure that would improve system reliability, implementing those upgrades is prudent. I expect it would be in the best interests of GLHA to implement them under any circumstances.

In the filings pertinent to this issue I also noted several different possibilities for interim resource protection via continuous flow of varying amounts from Ripogenus Dam. Neither MEDIFW nor GLHA favor a large release, and I concur. Balancing water storage and flow through McKay Station among the various interests will be even more challenging if a large flow through Ripogenus Dam were to be implemented. Protection or enhancement of the existing aquatic community downstream from McKay Station is a worthy goal. Proponents seeking a substantial release from Ripogenus Dam need to remember that Atlantic Salmon and Brook Trout are cold water species that will not benefit from additional releases of warm surface waters.

Thank you for recognizing the importance of addressing outage impacts and for the opportunity to provide comments on this important matter.

Philip J. Hulbert

East Meredith, NY 13757

RIPOGENUS AND PENOBSCOT MILLS PROJECTS RELICENSING - Request for Operations Model Run

Datte of Request February 9, 2024
Name of Requestor: : Edward Spear
Affiliation of Requestor: None
Title of Scenario: Verify the Maine Department of Fisheries and Wildlife's (MeDIFW) requested flow in the Historic West Branch of the Penobscot River Channel Area

This request asks for verification of MeDIFW proposed West Branch Channel (Backchannel) flow of 500cfs (from Stone Dam)

This request focuses on providing river flows needed to sustain all landlocked salmon (salmon) life stages. This MeDIFW's proposal also provides fish and aquatic communities needs while providing seasonal fishing opportunity for adult salmon and possibly, stocked brook trout.

Present Project operations appear to have eliminated salmon production i.e., salmon spawning and incubation as well as parr production, in the tailwater reach below North Twin Dam. Watering of the backchannel (West Branch Channel) will produce recruits to the North Twin tailwaters as the tailwaters of Mill One. In effect the MeDIFW request serves as a Mitigation measure that replaces habitat lost to current Options.

Additional the proposed flow will create kayak, rafting, canoeing and other non fisheries recreation opportunities. These non fisheries and aquatic communities gain will combine and provide economic benefits to the local economy

request covers camp owners, boating, fisheries, aquatic communities and other recreationist stated needs. Additionally, this storage produces hydro-electric generation in an increasingly valuable wholesale market (see ISO NE)

2) The minimum operating flow i.e., when electricity is being generated, for this five-month period is 2400 cfs (including any Upper Gorge flow). The recommended flow waters the Holbrook bypass channel and fulfills the requirement of Article 406. This request also covers campers, boating, fisheries, aquatic communities, and other needs stated by recreationists. The recommended flow regime provides significant value to the local economy.

3) Yearlong Upper Gorge flow, provided by a deep gate or other cool water source is to be set at 200 cfs. This requests covers sightseeing, boating, fisheries, and aquatic communities and other stated needs.

While McKay Station flows can be increased, the system operator is responsible for maintaining impoundment elevations needed to meet the flow requirement of item two.

Following October 15th.

4) Maintain McKay station flow at a minimum of 2000 cfs until spring spill. This request provided protection to fish and aquatic communities.

5) From November 1st to Spring spill period the Licensee's only obligation is to ensure Ripogenus Impoundment storage is available to provide the requested West Branch "fall-winter" flow of 2000 cfs. This request provides protection during the salmon spawning and incubation period as well as all fish and aquatic communities.

Subject: Importance of Sport Fisheries Such As the West Branch Penobscot River (FERC No. P-2572-133)

Dear Acting Secretary Reese:

I am writing to emphasize the importance of sport fishing to the national economy, and more particularly to the economy of the State of Maine. This is relevant to the deliberations and decisions to be made in determining license conditions for the matter at hand. Those conditions will affect the quality of the sport fishery on the West Branch Penobscot River, particularly in reaches downstream from McKay Station to Abol Bridge, for many years.

Surveys of outdoor activities such as sport fishing are conducted by various agencies and organizations. Two purposes of these surveys are to estimate participation levels and the economic impact of sport fishing from geographical perspectives. The U.S. Fish and Wildlife Service periodically conducts a national survey. Based on their recent survey, in 2022, 39.9-million people age 16 and older fished a total of 785-million days in fresh and salt water combined, and approximately 71% of that angling activity reportedly occurred in the nation's fresh waters (U.S. Department of the Interior, 2023). Total expenditures for the 785-million days of fishing were estimated to be $99.4 billion; however, separation between fresh and salt water expenditures were not reported (same citation). In economic terms fishing is clearly a “big deal.”

Data specific to Maine are not available from the 2022 national survey. Data pertinent to the economic impact of sport fishing in Maine can, however, be found in a report prepared for the American Sportfishing Association (ASA) [lengthy citation to follow at the end of this letter]. That report estimated that fresh water fishing in Maine resulted in $233-million in retail sales, $111-million in salaries and wages, supported 3,151 jobs, and yielded $25.5-million in state and local tax revenue. It should also be noted that a federal excise tax on fishing related equipment purchased in Maine contributes to programs administered by the Maine Department of Inland Fisheries and Wildlife to enhance conservation activities. I am not familiar with studies or reports that document participation levels and economic impacts for the boating industry in Maine, but clearly whitewater rafting, canoeing and kayaking generate qualitatively similar benefits.

Why does this information matter? It matters because fishing and boating are enjoyed by many people, resident and non-residents of Maine alike, who spend significant amounts of money in these pursuits. It matters because the license conditions that will prevail on the West Branch Penobscot River below McKay Station for 30 years or so will profoundly influence the quality of fishery supported by that totally renewable aquatic resource. Many years ago an organization named the Sport Fishing Institute regularly published a bulletin. Immediately below the organization's name on each issue was the phrase “The Quality of Sport Fishing Reflects the Quality of Life.” Given the opportunity, why would one not use this re-licensing process to provide the best possible conditions for the West Branch Penobscot River sport fishery to flourish?

Thank you for the opportunity to comment on this matter.

Subject: Erroneous Flow Data for the West Branch Penobscot River (FERC No. P-2572-133)

Dear Acting Secretary Reese:

I am writing to call attention to what I believe are significant errors in hourly flow data for the Ripogenus Project provided by Great Lakes Hydro Associates (GLHA). I examined some of the data, specifically "Ripogenus_HourlyOpsData_2000-2022 xls" contained in the Interim Study Report filed by GLHA on May 22, 2023 primarily to detect abrupt flow changes at McKay Station. On October 5, 2022 the short term flow reduction for the stranding study clearly appears in the data. Beginning on October 28, 2022 however, reported flows declined from 1,741 cfs (1300 hours) to 332 cfs (1400 hours) to 0 cfs (1500 hours) from both McKay Station and Ripogenus Dam. Zero flow is reported for all of the next four consecutive days and flow does not resume until 1000 hours on November 2, 2022. I infer that this information is incorrect as zero flow in the West Branch Penobscot River for that amount of time would be both ecologically catastrophic and a headline-grabbing event. I did not note recognition or clarification of this specific anomalous data in subsequent filings, though it is possible I missed that.

I respectfully request that FERC seek some explanation from GLHA as to what occurred, why it occurred, and, if possible, reassurance that target flows were actually achieved. Late October-early November are critical times for Atlantic Salmon as spawning generally commences within that time frame. I believe that the information presented in this letter reinforces the need for independent flow monitoring capability at a suitable location downstream from McKay Station. I leave it to FERC and GLHA to consider whether or not to determine if other hourly flow data for Ripogenus (ie. from other years) and the other locations included in the May 22, 2023 Interim Study Report filing are correct.

I look forward to your findings and thank you for the opportunity to comment on this matter.

Subject: Puzzling Flow Data for the West Branch Penobscot River (FERC No. P-2572-133)

Dear Acting Secretary Reese:

I am writing to seek clarification pertinent to the following: flow data provided by Great Lakes Hydro Associates (GLHA); notifications when deviations from required minimum flows are implemented; and FERC's role in such circumstances. I will address each of these items separately although they are at least somewhat intertwined.

1. Previously I pointed out anomalous flow data reportedly occurring between October 28 and November 2, 2022. During this interval flows from McKay Station and Ripogenus Dam were predominately recorded as "zero" in the Ripogenus Hourly Ops Data for 2000-2022 provided by GLHA. These data are puzzling. Ripogenus Dam flows/releases of 100 or more cfs appeared both before and after this time interval as did non-zero flows from McKay Station. This situation does not comport with a statement from GLHA: "Additionally, in early 2020, GLHA implemented updates to the program that calculates station outflows, which removed sources of variability in the previous program and improved the overall consistency and accuracy of the calculated station outflows" (GLHA letter to ME Council of Trout Unlimited filed December 12, 2023). How does one know or determine what flows actually occurred? Were there in fact violations of the minimum flow requirement (at least 1,300 cfs) for that critical time of year (salmon spawning), and the amount of time required (3 days) to restore required flow? Did the Holbrook channel have required flow?

2. I do not fully understand the notification process regarding flows that depart from license conditions, and implementation of this process. For example, GLHA did not provide timely notification to FERC of flow deviations commencing in October 2021, which was clearly noted by FERC (FERC letter to GLHA filed August 22, 2023), although required consultation with various State of Maine agencies regarding this deviation did occur. GLHA did however, provide timely notice of an approximately 2-hour deviation from whitewater recreation flow requirements occurring on July 8, 2023 (GLHA letter to FERC filed July 21, 2023). The event I write about encompassed portions of 6 days. If there are flow data other than that specific to October 28-

November 2, 2022 that I am referencing, are stakeholders entitled to see them or be aware of their existence via notification? Is FERC aware of other flow information? Transparency of non-confidential information, ie. flow records, is a reasonable stakeholder and public expectation.

3. Based on reading most filings for this project from 2022 to the present time I see that FERC has followed up on some observations and concerns brought forward by stakeholders. To my knowledge no other individual or organization has filed a comment regarding what did/did not happen commencing on October 28, 2022. Perhaps my doing so does not meet the threshold for notification or some kind of follow-up. If so, I wonder what is the threshold?

Thank you for the opportunity to comment on this matter.

**Electronically Filed**

**RE: Ripogenus Project (FERC P-2572) and Penobscot Mills Project (P-2458)**
**Request for Operations Model Run**

Dear Secretary Reese:

I am writing as a waterfront property owner/stakeholder within the above referenced re-licensing project area. My seasonal camp is on Caribou Lake within the Ripogenus Project area (FERC P-2572).

First, I would like to thank the Licensee (GLHA) and their consultant (HDR) for preparing and conducting the two-day Operations Model Technical Workshop on January 31st and February 1st in Bangor. I was able to attend in person and learned a great deal through all the presentations and open discussion. As a camp owner, the primary benefit for me was to be able to focus on the project operations data for 8 hours a day for two straight days.

Based on the workshop discussions, and my review of the baseline scenario simulation results, I am proposing one Scenario run with input data modifications to the "Target Elevation" schedule (see attached Ops Model Run form). The proposed modifications are based on actual historical elevation data for Ripogenus and N. Twin (predominantly using pre-2014 data). The proposed modifications represent more stable water levels with reduced drawdowns (in comparison to the current operating conditions).

My knowledge of the project areas dates to the late 1970's when I first canoed and fished the West Branch Penobscot River. I have returned regularly over the decades and have owned a camp on Caribou Lake since 2015. I have direct observational experience, over a lengthy time, of the project area.

As a professional geologist, I have over 40 years of professional environmental consulting experience throughout New England. My expertise in hazardous waste and hydrogeological consulting includes site assessment, subsurface investigations, delineation of groundwater capture zones and flow nets for recovery well systems, use of analytical and numerical computer models to simulate groundwater flow and contaminant transport; and design, operation and maintenance of soil and groundwater remediation systems. Since the 1980's I have developed and utilized numerical groundwater flow models and analytical groundwater models for simulating pumping

well zones of contribution and solute transport. This modeling often includes simulation of surface water impacts.

So, based on education, technical modeling experience, knowledge of the project area, and my understanding of the CHEOPS model gained at the workshop as a stakeholder, I feel qualified to evaluate the Baseline Scenario and request modifications to the scenario.

Thank you for considering these comments.

Respectfully submitted,

Michael J. Hudson

Attachment: Request for Operations Model Run

March 5, 2024

Ms. Debbie- Anne Reese
Acting Secretary Federal Energy Regulatory Commission
888 First Street, N.E.
Washington, D.C. 20426

**Via online submission to: http://www/ferc.gov**

Subject: **NGO Requests for Ops Model Runs for the Ripogenus Project (P-2572) and the Penobscot Mills Project (P-2458)**

Dear Secretary Bose:

American Whitewater, the Appalachian Mountain Club, Caribou and Chesuncook Lake Camp Association, Chesuncook Village Association, the Chesuncook Dam Camp Association, and Maine Council of Trout Unlimited ("NGOs" or "signatories") submit these requests for Ops Model runs in response to the Great Lakes Hydro America, LLC ("Brookfield") letter dated February 5, 2024, Subject: Ripogenus Hydroelectric Project (FERC No. 2572-133) Penobscot Mills Hydroelectric Project (FERC No. 2458-247) Operations Model Technical Workshop Follow-up.

These requests taken together represent major user groups and stakeholders of the river and lakes, including fishermen and women on both the lakes and rivers, whitewater boaters, hikers, canoeists, campers at public campsites, and camp owners. We ask that special consideration be given to these requests. We ask that they be run individually and those results reported to us. Once that has been accomplished, we ask that a combination of the scenarios be run and those results be reported to us as well.

We ask that leeway be given in determining the viability of the modifications from the baseline scenario. While the CHEOPS Ops Model as presented may be the best available tool for evaluating operational scenarios for the projects, many assumptions were made to generate the model, e.g., flashboard installation, proration of Seboeis flows, rules on how the project is operated, correlation between generation data and actual flows, etc. Variability was not quantified but some variability must be expected.

The signatories appreciate the opportunity to submit these requests for Ops Model runs and trust that they will be run as requested.

Respectfully submitted,

American Whitewater

American Whitewater/Appalachian Mountain Club Requests

Caribou and Chesuncook Lake Camp Association, Chesuncook Village Association, and the Chesuncook Dam Camp Association Requests

| | |
|---|---|
| **Date of Request:** | March 4, 2024 |
| **Name of Requestor:** | Michael J. Hudson |
| **Affiliation of Requestor:** | Camp Owner/Stakeholder, Caribou Lake |
| **Title of Scenario:** | Scenario 1 |

**Required: Describe the scenario request (i.e., modification to the Baseline Scenario) and the resource(s) of interest and the anticipated benefit to the resource(s) as a result of this requested scenario. Identify metrics for evaluating success/ benefit of this scenario and the specific questions you think this scenario will answer.**

The attached 2-page table is a scenario that requests one set of specific changes to the "Target Elevation" schedules for Ripogenus and N. Twin. The selected target elevations for Scenario 1 are based on observed historical data and pre-2014 trends (i.e. they are "feasible").

The table lists the resources of interest, anticipated benefits, and questions the scenario answers.

Please perform this scenario with no other modifications to the Baseline Scenario, to allow a direct comparison to the Baseline Scenario results.

Each scenario run will be compared with the "Baseline Scenario". "Baseline" project operating conditions follow the operating requirements of the existing FERC license as described below.

All elevations are expressed in National Geodetic Vertical Datum of 1929 (NGVD 29) unless otherwise specified.

RE: Alternative Operating Scenario Requests for Ripogenus (FERC No. 2572) and Penobscot Mills Projects (FERC No. 2458)

Dear Acting Secretary Reese:

Brookfield Renewable Inc. requested alternative operating scenario requests for the Ripogenus and Penobscot Mills Hydroelectric Projects be filed with FERC. The Maine Department of Environmental Protection requests the following alternative operating scenarios be modelled:

- Discharge from McKay Station
  - Model Steady Target flows (24/7) at 500, 600, 800, 1,000, 1,200, and 1,400 cfs
    - If the number of requests is infeasible, the Department requests the following be the minimum discharges modelled from McKay Station: 500, 1,000, and 1,400 cfs
  - See November 15, 2023 Department comments on the "Draft Interim Plan for Aquatic Resource Protection during McKay Station Outages"
  - Requested scenarios are to address water quality concerns from the Stranding Study in the ISR, which will be a topic in the Water Quality Certification process with the Department
- Below Stone Dam into the West Branch
  - Model steady target flows (24/7) at 3, 50, 100, 170, 200, 300, 500, 1,000, and 2,000 cfs discharged from Stone Dam into the West Branch.
    - If the number of requests is infeasible, the Department requests the following be the minimum discharges modelled from Stone Dam: 50, 200, 500, 1,000, and 2,000 cfs
    - Leakage (minimum flow under current license) often provides 100 cfs, which is only 53-60% of the wetted width below Stone Dam
  - See ISR Table 5.3-3.6 Total wetted area and percentage wetted area in the West Branch below Stone Dam (Class B water)
  - Requested scenarios are to address minimum flows that will be required by the Water Quality Certification

WEBSITE: www.maine.gov/dep

Additionally, the Department requests any photographs or diagrams showing stream conditions in the Upper Gorge and below Stone dam. The 1989 Upper Gorge Flow Study included black and white photocopies of sites in the Upper Gorge under leakage and 50 cfs, and copies of those in color or any photos like it, such as below Stone Dam, would be appreciated.

The Department consulted with the Maine Department of Inland Fish & Wildlife and the U.S. Fish and Wildlife Service and supports their flow requests in addition to those listed above.

If you have any questions about this matter, please contact me at laura.paye@maine.gov or 207-219-9563.

Sincerely,

Laura Paye
Hydropower Coordinator
Maine Department of Environmental Protection

**RE: Alternative Operating Scenario Requests for Ripogenus (FERC No. 2572) and Penobscot Mills Projects (FERC No. 2458)**

Dear Acting Secretary Reese:

Great Lakes Hydro America, LLC (GLHA), a subsidiary of Brookfield Renewable, has requested alternative operating scenario requests for the Ripogenus and Penobscot Mills Hydroelectric Projects be filed with FERC. The Maine Department of Inland Fisheries and Wildlife requests the following alternative operating scenarios be modelled:

1. **Ripogenus Impoundment Elevations**

   Target Elevation: May 31: 940 ft.

   Minimum elevation: July 1: 937 ft. (2-foot drawdown)

   Minimum elevation: Sept 30: 935 ft. (4-foot drawdown)

2. **MacKay Station Outflows Scenarios:**

   A. Model steady target flows (24/7) flows at 1800 cfs, 2000 cfs, 2200 cfs, and 2400 cfs from May 31 to September 30 while maintaining lake elevation goals.
   B. Model steady target flows as above with the option to reduce flows from 9:00 PM - 6:00 AM to 1,000 cfs (current minimum flow), 1,200 cfs, 1,400 cfs, and 1,600 cfs using ramping rate of no more than 25% change per hour while maintaining lake elevation goals.

3. **West Branch Penobscot River below Stone Dam**

   A. Model steady target flows (24/7) at 200 cfs, 300 cfs, 500 cfs, and 700 cfs, and calculated Aquatic Base Flow, discharged from Stone Dam into the West Branch.

**Re**: Ripogenus Project (P-2572) and Penobscot Mills Project (P-2458)
Comments on Request for Operations Model Run

Dear Secretary Reese:

Maine Professional Rafting Outfitters (MEPRO) is an organization of the commercial rafting outfitters that operate on the Penobscot River below McKay Station. Its members are impacted by the commitments to the industry made in connection with this licensing process. Maine's whitewater rafting industry plays a vital role in bolstering the State's rural economy by attracting tourists and providing employment opportunities in remote areas. We appreciate the opportunity to provide comments on the Operations Model Run.

Under the existing FERC license, commercial rafters and the whitewater rafting industry have historically had recreation flows from May 1 - September 15 between the hours of 8:30am-5:00pm. MEPRO seeks to ensure that this arrangement is preserved and that a minor logistical adjustment is made to fully satisfy that arrangement. Under the existing license, the agreed-upon flows are set forth below:

| ***Whitewater*** | |
|---|---|
| May 1 – September 15<br>(8:30 AM – 5:00 PM) | Normal hydrologic year[3]:<br>• 2,300 cfs on Saturdays and Sundays<br>• 2,200 cfs on Mondays and Fridays<br>• 2,000 cfs on Tuesdays through Thursdays<br>Wet or dry hydrologic year[3]:<br>• 2,200 cfs on Saturdays and Sundays<br>• 2,000 cfs on Mondays and Fridays<br>• 1,800 cfs on Tuesdays through Thursdays |
| September 16 – October 1<br>(8:30 AM– 5:00 PM) | Normal hydrologic year[3]:<br>• 2,300 cfs on Saturdays and Sundays<br>Wet or dry hydrologic year[3]:<br>• 2,200 cfs on Saturdays and Sundays |
| June 8 – October 14<br>(5:00 PM – 8:30 AM) | 1,000 cfs |

It is critical to the whitewater rafting industry that the license requires maintaining these flows and ensuring their predictability during recreation hours. The simple act of preserving our existing arrangement will provide significant benefits to support outdoor recreation and tourism, which, with the decline of other industry, has become the number one industry in the area and is increasingly important to Maine's rural economy.

**Scenario request**

In order to ensure that recreational flows are available during the agreed upon hours, our request is as follows:

1. **If flows are dropped below agreed-upon flows during the overnight hours, we request earlier releases that will enable recreation flow to reach all commercial access points (McKay and Nesowadnehunk) by 8:30am.**

Recreation flows are guaranteed from 8:30am-5:00pm, with a minimum of 1800 cfs being released during a wet/dry year on certain days of the week. We have experienced that, in a dry year when the turbines may be dropped to just 1 operating turbine overnight, an earlier release is needed to ensure that the recreation flow reaches McKay and Nesowadnehunk by 8:30am.

The minimum flow required to run a safe and enjoyable whitewater rafting trip are the flows that are currently in the license– including a minimum of 1800 cfs on a wet/dry year, and 2000 cfs on a normal year. This request is intended identify and confirm an earlier release from McKay when flows are dropped below 2000 cfs overnight, to ensure sufficient recreational flows make it to Nesowadnehunk Falls by 9:00am for our members who put in there, and to ensure river operations can continue to operate as usual and consistent flows are maintained throughout the 14 mile section we raft during recreation hours.

To illustrate, some of our members put their rafts in at 8:30am at McKay station for a full river trip, which could mean taking out as late as 5:00pm at Never's Corner. Other members put their trips in at Nesowadnehunk Falls at 9:00am for a lower river trip. Different trips offer different experiences, with some outfitters offering lower river only trips to accommodate the folks looking for a less adventurous trip. Under the current permitting regime, when flows have dropped below 2000 cfs overnight, outfitters have experienced low water at Nesowadnehunk Falls during the identified recreation hours of 8:30am to 5:00pm (most specifically at 9:00am when they are putting in their rafts). This inhibits their ability to begin full river trips on time.

Therefore, we are using this process to communicate with FERC and the license holder that we would like the arrangement to remain the same as has been true under the current permit. However, in order to honor that arrangement, additional time is required to increase the low flow

up to the recreation flow by the start of designated recreation hours, due to slow fill in Nesowadnehunk Dead Water and Abol Dead Water.

This request helps us to identify the time needed to ensure there is adequate flow during recreation hours. Our goal is to protect the water levels the whitewater industry relies on for continued success, while also recognizing the importance and value of other interests and endeavors. We favor a water management system that supports a stable operating environment.

Commitment to an earlier release time under low flow scenarios will allow the whitewater industry and customers to have confidence that recreation flows will reach launch points at a time and in a manner that enables predictable launch times, and a consistent flow throughout the river for running rapids. We would consider this scenario a success if the outcome is that the whitewater industry has adequate flow for running the river at 8:30am, whether putting in at McKay Station or Nesowadnehunk.

**Re: Ripogenus Hydroelectric Project, FERC No. 2752**
**Penobscot Mills Hydroelectric Project, FERC No. 2458**
**Alternative Operating Scenario Requests**

Dear Acting Secretary Reese:

As part of the Operations Model Study for the relicensing of the Ripogenus and Penobscot Mills Hydroelectric Projects (Project Nos. 2752 and 2458), Great Lakes Hydro America has requested that interested parties submit alternative operating scenario requests to FERC by March 6, 2024.

The U.S. Fish and Wildlife Service, Maine Field Office, provides its alternative operating scenario requests in the attached documents. Should you have any questions about these requests, please contact Kyle Olcott by telephone at 207-902-1573 or via email at dudley_olcott@fws.gov.

Sincerely,

AMANDA CROSS Digitally signed by AMANDA CROSS

| | |
|---|---|
| **Date of Request:** | March 6, 2024 |
| **Name of Requestor:** | Kyle Olcott |
| **Affiliation of Requestor:** | Hydropower Coordinator, US FWS Maine Field Office |
| **Title of Scenario:** | Range of Flows Below Ripogenus Dam and McKay Station |

**Required: Describe the scenario request (i.e., modification to the Baseline Scenario) and the resource(s) of interest and the anticipated benefit to the resource(s) as a result of this requested scenario. Identify metrics for evaluating success/ benefit of this scenario, and the specific question(s) you would like this scenario will answer.**

Request 1 - Model Steady Target flows below Rip Dam into Upper Gorge (24/7) at 200, 300, 400, 500, 600, 800, 1,000, 1,200, and 1,400 cfs

- If the number of requests is infeasible, FWS requests the following be the minimum discharges modeled from Rip Dam into the Upper Gorge: 200, 500, 1,000, and 1,400 cfs

-See November 15, 2023 MDEP comments on the "Draft Interim Plan for Aquatic Resource Protection during McKay Station Outages" which the FWS supported

-Requested scenarios are to address water quality concerns from the Stranding Study in the ISR

-Any minimum flows into the Upper Gorge could potentially be provided via a minimum flow turbine at the deep gates at Rip Dam.

Request 2 - Chesuncook impoundment elevation

- target elevation of 940 feet by May 31st
- minimum elevation of 937 feet on July 1st
- minimum elevation of 935 feet on September 30th

Request 3 - model steady target flows into West Branch via McKay station (24/7) at 1800, 2000, 2200, and 2400 cfs from May 31 to Sept 30 while maintaining Chesuncook impoundment elevation goals

-model steady target flows via McKay station as above with the option to reduce flows from 9pm to 6am to 1000 (current minimum flow), 1200, 1400, 1600 cfs using ramping rate of no more than 25% change per hour while maintaining Chesuncook impoundment elevation goals

Each scenario run will be compared with the "Baseline Scenario". "Baseline" project operating conditions follow the operating requirements of the existing FERC license as described below.

All elevations are expressed in National Geodetic Vertical Datum of 1929 (NGVD 29) unless otherwise specified.

| **Date of Request:** | March 6, 2024 |
| **Name of Requestor:** | Kyle Olcott |
| **Affiliation of Requestor:** | Hydropower Coordinator, US FWS Maine Field Office |
| **Title of Scenario:** | Range of Flows Below Stone Dam |

**Required: Describe the scenario request (i.e., modification to the Baseline Scenario) and the resource(s) of interest and the anticipated benefit to the resource(s) as a result of this requested scenario. Identify metrics for evaluating success/ benefit of this scenario and the specific questions you think this scenario will answer.**

Below Stone Dam into the West Branch:

-Model steady target flows (24/7) at 3, 50, 100, 170, 200, 300, 500, 1,000, and 2,000 cfs discharged from Stone Dam into the West Branch.

- If the number of requests is infeasible, FWS requests the following minimum discharges are modeled below Stone Dam: 50, 200, 500, 1,000, and 2,000 cfs

-Requested scenarios are to assess the feasibility of potential minimum flows below Stone Dam that would protect and/or enhance aquatic habitat.

Each scenario run will be compared with the "Baseline Scenario". "Baseline" project operating conditions follow the operating requirements of the existing FERC license as described below.

All elevations are expressed in National Geodetic Vertical Datum of 1929 (NGVD 29) unless otherwise specified.

Title of Scenario: Increase Ripogenus Operating Level and Introduce Minimum Elevation Requirement

Dear Acting Secretary Reese:

This request focuses on maintaining a minimum elevation for the Ripogenus Impoundment and increasing the Impoundment's operational level to 944 feet, and introduce a minimum elevation during peak recreation season.

**HISTORICAL RECORD FOR INCREASED ELEVATION LEVEL**

The Ripogenus Impoundment dates back to 1916 with the construction of the Ripogenus Dam. The Pre-Application Document, filed on June 11, 2021, states that in 1923 the Ripogenus Dam was heavily modified, which resulted in the normal full pond elevation of the Ripogenus impoundment to increase in elevation of four feet to a total of 941.59 feet, and that the Ripogenus has remained unchanged since 1923. However, this is not an accurate depiction of the impoundment's historical elevation levels. In 1917 an easement was granted from the Weber family to the West Branch Driving and Reservoir Dam Company, a subsidiary of Great Northern Paper Company,

> …to keep and maintain a head of water on Chesunook Dam and the Ripogenus Concrete Dam… and other bodies of water affected, or to be effected by such head and flowage that shall flow the same land of the above name grantors in the East half of Township three (3), Range twelve (12) in said Piscataquis County up to contour line nine hundred and forty (940), and no further, and the right to flow and cover with water at any and all times so much of said land as will be flowed or covered with water by keeping and maintain said head of water on said dam, or either of them, up to said contour line of nine hundred forty (940)…

Said easement was recorded with the Piscataquis County Registry of Deeds and is attached as *Exhibit A*. Furthermore, the easement was modified in 1924,

> …to keep and maintain a head of water on the Ripogenus Concrete Dam in the County of Piscataquis and State of Maine, and on Chesuncook Lake, Ripogenus Lake, and other bodies of water affected, or to be affected by such head and flowage that shall flow the

> same land of the above name grantors in the East one-half of Township three (3), Range twelve (12), W.E.L.S, (4) four feet beyond and above contour line nine hundred and forty (940) and no further, and the right to flow and cover with water at any and all times so much of said land as will be flowed or covered with water by keeping and maintain said head of water on said dam up to a point four (4) feet beyond and above said contour line 940 and no farther.

Said easement was recorded with the Piscataquis Registry of Deeds and is attached as *Exhibit B*. Accordingly, the 1924 amended easement set the full pond elevation of the Chesuncook Lake and Ripogenus Impoundment at 944 feet.

The rights held under the above easements have been transferred several times over the years. Starting in 1952, a contract between West Branch Driving and Reservoir Dam Company and Great Northern Paper Company was recorded with the Piscataquis County Registry of Deeds. Said contract granted Great Northern Paper the right to operate the Ripogenus Dam and to draw water out of ponds raised by said Dam in Township three (3), Range eleven (11). Said contract failed to incorporate the terms from the 1924 easement related to the water on the other side of the Ripogenus Dam. Great Northern Paper held the rights to the project areas until 1970 when it merged with the Nekoosa-Edwards Paper Company to form Great Northern Nekoosa Corporation. During the 1970's and 1980's Great Northern Paper deeded various areas of land and use rights to different companies and individuals as FERC was established and as Great Northern Nekoosa changed their operations. Specifically, on December 16, 1988, Great Northern Nekoosa signed a Quitclaim Deed with Covenant to several individuals, which covered several areas related to the Ripogenus Project including areas in Township three (3), Range twelve (12), which were subject to 1924 amended flowage easement and is attached as *Exhibit C*. Said deed conveys,

> Excepting that portion of land laying between the normal high water mark of Chesuncook Lake as flooded by Ripogenus Dam under FERC Project No. 2572 (spillway crest of 941.59 feet U.S.G.S. vertical datum) and the elevation line of 943.00 feet U.S.G.S. vertical datum, as shown on a map by Great Northern Paper, titled Survey Plan, Sheet 1 of 2, dated March 1986… Further excepting certain flowage rights granted to West Driving and Reservoir Dam Company by instruments dated July 28 and 31, 1908…

However, the reference deeds cited in the 1988 quitclaim deed does not include the 1924 amended flowage easement for waters conveyed. Thus, the true high water mark of the Ripogenus Impoundment of 944 was not accurately represented in the 1988 deed.

This trend continued through the 1990's and early 2000's as Great Northern Nekoosa under a corporate takeover, started winding down operations, and transferred its remaining interests in the corresponding project areas. Accordingly, it was during this time that Great Lakes Hydro America and Brookfield Renewable became interest holders in project areas. As this occurred, several deeds were recorded to secure GLHA/Brookfield's interests in the project areas, all of which failed to memorialize the true elevation of the Chesuncook Lake and Ripogenus Impoundment. However, in 2022, GLHA/Brookfield received a mortgage from the

Bank of New York Mellon Trust Co. via a secured transaction which was recorded in Piscataquis County Registry of Deeds, Book 2829, Page 95 and is attached as *Exhibit D*. The Ripogenus Project and other FERC projects are subject to said mortgage as collateral. Section 2.24 of said mortgage references a 1999 deed from Great Northern Paper to Great Northwoods LLC with a flowage easement for land upstream of the Ripogenus Dam to not exceed an elevation of **943.6** feet.

Accordingly, there is a historical precedent that the Ripogenus operated at a higher maximum operating level then is represented in the Operations Model. Furthermore, GLHA/Brookfield has recognized this historical precedent as evidenced by their 2022 mortgage with the Bank of New York Mellon Trust Co.

WEST BRANCH DRIVING AND RESERVOIR DAM COMPANY

EASEMENT

$1.00 etc.

Dated: September 26, 1924
Acknd: November 25, 1924
Rec'd: January 6, 1925

. . . the receipt whereof is hereby acknowledged do hereby remise, release, sell and forever quit-claim unto the said West branch Driving and Reservoir Dam Company, its successors and assigns forever the right to keep and maintain a head of water on Ripogenus Concrete Dam in the County of Piscataquis and State of Maine, and on Chesuncook Lake Ripogenus Lake and other bodies of water affected or to be affected by such head and flowage that shall flow the land of the above named grantors in the East one-half of Township Three (3), Range Twelve (12), W.E.L.S , to a height of four (4) feet beyond and above contour line 940 and no farther, and the right to flow and cover with water at any and all times so much of said land as will be flowed or covered with water by keeping and maintaining said head of water on said dam up to a point four (4) feet beyond and above said contour line 940 and no farther.

The survey and datum on which said contour line is based refers to the same datum, bench marks, etc., established by the Flowage Commission in 1908, which datum and bench marks are recorded in Piscataquis Registry of Deeds in Plan Book 2, Page 10, and all the same are made a part hereof.

The Grantors' interests in said Township Three (3), Range Twelve (12), is all of the east one-half except a thirty (30) acre lot at the old Chesuncook Dam site and the rights to flow up to said

contour line 940 have been obtained by a deed from Charles P. Webber et als., dated November 1, 1917, and recorded in Piscataquis Registry of Deeds, Vol. 193, Page 138, and a deed from Ralph B. Webber, dated January 9, 1918, and recorded in Piscataquis Registry of Deeds, Vol. 191, Page 232.

TO HAVE AND TO HOLD the aforegranted easement to the said West Branch Driving and Reservoir Dam Company, its successors and assigns forever.

IN WITNESS WHEREOF, We, the said Charles P. Webber, Franklin R. Webber, Ralph B. Webber, Minnie P. Heald and June W. McGee have hereunto set our hands and seals this 26th day of September in the year of our Lord one thousand nine hundred and twenty-four.

QUITCLAIM DEED WITH COVENANT

07285

"ME REAL ESTATE TRANSFER TAX PAID"

Great Northern Nekoosa Corporation, formerly known as Great Northern Paper Company, a Maine corporation having a place of business in Millinocket, County of Penobscot and State of Maine, for consideration paid, grants to the following named Grantees, as tenants in common, with Quitclaim Covenant, in and to the in common and undivided interest stated for each respective tract or parcel of land: Barbara A. Cassidy, of Bangor, County of Penobscot, State of Maine, a one-fifth (1/5) in common and undivided interest in and to the respective fractional interests herein stated for each of the following described tracts or parcels of land; John Cassidy III, of Hampden, County of Penobscot, State of Maine, a one-fifth (1/5) in common and undivided interest in and to the respective fractional interests herein stated for each of the following described tracts or parcels of land; Roselle C. Flynn, of Kennebunkport, County of York, State of Maine, a one-fifth (1/5) in common and undivided interest in and to the respective fractional interests herein stated for each of the following described tracts or parcels of land;Fleet Bank of Maine, a Maine banking corporation, with a place of business at Bangor, County of Penobscot, State of Maine, and David M. Carlisle, of Bangor, in said County and State, Personal Representatives under the Will of Jane M. Sullivan, an eighteen-one hundred and twenty fifths (18/125) in common and

undivided interest in and to the respective fractional interests herein stated for each of the following described tracts or parcels of land;Fleet Bank of Maine, a Maine banking corporation, with a place of business at Bangor, County of Penobscot, State of Maine, and David M. Carlisle, of Bangor, in said County and State, Trustees under Indenture with Jane M. Sullivan dated December 20, 1978, a seven-one hundred and twenty fifths (7/125) in common and undivided interest in and to the respective fractional interests herein stated for each of the following described tracts or parcels of land;Fleet Bank of Maine, a Maine banking corporation with a place of business at Bangor, County of Penobscot, State of Maine, and Ralph I. Lancaster, Jr. of Portland, County of Cumberland, State of Maine, Trustees of the Marital Trust established under Article THIRD of the Will of Joan Cassidy Stetson, a seven-fiftieths (7/50) in common and undivided interest in and to the respective fractional interests herein stated for each of the following described tracts or parcels of land;Fleet bank of Maine, a Maine banking corporation with a place of business at Bangor, County of Penobscot, State of Maine, and Ralph I. Lancaster, Jr. of Portland, County of Cumberland, State of Maine, Trustees of the Residuary Trust established under Article FIFTH of the Will of Joan Cassidy Stetson, a three-fiftieths (3/50) in common and undivided interest in and to the respective fractional interests herein stated for each of the following described tracts or parcels of land, together with certain easements and rights of way, all as more particularly described in Schedule A attached hereto.

The following exceptions pertain to all parcels above described.

EXCEPTING AND RESERVING to the Grantor, its successors and assigns, from the above described premises the right to cross and recross on all the roads as they now exist or may in the future be reconstructed or relocated on the above-described premises for all lawful purposes including but not limited to access to other lands owned by the Grantor, whether contiguous or non-contiguous.

ALSO EXCEPTING AND RESERVING from the above described premises all real estate or rights therein, if any, conveyed of record by the Grantor herein or its predecessors in interest and all real estate or rights therein, if any, acquired through the exercise of the power of eminent domain by the United States of America, the State of Maine or any political subdivision thereof which may be a record but not specifically referred to herein.

ALSO EXCEPTING AND RESERVING from the above described premises all rights and title of the public and the State of Maine in and to all great ponds and the property underlying said great ponds falling in whole or in part within the property herein conveyed. Hereby conveying, however, as appurtenant to the above described premises, any right, title or interest that the Grantor may ever be determined to hold in or to said great ponds, or the property underlying said great ponds.

The above described premises are conveyed subject to the in common and undivided fractional interests set forth above under any and all leases, mineral and exploration permits, easements, harvesting or extraction permits affecting the above described premises, whether recorded or unrecorded. For the same consideration paid, Grantor hereby also assigns, sells, transfers and sets over to the above named Grantees, their respective heirs, personal representatives, successors and assigns, forever, the in common and undivided fractional interests set forth above under said leases and permits in and to the above described premises and the right to collect moneys due by reason of any wood, lumber, gravel or minerals cut or taken from any of the above described premises.

All real estate, fire protection and other taxes assessed against the herein conveyed premises for the year 1988 shall be paid by the Grantor as of the date of this deed.

IN WITNESS WHEREOF, Great Northern Nekoosa Corporation has caused this instrument to be signed in its corporate name and sealed by William R. Laidig, its Chairman and Chief Executive Officer, duly authorized this 16th day of December, 1988.

SCHEDULE A

The following described tracts of land situated in Piscataquis County, to wit:

FIRST: TOWNSHIP A RANGE 10, WELS: A one-third (1/3) in common and undivided interest in Township A, Range 10 W.E.L.S. and all of the unlocated Public Lot acreage in said Township;

Excepting and Reserving to the Grantor, its successors and assigns, all right, title and interest of the Grantor to be taken by the United States of America in said Township as described in Lis Pendens dated October 5, 1987,and recorded in Piscataquis County Registry of Deeds, Book 655, Page 37, in the matter of United States of America vs. 1,205.00 acres of land, more or less, situated in the County of Piscataquis, State of Maine; Great Northern Paper Company; et als.

For Grantor's source of title see (1) the deed of Charles Stetson, Executor of the Will of Annie S. Stetson to Great Northern Paper Company dated January 13, 1930 and recorded in Piscataquis County Registry of Deeds, Book 234, Page 376, (2) the deed of Charles Stetson to Great Northern Paper Company dated January 13, 1930 and recorded in Book 234, Page 378, and (3) deed of the State of Maine dated December 28, 1984 and recorded in Book 573, Page 55.

SECOND: TOWNSHIP B RANGE 10, WELS: A one-third (1/3) in common and undivided interest in said Township B, Range 10, including the Philbrook Farm, so-called, and all of the unlocated Public Lot in said Township.

For Grantor's source of title see (1) deed of Charles Stetson, Executor under the Will of Annie Stetson dated January 13, 1930 and recorded in Piscataquis County Registry of Deeds Book 234, Page 376; (2) deed of Charles Stetson dated January 13, 1930 and recorded in Book 234, Page 378, (3) deed of Gerald E. Ladd dated June 10, 1975 and recorded in Book 431, Page 57; and (4) deed of the State of Maine dated December 28, 1984 and recorded in Book 573, Page 55.

THIRD: TOWNSHIP 2 RANGE 12, WELS, SOUTHEAST QUARTER: All of the southeast quarter of said Township more particularly bounded and described as follows:

Commencing at a corner post at the southeast corner of said

Township 2, Range 12; thence running westerly by and along the south town line of said Township for a distance of two hundred twenty-three and 61/100 (223.61) chains to a point on said south town line marked by a corner post; thence running northerly at a magnetic bearing of north twenty-five (25) degrees east for a distance of two hundred twenty-five and 63/100 (225.63) chains to a corner post; thence running easterly at a magnetic bearing of south seventy (70) degrees east for a distance of two hundred fifteen and 06/100 (215.06) chains to a point on the east town line of said Township which point is marked by a corner post; thence running southerly by and along said east town line for a distance of two hundred twenty-three and 61/100 (223.61) chains to the point of beginning at the southeast corner of said Township. Said premises above described contain approximately 4,930 acres and includes the minerals thereon. The above courses are magnetic north bearings as of 1981.

There is also hereby conveyed as appurtenant to the above described parcel, the right and easement conveyed by Barbara Cassidy, et al., to Edythe Rice Dyer by deed dated October 1, 1981 and recorded in the Piscataquis Registry of Deeds in Volume 520, Page 193, to which said deed reference may be had for a more particular description of the property subject to said right and easement. The right and easement includes the right to cross and recross with men and equipment for all purposes of ingress and egress over and across roads and ways as presently located or as may be reconstructed or relocated, said right of way and easement being limited to sixty-six (66) feet in width.

The above described parcel is conveyed subject to the right and easement conveyed by Edythe Rice Dyer to Barbara Cassidy, et al., by deed dated October 1, 1981 and recorded in the Piscataquis Registry of Deeds in Volume 520, Page 206, to which said deed reference may be had for a more particular description of the property subject to said right and easement. The right and easement includes the right to cross and recross with men and equipment for all purposes of ingress and egress over and across roads and ways as presently located or as may be reconstructed or relocated, said right of way and easement being limited to sixty-six (66) feet in width.

For Grantor's source of title see the deed of Edythe Rice Dyer dated February 13, 1984 and recorded in Piscataquis County Registry of Deeds Book 559, Page 360.

FOURTH: TOWNSHIP 2 RANGE 12, WELS, PUBLIC LOT: All of Public Lot in Township 2, Range 12 W.E.L.S. as conveyed to the Grantor herein by the State of Maine by deed dated December 28, 1984, and

recorded in Piscataquis County Registry of Deeds in Book 573, Page 55; to which deed reference may be had for a description of the premises hereby conveyed.

Excepting that portion of land laying between the normal high water mark of Chesuncook Lake as flooded by Ripogenus Dam under FERC Project No. 2572 (spillway crest of 941.59 feet U.S.G.S. vertical datum) and the elevation line of 943.00 feet U.S.G.S. vertical datum, as shown on a map by Great Northern Paper, titled Survey Plan, Sheet 1 of 2, dated March 1986, and recorded in the Piscataquis County Registry of Deeds in Plan Cabinet I, Number 30, amounting to approximately 2.3 acres; and

The Grantor, its successors and assigns, hereby agrees to convey to the Grantees, their respective heirs, successors or assigns, without additional consideration therefor, the Grantor's interest in the Project Lands at such time as Grantor, in its sole opinion, determines that said conveyance will not affect its right, interest or ability to operate any hydro-electric project now or in the future.

Further excepting certain flowage rights granted to West Branch Driving and Reservoir Dam Company by instruments dated July 28 and 31, 1908, and recorded Book 161, Pages 277 and 281.

FIFTH: TOWNSHIP 3 RANGE 12, WELS, (3 Tracts in the West Half):

All of each of three tracts, bounded on the west by the west townline of T3 R12 WELS and bounded to the north and east by the high water line of Chesuncook Lake and on the south by the high water line of Caribou Lake.

Excepting and reserving therefrom the following described parcel:

Beginning at a point in the west town line which is also the northeast corner of the parcel reserved in the T3 R13 S/2 conveyance; thence South 70° East, Magnetic bearing, to the high water line of Chesuncook Lake; thence southwesterly by and along said high water line to its intersection with the west townline;thence northerly by and along the west townline, to the point of beginning;and

Further excepting that portion of land laying between the normal high water mark of Chesuncook Lake as flooded by Ripogenus Dam under FERC Project No. 2572 (spillway crest of

941.59 feet, U.S.G.S. vertical datum) and the elevation line of 943.00 feet, U.S.G.S. vertical datum, as shown on a map by Great Northern Paper, titled Survey Plan, Sheet 1 of 2, dated March 1986, and recorded in the Piscataquis County Registry of Deeds in Plan Cabinet I, Number 30, amounting to approximately 7.7. acres;and

The Grantor, its successors and assigns, hereby agrees to convey to the Grantees, their respective heirs, successors or assigns, without additional consideration therefor, the Grantor's interest in the Project Lands at such time as Grantor, in its sole opinion, determines that said conveyance will not affect its right, interest or ability to operate any hydro-electric project now or in the future.

Further excepting certain flowage rights granted to the West Branch Driving and Reservoir Dam Company by instrument dated August 10, 1908 and recorded in Piscataquis County Registry of Deeds, Book 161, Page 375.

For the Grantor's source of title see (1) the deed of Frank H. Holyoke dated September 18, 1906 and recorded in Piscataquis County Registry of Deeds Book 149, Page 207, (2) the deed of Frederick H. Appleton et ux. dated July 1, 1920 and recorded in Book 204, Page 194, and (3) deed of the State of Maine dated November 12, 1975 and recorded in Book 434, Page 362.

SIXTH: TOWNSHIP 6 RANGE 12, WELS: The real estate situated in Township 6, Range 12, W.E.L.S. in the County of Piscataquis and State of Maine, more particularly bounded and described as follows:

Commencing at a point at the intersection of the west town line of said Township 6, Range 12, W.E.L.S. and the centerline of a gravel road referred to as the main haul road, said point being located one hundred nineteen and 50/100 (119.50) chains, more or less, northerly from the southwest corner of said township; thence running northerly by and along the west town line of said township for a distance of one hundred eighty-eight and 03/100 (188.03) chains to a corner post; thence turning and running easterly at a magnetic bearing of south seventy (70) degrees east along a blazed line for a distance of forty-four and 20/100 (44.20) chains to a post set at the high water mark on the west shore of Mud Pond; thence continuing to run easterly through Mud Pond on the same easterly course for a distance of one hundred thirty-six and 26/100 (136.26) chains to a post set at the high water mark on the east shore of Mud Pond; thence continuing to run on the same easterly course by and along a blazed line for a distance of one hundred thirty-four and 68/100 (134.68) chains to a corner post;

thence turning and running southerly at a magnetic bearing of south twenty (20) degrees west by and along a blazed line for a distance of eighty-six and 00/100 (86.00) chains to a point in the centerline of the aforesaid gravel road referred to as the main haul road; thence turning and running by and along the centerline of said main haul road for the following courses and distances, north seventy-seven (77) degrees west for a distance of thirty-six and 78/100 (36.78) chains; thence north seventy-nine (79) degrees west for a distance of twenty-one and 91/100 (21.91) chains; thence north eighty-one (81) degrees west for a distance of forty-seven and 41/100 (47.41) chains; thence north eighty-four (84) degrees west for a distance of thirteen and 47/100 (13.47) chains; thence north eighty-five (85) degrees west for a distance of seven and 18/100 (7.18) chains; thence north eighty-three (83) degrees west for a distance of eighteen and 88/100 (18.88) chains; thence north seventy-seven (77) degrees west for a distance of eighteen and 76/100 (18.76) chains; thence north eighty-eight (88) degrees west for a distance of five and 45/100 (5.45) chains; thence south eighty (80) degrees west for a distance of ten and 61/100 (10.61) chains; thence due west for a distance of fifty-one and 44/100 (51.44) chains; thence north eighty-six (86) degrees west for a distance of nineteen and 14/100 (19.14) chains; thence south eighty-eight (88) degrees west for a distance of twenty-eight and 88/100 (28.88) chains; thence due west for a distance of seventeen and 33/100 (17.33) chains; thence south eighty-seven (87) degrees west for a distance of fifteen and 24/100 (15.24) chains; thence south eighty (80) degrees west for a distance of seven and 90/100 (7.90) chains; thence south fifty-four degrees west for a distance of fifteen and fifty-eight (15.58) chains to a point at the intersection of the centerline of the main haul road and the west town line, said point also being the point of beginning. Said premises above described contains approximately 3,909 acres and includes the minerals thereon. The above courses are magnetic north bearings as of 1981.

There is also hereby conveyed as appurtenant to the above described parcel, the right and easement conveyed by Barbara Cassidy, et al., to Edythe Rice Dyer by deed dated October 1, 1981 and recorded in the Piscataquis Registry of Deeds in Volume 520, Page 193, to which said deed reference may be had for a more particular description of the property subject to said right and easement. The right and easement includes the right to cross and recross with men and equipment for all purposes of ingress and egress over and across roads and ways as presently located or as may be reconstructed or relocated, said right of way and easement being limited to sixty-six (66) feet in width.

The above described parcel is conveyed subject to the right and easement conveyed by Edythe Rice Dyer to Barbara

Cassidy, et al., by deed dated October 1, 1981 and recorded in the Piscataquis Registry of Deeds in Volume 520, Page 206, to which said deed reference may be had for a more particular description of the property subject to said right and easement. The right and easement includes the right to cross and recross with men and equipment for all purposes of ingress and egress over and across roads and ways as presently located or as may be reconstructed or relocated, said right of way and easement being limited to sixty-six (66) feet in width.

For Grantor's source of title see the deed of Edythe Rice Dyer dated February 13, 1984 and recorded in Book 559, Page 360 of the Piscataquis County Registry of Deeds.

SEVENTH: TOWNSHIP 3 RANGE 13, WELS,SOUTH HALF: All of a tract in the south half of Township 3, Range 13 W.E.L.S. lying along the east townline and bounded on the north by the division line described in deed of Northern Finance Corporation to Great Northern Paper Company dated December 17, 1926, and recorded in Piscataquis County Registry of Deeds in Volume 226, Page 346 and on the west and south by the high water line of Caribou Lake.

Excepting and reserving therefrom the following parcel as described:

Beginning at a cedar post set at the high water line on the east shore of Caribou Lake at a point which is five hundred feet (500.0') more or less from the point where the east townline intersects said high water line as measured by and along said high water line, thence South 70° East, Magnetic bearing, to a point in the east townline; thence southerly by and along said east townline to the high water line; thence northwesterly by and along said highwater line to the point of beginning. Said parcel is part of Recreation Area No. 3 in FERC project No. 2572.

Further excepting that portion of land laying between the normal high water mark of Caribou lake as flooded by Ripogenus Dam under FERC project No. 2572 (spillway crest of 941.59 feet U.S.G.S. vertical datum) and the elevation line of 943.00 feet, U.S.G.S. vertical datum, as shown on a map by Great Northern Paper, title Survey Plan, Sheet 1 of 2, dated March 1986, and recorded in the Piscataquis County Registry of Deeds in Plan Cabinet I, Number 30, amounting to approximately 4.7 acres; and

The Grantor, its successors and assigns, hereby agrees to

JPL

convey to the Grantees, their respective heirs, successors or assigns, without additional consideration therefor, the Grantor's interest in the Project Lands at such time as Grantor, in its sole opinion, determines that said conveyance will not affect its right, interest or ability to operate any hydro-electric project now or in the future.

Further excepting certain flowage rights granted to the West Branch Driving and Reservoir Dam Company by instrument dated July 30, 1908, and recorded in Piscataquis County Registry of Deeds, Book 161, Page 337.

For Grantor's source of title see the deed of Northern Finance Corporation dated December 17, 1926 and recorded in Book 226, Page 346 of the Piscataquis County Registry of Deeds.

EIGHTH: TOWNSHIP 3 RANGE 13, WELS, NORTH HALF: A One-sixteenth (1/16) in common and undivided interest in said Township 3, Range 13 W.E.L.S. excepting the Morris Farm, said Farm being more fully described hereinafter as Parcel Ninth so-called; and

Further excepting that portion of land laying between the normal high water mark of Chesuncook and Caribou Lakes as flooded by Ripogenus Dam under FERC Project No. 2572 (spillway crest of 941.59 feet, U.S.G.S. vertical datum) and the elevation line of 943.00 feet, U.S.G.S. vertical datum, as shown on a map by Great Northern Paper, titled Survey Plan, Sheet 1 of 2, dated March, 1986, and recorded in the Piscataquis County Registry of Deeds in Plan Cabinet I, Number 30, amounting to approximately 72.8 acres;and

The Grantor, its successors and assigns, hereby agrees to convey to the Grantees, their respective heirs, successors or assigns, without additional consideration therefor, the Grantor's interest in the Project Lands at such time as Grantor, in its sole opinion, determines that said conveyance will not affect its right, interest or ability to operate any hydro-electric project now or in the future.

Further excepting all rights as granted in a charter to the Pine Stream Dam and Improvement Company on February 11,1913; and

Further excepting certain flowage rights granted to the West Branch Driving and Reservoir Dam Company by instrument dated July 30, 1908, and recorded in Piscataquis County Registry of Deeds, Book 161, Page 337.

For the Grantor's sources of title see the following: (1) deed of Ansel L. Lumbert to Great Northern Paper Company dated October 4, 1923 and recorded in Piscataquis County Registry of

Deeds Book 217, Page 336, and (2) deed of Barbara A. Cassidy et al dated October 15, 1985 and recorded in Book 393, Page 231.

NINTH: TOWNSHIP 3 RANGE 13, WELS,NORTH HALF (Morris Farm):All of the following described premises, in Township 3, Range 13 W.E.L.S., North Half, to wit:

A certain lot or parcel of land with all buildings thereon, situated in township number three in the thirteenth Range, West from the East line of the State in the County of Piscataquis, and bounded as follows, viz: Beginning at a spruce tree standing twenty-eight and two-thirds rods North 88 degrees east, from north east corner of dwelling house formerly occupied by Joseph Morris, marked "J.M. 1869"; thence north 75 degrees West one hundred and sixty rods to a fir tree marked "J.M. 1869"; thence south 15 degrees west one hundred rods to a small beach tree marked "J.M. 1869"; thence south 75 degrees east one hundred and sixty rods to a white maple tree marked "J.M. 1869"; thence North 15 degrees east one hundred rods to point begun at. Being the same premises conveyed to Edwin D. Southard by John Cassidy by deed, dated November 5th, A.D. 1891, and recorded in Piscataquis Registry for deeds, Vol. 111, Page 95.

For Grantor's source of title see the deed of Karl H. Shaw et al dated January 18, 1937 and recorded in Book 250, Page 264 of the Piscataquis County Registry of Deeds.

TENTH: TOWNSHIP 6 RANGE 14, WELS,SOUTH HALF: A One hundred ninety three-one-hundred ninety fifths (193/195) in common and undivided interest in the south half of Township 6, Range 14 W.E.L.S.; together with any interest the Grantor may have in the remaining 2/195 in common and undivided interest in the south half of said Township.

Excepting that portion of land laying between the normal highwater mark of Black Pond as flooded by Ripogenus Dam under FERC project No. 2572 (spillway crest of 941.59 feet U.S.G.S. vertical datum) and the elevation line of 943.00 feet, U.S.G.S. vertical datum, as shown on a map by G.N.P., titled Survey Plan, Sheet 2 of 2, dated March, 1986 and recorded in the Piscataquis County Registry of Deeds in Plan Cabinet I, Number 29, amount to approximately 0.0 acres; and

Further excepting and reserving to the Grantors, its successors and assigns, the fee title in the following

described land (approximately 1.9 acres) which lies between the normal high water mark of Caucomgomoc Lake and a line (the "Project Boundary") lying ten feet horizontally outside of the normal high water mark of Caucomgomoc Lake at an elevation equal to the elevation of the spillway crest of Caucomgomoc Dam, as it exists as of this date, which are project lands and waters ("Project Lands") included in Project No.2634, for which a license ("the License") has been issued to Grantor by the Federal Energy Regulatory Commission (the "FERC"). The use of and access to Project Lands is subject to regulation by the FERC.

(a) Grantee shall have free access, subject to the conditions described below, to the Project Lands for outdoor recreational purposes, including, but not limited to, navigation, fishing and hunting.

(b) Grantee shall, subject to the terms and conditions listed herein, have the right to use Project Lands for (1) landscape plantings; (2) non-commercial piers, landings, boat docks, or similar structures and facilities; (3) embankments, bulkheads, retaining walls, or similar structures for erosion control to protect the existing shoreline; and (4) harvesting trees.

(c) Grantee's access to and use of the Project Lands shall be subject, in additions, to the following terms, conditions and limitations:

(i) Notwithstanding anything contained herein, Grantor reserves to itself, its successors and assigns, the right to use Project Lands for all purposes required of it as licensee for Project 2634.

(ii) The rights of access and use granted herein will not be used in any way that would endanger health, create a nuisance, or otherwise be incompatible with the recreational use or scenic, environmental, or recreational values of Project 2634.

(iii) In order to ensure that the construction, operation, and maintenance of any structures or facilities on or in Project Lands shall be conducted in a manner that will protect the scenic, recreational, and environmental values of Project 2634.

(a) Grantor, its successors and assigns, may take reasonable remedial action, at the direction of the FERC or upon its own initiative, for the protection and enhancement of the project's scenic, recreational, and environmental values; and

(b) Grantor, its successors and assigns, shall

have the right to inspect the site of any proposed construction, and to disapprove or to require reasonable modifications to that construction.

(d) Neither access to nor use of the Project Lands shall change the Project Boundary of Project 2634; unless such a change shall be approved by the FERC. Grantor may, but shall not be obligated to, apply for such approval; and in the event such approval is sought by Grantee, Grantee shall bear the reasonable costs, including attorneys' fees, thereof.

(e) Nothing herein contained shall be construed as imposing any term, condition or restriction upon the undivided interests owned by the Grantees herein prior to the delivery of this deed by virtue of FERC license - Project 2634; and

The Grantor, its successors and assigns, hereby agrees to convey to the Grantees, their respective heirs, successors or assigns, without additional consideration therefor, the Grantor's interest in the Project Lands at such time as Grantor, in its sole opinion, determines that said conveyance will not affect its right, interest or ability to operate any hydro-electric project now or in the future.

Further excepting a parcel of land described as follows:

Beginning at a point which is located on the west townline, 1 chain south of the high water line of the south shore of Loon Lake; thence S 70° E, a distance of 6 chains more or less to the centerline of the Loon Lake Road, so called; thence northwesterly, northerly and northwesterly, by and along said centerline of the Loon Lake Road to its intersection with the west townline; thence southerly by and along the west townline to the point of beginning; said parcel contains 35 acres more or less.

Further excepting certain flowage rights granted to the West Branch Driving and Reservoir Dam Company by instruments dated July 30, 1908, July 6, 1917 and October 9, 1917 and recorded in Piscataquis County Registry of Deeds in Book 161, Page 367, Book 189, Page 491, and Book 193, Page 120, respectively.

For the Grantor's source of title see (1) the deed of Thomas U. Coe dated August 19, 1910 and recorded in Piscataquis County Registry of Deeds Book 172, Page 94, (2) the deed of Northern Finance Corporation to Great Northern Paper Company dated December 17, 1926 and recorded in Book 226, Page 346, (3) the deed of James N. Chandler dated August 10, 1901 and recorded in Book 136, Page 344; (4) the deed of Charles Stetson, Executor under the Will of Annie S. Stetson dated January 13, 1930 and

recorded in Book 234, Page 376, and (5) the deed of Charles Stetson dated January 13, 1930 and recorded in Book 234, Page 378.

ELEVENTH: TOWNSHIP 4 RANGE 15, WELS, NORTH EAST PORTION: A One-half (1/2) in common and undivided interest in that tract in Township 4, Range 15 W.E.L.S. that lies north and east of the thread of Russell Stream and Cassidy Deadwater in said Township.

For the Grantor's source of title see the deed of Sara W. Richards et al dated December 31, 1984 and recorded in Piscataquis County Registry of Deeds Book 572, Page 394.

TWELFTH: EASEMENTS

Together with a right of way for all purposes of a way including but not limited to the right of ingress and egress for persons, vehicles and equipment and for the installation, maintainance and replacement of utilities, conduits and pipes whether above ground or underground to:

(1) Township B Range 10 WELS and Veazie Gore across or over the Grantor's timberlands in Township A Range 8 and Range 9 (Long A) on the "Jo-Mary Road", so-called, as it now exists or may in the future be relocated or reconstructed;

(2) Veazie Gore and Township A Range 10 WELS across or over the Grantor's timberlands in Township #4 of the Indian Purchase, so-called, on the "Turkey Tail Road", so-called, as it now exists or may in the future be relocated or reconstructed;

(3) Hopkins Academy (West half) across or over the Grantor's timberlands in Township #4 Indian Purchase and Township A Range 8 and Range 9 WELS (Long A) on the "Tolman Road", so-called, as it now exists or may in the future be relocated or reconstructed.

(4) Township 2 Range 8 (South half) across or over the Grantor's timberlands in Township #3 Indian Purchase and Township 1 Range 8 on the "Stacyville Road", so-called, as it now exists or may in the future be relocated or reconstructed.

The use of said roads shall be at the users own risk and no representation is made concerning the condition or safety of said roads either now or in the fture and no assurance is made that said roads will be maintained and/or kept usable by either the Grantor herein or the Grantees herein.

The use of said roads herein conveyed shall be subject to reasonable rules relating to the safety and maintenance of said roads, including road use fees, as may from time to time be imposed upon the users of said roads, by the party responsible

for the maintenance of said roads or rights of way.

The conveyance of the easement rights herein described does not in any way constitute a dedication to public use of said roads. If any of these easements should be conveyed by the Grantees, their heirs, personal representatives, successors or assigns, at any future date, to a public agency of any kind, then said easements shall be of no further force and effect.

# MORTGAGE, FIXTURE FILING, ASSIGNMENT OF RENTS AND LEASES AND SECURITY AGREEMENT

from

GREAT LAKES HYDRO AMERICA, LLC, Mortgagor

to

THE BANK OF NEW YORK MELLON TRUST COMPANY, N.A.,
as Collateral Agent, Mortgagee

DATED AS OF JANUARY 31, 2022

MORTGAGE, FIXTURE FILING, ASSIGNMENT OF RENTS AND LEASES AND SECURITY AGREEMENT

THIS MORTGAGE, FIXTURE FILING, ASSIGNMENT OF RENTS AND LEASES AND SECURITY AGREEMENT, dated as of January 31, 2022, is made by GREAT LAKES HYDRO AMERICA, LLC (formerly known as GNE, LLC), a Delaware limited liability company ("**Mortgagor**"), whose address is c/o Brookfield Renewable US, 200 Liberty Street, 14th Floor, New York, NY 10281, to THE BANK OF NEW YORK MELLON TRUST COMPANY, N.A., a national banking association, as Collateral Agent (together with its successors and assigns in such capacity as permitted under the Collateral Agency Agreement (as defined below), the **"Mortgagee"**), for the benefit of the Noteholders (as defined below), the Depository (as defined below), and the Mortgagee (collectively, the **"Secured Parties"**), and the address of the Mortgagee is 4655 Salisbury Road, Suite 300, Jacksonville, Florida 32256. References to this "**Mortgage**" shall mean this instrument and any and all renewals, modifications, amendments, supplements, restatements, extensions, consolidations, substitutions, spreaders and replacements of this instrument. References to the "**Collateral Agency Agreement**" mean the Collateral Agency Agreement of even date herewith among Mortgagor, Mortgagee, the purchasers of the Notes and The Bank of New York Mellon Trust Company, N.A., in its capacity as depository (the "**Depository**") under the Depository Agreement (as defined in the Note Purchase Agreement), as amended, restated or otherwise modified from time to time.

THE MAXIMUM AMOUNT SECURED BY THIS MORTGAGE, INCLUDING, WITHOUT LIMITATION, PRINCIPAL, INTEREST, MAKE-WHOLE AMOUNT, PREMIUM, COSTS OF COLLECTION, INCLUDING ATTORNEYS' FEES, FUTURE ADVANCES, ADDITIONAL INDEBTEDNESS, FUTURE PROMISSORY NOTES AND OTHER COSTS, EXCLUSIVE OF PROTECTIVE ADVANCES, IS SIX HUNDRED EIGHTY MILLION DOLLARS ($680,000,000.00).

Background

A. Mortgagor and the initial purchasers of the Notes described below (together with such purchasers' successors and assigns and any other holders from time to time of the Notes described below, the **"Noteholders"**) are entering into a Note Purchase Agreement, dated as of even date herewith (as amended, restated or otherwise modified from time to time, the **"Note Purchase Agreement"**), providing for the issue by Mortgagor of Mortgagor's (i) Senior Secured First Lien Fixed Rate Notes in the aggregate principal amount of $170,000,000.00 (including any notes delivered in substitution or exchange therefor, and as amended, restated or otherwise modified from time to time, collectively, the **"Fixed Rate Notes"**), and (ii) secured Additional Notes (as defined in the Note Purchase Agreement) now or hereafter issued in the principal amount or amounts authorized by the Note Purchase Agreement (the Fixed Rate Notes and the Additional Notes are collectively referred to herein as the "**Notes**"). In the event of any conflict between the provisions of this Mortgage and the provisions of the Note Purchase Agreement, the applicable provisions of the Note Purchase Agreement shall govern and control, provided, that in the case of a provision in this Mortgage

which is more specific and detailed than the related provision in the Note Purchase Agreement, such Mortgage provision shall not be deemed to be in conflict with the related provision in the Note Purchase Agreement; provided further, that this Mortgage shall control the description of the "Real Estate" and the "Premises" as those terms are hereinafter defined. Capitalized terms not otherwise defined herein shall have the meanings ascribed thereto in the Note Purchase Agreement.

B. Mortgagor is the owner of certain real property located in the counties of Penobscot, Piscataquis, and Somerset in the State of Maine described on Schedule A attached hereto (the "**Land**"), and the buildings, structures, and other improvements located thereon, including without limitation dams, powerhouses, gatehouses, gates, flashboards, spillways, penstocks, trash racks, waterways, walls, turbines, generators, substations, channels, water pools, stoplogs, lines for the transmission or distribution of electricity and/or communications, wires, cables, pipes, ducts, conduits, manholes, terminals, transformers, switches, pedestals, padmounts and fences (the "**Improvements**"; the Land and the Improvements being collectively referred to as the "**Real Estate**"); the Real Estate is also benefitted by certain flowage rights in Aroostook County, the State of Maine.

C. It is a condition precedent to the Purchasers' purchase of the Notes pursuant to the Note Purchase Agreement that Mortgagor grant the mortgage and assignment described herein, and Mortgagor wishes to grant such mortgage and assignment in favor of Mortgagee, for the benefit of the Secured Parties, as herein provided.

Granting Clauses

For good and valuable consideration, the receipt and sufficiency of which are hereby acknowledged, Mortgagor agrees that to secure the prompt and complete payment of the principal of, interest, Make-Whole Amounts, if any, and premium, if any, on all of the Notes issued and delivered and outstanding under the Note Purchase Agreement, the payment of all other sums now or hereafter owing under the Notes, the Note Purchase Agreement, and each other Financing Document, and the performance of the covenants contained in the Note Purchase Agreement, this Mortgage and each of the other Financing Documents, as each of the foregoing may be varied, supplemented, amended or restated from time to time (collectively, and as so varied, supplemented, amended or restated, the "**Obligations**") when due (whether at stated maturity, by acceleration, because of mandatory prepayment, or otherwise, and including the payment of amounts which would become due but for the operation of the automatic stay under Section 362(a) of the Bankruptcy Code, 11 U.S.C. § 362(a)), and to induce the Purchasers to purchase the Notes,

MORTGAGOR HEREBY GRANTS TO MORTGAGEE, FOR THE BENEFIT OF THE SECURED PARTIES, A LIEN UPON AND A SECURITY INTEREST IN, AND HEREBY MORTGAGES, GRANTS, ASSIGNS, TRANSFERS AND SETS OVER TO MORTGAGEE, FOR THE BENEFIT OF THE SECURED PARTIES WITH MORTGAGE COVENANTS:

(A) the Land and all Improvements thereon;

(B) all right, title, and interest of Mortgagor in, to and under all flowage rights, easements, rights of way, gores of land, streets, ways, alleys, passages, sewer rights, waters, water courses, water and riparian rights, development rights, air rights, mineral rights and all estates, rights, titles, interests, privileges, licenses, tenements, hereditaments, and appurtenances belonging, relating, or appertaining to the Real Estate, and any rights or easements in gross in any way used useful in connection with the Real Estate, and any reversions, remainders, rents, issues, profits, and revenue thereof, and all land lying in the bed of any street, road or avenue, in front of or adjoining the Real Estate to the center line thereof (collectively, "**Appurtenances**");

(C) all estate, right, title, and interest of Mortgagor in and to all such tangible property now owned or hereafter acquired by Mortgagor (including all machinery, apparatus, equipment, fittings and articles of personal property) and now or hereafter located on or at or attached to the Real Estate such that an interest in such tangible property arises under applicable real estate law, and any and all products and accessions to any such property that may exist at any time (collectively, "**Fixtures**");

(D) all of the chattels, business machines, machinery, apparatus, equipment, furnishings, fittings and articles of tangible personal property of every kind and nature whatsoever, and all appurtenances and additions thereto and substitutions or replacements thereof (together with, in each case, attachments, components, parts and accessories) currently owned or subsequently acquired by Mortgagor and now or subsequently attached to, or contained in or used or usable in any way in connection with any operation or letting of the Real Estate, including, but without limiting the generality of the foregoing, turbines, generators, transformers, busses, generator leads, gates, switches, poles, guys, electric lines, water flow and water level monitoring equipment, booms, boom anchors, trash racks, flash boards, wires, controls, relays, meters, regulators, circuit breakers, cross-arms, valves, fans, compressors and battery systems, and also including all heating, electrical, and mechanical equipment, lighting, switchboards, plumbing, ventilating, air conditioning and air-cooling apparatus, loading and unloading equipment and systems, communication systems (including satellite dishes and antennae), computers, sprinkler systems and other fire prevention and extinguishing apparatus and materials, security systems, motors, engines, machinery, pipes, pumps, tanks, conduits, appliances, fittings and fixtures of every kind and description (all of the foregoing in this paragraph (D) being referred to as the "**Equipment**");

(E) all right, title, and interest of Mortgagor in and to all substitutes and replacements of, and all additions and improvements to, the Real Estate, Appurtenances, Fixtures and Equipment, subsequently acquired by or released to Mortgagor or constructed, assembled, or placed by Mortgagor on the Real Estate, immediately upon such acquisition, release, construction, assembling, or placement, including, without limitation, any and all building materials whether stored at the Real Estate or offsite, and, in each such case, without any further mortgage, conveyance, assignment or other act by Mortgagor;

(F) all right, title and interest of Mortgagor in, to and under all leases, subleases, underlettings, concession agreements, management agreements, licenses and

other agreements relating to the use or occupancy of the Real Estate or the Appurtenances or Fixtures or the Equipment or any part thereof, now existing or subsequently entered into by Mortgagor and whether written or oral, and all guarantees of any of the foregoing (collectively, as any of the foregoing may be amended, restated, extended, renewed or modified from time to time, the "**Leases**"), and all rights of Mortgagor in respect of cash and securities deposited thereunder and the right to receive and collect the revenues, income, rents, issues and profits thereof, together with all other rents, royalties, issues, profits, revenue, income and other benefits arising from the use and enjoyment of the Mortgaged Property (as defined below) (collectively, the "**Rents**");

(G) any and all rights to payment of money, including under contracts for the sale of energy, all rights in Federal Energy Regulatory Commission licenses, applicable permits and water supply agreements;

(H) any and all rights in plans, specifications, insurance proceeds, condemnation or eminent domain payments, cash and investments, all contracts relating to ownership, operation and management of the Real Estate, the Appurtenances, the Fixtures or the Equipment;

(I) all proceeds, both cash and noncash, of the foregoing; and

(J) any and all other rights or interests described in Schedule A:

(All of the foregoing property and rights and interests now owned or held or subsequently acquired by Mortgagor and described in the foregoing clauses (A) through (E) are collectively referred to as the "**Premises**", and those described in the foregoing clauses (A) through (J) are collectively referred to as the "**Mortgaged Property.**")

Also granting to Mortgagee hereby the right, upon the occurrence of an Event of Default, to foreclose and sell the aforesaid Mortgaged Property by any means permitted by law, including pursuant to the STATUTORY POWER OF SALE.

TO HAVE AND TO HOLD THE MORTGAGED PROPERTY AND THE RIGHTS AND PRIVILEGES HEREBY MORTGAGED UNTO MORTGAGEE, ITS SUCCESSORS AND ASSIGNS, FOR THE BENEFIT OF THE SECURED PARTIES, TO ITS USE AND BEHOOF FOREVER. Provided, however, that the condition of this Mortgage is such that if the Obligations are fully paid and performed, then this Mortgage shall be of no further force and effect.

Terms and Conditions

Mortgagor further represents, warrants, covenants and agrees with Mortgagee as follows:

1. Warranty of Title. Mortgagor warrants that it has good title to its estates and interests in and to the Mortgaged Property and holds valid and subsisting easements, rights of way or other use or possessory rights in respect of the lands adjacent to the Land owned in fee

simple by Mortgagor that are sufficient for the intended use, operations, and maintenance of Mortgagor's facilities, in each case subject only to the matters that are set forth in Schedule B attached hereto (the "**Permitted Exceptions**").

2. Payment and Performance of the Obligations. Mortgagor shall pay and perform the Obligations at the times and places and in the manner specified in the Notes, the Note Purchase Agreement, and the other Financing Documents to which it is a party, including this Mortgage.

3. Requirements. (a) Mortgagor shall promptly comply with, or cause to be complied with, and conform to all present and future laws, statutes, codes, ordinances, orders, judgments, decrees, rules, regulations and requirements, and irrespective of the nature of the work to be done, of each of the United States of America, any State and any municipality, local government or other political subdivision thereof and any agency, department, bureau, board, commission or other instrumentality of any of them, now existing or subsequently created (collectively, "**Governmental Authority**") which has jurisdiction over the Mortgaged Property and all covenants, restrictions and conditions now or later of record which may be applicable to any of the Mortgaged Property, or to the use, manner of use, occupancy, possession, operation, maintenance, alteration, repair or reconstruction of any of the Mortgaged Property, except to the extent that failure to comply therewith could not, in the aggregate, reasonably be expected to have a Material Adverse Change. All present and future laws, statutes, codes, ordinances, orders, judgments, decrees, rules, regulations and requirements of every Governmental Authority applicable to Mortgagor or to any of the Mortgaged Property and all covenants, restrictions, and conditions which now or later may be applicable to any of the Mortgaged Property are collectively referred to as the "**Legal Requirements.**"

(b) From and after the date of this Mortgage, Mortgagor shall not by act or omission permit any new building or other new improvement on any premises not subject to the lien of this Mortgage to rely on any portion of the Real Estate then constituting a separate lot of record to fulfill any Legal Requirement so as to impair the ability of such portion to be sold as a separate lot, and Mortgagor hereby assigns to Mortgagee any and all rights to give consent for all or any portion of the Real Estate or any interest therein to be so used. Mortgagor shall not by act or omission impair the integrity of any of the Real Estate so as to constitute an illegal subdivision or to prohibit any portion of the Real Estate previously constituting a separate lot of record from being conveyed as a separate lot for purposes of applicable zoning or tax lot and subdivision ordinances. Mortgagor represents that no portion of the Real Estate is part of a larger tract of land constituting a separate lot of record that includes any land or improvements that are not part of the Real Estate, or that, in regard to any such portion that may exist, any authorization or variance required for the subdivision of such larger tract which a sale of the Real Estate would entail has been obtained from all appropriate Governmental Authorities so that the Real Estate will be entirely comprised of separate lots of record capable of being conveyed as such. Any act or omission by Mortgagor which would result in a violation of any of the provisions of this subsection shall be void.

4. Payment of Taxes and Other Impositions. (a) Promptly when due, but in any event before any delinquency occurs, Mortgagor shall pay and discharge all taxes of every

kind and nature (including, without limitation, all real and personal property, income, franchise, withholding, transfer, gains, profits and gross receipts taxes), all charges for any easement or agreement maintained for the benefit of any of the Mortgaged Property, all general and special assessments, levies, permits, inspection and license fees, all water and sewer rents and charges, vault taxes, and all other public charges even if unforeseen or extraordinary, imposed upon or assessed against or which may become a lien on any of the Mortgaged Property, or arising in respect of the occupancy, use or possession thereof, together with any penalties or interest on any of the foregoing (all of the foregoing are collectively referred to as the "**Impositions**"). Mortgagor shall promptly deliver to Mortgagee (i) original or copies of receipted bills and cancelled checks evidencing payment of such Imposition if it is a real estate tax or other public charge and (ii) evidence showing the payment of any other such Imposition. If by law any Imposition, at Mortgagor's option, may be paid in installments (whether or not interest shall accrue on the unpaid balance of such Imposition), Mortgagor may elect to pay such Imposition in such installments and shall be responsible for the payment of such installments with interest, if any.

(b) Nothing herein shall affect any right or remedy (which shall not be deemed to be an obligation) of Mortgagee under this Mortgage or otherwise, without notice or demand to Mortgagor, to pay any Imposition after the date such Imposition shall have become delinquent. Any sums paid by Mortgagee in discharge of any Impositions shall be payable on demand by Mortgagor to Mortgagee together with interest at the Default Rate.

(c) Mortgagor shall have the right before any delinquency occurs to contest or object in good faith to the amount or validity of any Imposition by appropriate legal proceedings, but such right shall not be deemed or construed in any way as relieving, modifying, or extending Mortgagor's covenant to pay any such Imposition at the time and in the manner provided in this Section unless (i) Mortgagor has given prior written notice to Mortgagee of Mortgagor's intent so to contest or object to an Imposition, (ii) Mortgagor shall demonstrate to Mortgagee's satisfaction (acting at the written direction of the Required Holders) that the legal proceedings shall operate conclusively to prevent the sale of the Mortgaged Property, or any part thereof, to satisfy such Imposition prior to final determination of such proceedings and (iii) Mortgagor shall furnish evidence of compliance with Section 8.4 of the Note Purchase Agreement or shall furnish a good and sufficient bond or surety reasonably satisfactory to Mortgagee (acting at the written direction of the Required Holders) in the amount of the Impositions which are being contested plus any interest and penalty which may be imposed thereon and which could become a lien against the Real Estate or any part of the Mortgaged Property.

5. Insurance. (a) Mortgagor shall maintain or cause to be maintained on all of the Premises such insurance in such amounts as is required pursuant to the Note Purchase Agreement.

(b) In the event of foreclosure of this Mortgage or other transfer of title to the Mortgaged Property, all right, title and interest of Mortgagor in and to any insurance policies then in force shall pass to the purchaser or grantee.

6. Restrictions on Liens and Encumbrances. Except for the lien of this Mortgage and the Permitted Exceptions, and except as expressly permitted under the Note Purchase Agreement, Mortgagor shall not further mortgage, nor otherwise encumber the Mortgaged Property nor create or suffer to exist any lien, charge or encumbrance on the Mortgaged Property, or any part thereof, whether superior or subordinate to the lien of this Mortgage and whether recourse or non-recourse.

7. Due on Sale and Other Transfer Restrictions. Except as expressly permitted under the Note Purchase Agreement, Mortgagor shall not sell, transfer, convey or assign all or any portion of, or any interest in, the Mortgaged Property.

8. Maintenance; No Alteration; Inspection; Utilities. (a) Mortgagor shall keep the Premises in good working order and condition, ordinary wear and tear excepted and operate and maintain the Mortgaged Property in accordance with Section 8.3 of the Note Purchase Agreement. Mortgagee (acting at the written direction of the Required Holders) and any persons authorized by Mortgagee upon notice given reasonably in advance shall have the right (subject to any restrictions thereupon which may be contained in any Lease) at any reasonable time and as often as may reasonably be desired to enter and inspect the Premises and all work done, labor performed and materials furnished in and about the Improvements and to inspect and make abstracts of all books, contracts and records of Mortgagor relating to the Mortgaged Property.

(b) Mortgagor shall pay or cause to be paid when due all utility charges which are incurred for gas, electricity, water or sewer services furnished to the Premises and all other assessments or charges of a similar nature, whether public or private, affecting the Premises or any portion thereof, whether or not such assessments or charges are liens thereon, except to the extent any such charge, assessment or other similar obligation shall be the obligation of the lessee under any Lease.

9. Condemnation/Eminent Domain. Promptly upon obtaining knowledge of the institution of any proceedings for the condemnation of the Mortgaged Property, or any portion thereof, Mortgagor will notify Mortgagee of the pendency of such proceedings.

10. Leases. (a) Except as may be expressly permitted under the Note Purchase Agreement, Mortgagor shall not (i) execute an assignment or pledge of any Lease relating to all or any portion of the Mortgaged Property other than in favor of Mortgagee or (ii) enter into any Lease of the Mortgaged Property without Mortgagee's consent (acting at the written direction of the Required Holders).

(b) If Mortgagor shall enter into any Leases, Mortgagor shall deliver to Mortgagee on or before January 15 of each year, commencing January 15, 2023, a written statement, certified by Mortgagor as being true, correct and complete, containing the names of all lessees and other occupants of the Mortgaged Property, the terms of all Leases and the spaces occupied and rentals payable thereunder, and a list of all Leases which are then in default, including the nature and magnitude of the default. Mortgagor shall also promptly deliver written

notice to Mortgagee of any new Leases, Lease terminations, Lease defaults, or material changes in any Leases.

11. Further Assurances. To further assure Mortgagee's rights under this Mortgage, Mortgagor agrees upon demand of Mortgagee (acting at the written direction of the Required Holders) to do any act or execute any additional documents (including, but not limited to, security agreements on any personalty included or to be included in the Mortgaged Property and a separate assignment of each Lease in recordable form) as may be reasonably required by Mortgagee (acting at the written direction of the Required Holders) to confirm the lien of this Mortgage and all other rights or benefits conferred on Mortgagee.

12. Mortgagee's Right to Perform. If Mortgagor fails to perform any of the covenants or agreements of Mortgagor within the applicable notice and grace period, if any, Mortgagee, without waiving or releasing Mortgagor from any obligation or default under this Mortgage, may at any time (but shall be under no obligation to) pay or perform the same, and the amount or cost thereof, with interest at the Default Rate, shall immediately be due from Mortgagor to Mortgagee. To the extent that any such amounts or costs paid by Mortgagee shall constitute payment of (i) Impositions; (ii) premiums on insurance policies covering the Premises; (iii) expenses incurred in upholding or enforcing the lien of this Mortgage, including, but not limited to the expenses of any litigation to prosecute or defend the rights and lien created by this Mortgage; (iv) costs of removal of or otherwise related to Hazardous Substances; or (v) any amount, costs or charge to which Mortgagee becomes subrogated, upon payment, whether under recognized principles of law or equity, or under express statutory authority; then, and in each such event, such amounts or costs, together with interest thereon at the Default Rate, shall be added to the Obligations and shall be secured by this Mortgage and shall be a lien on the Mortgaged Property prior to any right, title to, interest in, or claim upon the Mortgaged Property attaching subsequent to the lien of this Mortgage. No payment or advance of money by Mortgagee under this Section shall be deemed or construed to cure Mortgagor's default or waive any right or remedy of Mortgagee.

13. Events of Default. The occurrence of an Event of Default under the Note Purchase Agreement shall constitute an Event of Default hereunder.

14. Remedies. (a) Upon the occurrence of any Event of Default, in addition to any other rights and remedies Mortgagee may have pursuant to Section 18 of this Mortgage or pursuant to the Financing Documents, or as provided by law, and without limitation, Mortgagee (acting at the written direction of the Required Holders) may immediately take such action, without notice or demand, as it deems advisable to protect and enforce its rights against Mortgagor and in and to the Mortgaged Property, including, but not limited to, the following actions, each of which may be pursued concurrently or otherwise, at such time and in such manner as Mortgagee (acting at the written direction of the Required Holders) may determine, in the Required Holders' sole discretion, without impairing or otherwise affecting the other rights and remedies of Mortgagee:

(i) Mortgagee may, to the extent permitted by applicable law, (A) institute and maintain an action of mortgage foreclosure against all or any part of the

Mortgaged Property, (B) institute and maintain an action on the Notes or any other Financing Document, (C) sell all or part of the Mortgaged Property (Mortgagor expressly granting to Mortgagee the STATUTORY POWER OF SALE), or (D) take such other action at law or in equity for the enforcement of this Mortgage or any of the Financing Documents as the law may allow. Mortgagee may proceed in any such action to final judgment and execution thereon for all sums due hereunder, together with interest thereon at the Default Rate and all costs of suit, including, without limitation, reasonable attorneys' fees and disbursements. Interest at the Default Rate shall be due on any judgment obtained by Mortgagee from the date of judgment until actual payment is made of the full amount of the judgment.

(ii) Mortgagee may personally, or by its agents, attorneys and employees and without regard to the adequacy or inadequacy of the Mortgaged Property or any other collateral as security for the Obligations enter into and upon the Mortgaged Property and each and every part thereof and exclude Mortgagor and its agents and employees therefrom without liability for trespass, damage or otherwise (Mortgagor hereby agreeing to surrender possession of the Mortgaged Property to Mortgagee upon demand at any such time) and use, operate, manage, maintain and control the Mortgaged Property and every part thereof. Following such entry and taking of possession, Mortgagee shall be entitled, without limitation, (x) to lease all or any part or parts of the Mortgaged Property for such periods of time and upon such conditions as Mortgagee may, in its discretion, deem proper, (y) to enforce, cancel or modify any Lease and (z) generally to execute, do and perform any other act, deed, matter or thing concerning the Mortgaged Property as Mortgagee shall deem appropriate as fully as Mortgagor might do; and Mortgagor hereby appoints and constitutes Mortgagee its attorney-in-fact to do or accomplish any such actions in Mortgagor's name, such power of attorney being coupled with an interest and irrevocable.

(iii) Mortgagee may sell all or any part of the Mortgaged Property pursuant to the STATUTORY POWER OF SALE in some place in any municipality in which any part of the Mortgaged Property is located, at one or more sales, in whole or in parcels, in any order or manner, at such time and place, upon such terms and after such notice thereof as may be required or permitted by law, at the discretion of Mortgagee. In the event of a sale, by foreclosure or otherwise, of less than all of the Mortgaged Property, this Mortgage shall continue as a lien on the remaining portion of the Mortgaged Property.

(b) The holder of this Mortgage, in any action to foreclose it, shall be entitled to the appointment of a receiver. In case of a foreclosure sale, the Mortgaged Property may be sold, at Mortgagee's election (acting at the written direction of the Required Holders), in one parcel or in more than one parcel and Mortgagee (acting at the written direction of the Required Holders) is specifically empowered, (without being required to do so, and in the Required Holders' sole and absolute discretion) to cause successive sales of portions of the Mortgaged Property to be held.

(c) In the event of any breach of any of the covenants, agreements, terms or conditions contained in this Mortgage, and notwithstanding to the contrary any exculpatory or non-recourse language which may be contained herein, Mortgagee (acting at the written direction of the Required Holders) shall be entitled to enjoin such breach and obtain specific performance of any covenant, agreement, term or condition and Mortgagee (acting at the written direction of the Required Holders) shall have the right to invoke any equitable right or remedy as though other remedies were not provided for in this Mortgage.

15. Right of Mortgagee to Credit Sale. Upon the occurrence of any sale made under this Mortgage, whether made under the power of sale or by virtue of judicial proceedings or of a judgment or decree of foreclosure and sale, Mortgagee may bid for and acquire the Mortgaged Property or any part thereof. In lieu of paying cash therefor, Mortgagee may make settlement for the purchase price by crediting upon the Obligations or other sums secured by this Mortgage the net sales price after deducting therefrom the expenses of sale and the cost of the action and any other sums which Mortgagee is authorized to deduct under this Mortgage. In such event, this Mortgage, the Note Purchase Agreement, the Notes, and documents evidencing expenditures secured hereby may be presented to the person or persons conducting the sale in order that the amount so used or applied may be credited upon the Obligations as having been paid.

16. Appointment of Receiver. If an Event of Default shall have occurred and be continuing, Mortgagee (acting at the written direction of the Required Holders) as a matter of right and without notice to Mortgagor, unless otherwise required by applicable law, and without regard to the adequacy or inadequacy of the Mortgaged Property or any other collateral as security for the Obligations or the interest of Mortgagor therein, shall have the right to apply to any court having jurisdiction to appoint a receiver or receivers or other manager of the Mortgaged Property, and Mortgagor hereby irrevocably consents to such appointment and waives notice of any application therefor (except as may be required by law). Any such receiver or receivers shall have all the usual powers and duties of receivers in like or similar cases and all the powers and duties of Mortgagee in case of entry as provided in this Mortgage, including, without limitation and to the extent permitted by law, the right to enter into leases of all or any part of the Mortgaged Property, and shall continue as such and exercise all such powers until the date of confirmation of sale of the Mortgaged Property unless such receivership is sooner terminated.

17. Extension, Release, etc. (a) Without affecting the lien or charge of this Mortgage upon any portion of the Mortgaged Property not then or theretofore released as security for the full amount of the Obligations, Mortgagee (acting at the written direction of the Required Holders) may, from time to time and without notice, agree to (i) release any person liable for the Obligations under the Note Purchase Agreement or any other Financing Document, (ii) extend the maturity or alter any of the terms of the indebtedness guaranteed under any guaranty of the Obligations, (iii) grant other indulgences, (iv) release or reconvey, or cause to be released or reconveyed at any time at Mortgagee's option (acting at the written direction of the Required Holders) any parcel or portion or all of the Mortgaged Property, (v) take or release any other or additional security for any obligation herein mentioned, or (vi) make compositions or other arrangements with debtors in relation thereto. If at any time this Mortgage shall secure less

than all of the principal amount of the Obligations, it is expressly agreed that any repayments of the principal amount of the Obligations shall not reduce the amount of the lien of this Mortgage until the lien amount shall equal the principal amount of the Obligations outstanding.

(b) No recovery of any judgment by Mortgagee and no levy of an execution under any judgment upon the Mortgaged Property or upon any other property of Mortgagor shall affect the lien of this Mortgage or any liens, rights, powers or remedies of Mortgagee hereunder, and such liens, rights, powers and remedies shall continue unimpaired.

(c) If Mortgagee shall have the right to foreclose this Mortgage, Mortgagor authorizes Mortgagee (acting at the written direction of the Required Holders) to foreclose the lien of this Mortgage, at the Required Holders' option, either against or subject to the rights of any tenants of the Mortgaged Property. The failure to make any such tenants parties defendant to any such foreclosure proceeding and to foreclose their rights will not be asserted by Mortgagor as a defense to any proceeding instituted by Mortgagee to collect the Obligations or to foreclose the lien of this Mortgage.

(d) Unless expressly provided otherwise, in the event that ownership of this Mortgage and title to the Mortgaged Property or any estate therein shall become vested in the same person or entity, this Mortgage shall not merge in such title but shall continue as a valid lien on the Mortgaged Property for the amount secured hereby.

18. Security Agreement under Uniform Commercial Code. (a) It is the intention of the parties hereto that this Mortgage shall constitute a Security Agreement within the meaning of the Uniform Commercial Code of the State of Maine (the "**Code**"). Upon the occurrence of an Event of Default, then in addition to having any other right or remedy available at law or in equity, Mortgagee (acting at the written direction of the Required Holders) shall have the option of either (i) proceeding under the Code and exercising such rights and remedies as may be provided to a secured party by the Code with respect to all or any portion of the Mortgaged Property which is personal property (including, without limitation, taking possession of and selling such property) or (ii) treating such property as real property and proceeding with respect to both the real and personal property constituting the Mortgaged Property in accordance with Mortgagee's rights, powers and remedies with respect to the real property (in which event the default provisions of the Code shall not apply). If Mortgagee (acting at the written direction of the Required Holders) shall elect to proceed under the Code, then ten days' notice of sale of the personal property shall be deemed reasonable notice and the reasonable expenses of retaking, holding, preparing for sale, selling and the like incurred by Mortgagee shall include, but not be limited to, attorneys' fees and legal expenses. At Mortgagee's request (acting at the written direction of the Required Holders), Mortgagor shall assemble the personal property and make it available to Mortgagee at a place designated by Mortgagee which is reasonably convenient to both parties.

(b) Mortgagor and Mortgagee agree, to the extent permitted by law, that: (i) all of the goods described within the definition of the word "Fixtures" are or are to become fixtures on the Real Estate; (ii) this Mortgage upon recording or registration in the real estate records of the proper office shall constitute a financing statement filed as a "fixture filing"

within the meaning of Sections 9-334 and 9-502 of the Code; (iii) Mortgagor is the record owner of the Real Estate; and (iv) the addresses of Mortgagor and Mortgagee are as set forth on the first page of this Mortgage.

(c) Mortgagor, upon request by Mortgagee (acting at the written direction of the Required Holders) from time to time, shall execute, acknowledge and deliver to Mortgagee one or more separate security agreements, in form satisfactory to Mortgagee (acting at the written direction of the Required Holders), covering all or any part of the Mortgaged Property and will further execute, acknowledge and deliver, or cause to be executed, acknowledged and delivered, any affidavit or certificate or other document as Mortgagee (acting at the written direction of the Required Holders) may request in order to perfect, preserve, maintain, continue or extend the security interest under and the priority of this Mortgage and such security instrument. Mortgagor further agrees to pay to Mortgagee on demand all costs and expenses incurred by Mortgagee in connection with the preparation, execution, recording, filing and re-filing of any such document and all reasonable costs and expenses of any record searches for financing statements Mortgagee (acting at the written direction of the Required Holders) shall reasonably require. Mortgagor hereby authorizes Mortgagee, without obligation and only if the Mortgagor does not file in the first instance, to file any financing statements and amendments thereto covering all or any part of the Mortgaged Property. The filing of any financing statements or amendments thereto or continuation statements with respect thereto in the records relating to personal property or chattels shall not be construed as in any way impairing the right of Mortgagee to proceed against any personal property encumbered by this Mortgage as real property, as set forth above.

(d) Mortgagor forthwith upon the execution and delivery of this Mortgage and thereafter, from time to time, will cause this Mortgage and any of the other Financing Documents creating a lien or security interest or evidencing the lien hereof upon the Mortgaged Property and each instrument of further assurance to be filed, registered or recorded in such manner and in such places as may be required by any present or future law in order to publish notice of and fully to protect and perfect the lien or security interest hereof upon, and the interest of Mortgagee in, the Mortgaged Property. Mortgagor will pay all taxes, filing, registration or recording fees, and all expenses incident to the preparation, execution, acknowledgment and/or recording of the Notes, this Mortgage, the other Financing Documents, any note, deed to secure debt, deed of trust or mortgage supplemental hereto, any Mortgage with respect to the Mortgaged Property and any instrument of further assurance, and any modification or amendment of any of the foregoing documents, and all federal, state, county and municipal taxes, duties, imposts, assessments and charges arising out of or in connection with the execution and delivery of this Mortgage, any deed of trust, deed to secure debt or mortgage supplemental hereto, any Mortgage with respect to the Mortgaged Property or any instrument of further assurance, and any modification or amendment of any of the foregoing documents, except where prohibited by law so to do.

19. Assignment of Rents. Mortgagor hereby assigns to Mortgagee the Rents as further security for the payment and performance of the Obligations, and Mortgagor grants to Mortgagee the right to enter the Mortgaged Property for the purpose of collecting the same and to let the Mortgaged Property or any part thereof, and to apply the Rents on account of the Obligations. The foregoing assignment and grant is present and absolute and shall continue in

effect until the Obligations are paid and performed in full, but Mortgagee hereby waives the right to enter the Mortgaged Property for the purpose of collecting the Rents and Mortgagor shall be entitled to collect, receive, use and retain the Rents until the occurrence of an Event of Default under this Mortgage; such right of Mortgagor to collect, receive, use and retain the Rents may be revoked by Mortgagee upon the occurrence of any Event of Default under this Mortgage by giving not less than ten days' written notice of such revocation to Mortgagor; in the event such notice is given, Mortgagor shall pay over to Mortgagee, or to any receiver appointed to collect the Rents, any lease security deposits, and shall pay monthly in advance to Mortgagee, or to any such receiver, the fair and reasonable rental value as determined by Mortgagee for the use and occupancy of the Mortgaged Property or of such part thereof as may be in the possession of Mortgagor or any affiliate of Mortgagor, and upon default in any such payment Mortgagor and any such affiliate will vacate and surrender the possession of the Mortgaged Property to Mortgagee or to such receiver, and in default thereof may be evicted by summary proceedings or otherwise.

20. Trust Funds. All lease security deposits of the Real Estate shall be treated as trust funds not to be commingled with any other funds of Mortgagor. Within 10 days after request by Mortgagee (acting at the written direction of the Required Holders), Mortgagor shall furnish Mortgagee satisfactory evidence of compliance with this subsection, together with a statement of all lease security deposits by lessees and copies of all Leases not previously delivered to Mortgagee, which statement shall be certified by Mortgagor.

21. Additional Rights. The holder of any subordinate lien on the Mortgaged Property shall have no right to terminate any Lease whether or not such Lease is subordinate to this Mortgage nor shall any holder of any subordinate lien join any tenant under any Lease in any action to foreclose the lien or modify, interfere with, disturb or terminate the rights of any tenant under any Lease. By recordation of this Mortgage all subordinate lienholders are subject to and notified of this provision, and any action taken by any such lienholder contrary to this provision shall be null and void. Upon the occurrence of any Event of Default, Mortgagee (acting at the written direction of the Required Holders) may, in the Required Holders' sole discretion and without regard to the adequacy of its security under this Mortgage, apply all or any part of any amounts on deposit with Mortgagee under this Mortgage against all or any part of the Obligations. Any such application shall not be construed to cure or waive any Default or Event of Default or invalidate any act taken by Mortgagee on account of such Default or Event of Default.

22. Notices. All notices, requests, demands and other communications hereunder shall be given in accordance with the provisions of Section 17 of the Note Purchase Agreement to Mortgagor and to Mortgagee as specified therein.

23. No Oral Modification. This Mortgage may not be amended, supplemented or otherwise modified except by an instrument in writing executed by Mortgagor and Mortgagee in accordance with the provisions of Section 16 of the Note Purchase Agreement. Any agreement made by Mortgagor and Mortgagee after the date of this Mortgage relating to this Mortgage shall be superior to the rights of the holder of any intervening or subordinate lien or encumbrance.

24. Partial Invalidity. In the event any one or more of the provisions contained in this Mortgage shall for any reason be held to be invalid, illegal or unenforceable in any respect, such invalidity, illegality or unenforceability shall not affect any other provision hereof, but each shall be construed as if such invalid, illegal or unenforceable provision had never been included. Notwithstanding to the contrary anything contained in this Mortgage or in any provisions of any of the Financing Documents, the obligations of Mortgagor and of any other obligor under any Financing Document shall be subject to the limitation that Mortgagee shall not charge, take or receive, nor shall Mortgagor or any other obligor be obligated to pay to Mortgagee, any amounts constituting interest in excess of the maximum rate permitted by law to be charged by Mortgagee.

25. Mortgagor's Waiver of Rights. To the fullest extent permitted by law, Mortgagor waives the benefit of all laws now existing or that may subsequently be enacted providing for (a) any appraisement before sale of any portion of the Mortgaged Property, (b) any extension of the time for the enforcement of the collection of the Obligations or the creation or extension of a period of redemption from any sale made in collecting such debt and (c) exemption of the Mortgaged Property from attachment, levy or sale under execution or exemption from civil process. To the full extent Mortgagor may do so, Mortgagor agrees that Mortgagor will not at any time insist upon, plead, claim or take the benefit or advantage of any law now or hereafter in force providing for any appraisement, valuation, stay, exemption, extension or redemption, or requiring foreclosure of this Mortgage before exercising any other remedy granted hereunder and Mortgagor, for Mortgagor and its successors and assigns, and for any and all persons ever claiming any interest in the Mortgaged Property, to the extent permitted by law, hereby waives and releases all rights of redemption, valuation, appraisement, stay of execution, and marshalling in the event of foreclosure of the liens hereby created.

26. Remedies Not Exclusive. Mortgagee shall be entitled to enforce payment and performance of the Obligations and to exercise all rights and powers under this Mortgage or under any of the other Financing Documents or other agreement or any laws now or hereafter in force, notwithstanding that some or all of the Obligations may now or hereafter be otherwise secured, whether by mortgage, security agreement, pledge, lien, assignment or otherwise. Neither the acceptance of this Mortgage nor its enforcement, shall prejudice or in any manner affect Mortgagee's right to realize upon or enforce any other security now or hereafter held by Mortgagee, it being agreed that Mortgagee shall be entitled to enforce this Mortgage and any other security now or hereafter held by Mortgagee in such order and manner as Mortgagee (acting at the written direction of the Required Holders) may determine in the Required Holders' absolute discretion. No remedy herein conferred upon or reserved to Mortgagee is intended to be exclusive of any other remedy herein or by law provided or permitted, but each shall be cumulative and shall be in addition to every other remedy given hereunder or now or hereafter existing at law or in equity or by statute. Every power or remedy given by any of the Financing Documents to Mortgagee or to which it may otherwise be entitled, may be exercised, concurrently or independently, from time to time and as often as may be deemed expedient by Mortgagee. In no event shall Mortgagee, in the exercise of the remedies provided in this Mortgage (including, without limitation, in connection with the assignment of Rents to Mortgagee, or the appointment of a receiver and the entry of such receiver on to all or any part of

the Mortgaged Property), be deemed a "mortgagee in possession," and Mortgagee shall not in any way be made liable for any act, either of commission or omission, in connection with the exercise of such remedies.

27. Multiple Security. If (a) the Premises shall consist of one or more parcels, whether or not contiguous and whether or not located in the same county, or (b) in addition to this Mortgage, Mortgagee shall now or hereafter hold one or more additional mortgages, liens, deeds of trust or other security (directly or indirectly) for the Obligations upon other property in the State in which the Premises are located (whether or not such property is owned by Mortgagor or by others) or (c) both the circumstances described in clauses (a) and (b) shall be true, then to the fullest extent permitted by law, Mortgagee (acting at the written direction of the Required Holders) may commence or consolidate in a single foreclosure action all foreclosure proceedings against all such collateral securing the Obligations (including the Mortgaged Property), which action may be brought or consolidated in the courts of any county in which any of such collateral is located. Mortgagor acknowledges that the right to maintain a consolidated foreclosure action is a specific inducement to Mortgagee to enter into the Collateral Agency Agreement, and Mortgagor expressly and irrevocably waives any objections to the commencement or consolidation of the foreclosure proceedings in a single action and any objections to the laying of venue or based on the grounds of forum non conveniens which it may now or hereafter have. Mortgagor further agrees that if Mortgagee shall be prosecuting one or more foreclosure or other proceedings against a portion of the Mortgaged Property or against any collateral other than the Mortgaged Property, which collateral directly or indirectly secures the Obligations, or if Mortgagee shall have obtained a judgment of foreclosure and sale or similar judgment against such collateral, then, whether or not such proceedings are being maintained or judgments were obtained in or outside the State in which the Premises are located, Mortgagee (acting at the written direction of the Required Holders) may commence or continue foreclosure proceedings and exercise its other remedies granted in this Mortgage against all or any part of the Mortgaged Property and Mortgagor waives any objections to the commencement or continuation of a foreclosure of this Mortgage or exercise of any other remedies hereunder based on such other proceedings or judgments, and waives any right to seek to dismiss, stay, remove, transfer or consolidate either any action under this Mortgage or such other proceedings on such basis. Neither the commencement nor continuation of proceedings to foreclose this Mortgage nor the exercise of any other rights hereunder nor the recovery of any judgment by Mortgagee in any such proceedings shall prejudice, limit or preclude Mortgagee's right to commence or continue one or more foreclosure or other proceedings or obtain a judgment against any other collateral (either in or outside the State in which the Premises are located) which directly or indirectly secures the Obligations, and Mortgagor expressly waives any objections to the commencement of, continuation of, or entry of a judgment in such other proceedings or exercise of any remedies in such proceedings based upon any action or judgment connected to this Mortgage, and Mortgagor also waives any right to seek to dismiss, stay, remove, transfer or consolidate either such other proceedings or any action under this Mortgage on such basis. It is expressly understood and agreed that to the fullest extent permitted by law, Mortgagee (acting at the written direction of the Required Holders) may cause the sale of all collateral which is the subject of a single foreclosure action at either a single sale or at multiple sales conducted simultaneously and take such other measures as are appropriate in order to effect the agreement

of the parties to dispose of and administer all collateral securing the Obligations (directly or indirectly) in the most economical and least time-consuming manner.

28. Successors and Assigns. All covenants of Mortgagor contained in this Mortgage are imposed solely and exclusively for the benefit of Mortgagee and the Secured Parties and their successors and assigns, and no other person or entity shall have standing to require compliance with such covenants or be deemed, under any circumstances, to be a beneficiary of such covenants, any or all of which may be freely waived in whole or in part by Mortgagee (acting at the written direction of the Required Holders) at any time if in the Required Holders' sole discretion it deems such waiver advisable. All such covenants of Mortgagor shall run with the land and bind Mortgagor, the successors and assigns of Mortgagor (and each of them) and all subsequent owners, encumbrancers and tenants of the Mortgaged Property, and shall inure to the benefit of Mortgagee, its successors and assigns until all of the Obligations shall have been paid or satisfied in full and this Mortgage shall have been discharged. The word "Mortgagor" shall be construed as if it read "Mortgagors" whenever the sense of this Mortgage so requires and if there shall be more than one Mortgagor, the obligations of the Mortgagors shall be joint and several.

29. No Waivers, etc. Any failure by Mortgagee to insist upon the strict performance by Mortgagor of any of the terms and provisions of this Mortgage shall not be deemed to be a waiver of any of the terms and provisions hereof, and Mortgagee, notwithstanding any such failure, shall have the right thereafter to insist upon the strict performance by Mortgagor of any and all of the terms and provisions of this Mortgage to be performed by Mortgagor. Mortgagee (acting at the written direction of the Required Holders) may release, regardless of consideration and without the necessity for any notice to or consent by the holder of any subordinate lien on the Mortgaged Property, any part of the security held for the obligations secured by this Mortgage without, as to the remainder of the security, in any way impairing or affecting the lien of this Mortgage or the priority of such lien over any subordinate lien.

30. Governing Law, Etc. This Mortgage shall be governed by and construed in accordance with the laws of the State of Maine, except that Mortgagor expressly acknowledges that by their terms the Note Purchase Agreement, the Notes, and the other Financing Documents shall be construed in accordance with the laws of the State of New York, without regard to principles of conflicts of law, and for purposes of consistency, Mortgagor agrees that in any in personam proceeding related to this Mortgage the rights of the parties to this Mortgage shall also be governed by and construed in accordance with the laws of the State of New York governing contracts made and to be performed in that state, without regard to principles of conflicts of law.

31. Certain Definitions. Unless the context clearly indicates a contrary intent or unless otherwise specifically provided herein, words used in this Mortgage shall be used interchangeably in singular or plural form and the word "Mortgagor" shall mean "each Mortgagor or any subsequent owner or owners of the Mortgaged Property or any part thereof or interest therein," the word "Mortgagee" shall mean "Mortgagee or any successor agent for the Secured Parties," the word "person" shall include any individual, corporation, partnership, trust,

limited liability company, unincorporated association, government, governmental authority, or other entity, and the words "Mortgaged Property" shall include any portion of the Mortgaged Property or interest therein. Whenever the context may require, any pronouns used herein shall include the corresponding masculine, feminine or neuter forms, and the singular form of nouns and pronouns shall include the plural and vice versa. The captions in this Mortgage are for convenience or reference only and in no way limit or amplify the provisions hereof.

32. Release. Upon the sale of any portion of the Mortgaged Property pursuant to the provisions of Section 9.15 of the Note Purchase Agreement, the lien of this Mortgage shall be released from the applicable portion of the Mortgaged Property. Mortgagee (acting at the written direction of the Required Holders) shall execute any documents reasonably requested in writing by Mortgagor to accomplish any release contemplated by this Section (any such release to be without recourse, representation or warranty) and Mortgagor will pay all costs and expenses, including reasonable attorneys' fees, disbursements and other charges, incurred by Mortgagee in connection with the preparation and execution of such documents.

33. State Specific Provisions.

(a) Applicability of Maine Law. Notwithstanding anything else contained herein to the contrary, where provisions contained in this Section 33 conflict with other provisions of this Mortgage, these provisions shall control to the extent necessary to establish, perfect, and maintain a mortgage and an enforceable security interest in the Mortgaged Property.

(b) Statutory Condition. This Mortgage is given upon the STATUTORY CONDITION, which is incorporated herein by reference. To the extent that the provisions of this Mortgage and the provisions set forth in the Statutory Condition conflict, the provisions of this Mortgage shall control to the extent permitted by applicable law.

(c) Statutory Power of Sale. If any Event of Default shall occur and be continuing, the Mortgagee shall have the right to foreclose this Mortgage under any legal method of foreclosure in existence at the time or now existing, or under any other applicable law, including, without limitation, the STATUTORY POWER OF SALE, as set forth in 33 M.R.S.A. Section 501-A and 14 M.R.S.A. Section 6203-A, as each may be amended, which is expressly incorporated herein by reference, to the extent authorized or allowed by any present or future law of the State of Maine. In connection therewith, Mortgagor acknowledges that this Mortgage secures a loan or loans for business and commercial purposes and that this Mortgage is given primarily for a business, commercial or agricultural purpose.

(d) Non-Waiver. Mortgagor agrees for itself, its successors and assigns, that the acceptance, before the expiration of the right of redemption and after the commencement of foreclosure proceedings of this Mortgage, of insurance proceeds, eminent domain awards, rents or anything else of value to be applied on or to the Obligations by the Mortgagee, the Secured Parties or any person or party holding under the Mortgagee shall not constitute a waiver of such foreclosure by the Mortgagee or waiver of the failure of performance by the Mortgagor of any covenants or agreements contained herein, in the other Financing Documents, or in the Note Purchase Agreement. This agreement by Mortgagor shall be that agreement referred to in 14

M.R.S.A. §6321, as amended, as necessary to prevent such waiver of foreclosure. This agreement by Mortgagor is intended to apply to the acceptance and such applications of any such insurance proceeds, eminent domain awards, rents and other sums or anything else of value, whether the same shall be accepted from, or for the account of, the Mortgagor from any other sources whatsoever by the Mortgagee, the Secured Parties or by any person or party holding under the Mortgagee at any time or times in the future while any portion of the Obligations shall remain outstanding.

34. Open-End Mortgage; Limitations. This Mortgage is an open-end mortgage and the Obligations secured hereby include existing indebtedness, "Contingent Obligations," "Future Advances" and "Protective Advances" as such terms are defined in 33 M.R.S.A. § 505, as amended (herein called the "**Open-End Mortgage Statute**"). The maximum aggregate amount of all debts or obligations secured by this Mortgage, individually and collectively, including Contingent Obligations and Future Advances, but excluding Protective Advances, shall not at any time exceed the total amount of Six Hundred Eighty Million Dollars ($680,000,000.00). As stated in this Mortgage, the Obligations include both obligations existing on the date hereof and obligations that may arise in the future. Pursuant to Maine's Open-End Mortgage Statute, to the extent the Obligations may be Contingent Obligations, the maximum amount of such Contingent Obligations shall not at any time exceed $255,000,000, and the maximum amount of any Future Advances, shall not at any time exceed $255,000,000; *provided, further*, that nothing herein contained shall limit the amount secured by this Mortgage if such amount is increased by Protective Advances. All of the Obligations that are Future Advances, Contingent Obligations or Protective Advances shall be secured by this Mortgage with the record priority set forth in the Open-End Mortgage Statute. The maximum amounts set forth above shall only pertain to the record priority of the amount secured hereby pursuant to the Open-End Mortgage Statute and shall not otherwise limit the amount of total obligations of Mortgagor, secured hereby or limit the liability of Mortgagor, to the Mortgagee, or any Secured Parties for such Obligations.

**UNDER MAINE LAW, A BORROWER MAY NOT MAINTAIN AN ACTION UPON ANY AGREEMENT TO LEND MONEY, EXTEND CREDIT, FORBEAR FROM COLLECTION OF A DEBT OR MAKE ANY OTHER ACCOMMODATION FOR REPAYMENT OF A DEBT FOR MORE THAN $250,000.00 UNLESS THE PROMISE, CONTRACT OR AGREEMENT ON WHICH THE ACTION IS BROUGHT OR SOME MEMORANDUM OR NOTE OF THE PROMISE, CONTRACT OR AGREEMENT ON WHICH THE ACTION IS BROUGHT IS BOTH: (1) IN WRITING; AND (2) SIGNED BY THE LENDER.**

35. Waiver of Jury Trial. THE PARTIES HERETO AGREE TO WAIVE THEIR RESPECTIVE RIGHTS TO A JURY TRIAL OF ANY CLAIM OR CAUSE OF ACTION BASED UPON OR ARISING OUT OF THIS MORTGAGE, ANY OTHER FINANCING DOCUMENT, OR ANY DEALINGS BETWEEN THEM RELATING TO THE SUBJECT MATTER OF THIS TRANSACTION. THE SCOPE OF THIS WAIVER IS INTENDED TO BE ALL-ENCOMPASSING OF ANY AND ALL DISPUTES THAT MAY BE FILED IN ANY COURT AND THAT RELATE TO THE SUBJECT MATTER OF THIS TRANSACTION. EACH PARTY HERETO ACKNOWLEDGES THAT THIS WAIVER IS A

MATERIAL INDUCEMENT TO ENTER INTO THIS BUSINESS RELATIONSHIP, THAT IT HAS ALREADY RELIED ON THE WAIVER IN ENTERING INTO THIS MORTGAGE, AND THAT IT WILL CONTINUE TO RELY ON THE WAIVER IN ITS RELATED FUTURE DEALINGS. EACH PARTY HERETO FURTHER WARRANTS AND REPRESENTS THAT IT HAS REVIEWED THIS WAIVER WITH ITS LEGAL COUNSEL, AND THAT IT KNOWINGLY AND VOLUNTARILY WAIVES ITS JURY TRIAL RIGHTS FOLLOWING CONSULTATION WITH LEGAL COUNSEL. IN THE EVENT OF LITIGATION, THIS MORTGAGE MAY BE FILED AS A WRITTEN CONSENT TO A TRIAL BY THE COURT

36. Protections Afforded to the Mortgagee. The Mortgagor hereby agrees that the Mortgagee shall be afforded all of the rights, protections, immunities, indemnities and privileges afforded to the Collateral Agent under the Collateral Agency Agreement.

[Balance of page intentionally blank. Signature pages and acknowledgments follow.]

This Mortgage has been duly executed by Mortgagor on January 25, 2022, and is intended to be effective as of January 31, 2022.

SIGNED, SEALED & DELIVERED
In the presence of:

Witness

GREAT LAKES HYDRO AMERICA, LLC

By: _____
Name: Michael Tebbutt
Title: Chief Financial Officer & Treasurer

STATE OF NEW YORK

COUNTY OF New York, ss.

January 25, 2022

Then personally appeared the above-named Michael Tebbutt, the duly authorized Chief Financial Officer and Treasurer of Great Lakes Hydro America, LLC, a Delaware limited liability company, and acknowledged the foregoing instrument to be his/her free act and deed in his/her capacity and the free act and deed of the said limited liability company.

Notary Public
My commission expires: August 4, 2022

Schedule A

**To Mortgage, Fixture Filing, Assignment of Rents and Leases and Security Agreement from Great Lakes Hydro America, LLC, as Mortgagor, to The Bank of New York Mellon Trust Company, N.A., as Collateral Agent, as Mortgagee, dated as of January 31, 2022**

**This Schedule A is comprised of two sections; Section I and Section II which together describe the Real Estate and Appurtenances**

**SECTION I**

I. PENOBSCOT MILLS PROJECT - FERC PROJECT #2458

The land and interests in land, and the improvements thereon, including, without limitation, the hydroelectric generating facilities and storage projects on the Penobscot River in Maine, comprising FERC Project #2458, including dams, impoundments, substations, dikes, boat launches and other related and appurtenant facilities depicted on the following plans, or any amendments thereto, on file with the Federal Energy Regulatory Commission (collectively the "Penobscot Mills Project Plans"):

1. Exhibit G-1 Sheet 1 of 10, Penobscot Mills Project, Project Area Map, FERC No. 2458-1056

2. Exhibit G-2, Sheet 2 of 10 Penobscot Mills Project, Project Boundary Map, North Twin Development, FERC No. 2458- 1071.

3. Exhibit G-3, Sheet 3 of 10 Penobscot Mills Project, Project Boundary Map, Millinocket Lake Storage Development, FERC No. 2458-1072

4. Exhibit G-4, Sheet 4 of 10 Penobscot Mills Project, Project Boundary Map, Lower Project Developments, FERC No. 2458- 1073

5. Exhibit G-5, Sheet 5 of 10 Penobscot Mills Project, Millinocket Development, Project Boundary Detail Sheet, FERC No. 2458-1074

6. Exhibit G-6, Sheet 6 of 10 Penobscot Mills Project, Dolby and East Millinocket Developments, Project Boundary Detail Sheet, FERC No. 2458-1075

7. Exhibit G-7, Sheet 7 of 10 Penobscot Mills Project, North Twin Development, Project Boundary Detail Sheet, FERC No. 2458-1076

8. Exhibit G-8, Sheet 8 of 10 Penobscot Mills Project, Millinocket Development, Ferguson Pond Detail Sheets, FERC No. 2458-1077

9. Exhibit G-9, Sheet 9 of 10 Penobscot Mills Project, East Millinocket Development, Millinocket Lake Storage Development, Project Boundary Detail Sheet, FERC No. 2458-1078

10. Exhibit G-10, Sheet 10 of 10, Penobscot Mills Project, Miscellaneous Project Boundary Details, FERC No. 2458-1079 All of which are further described as follows:

A. North Twin - FERC #2458 1. Project Works-land area

The land and interests in land and the improvements thereon, including, without limitation, North Twin dam, intake structure, spillway, six auxiliary dikes around the perimeter of the reservoir, ice/trash sluice, transmission line, upstream wood fish passageway (no longer used), penstock, powerhouse, walls, racks, gates, substation, boat launch, flowage area and other related improvements (collectively, the "Project Works"), in Township 3 Indian Junction, County of Penobscot, State of Maine, and other related improvements depicted on the following plans (collectively the "Survey"):

Plan of Plisga & Day, Land Surveyors entitled "North Twin Dam & Transmission Line, North Twin Lake

to Millinocket Great Northern Paper Company, TWP 3 Indian Purchase & Millinocket, Maine for Great Lakes Hydro America, LLC, consisting of 4 Sheets.

Note: This plan depicts substation, transmission line, dam (3.2.1 North Twin Dam parcel) and related facilities.

2. Flowage Rights/Easements

Rights, whether in fee or easement, to flow land up to the normal full pond level by the operation of the North Twin Dam at the impoundment created by the North Twin Dam, which includes a portion of North Twin Lake aka Elbow Lake, as further shown on the Penobscot Mills Project Plans.

3. Project Lands

All real estate located within the Project Boundary shown on the Penobscot Mills Project Plans and to the extent further described in this Schedule A the lands adjacent thereto.

4. Access Roads to Project Works

Pedestrian and vehicular rights to cross the private roads and ways, as historically used, leading from the Project Works to the public roads, including the appurtenant easements described in this Schedule A.

B. Millinocket - FERC #2458 1. Project Works-land area

The land and interests in land and the improvements thereon, including, without limitation, Millinocket Lake dam, intake structure, spillway, six auxiliary dikes around the perimeter of the reservoir, ice/trash sluice, transmission line, upstream wood fish passageway (no longer used), penstock, powerhouse, walls, racks, gates, substation, boat launch, flowage area and other related improvements (collectively, the "Project Works"), in Township 1, Range 8 WELS, County of Penobscot, State of Maine, and other related improvements depicted on the following plans (collectively the "Survey"):

i. Plan of Plisga & Day, Land Surveyors entitled "Boundary Survey Plan of Easement Area 4, Easement Area 2, Substation 4 & 2-3 Easements, The Frequency Converter Parcel & The T-33 Parcel on Land of Katahdin Paper Company, Millinocket, Maine for Great Lakes Hydro America, LLC", dated January 28, 2002, last revised August 23, 2004, Sheet 3 of 15 (3.10.5 Substation No. 4 Parcel, 3.10.6 Frequency Converter Parcel, 3.10.7 Substation No. 2-3 Parcel, 3.10.8 T33 Transformer Parcel, 4.4.2 Transmission Line Easement Area 2, 4.4.4 Stone Dam Transmission Line Easement-Easement Area 4);

ii. Plan of Plisga & Day, Land Surveyors entitled "Boundary Survey Plan of Easement Area 5 on Land of Katahdin Paper Company, Millinocket, Maine for Great Lakes Hydro America, LLC", dated January 28, 2002, last revised August 23, 2004, Sheet 15 of 15 (3.10.9 Penstock Easement);

iii. Plan of Plisga & Day, Land Surveyors entitled "Survey Plan of the Millinocket Mill Site, Millinocket, Maine, Katahdin Paper Company", consisting of 2 sheets (3.4 Ferguson Canal, 3.10.2 Little Italy Substation, portion of 3.10.5 Substation No. 4 Parcel and 3.10.3 Power Station);

iv. Plan of Bridgham Engineering and Land Surveying entitled "Survey Plat Penobscot Mills Pumping Station Ambejejus & Millinocket Lakes, T1 R9 WELS" dated November 24, 1999, last revised August 24, 2004, consisting of 1 sheet (3.7 Penobscot Mills Pumping Station);

v. Plan of Plisga & Day, Land Surveyors entitled "Survey Plan Stone Dam, Ferguson Lake & Quakish Lake Dikes, Millinocket, T3 Indian Purchase for Great Northern Paper, Inc.", dated September 6, 2001, last revised August 24, 2004, consisting of 2 sheets (3.3 Stone Dam (Quakish Lake Dam), Quakish and Ferguson Lake Dikes); and

vi. Plan of Bridgham Engineering and Lane Surveying entitled "Survey Plat Millinocket Lake Dam Lot, T1 R8 WELS, dated October 8, 1999, last revised August 14, 2004, consisting of 1 sheet (3.8 Millinocket Lake Dam).

2. Flowage Rights/Easements

Rights, whether in fee or easement, to flow land up to the normal full pond level by the operation of the Millinocket Lake Dam, Millinocket Mill Dam, and Stone Dam at the impoundments created by the aforesaid dams, which includes portions of Millinocket Lake, Ferguson Pond, and Quakish Lake as further shown on the Penobscot Mills Project Plans.

3. Project Lands

All real estate located within the Project Boundary shown on the Penobscot Mills Project Plans and to the extent further described in this Schedule A the lands adjacent thereto, and the Central Street Woodlands Office described in this Schedule A (3.11 Millinocket (Central Street Woodlands Office).

4. Access Roads to Project Works

Pedestrian and vehicular rights to cross the private roads and ways, as historically used, leading from the Project Works to the public roads, including the appurtenant easements described in this Schedule A.

C. Dolby - FERC #2458

1. Project Works-land area

The land and interests in land and the improvements thereon, including, without limitation, Dolby Dam, intake structure, spillway, six auxiliary dikes around the perimeter of the reservoir, ice/trash sluice, transmission line, upstream wood fish passageway (no longer used), penstock, powerhouse, walls, racks, gates, substation, boat launch, flowage area and other related improvements (collectively, the "Project Works"), in the Town of East Millinocket and Township A, Range 7 WELS, County of Penobscot, State of Maine, and other related improvements depicted on the following plans (collectively the "Survey"):

i. Plan of Plisga & Day, Land Surveyors entitled "Boundary Survey Plan Lands of Katahdin Paper Company, TA R7, WELS & East Millinocket, Maine for Great Lakes Hydro America, LLC" dated January 28, 2002; updated August 23, 2004, consisting of 1 Sheet (3.14.1 Mill Dam Parcel).
ii. Plan of Plisga & Day, Land Surveyors entitled "Survey Plan of the Dolby Dam Sites, East Millinocket & TA R7, WELS for Great Lakes Hydro America, LLC" dated September 7, 2001; updated August 23, 2004, consisting of 3 Sheets (3.14.1 Mill Dam Parcel).
iii. Plan of Plisga & Day, Land Surveyors entitled "Survey Plan of the Dolby Pond Boat Launch, Route 11 & 157, Millinocket, Maine for Great Lakes Hydro America, LLC dated September 4, 2001, updated August 23, 2004, consisting of 1 sheet (3.17 Dolby Boat Launch).
iv. Plan of Plisga & Day, Land Surveyors entitled "Boundary Survey Plan of Transmission Line easement & Sub- Station easement on land of Maine Timberlands Company TA R7, Medway & T2 R9 NWP for Great lakes Hydro America, LLC, Sheet 2 of 4 (3.14.2 New Substation).

2. Flowage Rights/Easements

Rights, whether in fee or easement, to flow land up to the normal full pond level by the operation of the Dolby Dam at the impoundment created by the Dolby Dam, which includes a portion of Dolby Pond, as further shown on the Penobscot Mills Project Plans.

3. Project Lands

All real estate located within the Project Boundary shown on the Penobscot Mills Project Plans and to the extent further described in this Schedule A the lands adjacent thereto.

4. Access Roads to Project Works

Pedestrian and vehicular rights to cross the private roads and ways, as historically used, leading from

the Project Works to the public roads, including the appurtenant easements described in this Schedule A.

D. East Millinocket - FERC #2458 1. Project Works-land area

The land and interests in land and the improvements thereon, including, without limitation, East Millinocket Dam, intake structure, spillway, six auxiliary dikes around the perimeter of the reservoir, ice/trash sluice, transmission line, upstream wood fish passageway (no longer used), penstock, powerhouse, walls, racks, gates, substation, boat launch, flowage area and other related improvements (collectively, the "Project Works"), in Town of East Millinocket, County of Penobscot, State of Maine, and other related improvements depicted on the following plans (collectively the "Survey"):

a. Plan of Plisga & Day, Land Surveyors entitled "Boundary Survey Plan - a portion of the Dam Site on lands of Katahdin Paper Company, East Millinocket, Maine for Great Lakes Hydro America, LLC" dated January 28, 2002; updated August 23, 2004, consisting of 7 Sheets.

i. Sheet 2 depicts North side of dam (3.13.1 East Millinocket Dam)
ii. Sheet 6 depicts Electrical Substation 3 (3.13.3 Electric Substation 3)
iii. Sheet 7 depicts Electrical Substation 3 (3.13.2 Electric Substation 1)

b. "Survey Plan of the Dolby Dam Sites East Millinocket 7 TA R7 WELS for Great Lakes Hydro America, LLC" prepared by Plisga & Day dated 9/7/2001, updated 8/23/2004, consisting of 3 sheets (south side of dam included in within 3.14.1 Mill Dam)

c. Plan of Plisga & Day, Land Surveyors entitled "Boundary Survey Plan of Transmission Line easement & Sub-Station easement on land of Maine Timberlands Company TA R7, Medway & T2 R9 NWP for Great lakes Hydro America, LLC, Sheet 2 of 4 (3.14.2 New Substation).

2. Flowage Rights/Easements

Rights, whether in fee or easement, to flow land up to the normal full pond level by the operation of the East Millinocket Dam at the impoundment created by the East Millinocket Dam, which includes a portion of West Branch of Penobscot River, as further shown on the Penobscot Mills Project Plans.

3. Project Lands

All real estate located within the Project Boundary shown on the Penobscot Mills

Project Plans and to the extent further described in this Schedule A the lands adjacent thereto.

4. Access Roads to Project Works

Pedestrian and vehicular rights to cross the private roads and ways, as historically used, leading from the Project Works to the public roads, including the appurtenant easements described in this Schedule A.

II. RIPOGENUS/MCKAY - FERC PROJECT #2572

The land and interests in land and the improvements thereon, including, without limitation, the hydroelectric generating facilities and storage projects on Ripogenus Lake in Maine, comprising FERC Project #2572, including dams, impoundments, intake structure, tunnel, and penstocks, powerhouse, tailrace, 115k kV substation, transmission line, surge tank, pumping house, boat launches and other related and appurtenant facilities depicted on the following plans, or any amendments thereto, on file with the Federal Energy Regulatory Commission (collectively the "Ripogenus/Mckay Project Plans"):

1. Exhibit G-1 Sheet 1 of 3, Ripogenus Project, Project Area Map, Great Northern Paper, Inc., Millinocket, Maine, FERC No. 2572-1019.

2. Exhibit G-1 Sheet 2 of 3, Ripogenus Project, Project Boundary Detail Map, Project Structures, Great Northern Paper, Inc., Millinocket, Maine, FERC No. 2572-1015.

3. Exhibit G-1 Sheet 3 of 3, Ripogenus Project, Project Boundary Detail Map, Transmission Line, Great Northern Paper, Inc., Millinocket, Maine, FERC No. 2572-1018.

1. Project Works-land area:

The land and interests in land and the improvements thereon, including, without limitation, the Ripogenus dam, McKay Station, impoundments, intake structure, tunnel, and penstocks, powerhouse, tailrace, 115k kV substation, transmission line, surge tank, pumping house and other related improvements (collectively, the "Project Works"), in Township T3, Range 11 WELS, County of Piscataquis, State of Maine, depicted on the following plans (collectively the "Survey"):

i. Plan by Bridgham Engineering and Land Surveying entitled "Survey Plat Ripogenus Project T3 R11 WELS" dated September 4, 2001; revised August 19, 2004, consisting of 1 sheet (2.19 Ripogenus Dam Lot and McKay Station)

ii. Plan by Bridgham Engineering and Land Surveying entitled "Survey Plat, Umbazooksus Lake, T6 R13" dated September 4, 2001, revised January 12, 2005, consisting of 1 sheet (2.4 Umbazooksus Lake).

2. Flowage Rights/Easements

Rights, whether in fee or easement, to flow land up to the normal full pond level by the operation of the Ripogenus Dam at the impoundment created by the Ripogenus Dam, as further shown on the Ripogenus/Mckay Project Plans.

3. Project Lands

All real estate located within the Project Boundary shown on the Ripogenus/Mckay Project Plans and to the extent further described in this Schedule A the lands adjacent thereto.

4. Access Roads to Project Works

Pedestrian and vehicular rights to cross the private roads and ways, as historically used, leading from the Project Works to the public roads, including the appurtenant easements described in this Schedule A.

III. MATTACEUNK/WELDON - FERC PROJECT #2520

The land and interests in land and the improvements thereon, including, without limitation, the hydroelectric generating facilities and storage projects on the Penobscot River in Maine, comprising FERC Project #2520, including a dam, impoundment, reservoir, powerhouse, tailrace, rollgate, turbine generators, 6.9kV generator leads, transformer banks, a nine-mile long, 34kV, 40 Hertz transmission line, canoe portage, and other related and appurtenant facilities depicted on the following plans, or any amendments thereto, on file with the Federal Energy Regulatory Commission (collectively the "Mattaceunk/Weldon Project Plans"):

1. Exhibit G, Sheet 1 of 7, Map of Drainage Area of the Power System of Great Northern Paper Co., Great Northern Nekoosa Corp., Millinocket, Maine, FERC No. 2520-9.

2. Exhibit G, Sheet 2 of 7, General Map of Power System, Ripogenus Project, Penobscot Mills Project, Mattaceunk Project, Great Northern Nekoosa Corp., Millinocket, Maine, FERC No. 2520-10.

3. Exhibit G, Sheet 3 of 7, General Map of Power System, Ripogenus Project, Penobscot Mills Project, Mattaceunk Project, Great Northern Nekoosa Corp, Millinocket, Maine, FERC No. 2520-11.

4. Exhibit G, Sheet 4 of 7, General Map of Dam and Flowage Area, The Mattaceunk, Project, Mattawamkeag, Maine, Great Northern Nekoosa Corp, Millinocket, Maine, FERC No. 2520-12.

5. Exhibit G, Sheet 5 of 7, Detail Map of Dam and Flowage Area, The Mattaceunk Project, Mattawamkeag, Maine, Great Northern Nekoosa Corp., Millinocket, Maine, FERC No. 2520-13.

6. Exhibit G, Sheet 6 of 7, One Line Diagram of the Power System of the Great Northern Paper Co., Great Northern Nekoosa Corp., Millinocket, Maine, FERC No. 2520-14.

7. Exhibit G, Sheet 7 of 7, Map of Power Transmission Line, The Mattaceunk Project, Mattawamkeag, Maine, Great Northern Nekoosa Corp., Millinocket, Maine, FERC No. 2520-15.

1. Project Works-land area:

The land and interests in land and the improvements thereon, including, without limitation, the Mattaceunk/Weldon dam, impoundment, reservoir, powerhouse, turbine generators, 6.9kV generator leads, transformer banks, a nine-mile long, 34kV, 40 Hertz transmission line, canoe portage and other related improvements (collectively, the "Project Works"), in the Towns of Mattawamkeag and Woodville, County of Penobscot, State of Maine, depicted on the following plans (collectively the "Survey").

i. Plan by Plisga & Day Land Surveyors entitled "Survey Plan of the Mattaceunk Dam Site Weldon Station, State Route 157, Mattawamkeag & Woodville, Maine for Great Lakes Hydro America, LLC." dated September 6, 2001; revised August 23, 2004 (3.15.1 Mattaceunk Dam Parcel).

2. Flowage Rights/Easements

Rights, whether in fee or easement, to flow land up to the normal full pond level by the operation of the Mattaceunk Dam at the impoundment created by the Mattaceunk Dam, as further shown on the Mattaceunk/Weldon Project Plans.

3. Project Lands

All real estate located within the Project Boundary shown on the Mattaceunk/Weldon Project Plans and to the extent further described in this Schedule A the lands adjacent thereto.

4. Access Road to Project Works

Pedestrian and vehicular rights to cross the private roads and ways, as historically used, leading from the Project Works to the public roads, including the appurtenant easements described in this Schedule A.

IV. PENOBSCOT RIVER STORAGE PROJECTS - FERC PROJECT #2634

The land and interests in land and the improvements thereon, including, without limitation, the nine (9) storage developments, their associated dams, impoundments and storage reservoirs known as Canada Falls, Seboomook, Caucomgomoc, Ragged Lake, Dole Pond, Long Pond, Penobscot, Harrington Lake, and Loon Lake and all their related appurtenant facilities depicted on the following plans, or any amendments thereto, on file with FERC (collectively, the "Penobscot River Project Plans"):

1. Exhibit G-1, Sheet 1 of 11, Storage Project, Map of Regional Area, FERC No. 2634-1024.

2. Exhibit G-1, Sheet 2 of 11, Storage Project, Map of Project Area, FERC No. 2634-1025.

3. Exhibit G-1, Sheet 3 of 11, Storage Project, Map of Canada Falls Project Area, FERC No. 2634-1026.

4. Exhibit G-1, Sheet 4 of 11, Storage Project, Map of Seboomook Project Area, FERC No. 2634-1027.

5. Exhibit G-1, Sheet 5 of 11, Storage Project, Map of Caucomgomoc Project Area, FERC No. 2634-1028.

6. Exhibit G-1, Sheet 6 of 11, Storage Project, Map of Ragged Lake Project Area, FERC No. 2634-1029.

7. Exhibit G-1, Sheet 7 of 11, Storage Project, Map of Dole Pond Project Area, FERC No. 2634-1030.

8. Exhibit G-1, Sheet 8 of 11, Storage Project, Map of Long Pond Storage Area, FERC No. 2634-1031.

9. Exhibit G-1, Sheet 9 of 11, Storage Project, Map of Penobscot Lake Project, FERC No. 2634-1032

10. Exhibit G-1, Sheet 10 of 11, Storage Project, Map of Harrington Lake Project Area, FERC No.. 2634-1033

11. Exhibit G-1, Sheet 11 of 11, Storage Project, Map of Loon Lake Project Area, FERC No. 2634-1034

A. CANADA FALLS

1. Project Works-land area

The land and interests in land and the improvements thereon, including, without limitation, the Canada Falls Lake dam, including any spillways, gates, sluices, fish ways and all related improvements (collectively, the "Project Works"), in the Township of Pittston Academy Grant, County of Somerset, State of Maine, as are depicted on the following plans (collectively, the "Survey") and on the applicable Penobscot River Project Plans:

i. Plan by Bridgham Engineering and Land Surveying entitled "Survey Plat Canada Falls Lake Dam Lot Part of Pittston Academy Grant (Township 2 Range 4 NBKP)" dated May 17, 1999; revised July 19, 2004 (1.1 Canada Falls) (Job No. 2809).

2. Flowage Rights/Easements

Rights, whether in fee or easement, to flow land up to normal full pond level by the operation of the Canada Falls Dam, which includes a portion of the South Branch of the Penobscot River, as is further shown on the Penobscot River Project Plans.

3. Project Lands

All real estate located within the Project Boundary shown on the Penobscot River Project Plans and to the extent further described in this Schedule A, the lands adjacent thereto.

4. Access to Project Works

Pedestrian and vehicular rights to cross the private roads and ways, as historically used, leading from the Project Works to the public roads, including the appurtenant easements described in this Schedule A, if any.

B. SEBOOMOOK DAM

1. Project Works-land area

The land and interests in land and the improvements thereon, including, without limitation, the Seboomook Dam, including any spillways, gates, sluices, fish ways and all related improvements (the "Project Works") Township of Seboomook (T0 R4 NBKP), County of Somerset, State of Maine, as are depicted on the following plans (collectively, the "Survey") and on the applicable Penobscot River Project Plans:

i. Plan by Bridgham Engineering and Land Surveying entitled "Survey Plat GNP Storage Pond Lot Plan For Seboomook Dam" dated May 17, 1999; revised July 7, 2004 (1.2.1 Seboomook Lake Dam) (Project No. 2810).

ii. Plan by Bridgham Engineering and Land Surveying entitled "Survey Plat Proposed Pittston Boat Launch Site Part of Pittston Academy Grant (Township 2 Range 4 NBKP)" dated May 17, 1999; revised July 7, 2004 (1.2.2 Pittston Boat Launch) (Job No. 2814).

2. Flowage Rights/Easements

Rights, whether in fee or easement, to flow land up to normal full pond level by the operation of the Seboomook Dam, which includes a portion of the South Branch and North Branch of the Penobscot River, as is further shown on the Penobscot River Project Plans.

3. Project Lands

All real estate located within the Project Boundary shown on the Penobscot River Project Plans and to the extent further described in this Schedule A, the lands adjacent thereto.

4. Access to Project Works

Pedestrian and vehicular rights to cross the private roads and ways, as historically used, leading from the Project Works to the public roads, including the appurtenant easements described in this Schedule A, if any.

C. CAUCOMGOMAC

1. Project Works-land area

The land and interests in land and the improvements thereon, including, without limitation, the Caucomgomac Lake dam, including any spillways, gates, sluices, fish ways and all related improvements (collectively, the "Project Works") as are depicted on the following plans (collectively, the "Survey") in Township T6, R15 WELS, County of Piscataquis, State of Maine, and on the applicable Penobscot River Project Plans:

i. Plan by Plisga & Day, Land Surveyors entitled "Survey Plan Caucomgomoc Dam Site TWP T6 R14, WELS, Maine" for Great Lakes Hydro America, LLC" dated September 7, 2001; updated August 23, 2004 (Project No. 01237_S). (2.2 Caucomgomac Dam Lot).

ii. Plan by Bridgham Engineering and Land Surveying entitled "Survey Plat Caucomgomoc Lake Boat Launch Part of T6 R15 WELS" dated August 11, 1999; revised June 14, 2005 (2.1 Caucomgomoc Boat Launch) (Job No. 2812).

2. Flowage Rights/Easements

Rights, whether in fee or easement, to flow land up to normal full pond level by the operation of the Caucomgomac Dam, which includes Rowe Pond, Round Pond and Ciss Stream, as is further shown on the Penobscot River Project Plans.

3. Project Lands

All real estate located within the Project Boundary shown on the Penobscot River Project Plans and to the extent further described in this Schedule A, the lands adjacent thereto.

4. Access to Project Works

Pedestrian and vehicular rights to cross the private roads and ways, as historically used, leading from the Project Works to the public roads, including the appurtenant easements described in this Schedule A, if any.

D. RAGGED LAKE

1. Project Works-land area

The land and interests in land and the improvements thereon, including, without limitation, the Ragged Lake dam, including any spillways, gates, sluices, fish ways and all related improvements (collectively, the "Project Works") in Township T2, R13 WELS, County of Piscataquis, State of Maine, as are depicted on the following plans (collectively, the "Survey") and on the applicable Penobscot River Project Plans:

i. Plan by Bridgham Engineering and Land Surveying entitled "Survey Plat GNP Storage Pond Lot Plan for Ragged Lake Dam" revised August 11, 2004 FERC Project No. 2634 T2 R13 WELS (2.12 Ragged Lake) (Job No. 2811).

2. Flowage Rights/Easements

Rights, whether in fee or easement, to flow land up to normal full pond level by the operation of the Ragged Lake Dam, as is further shown on the Penobscot River Project Plans.

3. Project Lands

All real estate located within the Project Boundary shown on the Penobscot River Project Plans and to the extent further described in this Schedule A, the lands adjacent thereto.

4. Access to Project Works

Pedestrian and vehicular rights to cross the private roads and ways, as historically used, leading from the Project Works to the public roads, including the appurtenant easements described in this Schedule A, if any.

F. DOLE POND

1. Project Works - land area

The land and interests in land and the improvements thereon, including, without limitation, the Dole Pond dam, including any spillways, gates, sluices, fish ways and all related improvements (collectively, the "Project Works") in Township of Dole Brook, T3 R5 NBKP, County of Somerset, State of Maine, as are depicted on the following plans (collectively, the "Survey") and on the applicable Penobscot River Project Plans:

i. Plan by Bridgham Engineering and Land Surveying entitled "Survey Plat Proposed Dole Pond Lot Part of Dole Brook Township T3 R5 NBKP" dated May 17, 1999; updated July 7, 2004 (1.5 Dole Pond Dam) (Job No. 2808).

2. Flowage Rights/Easements

Rights, whether in fee or easement, to flow land up to normal full pond level by the operation of the Dole Pond Dam, as is further shown on the Penobscot River Project Plans.

3. Project Lands

All real estate located within the Project Boundary shown on the Penobscot River Project Plans and to the extent further described in this Schedule A, the lands adjacent thereto.

4. Access to Project Works

Pedestrian and vehicular rights to cross the private roads and ways, as historically used, leading from the Project Works to the public roads, including the appurtenant easements described in this Schedule A, if any.

F. LONG POND

1. Project Works - land area

The land and interests in land and the improvements thereon, including, without limitation, the Long Pond dam, including any spillways, gates, sluices, fish ways and all related improvements (collectively, the "Project Works") in Township T3 R5 NBKP, County of Somerset, State of Maine, as are depicted on the following plans (collectively, the "Survey") and on the applicable Penobscot River Project Plans:

i. Plan by Bridgham Engineering and Land Surveying entitled "Survey Plat Proposed Long Pond Dam Lot Part of Dole Brook Township (Township 3 Range 5 NBKP)" dated May 17, 1999; updated July 7, 2004 (1.3 Long Pond Dam) (Job No. 2806).

2. Flowage Rights/Easements

Rights, whether in fee or easement, to flow land up to normal full pond level by the operation of the Long Pond Dam, as is further shown on the Penobscot River Project Plans.

3. Project Lands

All real estate located within the Project Boundary shown on the Penobscot River Project Plans and to the extent further described in this Schedule A, the lands adjacent thereto.

4. Access to Project Works

Pedestrian and vehicular rights to cross the private roads and ways, as historically used, leading from the Project Works to the public roads, including the appurtenant easements described in this Schedule A, if any.

G. PENOBSCOT

1. Project Works - land area

The land and interests in land and the improvements thereon, including, without limitation, the Penobscot Lake dam, including any spillways, gates, sluices, fish ways and all related improvements (collectively, the "Project Works") in the Township of Prentiss, County of Somerset, State of Maine, as are depicted on the following plans (collectively, the "Survey") and on the applicable Penobscot River Project Plans:

i. Plan by Bridgham Engineering and Land Surveying entitled "Survey Plat Proposed Penobscot Lake Dam Lot Part of Prentiss Township (Township 4 Range 4 NBKP)" dated May 17, 1999; updated July 7, 2004 (1.4 Penobscot Lake) (Job No. 2807).

2. Flowage Rights/Easements

Rights, whether in fee or easement, to flow land up to normal full pond level by the operation of the Penobscot Lake Dam, as is further shown on the Penobscot River Project Plans.

3. Project Lands

All real estate located within the Project Boundary shown on the Penobscot River Project Plans and to the extent further described in this Schedule A, the lands adjacent thereto.

4. Access to Project Works

Pedestrian and vehicular rights to cross the private roads and ways, as historically used, leading from the Project Works to the public roads, including the appurtenant easements described in this Schedule A, if any.

H. HARRINGTON LAKE

1. Project Works - land area

The land and interests in land and the improvements thereon, including, without limitation, Harrington Lake dam, including any spillways, gates, sluices, fish ways and all related improvements (collectively, the "Project Works") in Township 4, Range 11 WELS, County of Piscataquis, State of Maine, as are depicted on the following plans (collectively, the "Survey") and on the applicable Penobscot River Project Plans:

i. Plan by Bridgham Engineering and Land Surveying entitled "Survey Plat Harrington Lake Dam Lot Part of T4 R11 WELS" dated September 4, 2001; revised August 20, 2004 (2.18 Harrington Lake Dam Easement) (Job No. 2857).

ii. Plan by Bridgham Engineering and Land Surveying entitled "Survey Plat Harrington Lake Dam Lot Portion of T3 R11 WELS" dated September 16, 1999; revised October 8, 1999; revised January 29, 2002; revised August 20, 2004 (2.18 Harrington Lake Dam Easement) (Job No. 2857).

2. Flowage Rights/Easements

Rights, whether in fee or easement, to flow land up to normal full pond level by the operation of the Harrington Lake Dam, as is further shown on the Penobscot River Project Plans.

3. Project Lands

All real estate located within the Project Boundary shown on the Penobscot River Project Plans and to the extent further described in this Schedule A, the lands adjacent thereto.

4. Access to Project Works

Pedestrian and vehicular rights to cross the private roads and ways, as historically used, leading from the Project Works to the public roads, including the appurtenant easements described in this Schedule A, if any.

I. LOON LAKE

1. Project Works - land area

The land and interests in land and the improvements thereon, including, without limitation, Loon Lake dam, including any spillways, gates, sluices, fish ways and all related improvements (collectively, the "Project Works") in Township T6 R14 WELS, County of Piscataquis, State of Maine, as are depicted on the following plans (collectively, the "Survey") and on the applicable Penobscot River Project Plans:

i. Plan by Bridgham Engineering and Land Surveying entitled "Survey Plat Loon Lake Dam Lot Part of T6 R15 & T6 R15" dated June 1, 1999; revised July 19, 2004 (2.3 Loon Lake Dam) (Job No. 2813).

2. Flowage Rights/Easements

Rights, whether in fee or easement, to flow land up to normal full pond level by the operation of the Loon Lake Dam, as is further shown on the Penobscot River Project Plans.

3. Project Lands

BK 8888 PG 187

All real estate located within the Project Boundary shown on the Penobscot River Project Plans and to the extent further described in this Schedule A, the lands adjacent thereto.

4. Access to Project Works

Pedestrian and vehicular rights to cross the private roads and ways, as historically used, leading from the Project Works to the public roads, including the appurtenant easements described in this Schedule A, if any.

Transmission Line Easements

Transmission line easements, located upon, over, under, through and across the transmission line easement parcels as more fully described in this Schedule A, including those transmission line easements shown on the applicable Project Plans and the following surveys:

1. Plan of Plisga & Day, Land Surveyors entitled "Transmission Line Survey, Mattaseaunk Dam to East Millinocket for Great Lakes Hydro America, LLC" dated September 7, 2001, updated August 23, 2004, consisting of 7 sheets (4.1 Transmission Line Easement)

2. Plan of Plisga & Day, Land Surveyors entitled "Transmission Line Survey for Great Lakes Hydro America, LLC, Dolby Dam to the Millinocket Mill TA R7 WELS", consisting of 3 sheets (4.2.1 First Easement Parcel, 4.2.2 Second Easement Parcel and

4.3 Transmission Line Easement).

3. Plan of Plisga & Day, Land Surveyors entitled "Boundary Survey Plan of Easement Area 1 and Easement Exception Area A on Land of Katahdin Paper Company, Millinocket, Maine for Great Lakes Hydro America, LLC", dated January 28, 2002, last revised August 23, 2004, Sheet 5 of 15 (4.4.1 Transmission Line Easement Area 1)

4. Plan of Plisga & Day, Land Surveyors entitled "Boundary Survey Plan of Easement Area 1 on Land of Katahdin Paper Company, Millinocket, Maine for Great Lakes Hydro America, LLC", dated January 28, 2002, last revised August 23, 2004, Sheets 6 and 7 of 15 (4.4.1 Transmission Line Easement Area 1)

5. Plan of Plisga & Day, Land Surveyors entitled "Boundary Survey Plan of Easement Area 4, Easement Area 2, Substation 4 & 2-3 Easements, The Frequency Converter Parcel & The T-33 Parcel on Land of Katahdin Paper Company, Millinocket, Maine for Great Lakes Hydro America, LLC", dated January 28, 2002, last revised August 23, 2004, Sheet 3 of 15 (4.4.2 Transmission Line Easement Area 2, 4.4.4 Stone Dam Transmission Line Easement-Easement Area 4)

6. Plan of Plisga & Day, Land Surveyors entitled "Boundary Survey Plan of Easement Area 3 on Land of Katahdin Paper Company, Millinocket, Maine for Great Lakes Hydro America, LLC", dated January 28, 2002, last revised August 23, 2004, Sheet 4 of 15 (4.4.3 Transmission Line Easement Area 3)

7. Plan of Plisga & Day, Land Surveyors entitled "Boundary Survey Plan of Easement Area 4 on Land of Katahdin Paper Company, Millinocket, Maine for Great Lakes Hydro America, LLC", dated January 28, 2002, last revised August 23, 2004, Sheets 1 and 2 of 15 (4.4.4 Stone Dam Transmission Line Easement-Easement Area 4)

8. Plan of Plisga & Day, Land Surveyors entitled "Boundary Survey Plan of Easement Area 6 on Land of Katahdin Paper Company, Millinocket, Maine for Great Lakes Hydro America, LLC", dated January 28, 2002, last revised August 23, 2004, Sheet 14 of 15 (4.4.5 Transmission Line Easement Area 6)

9. Plan of Plisga & Day, Land Surveyors entitled "Boundary Survey Plan of Easement Area 7 on

Land of Katahdin Paper Company, Millinocket, Maine for Great Lakes Hydro America, LLC", dated January 28, 2002, last revised August 23, 2004, Sheets 8-12 of 15 (4.4.6 Transmission Line Easement Area 7)

10. Plan of Plisga & Day, Land Surveyors entitled "Boundary Survey Plan of Transmission Line Easements & Substation Easements on land of Maine Timberlands Company TA R7, Medway and T2 R9 NWP for Great Lakes Hydro America, LLC, consisting of 4 sheets (4.7 Transmission Line Easement)

11. Plan of Plisga & Day, Land Surveyors entitled "North Twin Dam & Transmission Line, North Twin Lake to Millinocket Great Northern Paper Company, TWP 3 Indian Purchase & Millinocket, Maine for Great Lakes Hydro America, LLC, consisting of 4 Sheets.

12. Plan of Bridgham Engineering and Land Surveying entitled "Survey Plat of Transmission Line from North R.O.W. of Route 11 to McKay Station for Great Northern Paper Co., Inc., Sheets 1 through 4. (4.6 Transmission Line Easement; Ripogenus Transmission Line).

**SECTION II**

Certain lots or parcels of land situated in Penobscot, Piscataquis, and Somerset Counties, Maine, and flowage rights in Aroostook County, Maine, all as more fully described in this Schedule A.

Reference is made to deed from Great Northern Paper, Inc. ("GNP") and Maine Timberlands Company ("MTC") to GNE, LLC ("GNE") dated January 31, 2002, and recorded in the Penobscot County Registry of Deeds in Book 8063, Page 98, the Piscataquis County Registry of Deeds in Book 1366, Page 001, and the Somerset County Registry of Deeds in Book 2907, Page 340, as affected by that certain Corrective and Confirmatory Deed from Katahdin Paper Company LLC, Katahdin Timberlands LLC and Katahdin Forest Management LLC to Great Lakes Hydro America, LLC, ("GLHA") dated as of May 27, 2004, and recorded in said Penobscot County Registry of Deeds in Book 9349, Page 1; the Piscataquis County Registry of Deeds in Book 1561, Page 10; the Somerset County Registry of Deeds in Book 3313, Page 1, and also in the Aroostook County Registry of Deeds in Book 3975, Page 158. Further reference is made to the deed from Great Northern Paper, Inc. to Katahdin Paper Company LLC ("KPC") dated as of April 29, 2003, and recorded in the Penobscot County Registry of Deeds in Book 8702, Page 146, the Piscataquis County Registry of Deeds in Book 1461, Page 154, and the Somerset County Registry of Deeds in Book 3109, Page 149. Also, reference is made to the deed from Maine Timberlands Company to Katahdin Timberlands LLC ("KT') dated as of April 29, 2003, and recorded in the Penobscot County Registry of Deeds in Book 8702, Page 181, the Piscataquis County Registry of Deeds in Book 1461, Page 189, and the Somerset County Registry of Deeds in Book 3109, Page 184, and deed from Katahdin Timberlands LLC to Katahdin Forest Management LLC (collectively with Katahdin Timberlands LLC, "KT") dated February 26, 2004, and recorded in the Penobscot County Registry of Deeds in Book 9215, Page 177, the Piscataquis County Registry of Deeds in Book 1536, Page 177, and the Somerset County Registry of Deeds in Book 3273, Page 52.

Unless expressly stated otherwise herein, the terms KPC, KT, GNP, MTC, GLHA and GNE used herein shall be deemed to include the respective successors and assigns of each party.

EXCEPTING, however, the rights and interests granted in (1) Corrective Deed from GLHA to KT dated February 24, 2004 and recorded in the Penobscot County Registry of Deeds in Book 9214, Page 303, the Piscataquis County Registry of Deeds in Book 1535, Page 255, and the Somerset County Registry of Deeds in Book 3272, Page 344, and (2) Corrective Easement Deed from GLHA to KT dated as of May 27, 2004 and recorded in the Penobscot County Registry of Deeds in Book 9349, Page 156, the Piscataquis County Registry of Deeds in Book 1561, Page 1, and the Somerset County Registry of Deeds in Book 3313, Page 156.

1. **SOMERSET COUNTY**

1.1 Canada Falls

The land and interests in land including, without limitation, the dam and dam structures including a boat launch and canoe portage area at the outlet of Canada Falls Lake, in the Township of Pittston Academy Grant, County of Somerset, State of Maine being part of Township 2 Range 4 NBKP, also being part of the land now or formerly owned by GNP and being bounded and described more particularly as follows: Beginning, at a painted masonry nail set into the concrete abutment, on the northwest end of Canada Falls Lake Dam, located at UTM coordinate 16,666,989.55 North and 1,385,671.88 East, as acquired by G.P.S.;

thence, westerly, along the high water mark of Canada Falls Lake, at an elevation equal to the N.F.P.E. of 1238 feet MSL U.S.G.S., an approximate distance of 481 feet;

thence, along a UTM Grid north bearing of North 02°44'20" East, a distance of 10 feet to a #5 rebar set and capped #1027, having a tie-line bearing of South 78°07'40" West, a distance of 440.49 feet from the above mentioned masonry nail;

thence, continuing, North 02°44'20" East, a distance of 158.50 feet to a rebar set;

thence, continuing, North 02°44'20" East, a distance of 10 feet to the southerly shoulder of the Canada Falls Road; thence, easterly, along the southerly shoulder of the Canada Falls Road, a distance of 603 feet;

thence, South 82°23'20" East, a distance of 7 feet to a rebar set, having a tie-line bearing of North 75°33' 10" East, and a distance of 536.35 feet from last mentioned rebar set;

thence, continuing, South 72°00'40" East, a distance of 940.74 feet to a rebar set; thence, South 07°09'10" West, a distance of

484.54 feet to a rebar set;

thence, continuing, South 07'09'10" West, a distance of 11 feet to the high water mark of Canada Falls Lake;

thence, northwesterly and westerly, along the high water mark of Canada Falls Lake, at an elevation equal to the N.F.P.E. of 1238 feet MSL U.S.G.S., and along a low concrete dam an approximate distance of 592 feet to a painted masonry nail set into the southerly concrete wing wall of Canada Falls Dam, being on a tie-line bearing of North 44°03'40" West, and a distance of 543.20 feet from the last mentioned rebar set;

thence, along the face of the dam, North 72°00'40" West, a distance of 580.97 feet to the point of beginning. The above described parcel of land containing 8 acres, more or less.

The above-described parcel of land is based on a field survey conducted under the supervision of Daniel O. Bridgham, PLS #1027, and shown on a Plat having a revised date of August 12, 1999 and a published date of August 29, 2001. All bearings are calculated from UTM Grid, NAD27 Census datum, Zone 19 North. UTM coordinates are expressed in feet. Location Control by Trimble XL Pro GPS, with a minimum of 600 observations. Expected repeatability is 1.0 feet. Ground traverse was performed with an EDM. All monuments set were 5/8 inch metal rebar with yellow plastic caps affixed to them, with "D. Bridgham, PLS #1027" imprinted in the caps.

TOGETHER WITH:

i. Canada Falls Dam and dam structures.
ii. All of the land that lies between the high water mark of Canada Falls Lake which high water mark is at an elevation equal to the N.F.P.E. of 1238 feet MSL U.S.G.S. datum and a line lying ten feet horizontally outside of said high water mark of Canada Falls Lake.
iii. All islands within Canada Falls Lake.
iv. Canada Falls Lake and the bed of Canada Falls Lake.
v. All lands located upstream of the Canada Falls Dam that have been flowed by the dam.

vi. All flowage rights, whether acquired by Legislative Charter, by deed, by prescription or otherwise, over lands located upstream or downstream of the dam that, historically or currently have been flowed or flooded by Canada Falls Dam.

vii. A flowage easement for flowage of any lands conveyed herein, upstream or downstream of the dam, that may from time to time be flowed or flooded in the future by Canada Falls Dam, but only to the extent that such lands historically or currently have been flowed or flooded by this dam, and provided that such flowage easements for land upstream of the dam will not extend further than 1243 feet MSL U.S.G.S. datum.

The interests described in paragraphs (i) through (vii) affect property situated in Pittston Township (T2 R4 NBKP) and Soldiertown Township (T 2 R 3 NBKP) and may affect property situated in Hammond Township (T3 R4 NBKP).

Together with all flowage rights and interests in Alderbrook Township, whether acquired by Legislative Charter, by deed, by prescription or otherwise, over lands located upstream or downstream of the dam that historically or currently have been flowed or flooded by Canada Falls Dam.

1.2 Seboomook Lake

The land and interests in land including without limitation the dam and dam structures including a boat launch and canoe portage area at the outlet of Seboomook Lake, in Seboomook Township (T0 R4 NBKP), County of Somerset, State of Maine, being part of the land now or formerly owned by Great Northern Paper, Inc. and being bounded, and described as follows:

1.2.1 Seboomook Lake Dam

Beginning, at a painted masonry nail set into the concrete abutment, on the northwest side of the Seboomook Lake Dam, located at UTM coordinate 16,680,482.90 North and 1,453,542.18 East, as acquired by G.P.S.;

thence, southwesterly along the high water mark of Seboomook Lake, at an elevation equal to the N.F.P.E. of 1073 feet MSL

U.S.G.S. datum, an approximate distance of 729 feet;

thence, along a UTM Grid bearing of North 46°40'30" West, a distance of 29 feet to a #5 rebar set and capped #1027, located at UTM coordinate 16,680,154.06 North and 1,452,935.36 East, also having a tie-line bearing of South 61°32'50" West, and a distance of 690.19 feet from the above mentioned masonry nail;

thence, North 43°19'30" East, a distance of 1320.00 feet to a rebar set;

thence, South 46°40'30" East, a distance of 1471.00 feet to a #5 rebar set and capped #1027; thence, South 44°40'50" West, a distance of 423.82 feet to a rebar set;

thence, continuing, South 44°40'50" West, a distance of 10 feet to the northerly shoulder of the Seboomook Road;

thence, westerly along the northerly shoulder of the Seboomook Road, a distance of 258 feet, to the intersection of the northerly shoulder of the Seboomook Road and the centerline of the Seboomook Dam Road;

thence, continuing along the northerly shoulder of the Seboomook Road, a distance of 745 feet;

thence, North 46°40'30" West, a distance of 10 feet to a rebar set, having a tie-line bearing of South 75°10'30" West, and a distance of 1018.79 feet from the last mentioned rebar set;

thence, continuing, North 46°40'30" West, a distance of 44 feet to the high water mark of Seboomook Lake;

thence, easterly and northerly, along the high water mark of Seboomook Lake, at an elevation equal to the N.F.P.E. of 1073 feet MSL U.S.G.S. datum, an approximate distance of 777 feet to a painted masonry nail set into the southeasterly concrete abutment of the Seboomook Lake Dam, having a tie-line of North 26°30'40" East, and a distance of 651.39 feet from the last mentioned rebar set;

thence, North 46°32'50" West, a distance of 519.15 feet to the point of beginning. The above described parcel of land containing

27.3 acres +/-.

The above-described parcel of land is based on a field survey conducted under the supervision of Daniel O. Bridgham, PLS #1027, and shown on a Plat, having a revised dated of August 12, 1999 and a published date of August 30, 2001. All bearings are calculated from UTM Grid, NAD27 Census datum. Zone 19 North. UTM coordinates are expressed in feet. Location Control by Trimble XL Pro GPS, with a minimum of 600 observations. Expected repeatability is 1.0 feet. Ground traverse was performed with an EDM. All monuments set are 5/8 inch metal rebar with yellow plastic caps affixed to them, with "D. Bridgham, PLS #1027" imprinted in the caps.

TOGETHER WITH:

i. Seboomook Lake Dam and dam structures.
ii. All of the land that lies between the high water mark of Seboomook Lake which high water mark is at an elevation equal to the N.F.P.E. of 1073 feet MSL U.S.G.S. datum and a line lying ten feet horizontally outside of said high water mark of Seboomook Lake.
iii. All islands within Seboomook Lake.
iv. Seboomook Lake and the bed of Seboomook Lake.
v. All lands upstream of the Seboomook Lake Dam that have been flowed by the dam.
vi. All flowage rights, whether acquired by Legislative Charter, by deed, by prescription or otherwise, over lands located upstream or downstream of the dam that, historically or currently, have been flowed or flooded by Seboomook Lake Dam.
vii. A flowage easement for flowage of any lands conveyed herein, upstream or downstream of the Seboomook Lake Dam, that may from time to time be flowed or flooded in the future by Seboomook Lake Dam, but only to the extent that such lands historically or currently have been flowed or flooded by this dam, and provided that such flowage easements for land upstream of the dam will not extend further than 1078.5 feet MSL U.S.G.S. datum.

The interests described in paragraphs (i) through (vi) affect property situated in Seboomook Township (T0 R4 NBKP), Boyd Township (T1 R4 NBKP) and Pittston Township (T2 R4 NBKP).

1.2.2 Pittston Boat Launch

The land and interests in land, including a boat launch area on the southerly shore of Seboomook Lake, in the township of Pittston Academy Grant (T2 R4 NBKP), being located, bounded, and described as follows:

A certain parcel of land situated in Pittston Academy Grant (T2 R4 NBKP), County of Somerset, State of Maine being part of the land now or formerly owned by GNP being bounded and described more particularly as follows:

Beginning at a #5 rebar set in the ground and capped #1027, located at UTM coordinate 16,674,648.42 North and 1,396,754.26 East, having a UTM Grid tie-line bearing of, South 58°44'20" East, and a distance of 42.64 feet to a painted nail set into the root of a 5" white birch tree, said nail being further witnessed as having a tie-line bearing of, South 52°12'30" East and a distance of,

190.66 feet to a painted nail set into the root of a 15" spruce tree, marked with a "P";

thence, North 34°35'20" East, a distance of 10 feet to the high water mark of Seboomook Lake, at an elevation equal to the

N.F.P.E. of 1073 feet MSL U.S.G.S.;

thence, southeasterly along the high water mark of said Lake, an approximate distance of 279 feet; thence, South 34°00'50" West, a distance of 10 feet to a rebar set, having a tie-line bearing of South 55° 59'10" East, and a distance of 279.00 feet from above mentioned rebar set;

thence, continuing, South 34°00'50" West, a distance of 131.00 feet to a rebar set, having a tie-line bearing of, North 43°08'30" West, a distance of 566.62 feet from the intersection of the centerlines of the Old Pittston Road and an unnamed road;

thence, North 59°27'10" West, a distance of 281.00 feet to a rebar set; thence, North 34°35'20" East, a distance of 148.00 feet to the point of beginning. The above described parcel of land containing 1 acre +/-

The above-described parcel of land is based on a field survey conducted under the supervision of Daniel O. Bridgham, PLS #1027, and shown on a Plat having a revised date of August 11, 1999 and a published date of August 29, 2001. All bearings are calculated from UTM Grid, NAD27 Conus Datum, Zone 19 North. UTM coordinates are expressed in feet. Location Control by Trimble XL Pro GPS, with a minimum of 600 observations. Expected repeatability is 1.0 feet. Ground traverse was performed with EDM. All monuments set are 5/8 inch metal rebar with yellow plastic caps affixed to them, with "D. Bridgham, PLS #1027" imprinted in the caps.

1.3 Long Pond Dam

The land and interests in land including, without limitation, the dam and dam structures and an informal boat launch area at the outlet of Long Pond, in Dole Brook Township T3 R5 NBKP, County of Somerset, State of Maine, being part of the land now or formerly owned by GNP and being bounded and described more particularly as follows:

Beginning, at a masonry nail in the concrete abutment, on the southwest side of the Long Pond Dam, located at UTM coordinate 16,708,393.04 North and 1,343,096.49 East, as acquired by G.P.S.;

thence, southerly along the high water mark of Long Pond, at an elevation equal to N.F.P.E. of 1491 feet MSL U.S.G.S., an approximate distance of 900 feet to a point on the shore;

thence, along a UTM Grid bearing of, South 37°19'30" West, a distance of 30 feet to a #5 rebar set and capped #1027, located at UTM coordinate 16,707,591.24 North and 1,343,008.43 East, also having a tie-line bearing of, South 06°16'00" West, a distance of

806.62 feet from above mentioned masonry nail; thence, continuing, South 37°19'30" West, a distance of 418.68 feet to a rebar set;

thence, continuing, South 37°19' 30" West, a distance of 15 feet to the lakeside shoulder of the Cheney Pond Road;

thence, northerly along the lakeside shoulder of said Road, a distance of 897 feet, to the intersection of the lakeside shoulder of the Cheney Pond Road and the extension of the centerline of the Gravel Pit Road;

thence, continuing in an easterly direction along the lakeside shoulder of the Cheney Pond Road, a distance of 834 feet to the intersection of the Cheney Pond Road, and the extension of the centerline of the Dole Pond Road;

thence, continuing in an easterly direction along the lakeside shoulder of the Long Pond Road, a distance of 486 feet; thence, South 37°19'30" West, a distance of 15 feet to a rebar set;

thence, continuing, South 37°19'30" West, a distance of 150.11 feet to a rebar set;

thence, continuing, South 37°19'30" West, a distance of 30 feet to the high water mark of Long Pond;

thence, northwesterly and westerly along the high water mark of Long Pond, at an elevation equal to N.F.P.E. of 1491 feet MSL U.S.G.S., an approximate distance of 500 feet, to a painted masonry nail set into the northeast end of the concrete abutment of Long Pond Dam, having a tie- line bearing of, North 87°01'50" West, and a distance of 491.41 feet from the last mentioned rebar set;

thence, South 84°28'20" West, a distance of 14.28 feet to the point of beginning. The above described parcel of land containing

10.8 acres more or less.

The above-described parcel of land is based on a field survey conducted under the supervision of Daniel O. Bridgham, PLS #1027, and shown on a Plat having revised dates of August 11, 1999 and September 20, 2001 and a published date of August 29, 2001. All bearings are calculated from UTM Grid, NAD27 Census datum, Zone 19 North. UTM coordinates are expressed in feet.

Location Control by Trimble XL Pro GPS, with a minimum of 600 observations. Expected repeatability is 1.0 feet. Ground traverse was performed with and EDM. All monuments set are 5/8 inch metal rebar with yellow plastic caps affixed to them, with "D. Bridgham, PLS #1027" imprinted in the caps.

TOGETHER WITH:

i. Long Pond Dam and dam structures.
ii. An easement over lands located upstream and in the vicinity of the Long Pond Dam for purposes of maintaining, repairing and replacing Long Pond Dam and dam structures provided that any new dam must be located within the vicinity of the existing dam.
iii. All flowage rights, whether acquired by Legislative Charter, by deed, by prescription or otherwise, over lands located upstream or downstream of the Long Pond Dam that historically or currently have been flowed or flooded by Long Pond Dam.
iv. A flowage easement for flowage of any lands conveyed herein, upstream or downstream of the dam, that may from time to time be flowed or flooded in the future by Long Pond Dam, but only to the extent that such lands historically or currently have been flowed or flooded by this dam, and provided that such flowage easements for land upstream of the dam will not extend further than 1494.0 MSL U.S.G.S. datum.

The interests described in paragraphs (i) through (iv) affect property situated in Dole Brook Township (T 3 R 5 NBKP).

Expressly including in the property conveyed to GNE all right, title and interest, if any, in and to the bed of Long Pond.

1.4 Penobscot Lake

The land and interests in land including, without limitation, the dam and dam structures at the outlet of Penobscot Lake, located in Prentiss Township, County of Somerset, State of Maine being part of T4 R4 NBKP, also being part of the land now or formerly owned by GNP and being bounded and described more particularly as follows:

Beginning, at a painted masonry nail set into the concrete abutment, on the northeast side of Penobscot Lake Dam, located at UTM coordinate 16,681,838.98 North and 1,329,503.65 East, as acquired by G.P.S.;

thence, northeasterly along the high water mark of Penobscot Lake, at an elevation equal to the N.F.P.E. of 1603 feet MSL U.S.G.S., an approximate distance of 476 feet to a point on the shore;

thence, along a UTM Grid bearing of, South 17°57'40" East, a distance of 14 feet to a #5 rebar set and capped #1027, located at UTM coordinate 16,682,126.64 North and 1,329,869.51 East, also having a tie-line bearing of North 51°49'20" East, and a distance of 465.41 feet from the above mentioned masonry nail;

thence, continuing, South 17°57'40" East, a distance of 406.00 feet to a rebar set; thence, South 68°54'40" West, a distance of

777.33 feet to a rebar set;

thence, North 17°57'40" West, a distance of 501.00 feet to a rebar set; thence, North 72°02'20" East, a distance of 112.00 feet to a rebar set;

thence, continuing, North 72°02'20" East, a distance of 30 feet to the high water mark of Penobscot Lake;

thence, southerly and easterly along the high water mark of Penobscot Lake, at an elevation equal to the N.F.P.E. of 1603 feet MSL U.S.G.S., an approximate distance of 375 feet to a painted masonry nail set into the southwest concrete abutment of Penobscot Lake Dam, having a tie-line bearing of, South 61°56' 30" East, a distance of 301.28 feet from last mentioned rebar set; thence, North 61°32'00" East, a distance of 18.54 feet to the point of beginning. The above described parcel of land containing 6.3 acres more or less.

The above-described parcel of land is based on a field survey conducted under the supervision of Daniel O. Bridgham, PLS #1027, and shown on a Plat having a revised date of August 12, 1999 and a published date of August 29, 2001. All bearings are calculated from UTM Grid, NAD27 Census datum, Zone 19 North. UTM coordinates are expressed in feet. Location Control by Trimble XL Pro GPS, with a minimum of 600 observations. Expected repeatability is 1.0 feet. Ground traverse was performed with and EDM. All monuments set are 5/8 inch metal rebar with yellow plastic caps affixed to them, with "D. Bridgham, PLS #1027" imprinted in the caps.

TOGETHER WITH:

i. Penobscot Lake Dam and dam structures.

ii. An easement over lands located upstream and in the vicinity of the Penobscot Lake Dam for purposes of maintaining, repairing and replacing Penobscot Lake Dam and dam structures provided that any new dam must be located within the vicinity of the existing dam.

iii. All flowage rights, whether acquired by Legislative Charter, by deed, by prescription or otherwise, over lands located upstream or downstream of the Penobscot Lake Dam that historically or currently have been flowed or flooded by Penobscot Lake Dam.

iv. A flowage easement for flowage of any lands conveyed herein, upstream or downstream of the dam, that may from time to time be flowed or flooded in the future by Penobscot Lake Dam, but only to the extent that such lands historically or currently have been flowed or flooded by this dam, and provided that such flowage easements for land upstream of the dam will not extend further than 1607.4 MSL U.S.G.S. datum.

The interests described in paragraphs (i) through (iv) affect property situated in Prentiss Township (T4 R4 NBKP), Hammond Township (T 3 R 4 NBKP), Dole Brook Township (T3 R5 NBKP), and Penobscot Lake Township (T4 R5 NBKP).

Expressly including in the property conveyed to GNE all right, title and interest, if any, in and to the bed of Penobscot Lake. 1.5 Dole Pond Dam

The land and interests in land including, without limitation, the dam and dam structures at the outlet of Dole Pond, in the Township

of Dole Brook, T3 R5 NBKP, County of Somerset, State of Maine being part of the land now or formerly owned by GNP and being bounded and described more particularly as follows:

Beginning at a painted masonry nail in the concrete abutment, on the northwest side of the Dole Pond Dam, located at UTM coordinate 16,718,356.14 North and 1,337,148.76 East, as acquired by G.P.S.; thence, southwesterly along the high water mark of Dole Pond, at an elevation equal to N.F.P.E. of 1413 feet MSL U.S.G.S., an approximate distance of 252 feet;

thence; along a UTM Grid bearing of, North 41°47'30" West, a distance of 10 feet to a #5 rebar set and capped #1027, located at UTM coordinate 16,718,270.58 North and 1,336,933.34 East, having a tie-line bearing of South 68°20'10" West, and a distance of

231.79 feet from the above mentioned masonry spike;

thence, continuing, North 41°47'30" West, a distance of 325.46 feet to a rebar set;

thence, continuing, North 41°47'30" West, a distance of 10 feet to the southeast shoulder of the Dumas Road;

thence, easterly along the southerly shoulder of the Dumas Road 181 feet to the intersection of the southerly shoulder on said Dumas Road and the centerline of the Boundary Road;

thence, continuing easterly along the southerly shoulder of said Dumas Road, 373 feet;

thence, South 42°09'40" East, a distance of 10 feet to a rebar set, having a tie-line bearing of, North 69°24'00" East, a distance of

526.41 feet from the last mentioned rebar;

thence, continuing, South 42°09'40" East, a distance of 1108.42 feet to a rebar set;

thence, continuing, South 42°09'40" East, a distance of 10 feet to the northerly shoulder of the Dole Brook Road;

thence, along the northerly shoulder of said Dole Brook Road, South 50°14'30" West, a distance of 182 feet to the intersection of the northerly shoulder of said Road and the centerline of the Boundary Road; thence, South 50°14'30" West, a distance of 46.17 feet to a rebar set;

thence, continuing, South 50°14'30" West, a distance of 273.83 feet to a rebar set; thence, North 41°47'30" West, a distance of 191.62 feet to a rebar set;

thence, North 41°47'30" West, a distance of 10 feet to the high water mark of Dole Pond;

thence, northeasterly and northwesterly, along the high water mark of Dole Pond, at an elevation equal to N.F.P.E. of 1413 feet MSL U.S.G.S., in a generally northerly direction, to a painted masonry nail in the southeast concrete abutment of Dole Pond Dam, located at UTM 16,718,336.60 North and 1,337,169.57 East, having a tie-line bearing of North 23°25'20" West, and a distance of 698.59 feet from the last above mentioned rebar set;

thence, North 46°48'40" West, a distance of 28.55 feet to the point of beginning. The above described parcel of land containing 12 acres more or less.

The above-described parcel of land is based on a field survey conducted under the supervision of Daniel O. Bridgham, PLS #1027, and shown on a Plat having a revised date of August 11, 1999 and a published date of August 29, 2001. All bearings are calculated from UTM Grid, NAD27 Census datum, Zone 19 North. UTM coordinates are expressed in feet. Location Control by Trimble XL Pro GPS, with a minimum of 600 observations. Expected repeatability is 1.0 feet. Ground traverse was performed with and EDM.

All monuments set are 5/8 inch metal rebar with yellow plastic caps affixed to them, with "D. Bridgham, PLS #1027" imprinted in the caps.

TOGETHER WITH:

i. Dole Pond Dam and dam structures.
ii. All of the land that lies between the high water mark of Dole Pond which high water mark is at an elevation equal to the N.F.P.E. of 1413 feet MSL U.S.G.S. datum and a line lying ten feet

horizontally outside of said high water mark of Dole Pond.

iii. All islands within Dole Pond.

iv. Dole Pond and the bed of Dole Pond.

v. All lands located upstream of the Dole Pond Dam that have been flowed by the dam.

vi. All flowage rights, whether acquired by Legislative Charter, by deed, by prescription or otherwise, over lands located upstream or downstream of the Dole Pond Dam that historically or currently have been flowed or flooded by Dole Pond Dam.

vii. A flowage easement for flowage of any lands conveyed herein, upstream or downstream of the dam, that may from time to time be flowed or flooded in the future by Dole Pond Dam, but only to the extent that such lands historically or currently have been flowed or flooded by this dam, and provided that such flowage easements for land upstream of the dam will not extend further than 1417.5 MSL U.S.G.S. datum.

The interests described in paragraphs (i) through (vii) affect property situated in Dole Brook Township (T3 R5 NBKP).

## 2. PISCATAQUIS COUNTY

### 2.1 Caucomgomoc Lake Boat Launch

A certain parcel of land situated in Township T6 R15 WELS, County of Piscataquis, State of Maine being part of the land now or formerly owned by Great Northern Paper, Inc. and being bounded and described more particularly as follows:

Commencing, at the intersection of the Caucomgomoc Depot Road so-called, and an unnamed road leading to the East, this intersection being located approximately 455 feet northerly of the Township 6, Range 15 WELS North Town Line;

Thence, easterly and southeasterly along said unnamed road a distance of 2230 feet to the intersection of the unnamed road and the North Town Line of Township 6, Range 15 WELS;

Thence, easterly along the painted North Town Line of Township 6. Range 15 WELS, a distance of 248 feet to a #5 rebar set and capped #1027, being approximately 30 feet from the high water mark of Caucomgomoc Lake, located at UTM coordinate 16,790,336.61 North and 1,479,070.26 East, as acquired by G.P.S.;

Thence, along a UTM Grid tie-line bearing of, South 50°21'20" East, and a distance of 255.62 feet to a #5 rebar set in the ground, being the POINT OF BEGINNING, also being a tie-line bearing of, North 16°17' 50" West, and a distance of 30.60 feet from a painted spike set in the root of a 20" yellow birch tree, said #5 rebar located at UTM coordinate 16,790,173.52 North and 1,479,267.09 East as acquired by G.P.S., further witnessed by a 15" spruce tree, having a painted nail pinned in a root located at UTM coordinate 16,790,110.37 North and 1,479,381.67 East as acquired by G.P.S. being on a tie line of North 61°08'20" West, and a distance of 130.83 feet;

Thence, North 35°20'30" East, a distance of 10 feet to the high water mark of Caucomgomoc Lake; Thence, southeasterly along the high water mark of Caucomgomoc Lake, at an elevation equal to the N.F.P.E. of 998 feet MSL U.S.G.S. datum;

Thence, South 35°20'30" West, a distance of 10 feet to a rebar set, located at UTM coordinate 16,790,063.85 North and 1,479,440.29 East, being a tie-line bearing of, South 57°39'30" East, a distance of 205.00 feet from the above mentioned rebar set; Thence, South 35°20'30" West, a distance of 200.00 feet to a rebar set;

Thence, North 54°35'00" West, a distance of 204.72 feet to a rebar set;

Thence, North 35°20'30" East, a distance of 189.00 feet to the POINT OF BEGINNING. The above described parcel of land containing 1 acre +/.

The above-described parcel of land is based on a field survey conducted under the supervision of Daniel O. Bridgham, PLS #1027, and shown on a Plat having a revised date of August 11, 1999 revised through May 22, 2002. All bearings are calculated from UTM Grid, NAD27 Census datum, Zone 19 North. UTM coordinates are expressed in feet. Location Control by Trimble XL Pro GPS, with a minimum of 600 observations. Expected repeatability is 1.0 feet. Ground traverse by EDM. All monuments set are 5/8 inch metal rebar with yellow plastic caps affixed to them, with "D. Bridgham, PLS #1027" imprinted in the caps. Entrance road data were acquired and supplied by Bowater staff.

2.2 Caucomgomoc Lake Dam Lot

A certain lot or parcel of land with the buildings and improvements thereon, situated in the north half of Township 6, Range 14, W.E.L.S., County of Piscataquis, State of Maine and being more particularly described as follows:

Beginning at a point 50 feet easterly of the centerline of a gravel road, said point being located S 16°01'00" E, a distance of 1485.05 feet from an "X" chiseled in the top of a concrete curb at the northwest corner of the Caucomgomoc Dam;

Thence N 10°06'23" E, at all times 50 feet from the centerline of said gravel road, a distance of 816.41 feet to the point of tangency of a curve to the left;

Thence in a general northwesterly direction, at all times 50 feet from the centerline of said gravel road, along said curve to the left with a radius of 400.00 feet an arc distance of 254.12 feet to a point of tangency;

Thence N 26°17'35" W, at all times 50 feet from the centerline of said gravel road, a distance of 58.37 feet to a point of tangency of a curve to the left;

Thence in a general northwesterly direction, at all times 50 feet from the centerline of said gravel road, along said curve to the left with a radius of 221.32 feet an arc distance of 199.00 feet to a point of tangency;

Thence N 77°48'37" W, at all times 50 feet from the centerline of said gravel road, a distance of 172.10 feet to a point defined by the intersection of this line with a line 70 feet easterly of and parallel to the easterly face of said Caucomgomoc Dam;

Thence N 23°53'02" W, parallel to and 70 feet distant from said easterly face of Caucomgomoc Dam, crossing Caucomgomoc Stream, a distance of 277.05 feet to a point defined by the intersection of this line with a line offset 50 feet easterly of said gravel road;

Thence N 27°41'11" E, at all times 50 feet from the centerline of said gravel road, a distance of 489.09 feet to a point of tangency of a curve to the right;

Thence in a general northeasterly direction, at all times 50 feet from the centerline of said gravel road, along said curve to the right with a radius of 210.00 feet an arc distance of 195.48 feet to a point of tangency;

Thence N 81°01'11" E, at all times 50 feet from the centerline of said gravel road, a distance of 265.43 feet to a point; Thence N 8'58'49" W, crossing said gravel road, a distance of 100.00 feet to a point;

Thence S 81°01'11" W, at all times 50 feet from the centerline of said gravel road, a distance of 265.43 feet to a point of tangency of a curve to the left;

Thence in a general southwesterly direction, at all times 50 feet from the centerline of said gravel road, along said curve to the left with a radius of 310.00 feet an arc distance of 288.56 feet to a point of tangency;

Thence S 27°41'11" W, at all times 50 feet from the centerline of said gravel road, a distance of 524.10 feet to the low water mark of Caucomgomoc Lake;

Thence in a general southerly direction, by and along said low water mark, a distance of 83 feet, more or less, to a point defined by the intersection of said low water mark with a line 50 feet westerly of and parallel to the westerly face of said Caucomgomoc Dam, said point being located S 14°03'11" W, a distance of 82.44 feet from the last described point;

Thence S 24°06'27" E, 50 feet distant from and parallel to said westerly face of Caucomgomoc Dam, a distance of 290.97 feet to a point defined by the intersection of this line with a line offset 50 feet westerly of said gravel road;

Thence S 77°48'37" E, at all times 50 feet from the centerline of said gravel road, a distance of 271.39 feet to a point of tangency of a curve to the right;

Thence in a general southeasterly direction, at all times 50 feet from the centerline of said gravel road, along said curve to the right with a radius of 121.32 feet an arc distance of 109.08 feet to a point of tangency;

Thence S 26°17'35" E, at all times 50 feet from the centerline of said gravel road, a distance of 58.37 feet to a point of tangency of a curve to the right;

Thence in a general southerly direction, at all times 50 feet from the centerline of said gravel road, along said curve to the right with a radius of 300.00 feet an arc distance of 190.59 feet to a point of tangency; Thence S 10°06'23" W, at all times 50 feet from the centerline of said gravel road, a distance of 816.41 feet to a point;

Thence S 79°53'37" E, crossing said gravel road, a distance of 100.00 feet to the point of beginning; Containing 6.72 acres, more or less.

Subject to the rights of others in and to the gravel road as referenced herein.

Being the same parcel described as the eighth parcel in a deed from Cassidy, et. al. to Great Northern Nekoosa Corporation dated December 29, 1988 and recorded in the Piscataquis County Registry of Deeds in Book 708, Page 162.

Curve data cited herein are based on field location of existing gravel road. Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NED.

TOGETHER WITH:

i. Caucomgomoc Lake Dam and dam structures.
ii. All of the land that lies between the high water mark of Caucomgomoc Lake which high water mark is at an elevation equal to the N.F.P.E. of 998 MSL U.S.G.S. datum and a line lying ten feet horizontally outside of said high water mark of Caucomgomoc Lake.
iii. All islands within Caucomgomoc Lake.
iv. Caucomgomoc Lake and the bed of said lake.
v. All lands upstream of the Caucomgomoc Lake Dam that have been flowed by the dam.
vi. All flowage rights, whether acquired by Legislative Charter, by deed, by prescription or otherwise, over lands located upstream or downstream of the dam that, historically or currently, have been flowed or flooded by the Caucomgomoc Lake Dam.
vii. A flowage easement for flowage of any of the lands herein conveyed, upstream or downstream of the dam, that may from time to time be flowed or flooded in the future by this dam, but only to the extent that such lands historically or currently have been flowed or flooded by this dam, and provided that such flowage easements for land upstream of the dam will not extend further than 1005.5 MSL U.S.G.S. datum.
viii. Including, without limitation, all rights associated with the GNP Hydroelectric System previously retained and acquired by GNP in the following deeds recorded in the Piscataquis County Registry of Deeds: (i) deed dated February 23, 1983 and recorded at Book 537, Page 352; (ii) deed dated December 28, 1984 and recorded at Book 572, Page 189; (iii) deed dated

December 16, 1988 and recorded at Book 708, Page 174; and (iv) deed dated July 29, 1988 and recorded at Book 708, Page 78.

The interests described in paragraphs (i) through (vii) affect property situated in T6 R15 NE/2 WELS and T7 R15 E/2 WELS and may affect property in T6 R14 WELS and T7 R14 WELS.

2.3 Loon Lake Dam

A certain parcel of land, including without limitation, the dam and dam structures at the outlet of Loon Lake, situated in Township T6, R14 WELS and Township 6, Range 15 WELS. County of Piscataquis, State of Maine, being part of the land now or formerly owned by Great Northern Paper, Inc. and being bounded and described more particularly as follows:

Commencing at a painted nail found in the concrete abutment, on the northerly side of Loon Lake Dam, and located at UTM coordinate 16,760,313.33 North and 1,487,986.03 East, as acquired by G.P.S., this point of commencement is also North 30°05'20" West, along the Dam concrete abutment a distance of 37.59 feet from a second painted nail found in the concrete abutment;

Thence, to a #5 rebar set and capped #1027, located at UTM coordinate 16,760,313.78 North and 1,487,851.05 East, also being on a UTM Grid tie-line bearing of North 89°48'30" West, and a distance of 134.97 feet from the above-mentioned nail, this rebar being the true Point of Beginning;

Thence, North 13°29'50" West, a distance of 266.03 feet to a rebar set; Thence, North 82°00'40" East, a distance of 509.97 feet to a rebar set;

Thence, continuing North 82°00'40" East, a distance of 15 feet to the westerly shoulder of the Caucomgomoc Depot Road, so- called;

Thence, southerly along the westerly shoulder of said road 830 feet;

Thence, North 89°33'00" West, a distance of 15 feet, to a scribed and painted cedar post found labeled Cassidy, said post marking the easterly end of an existing painted and blazed lot line, and also having a tie line bearing of, South 9°34'20" East and a distance of 826.11 feet from the last mentioned rebar;

Thence, along the blazed and painted line, North 89°33'00" West, a distance of 451.97 feet to a rebar set, being the point of intersection of said blazed lot line and a blazed and painted Township Line;

Thence, continuing on the same course, North 89°33'00" West, an approximate distance of 50 feet, to the high water mark of Loon Lake at an elevation equal to the N.F.P.E. of 1027 feet MSL U.S.G.S. datum;

Thence, northerly and westerly along the high water mark of said Lake, at an elevation equal to the N.F.P.E. of 1027 feet MSL

U.S.G.S. datum to a painted masonry nail at the south end of Loon Lake Dam, also being on a tie-line bearing of, North 03°16'40" E, a distance of 449.05 feet from the last mentioned rebar;

Thence, continuing northerly along the westerly side of said Dam, North 30°05'20" W, a distance of 37.59' to a painted masonry nail on the northerly side of said Dam and also being the above mentioned point of commencement;

Thence, continuing northerly and westerly along the high water mark of said Lake, at an elevation equal to the N.F.P.E. of 1027 feet MSL U.S.G.S. datum to a point being South 13'29'50" East approximately 26 feet from the Point of Beginning;

Thence, North 13°29'50" West, a distance of approximately 26 feet to the Point of Beginning. The above described parcel of land containing 8 acres more or less.

Also including all of the dam structure westerly of the two painted masonry nails mentioned above.

The above described parcel of land is based on a field survey conducted under the supervision of Daniel O. Bridgham, PLS #1027, and shown on a Plat having a revised date of August 11, 1999 and revised on September 7, 2001 and revised on May 22, 2002. All bearings are calculated from UTM Grid, NAD27 Conus datum, Zone 19 North. UTM coordinates are expressed in feet. Location Control by Trimble XL Pro GPS, with a minimum of 600 observations. Expected repeatability is 1.0 feet. Ground traverse was performed with an EDM. All monuments set are 5/8 inch metal rebar with yellow plastic caps affixed to them, with "D. Bridgham, PLS #1027" imprinted in the caps.

TOGETHER WITH:

i. Loon Lake Dam and the dam structures.
ii. An easement over lands located upstream of and in the vicinity of Loon Lake Dam for purposes of maintaining, repairing and replacing Loon Lake Dam and dam structures, provided that any new dam must be located in the vicinity of the existing dam.
iii. All flowage rights, whether acquired by Legislative Charter, by deed, by prescription or otherwise, over lands located upstream or downstream of the Loon Lake Dam that, historically or currently have been flowed or flooded by Loon Lake Dam.
iv. A flowage easement for flowage of any of lands conveyed herein, upstream or downstream of Loon Lake Dam, that may from time to time be flowed or flooded in the future by said dam, but only to the extent that such lands historically or currently have been flowed or flooded by this dam, and provided that such flowage easements for land upstream of the dam will not extend further than 1030.0 MSL U.S.G.S. datum.

The interests described in paragraph (i) through (iv) affect property situated in T6 R14 S/2 WELS and T6 R15 NE/2 WELS. Expressly including in the property conveyed to GLHA all right, title and interest, if any, in and to the bed of Loon Lake.

2.4 Umbazooksus Lake

A certain parcel of land including, without limitation, the dam and dam structures, situated in Township 6, Range 13 WELS, County of Piscataquis, State of Maine, also being part of the land now or formerly owned by GNP bounded and described more particularly as follows:

Beginning at a railroad spike, set, on the southerly side of the Longley Stream Road near the westerly end of the bridge over the Umbazooksus Stream, near the high water mark of said stream, said railroad spike having an approximate UTM coordinate of N: 16,762,613.7, E: 1,548,532.0;

Thence, generally northerly, crossing said Longley Stream Road, to the high water mark of the connecting waterway between Umbazooksus Lake and Umbazooksus Cove, said high water mark being at an elevation of 941.59 feet MSL;

Thence, generally westerly, northerly and northeasterly along the westerly side of said connecting waterway, following said 941.59' contour to the remains of the dam at the southerly end of Umbazooksus Lake;

Thence, following the dam to the high water mark of said Umbazooksus Lake, said high water mark being at an elevation of 947.0 feet MSL;

Thence, generally northwesterly, northerly, southeasterly, and southerly around the body of Umbazooksus Lake, following said 947.0' contour, back to said dam;

Thence, following said dam to the easterly side of the connecting waterway between Umbazooksus Lake and Umbazooksus Cove, to the high water mark at 941.59 feet MSL;

Thence, generally southwesterly, along the easterly side of said connecting waterway, following said 941.59' contour, to a point near the east end of the Longley Stream Road Bridge;

Thence, crossing said Longley Stream Road , to a railroad spike, set, near the high water mark of

Umbazooksus Stream, aforementioned, said railroad spike having approximate UTM coordinates of N: 16,762,482.3, E: 1,548,254.3;

Thence, crossing said Umbazooksus Stream, South 64°40'50" West, a distance of 307.21 feet to the point of beginning.

The above described parcel containing approximately 120 acres in the connecting waterway, and approximately 1600 acres in Umbazooksus Lake.

The above described parcel of land is based on a field survey conducted under the supervision of Daniel O. Bridgham, PLS #1027, and shown on a Plat dated September 4, 2001. Coordinates are UTM feet Conus Datum, Zone 19 North. Location Control by Trimble XL Pro GPS, with a minimum of 600 observations.

TOGETHER WITH:

i. All flowage rights, whether acquired by Legislative Charter, by deed, by prescription or otherwise, over lands located upstream or downstream of the Umbazooksus Lake Dam that, historically or currently have been flowed or flooded by Umbazooksus Lake Dam.

ii. A flowage easement for flowage of any of lands conveyed herein, upstream or downstream of Umbazooksus Lake Dam, that may from time to time be flowed or flooded in the future by said clam, but only to the extent that such lands historically or currently have been flowed or flooded by this dam, and provided that such flowage easements for land upstream of the dam will not extend further than 947.0 MSL U.S.G.S. datum.

iii. All islands within Umbazooksus Lake.

2.5 T3 R11 Ripogenus Lake

Two certain parcels of land on the shore of Ripogenus Lake in Township T3 R11 WELS being a strip of land 250.00 feet wide extending from the High Water Line at an elevation of 941.59 MSL of said water body landward and to a line at all times 250.00 feet from said high water line of said water body.

2.5.1 North Shore

Beginning at a rebar set on the northerly shore of Ripogenus Lake, on a blazed and painted line found being the Town Line between T3 R11 and T3 R12 WELS, and at UTM coordinates of N 16671617.69, E 1590818.94 feet;

Thence, northerly along said Town Line to a point that is 250.00 feet from the high water line of said Lake; Thence, easterly and southerly along a line that is always 250.00 feet from said high water line of said Lake to intersect with the Ripogenus Dam Lot as surveyed by Bridgham;

Thence, continuing westerly along said Dam Lot, South 78°36'50" West, to a station set by Bridgham at UTM Coordinates of N 16669093.79, E 1595119.81 feet, and also on a tie line bearing of, South 59°35'40" E, a distance of 4986.70 feet from the above mentioned rebar;

Thence continuing southerly, South 19°42'30" West, to the high water line of said Lake;

Thence, westerly and northerly along said high water line to said Town Line; Thence, northerly along said Town Line to the Point of Beginning.

Subject to a 100.00 foot wide right-of-way for the Frost Pond Road as now located and described as follows:

Beginning at a point 50 feet southwesterly of the center line of said road, that is also 250.00 feet from the high water line of said Lake, and that is also, South 71°36'40" East, a distance of 2463.40 feet from the point of beginning described immediately above; Thence, crossing said Road to a point 50.00 feet northeasterly of the centerline of said Road being, North 85°26'00" East, a distance of 104.02 feet from

the last point;

Thence, continuing 50.00 feet from the center of said Road to a rebar set being South 25°40'10" East, a distance of 155.97 feet from the last point and located at UTM coordinates of N 16670840.45, E 1593156.53 feet;

Thence, continuing along said right-of-way to another rebar set being, South 51°37'10" East, a distance of 1091.56 feet;

Thence, continuing along said right-of-way to a point that is, South 37°59'40" East, a distance of 261.26 feet, said point also being

250.00 feet from the high water line of said Lake;

Thence, along said line always being 250.00 feet from said high water line and crossing said Road to a point that is, South 11°43'30" West, a distance of 120.22 feet, and on the other right-of-way line of said Road;

Thence, northwesterly along said other right-of-way and always 100.00 feet from the right-of-way line described immediately above to the point of beginning.

2.5.2 South Shore

Commencing at a railroad spike set on the South shore of Ripogenus Lake being at the point shown on the Survey of Ripogenus Dam by Bridgham, and at UTM coordinates of N 16667626.50, E 1594801.32 feet;

Thence, North 84°44'00" West, a distance of 50 feet, more or less, to a point at or near the high water line of Ripogenus Lake and the land described in Section 2.19 herein, such point being the POINT OF BEGINNING;

Thence, South 06°56'10" West along said land described in Section 2.19 to a point that is 250.00 feet measured perpendicularly, from the high water line of said Lake;

Thence, westerly and northerly along a line that is always 250.00 feet from said high water line of said Lake to the Town Line between T3-R11 and T3-R12 WELS;

Thence, northerly along said Town Line to a rebar set on the southerly shore of Ripogenus Lake on a blazed and painted line, and also being on a tie line bearing of, North 79'48'30" W, a distance of 3972.24 feet from the above mentioned Railroad Spike; Thence, northerly to the high water line of said Lake;

Thence, southerly and easterly along said high water line to the Ripogenus Dam Parcel and the POINT OF BEGINNING. Subject to a 100.00 foot wide right-of-way for the Golden Road as now located and described as follows; Beginning at a point 50 feet northeasterly of the center line of said road, that is 250.00 from the high water line of said Lake;

Thence, crossing said Road to a point 50.00 feet southwesterly of the center line of said Road being, South 61°42'30" West, a distance of 192.63 feet from the last point;

Thence, continuing along said right-of-way line that is 50.00 feet from the center of said Road to a rebar set being, North 89°57'10" West, a distance of 616.98 feet from the last point and located at UTM coordinates of N 16,667,183.89, E 1,593,846.30 feet; Thence, continuing along said right-of-way to another rebar set being, South 89°05'00" West, a distance of 651.47 feet;

Thence, continuing along said right-of-way to a point that is, North 88°10'50" West, a distance of 360.29 feet, said point also being

250.00 feet from the high water line of said Lake;

Thence, along said line always bring 250.00 feet from said high water line and crossing said Road to a point that is, North 50°30'20" West, a distance of 169.84 feet from the last point and being on the other right-of-way line of said Road;

Thence, southeasterly along said other right-of-way and always 100.00 feet from the right-of-way line described immediately above to the point of beginning.

2.6 T3 R12 Chesuncook Lake Area

Four certain parcels of land on Chesuncook Lake in Township T3 R12 WELS being strips of land 250.00 feet wide extending from the High Water Line at an elevation of 941.59 MSL of said water bodies landward and to a line at all times 250.00 feet from said high water line of said water body.

Excepting from the Chesuncook Lake area, that portion of the premises conveyed in deed from Great Lakes Hydro America, LLC to West Branch Historical Preservation Committee recorded on May 1, 2017 in the Piscataquis Registry of Deeds in Book 2488, Page 228, but reserving to Great Lakes Hydro America, LLC all appurtenant rights, flowage rights, and flowage easements as set forth therein.

Together with any and all right, title and interest of Katahdin Forest Management, LLC and the State of Maine, Department of Agriculture, Conservation and Forestry as set forth in Corrective Deed Confirming Boundary Line to Great Lakes Hydro America, LLC dated October 16, 2014 and recorded in the Piscataquis County Registry of Deeds in Book 2333, Page 160.

2.6.1 Northeast Shore First Parcel

Beginning at a cedar post found and rebar set on the northeasterly shore of Chesuncook Lake on the Town Line between T4 R12 and T3 R12 WELS at UTM coordinates of N 16689917.58, E 1561719.17 feet;

Thence, easterly along said Town Line to a point that is 250.00 feet from the high water line of said Lake; Thence, southeasterly along a line that is always 250.00 feet from said high water line of said Lake to a developed Lease;

Thence, along said Lease, South 50°32'10 West, to a rebar set;

Thence, continuing on the same course, a distance of 95.98 feet to a rebar set approximately 50 feet from the high water line on a high bank, said rebar being, South 42°16'40" East, a distance of 7231.38 feet from the point of beginning and also being the point of commencement for the next parcel described immediately below;

Thence, continuing on the same course to the high water line of said Lake;

Thence, northwesterly along said high water line of said Lake to the POINT OF BEGINNING.

2.6.2 Northeast Shore Second Parcel

Beginning at a rebar set on the northeasterly shore of Chesuncook Lake on the easterly side of said Lease referred to immediately above at UTM coordinates of N 16684437.67, E 1566854.50 feet, and also being, South 64°26'20" East, a distance of 300.00 feet from the point of commencement described immediately above;

Thence, easterly along said Lease Line, North 50°22'50" East, a distance of 125.07 feet to a rebar set; Thence, continuing on the same course to a point that is 250.00 feet from the high water line of said Lake; Thence, southeasterly along a line that is always

250.00 feet from said high water line of said Lake to the Division Line near the middle of T3 R12 WELS;

Thence, southerly along said Division Line to a rebar set at the high water line of said Lake on a

blazed and painted line being, South 49°22'40" East, a distance of 8779.76 feet from the point of beginning described immediately above;

Thence, continuing along said Town Line to the high water line of said Lake; Thence, continuing northwesterly along the high water line of said Lake;

Thence, North 50°22'50" E, approximately 50 feet to the POINT OF BEGINNING.

2.6.3 South Shore Parcel

Beginning at a rebar set at where the shores of Caribou and Chesuncook Lake meet in the northeast quarter of Caribou Lake at UTM coordinates of N 16667251.82, E 1563250.34 feet

Thence, northerly, easterly, and southerly along said high water line of Chesuncook Lake to the Division Line near the middle of T3 R12 WELS;

Thence, continuing southerly on the said Division Line to a point that is 250.00 feet from the high water line of said Lake; Thence, northerly, westerly, and southerly along a line that is always 250.00 feet from said high water line of said Lake; Thence, at right angles to the shore of said Lake Westerly to the POINT OF BEGINNING.

Excepting a parcel of leased land described as follows:

Beginning at a rebar found at the southwest corner of a lease being, North 07°59'30" East, a distance of 10804.05 feet from the point of beginning described immediately above, and also at UTM coordinates of N 16677950.97, E 1564752.25 feet;

Thence, along said lease, North 74°57'10 East, a distance of 143.91 feet to a rebar found;

Thence, continuing along said lease, North 75°03'00" East, a distance of 25.90 feet to the northwest corner of a second lease; Thence, along said second lease, South 34°35'30" East, a distance of 186.26 feet to a rebar found; Thence, continuing, North 58°52'00" East, a distance of 149.47 feet to a rebar found near the shore, Thence, continuing on the same course to the high water line of said Lake;

Thence, continuing westerly and southerly along the high water line of said Lake; Thence, North 74° 57' 10" East, to the POINT OF BEGINNING.

2.6.4 West Shore Parcel

Beginning at a cedar post found and rebar set on the West shore of Chesuncook Lake on the Division Line near the middle of T3- R12 WELS at UTM coordinates of N 16678721.42, E 1573518.49 feet; Thence, southerly along said Town Line to a point that is

250.00 feet from the high water line of said Lake;

Thence, northerly along a line that is always 250.00 feet from said high water line of said Lake to said Division Line;

Thence, southerly along said Line to a rebar set on the shore of said Lake, being North 02°23'00" West, a distance of 4327.45 feet from the point of beginning described immediately above;

Thence, southerly along said high water line of said Lake to the POINT OF BEGINNING. 2.6.5 West Shore Second Parcel (intentionally omitted)

2.6.6 Islands

Together with two islands with coordinates as follows:

# Northings Eastings

1 16680985.55 1570808.69 rebar set

2 16681735.28 1568909.56 rebar set

2.7 T4 R12 Chesuncook Lake Area

One certain parcel of land on the East shore of Chesuncook Lake in Township T4 R12 WELS being a strip of land 250.00 feet wide extending from the High Water Line at an elevation of 941.59 MSL of said water bodies landward and to a line at all times 250.00 feet from said high water line of said water body, more particularly described as follows:

2.7.1 East Shore Chesuncook Lake

Beginning at a cedar post found and rebar set on the easterly shore of Chesuncook Lake on the Town Line between T4-R12 and T5-R13 WELS at UTM coordinates of N 16725505.34, E 1551478.87 feet; Thence, easterly along said Town Line to a point that is

250.00 feet from the high water line of said Lake; Thence, southerly along a line that is always 250.00 feet from said high water line of said Lake to the Town Line between T4-R12 and T3-R12 WELS;

Thence, westerly along said Town Line to a cedar post found and a rebar set, being, South 16°03'10" East, a distance of 37031.77 feet from the point of beginning described immediately above;

Thence, northerly along said high water line of said Lake to the point of beginning.

2.8 T4-R13 Chesuncook Lake Area

Three certain parcels of land on the West shore of Chesuncook Lake in Township T4-R13 WELS being a strip of land 250.00 feet wide extending from the High Water Line at an elevation of 941.59 MSL of said water bodies landward and to a line at all times

250.00 feet from said high water line of said water body.

2.8.1 West Shore Chesuncook Lake

Beginning at a cedar post found and rebar set on the westerly shore of Chesuncook Lake on the Town Line between T4-R13 and T3-R13 WELS at UTM coordinates of N 16689911.15, E 1553254.88 feet; Thence, westerly along said Town Line to a point that is 250.00 feet from the high water line of said Lake;

Thence, northerly along a line that is always 250.00 feet from said high water line of said Lake to a developed lease;

Thence, along said lease, South 73°38'50 East, a distance of approximately 240 feet to a rebar set 10 feet from the high water line, said rebar being, North 06°13'50" West, a distance of 6127.58 feet from the point of beginning and also being the point of commencement for the next parcel described immediately below;

Thence, continuing to the high water line of said Lake;

Thence, southerly along said high water line of said Lake TO THE POINT OF BEGINNING.

2.8.2 To the Patterson Parcel

Beginning at a rebar set on the westerly shore of Chesuncook Lake at UTM coordinates of N 16696194.44, E 1552646.14 feet, also being, North 16°21'10" East, a distance of 200.00 feet from the point of commencement described immediately above; Thence, North 73°38'50" West, to a point that is 250.00 feet from the high water line of said Lake; Thence, northerly along a line that is always 250.00 feet from said high water line of said Lake to the Patterson Parcel so called;

Thence, along said Parcel, to a rebar set 10 feet from the high water line, said rebar being, North 22°42'00" West, a distance of 24630.55 feet from the point of beginning and also being the point of commencement for the next parcel described immediately below;

Thence, continuing to the high water line of said Lake;

Thence, southerly along said high water line of said Lake to the point of beginning.

2.8.3 Patterson Parcel to the Chesuncook Village Parcel

Beginning at an iron pipe found at the northeast corner of the so called Patterson Parcel on the westerly shore of Chesuncook Lake at UTM coordinates of N 16720624.55, E 1543381.95 feet, also being, North 08°02'20" East, a distance of 1724.56 feet from the point of commencement described immediately above;

Thence, northwesterly along said Patterson Parcel to a point that is 250.00 feet from the high water line of said Lake;

Thence, northerly along a line that is always 250.00 feet from said high water line of said Lake to the Town Line between T4-R13 and T5-R13 WELS;

Thence, easterly along said Town Line to a cedar post found and a rebar set on the shore of said Lake, being, North 22°38'10" West, a distance of 5329.23 feet from the point of beginning described immediately above.

Thence, continuing to the high water line of said Lake;

Thence, continuing southerly along the high water line of said Lake;

Thence, westerly along the Patterson Parcel to the POINT OF BEGINNING described immediately above.

2.9 T5-R13 Chesuncook Lake Area

Seven parcels of land on the shore of several Lakes and Ponds in Township T5-R13 WELS being a strip of land 250.00 feet wide extending from the High Water Line at an elevation of 941.59 MSL of said water bodies landward and to a line at all times 250.00 feet from said high water line of said water body.

2.9.1 East Shore Umbazooksus Cove

Beginning at a cedar post found and rebar set on the easterly shore of Umbazooksus Cove on the Town Line between T6-R13 and T5-R13 WELS at UTM coordinates of N 16757386.00, E 1548447.54 feet; Thence, easterly along said Town Line to a point that is

250.00 feet from the high water line of said Lake; Thence, southerly along a line that is always 250.00 feet from said high water line of said Cove to the Town Line between T5-R12 and T5-R13 WELS;

Thence, southerly along said Town Line to a cedar post found and a rebar set, being, South 16°51'00" East, a distance of 14950.65 feet from the point of beginning described immediately above, and also being the point of commencement for the next parcel described immediately below;

Thence, northerly along said high water line of said Cove to the POINT OF BEGINNING.

Subject to a 100.00 foot wide right-of-way for an existing haul road and its westerly bounds described as follows:

Beginning at a point 50.00 feet westerly of the centerline of said existing haul road, being, North 89'48'10" East, a distance of 340.32 feet from the point of beginning described immediately above; Thence, continuing 50.00 feet westerly from the centerline of said road, South 43°31'10" West, a

distance of 310.72 feet to a rebar set;

Thence, continuing, South 05°03'10" West, a distance of 419.72 feet to a rebar set; Thence, continuing, South 14°00'40" West, a distance of 460.58 feet to a rebar set;

Thence, continuing along a line that is always 50.00 feet westerly of the center line of the existing haul road to the point where it is

250.00 feet from the high water line of Umbazooksus Cove and the end of this exception.

2.9.2 East Shore Moose Pond

Beginning at a rebar set on a blazed line found on the easterly shore of Moose Pond on the Town Line between T 5-R12 and T5- R13, at UTM coordinates of N 16735732.68, E 1552836.28 feet, being, South 00°25'40" East, a distance of 7344.81 feet from the point of commencement described immediately above;

Thence, southerly along said Town Line to a point that is 250.00 feet from the high water line of said Pond;

Thence, southerly along a line that is always 250.00 feet from said high water line of said Pond to the Town Line between T5-R12 and T5-R13 WELS;

Thence, southerly along said Town Line to a cedar post found and a rebar set, being, South 00°00'10" West, a distance of 4884.39 feet from the point of beginning described immediately above, and also being the point of commencement for the parcel described immediately below;

Thence, northerly along said high water line of said Pond to the POINT OF BEGINNING.

2.9.3 East Shore of Chesuncook Lake

Beginning at a rebar set on a blazed line found on the easterly shore of Chesuncook Lake on the Town Line between T 5-R12 and T5-R13 at UTM coordinates of N 16,729,028.57, E 1,552,815.58 feet, being, South 00°38'30" West, a distance of 1819.83 feet from the point of commencement described immediately above;

Thence, southerly along said Town Line to a point that is 250.00 feet from the high water line of said Lake;

Thence, southerly along a line that is always 250.00 feet from said high water line of said Lake to the Town Line between T5-R13 and T4-R12 WELS;

Thence, westerly along said Town Line to a cedar post found and a rebar set, being, South 20°46'40" West, a distance of 3768.29 feet from the point of beginning described immediately above, and also being the point of commencement described immediately below;

Thence, northerly along said high water line of said Lake to the POINT OF BEGINNING.

2.9.4 West Shore of Chesuncook Lake and South Shore of the West Branch of the Penobscot River

Beginning at a rebar set on a painted and blazed line on the North bound of Chesuncook Village so called and at UTM coordinates of N 16735672.99, E 1534727.53 feet and being, North 58°44'40" West, a distance of 19595.63 feet from the point of commencement described immediately above;

Thence, westerly along the northerly bound of said Village to a point that is 250.00 feet from the high water line of said Lake; Thence, northerly and westerly along a line that is always 250.00 feet from said high water line of said Lake and continuing along the southerly high water mark of the West Branch of the Penobscot River to the Town Line between T5-R13 and T5-R14 WELS Thence, northerly along said Town Line to a cedar post found and a rebar set on the southerly shore of said

River, being, South 73°00'50" West, a distance of 14563.60 feet from the point of beginning described immediately above, and also being the point of commencement for the parcel described below;

Thence, easterly along said high water line of said River and Lake to POINT OF BEGINNING.

2.9.5 North Side of the Penobscot River around to Brandy Pond

Beginning at a rebar set on a blazed line found on the northerly shore of the West Branch of the Penobscot River on the Town Line between T5-R13 and T5-R14 at UTM coordinates of N 16732048.88 E 1520813.86 feet being, North 01°19'00" East, a distance of

630.96 feet from the point of commencement described immediately above;

Thence, northerly along said Town Line to a point that is 250.00 feet from the high water mark of said River;

Thence, easterly, northerly, westerly, and northerly along a line that is always 250.00 feet from said high water line of said River, along the westerly shore of Chesuncook Lake and then along the South and West shore Brandy Pond to the Town Line also between T5-R13 and T5-R14 WELS;

Thence, northerly along said Town Line to a rebar set on the westerly shore of Brandy Pond, being, North 00°30'50" East, a distance of 8646.16 feet from the point of beginning described immediately above, and also being the point of commencement for the next parcel described immediately below;

Thence, southerly, easterly, southerly and westerly along the high water line of said bodies of water to the POINT OF BEGINNING.

2.9.6 Brandy Pond to Black Pond

Beginning at a rebar set on a blazed line found on the westerly shore of Brandy Pond on the Town Line between T5-R13 and T5- R14 at UTM coordinates of N 16741409.48, E 1520867.50 feet being, North 01°54'50" West, a distance of 715.19 feet from the point of commencement described immediately above;

Thence, northerly along said Town Line to a point that is 250.00 feet from the high water line of said Pond;

Thence, northerly, easterly, and northerly along a line that is always 250.00 feet from said high water line of said Pond continuing to Black Pond to the Town Line also between T5-R13 and T5-R14 WELS; Thence, northerly along said Town Line to westerly shore of Black Pond, being, North along said Town Line from the point of beginning described immediately above;

Thence, southerly, easterly, southerly and westerly along the high water line of said bodies of water to the POINT OF BEGINNING.

2.9.7 East Shore of Black Pond, to the North Shore of Chesuncook Lake, and to the West Shore of Umbazooksus Cove

Beginning at a rebar set on a blazed line found on the easterly shore of Black Pond on the Town Line between T5-R13 and T6-R13 at UTM coordinates of N 16757518.36, E 1524150.37 feet being, North 11°31'10" East, a distance of 16439.99 feet from the point of beginning described immediately above; Thence, easterly along said Town Line to a point that is 250.00 feet from the high water line of said Pond;

Thence, southerly, easterly, and northerly along a line that is always 250.00 feet from said high water line of said Pond continuing to and along the North shore of Chesuncook Lake and then continuing to and along the West shore to Umbazooksus Cove and to the Town Line between T5-R13 and T6-R13 WELS;

Thence, easterly along said Town Line to the westerly shore of Umbazooksus Cove and a rebar set and cedar post found, being, North 89°57'50" East, a distance of 20908.17 feet along said Town Line from the point of beginning described immediately above, and also being the point of beginning for the course described immediately below;

Thence, southerly, westerly, northerly and westerly along the high water line of said bodies of water to the POINT OF BEGINNING.

2.9.8 Reserved

2.9.9 Islands

Whether or not described elsewhere herein, together with all islands, except Islands listed in Schedule 3 attached hereto and except Gero Island, and including in this grant without limitation four (4) islands identified by the following UTM coordinates in feet:

2.10 T5-R14 Brandy and Black Ponds Area

Certain parcels of land on the shore of Brandy and Black Ponds in Township T5-R14 WELS being a strip of land 250.00 feet wide extending from the High Water Line at an elevation of 941.59 MSL of said water bodies landward and to a line at all times 250.00 feet from said high water line of said water body, more particularly described as follows:

2.10.1 West Shore of Black Pond

Beginning on a blazed and painted line and a rebar set on the westerly shore of Black Pond on the Town Line between T6-R14 and T5-R14 WELS at UTM coordinates of N 16757466.19, E 1520717.25 feet; Thence, southerly along the high water line of said Pond to the Town Line between T5-R14 and T5-R13; Thence, southerly along said Town Line to a point that is 250.00 feet from the shore of said Pond; Thence, northerly along a line that is always 250.00 feet from said high water line of said Pond to the Town Line between T5-R14 and T6-R14 WELS;

Thence, easterly along said Town Line to the point of beginning.

2.10.2 West Shore of Brandy Pond

Beginning on a blazed and painted line and a rebar set on the westerly shore of Brandy Pond on the Town Line between T5-R13 and T5-R14 WELS at UTM coordinates of N 16740694.69, E 1520891.40 feet;

Thence, southerly along said Town Line to a point that is 250.00 feet from the shore of said Pond; Thence, northerly along a line that is always 250.00 feet from said high water line of said Pond crossing Brandy Brook to the Town Line between T5-R14 and T5- R13 WELS;

Thence, southerly along said Town Line again crossing Brandy Brook to the high water line of said Pond; Thence, southerly along the high water line of said Pond to the Town Line between T5-R14 and T5-R13 and the point of beginning.

2.11 T6-R13 Black Pond and Umbazooksus Cove

Certain parcels of land on the shore of Black Pond and Umbazooksus Cove in Township T6-R13 WELS being a strip of land

250.00 feet wide extending from the High Water Line at an elevation of 941.59 MSL of said water bodies landward and to a line at all times 250.00 feet from said high water line of said water body.

2.11.1 East Shore Black Pond

Beginning at a cedar post found and rebar set on the northeasterly shore of Black Pond on the Town Line between T6-R13 and T6- R14 WELS at UTM coordinates of N 16763431.26, E 1,521,114.43 feet; Thence, northerly along said Town Line to a point that is

250.00 feet from the high water line of said Pond;

Thence, southerly along a line that is always 250.00 feet from said high water line of said Pond to the Town Line between T6-R13 and T5-R13 WELS;

Thence, westerly along said Town Line to a cedar post found and a rebar set, being, South 27°10'40" East, a distance of 6646.75 feet from the point of beginning described immediately above, and also being the point of commencement for the next parcel described immediately below;

Thence, northerly, along said high water line of said Pond to the point of beginning.

2.11.2 Umbazooksus Cove

Beginning at a cedar post found and rebar set on the westerly shore of Umbazooksus Cove on the Town Line between T6-R13 and T5-R13 WELS at UTM coordinates of N 16757531.81, E 1545058.54 feet being, North 89°57'50" East, a distance of 20908.17 feet from the point of commencement described above in Section 2.9.7;

Thence, westerly along said Town Line to a point that is 250.00 feet from the high water line of said Lake;

Thence, northerly along a line that is always 250.00 feet from said high water line of said Cove to a point on the westerly shore of Umbazooksus Stream that is also the Point of Beginning for the Umbazooksus connector so called;

Thence, easterly along said Connector to the intersection of the easterly high water line of said Connector and 250.00 feet from the high water line of Umbazooksus Cove;

Thence, easterly and southerly along a line that is always 250.00 feet from said high water line of said Cove to the Town Line between T6-R13 and T5-R13 WELS;

Thence, westerly along said Town Line to the high water line of said Lake;

Thence, northerly, westerly and southerly along said high water line of said Cove to the POINT OF BEGINNING.

Subject to a 100.00 foot wide right-of-way for an existing haul road as now exists and its westerly bounds described as follows: Beginning at a point 50.00 feet westerly of the centerline of said existing haul road being, North 89°48'10" East, a distance of

340.32 feet from the point of commencement described above in Section 2.9.1;

Thence, continuing 50.00 feet westerly from the centerline of said road, North 43°31'10" East, a distance of 77.70 feet to a rebar set;

Thence, continuing, North 50°02'00" East, a distance of 301.56 feet to a rebar set; Thence, continuing, North 23°59'50" East, a distance of 173.58 feet to a rebar set; Thence, continuing, North 10°47'20" East,

a distance of 612.25 feet to a rebar set; Thence, continuing, North 08°09'50" East, a distance of 785.31 feet to a rebar set; Thence, continuing, North 05°36'00" East, a distance of 117.62 feet to a rebar set; Thence, continuing, North 08°21'50" East, a distance of 496.43 feet to a rebar set; Thence, continuing, North 05°23'00" East, a distance of 304.21 feet to a rebar set;

Thence, continuing along a line that is always 50.00 feet westerly of the center line of the existing haul road to the point where it is

250.00 feet from the high water line of Umbazooksus Cove and the end of this exception.

Excepting a certain parcel of leased land on the easterly shore of the water connector between Umbazooksus Cove and Umbazooksus Lake on the northerly side of the Longley Stream Road so called in Township T6-R13 WELS as follows:

Beginning at a rebar set on the easterly shore of the connector stream and the northerly side of the Longley Stream Road at UTM coordinates of North 16762616.75, East 1548442.53 feet;

Thence, westerly along said Road to the Umbazooksus Stream; Thence, northeasterly along said Stream;

Thence, South 73°13'30" East, to a rebar set that is, North 08°05'00" East, a distance of 200.00 feet from the last rebar set; Thence, continuing on the same course, a distance of 244.81 feet to a rebar set;

Thence, South 08°05'00" West, a distance of 30 feet more or less to the side of said Road;

Thence, southwesterly along said Road to the POINT OF BEGINNING. Said parcel of land containing approximately 0.65 acres.

The above described parcel of land is based on a field survey conducted under the supervision of Daniel O. Bridgham, PLS #1027. Coordinates are UTM feet Census Datum, Zone 19 North. Location Control by Trimble XL Pro GPS, with a minimum of 600 observations.

2.12 Ragged Lake

The land and interests in land, including, without limitation, the dam and dam structures, including a boat launch facility and campground situated in Township T2 R 13 WELS, County of Piscataquis, State of Maine being part of the land now or formerly owned by GNP, and being bounded and described more particularly as follows:

BEGINNING at a painted masonry nail set into the concrete abutment, on the northerly side of Ragged Lake Dam structure, located at UTM coordinate 16,634,366.36 North and 1,555,601.87 East, as acquired by G.P.S.;

Thence, northerly and northwesterly along the high water mark of Ragged Lake, at an elevation equal to the N.F.P.E. of 1135 feet MSL U.S.G.S. datum to the southwest corner of L-3601, a camp lot now or formerly leased to Thomas W. Varney;

Thence, along said L-3601, a UTM Grid bearing of, North 39°04'40" East, a distance of 10 feet to a #5 rebar set and capped #1027, located at UTM coordinate 16,634,556.41 North and 1,555,496.02 East, also being a tie-line bearing of, North 29°07'00" West, and a distance of 217.54 feet from above mentioned masonry nail;

Thence, continuing along said L-3601, North 39°04'40" East, a distance of 61.90 feet to the southeast corner of said Lot, and a rebar set;

Thence, across the source parcel, North 25°08'20" East, a distance of 244.89 feet to a rebar set;

Thence, continuing, South 56°49'10" East, a distance of 496.1 1 feet to a rebar set, being

approximately 10 feet westerly of the shoulder of a road;

Thence, South 27°03'40" East, a distance of 99.94 feet to a rebar set, being approximately 10 feet westerly of the shoulder of a road;

Thence, South 33°50'00" West, a distance of 1466.60 feet to a rebar set;

Thence, continuing, North 64°37'20" West, a distance of 551.93 feet to a rebar set; Thence, continuing, North 30°40'50" West, a distance of 263.00 feet to a rebar set; Thence, continuing, North 29°07'10" East, a distance of 252.00 feet to a rebar set;

Thence, continuing to the Shore of Ragged Lake, North 29°07'10" East, a distance of 15 feet;

Thence, southeasterly and northeasterly along the high water mark of Ragged Lake, at an elevation equal to the N.F.P.E. of 1135 MSL U.S.G.S. datum, a distance of approximately 1592 feet to a painted nail set into the southwest concrete abutment of the Ragged Lake Dam, being on a tie line bearing of, North 65°49'20" East, and a distance of 910.71 feet from the last mentioned rebar set;

Thence, North 01°41'30" West, a distance of 63.08 feet to the point of beginning. The above described parcel of land containing

15.0 acres.

The above described parcel of land is based on a field survey conducted under the supervision of Daniel O. Bridgham, PLS #1027, and shown on a Plat having a revised date of August 11, 1999. All bearings calculated from UTM Grid, NAD27 Conus datum, Zone 19 North. UTM coordinates are expressed in feet. Location Control by Trimble Pro XL GPS, with a minimum of 600 observations. Expected repeatability is 1.0 feet, Ground traverse was performed with an EDM. All monuments set are 5/8 inch metal rebar with yellow plastic caps affixed to them, with "D. Bridgham, PLS # 1027" imprinted in the caps.

TOGETHER WITH:

i. Ragged Lake Dam and the dam structures.
ii. All of the land that lies between the high water mark of Ragged Lake which high water mark is at an elevation equal to the N.F.P.E. of 1135 feet MSL U.S.G.S. datum and a line lying ten feet horizontally outside of said high water mark of Ragged Lake.
iii. All islands within Ragged Lake, excepting, however, the portion of Ragged Lake Island that lies above said line lying ten feet horizontally outside of said high water mark of Ragged Lake.
iv. Ragged Lake and the bed of Ragged Lake.
v. All lands upstream of the Ragged Lake Dam that have been flowed by the dam.
vi. All flowage rights, whether acquired by Legislative Charter, by deed, by prescription or otherwise, over lands located upstream or downstream of the dam that, historically or currently, have been flowed or flooded by the Ragged Lake Dam.
vii. A flowage easement for flowage of any of the lands herein conveyed, upstream or downstream of the Ragged Lake Dam, that may from time to time be flowed or flooded in the future by the Ragged Lake Dam to the extent that such lands historically or currently have been flowed or flooded by this dam and provided that such flowage easements for land upstream of the dam will not extend further than 1138.8 MSL U.S.G.S. datum.

The interests described in paragraphs (i) through (vii) affect property situated in T2 R13 WELS and T3 R13 S/2 WELS.

2.13 Caribou Lake Boat Launch

A certain Parcel of land being in Township 2, Range 12 WELS in the County of Piscataquis, State of Maine, described as follows: Beginning at a rebar set at UTM coordinates of North 16,652,552 feet, East 1,560,162 feet, on the easterly side of the Golden Road approximately 200 feet southerly of the

existing boat launch and camping site;

Thence, along said Golden Road, North 01°58'10" West, a distance of 406.27 feet to a rebar set at UTM coordinates of North 16,652,958 feet, East 1,560,148 feet;

Thence, North 88°01'50 East, a distance of 115 feet more or less to the high water line of Caribou Lake; Thence, along said high water line southerly with a tie-line of, South 9°40'50" East, a distance of 409.98 feet;

Thence, South 88°01'50" West, a distance of 170.00 feet more or less to the point of beginning. Said Parcel of land containing approximately 1.33 acres.

Also, granting an easement for the use, repair, maintenance and improvement of any portion of the boat launch facilities that may fall below the normal high water line of said Caribou Lake.

2.14 Caribou Lake Recreation Area No. 3

A certain Parcel of land being a parcel of land now or formerly owned by Great Northern Paper, Inc. in Township 3, Range 12 WELS in the County of Piscataquis, State of Maine, described as follows: Beginning at a rebar set on the northerly shore of Caribou Lake on a blazed line painted yellow at UTM coordinates of North 16,672,972, East 1,557,837;

Thence along said blazed and painted line, South 88°28'10" East, a distance of 2469.88 feet to a rebar set on the Westerly shore of Chesuncook Lake at UTM coordinates of North 16,672,906, East 1,560,306; Thence, continuing easterly to the high water line of said Lake;

Thence, continuing in a southerly direction along the high water line of Chesuncook Lake to a lease; Thence, South 66°49'30" West, to a rebar set, also being on a tie line bearing of, South 11°33'50" East, a distance of 694.28 feet from the above mentioned rebar set;

Thence, continuing, South 66°49'30" West, a distance of 560.69 feet to a rebar set on the northerly shore of Caribou Lake; Thence, continuing, South 66°49'30" West, to the high water line of said Lake;

Thence, continuing generally in a westerly direction along the high water line of Caribou Lake to a division line;

Thence, South 88°28'10 East, to the Point of Beginning, also being on a tie line bearing of, North 65°12'10" West, a distance of 2305.29 feet from the last mentioned rebar set.

Said Parcel of land containing approximately 38 acres above the high water line.

The above described parcel of land is based on a field survey conducted under the supervision of Daniel O. Bridgham, PLS #1027, and shown on a Plat dated August 30, 2001; as revised through May 30, 2002.

All bearings are calculated from UTM observations. All monuments set were 5/8 inch metal rebar with yellow plastic caps affixed to them, with "D. Bridgham, PLS #1027" imprinted in the caps.

2.15 T3 R12 WELS - Reserved.

2.16 Weymouth point, Chesuncook Lake Recreation Area No. 2

A certain parcel of land, now or formerly owned by GNP in Township 4, Range 12 WELS in the County of Piscataquis, State of Maine, described as follows:

Beginning at a rebar set at the high water line on the easterly shore of Chesuncook Lake at UTM coordinates of North 16,696,693, East 1,557,917;

Thence, easterly along said high water line to an estimated location being on a tie line of, North

69°00'10" East, a distance of 1175.20 feet;

Thence, along said estimated line, South 0°00'00" East, a distance of 3800.00 feet to the high water line of said Lake being, North 49°18'40" West, a distance of 45.00 feet from a rebar set at UTM coordinates of North 16,693,285, East 1,559,048;

Thence, northerly and then easterly along said shore of Chesuncook Lake to the point of beginning, being on a tie line of, North 17°59'20" West, a distance of 3552.55 feet. Said parcel of land containing approximately 106 acres above the high water line.

The above described parcel of land is based on a field survey conducted under the supervision of Daniel O. Bridgham, PLS #1027, and shown on a Plat dated August 31, 2001. All bearings are calculated from UTM observations. All monuments set were 5/8 inch metal rebar with yellow plastic caps affixed to them, with "D. Bridgham, PLS #1027" imprinted in the caps.

2.17 Chesuncook Dam

A certain Parcel of land, including, without limitation, the dam and dam structures, being a parcel of land now or formerly owned by GNP, known as the Chesuncook Dam Lot, in Township 3, Range 12 WELS, in the County of Piscataquis, State of Maine.

Described more particularly as follows:

Beginning on the 1903 high water mark of Chesuncook Lake, as shown on an unpublished plan entitled "Map of a Parcel of Land in Township No. 3 Range 12, Piscataquis County, Maine at outlet of Lake Chesuncook", "Dated July 1903, Retraced July 1908" File No. 519A, in the possession of KPC;

Thence, North 36°58'40" East, a distance of 150 feet, more or less, to a point approximately in line with the center of the old dam; Thence, continuing on the same course, North 36°58'40" East, 400 feet;

Thence, crossing the West Branch of the Penobscot River, South 53°01'20" East, a distance of 2000 feet; Thence, along a Plan entitled "Subdivision Plan for Webber Timberlands in T3 R12 WELS" by Prentiss and Carlisle Management Co. Inc. dated January 10, 1990, South 36°58'40" West, a distance of 310 feet, more or less, to an iron pin, found, capped #1050;

Thence, continuing along the same course, South 36°58'40" West, a distance of 395.42 feet to a painted cross on a rock;

Thence, continuing along the same course, South 36°58'40" West, a distance of 154 feet, more or less, to the 1903 low water mark of Chesuncook Lake;

Thence, generally northwesterly along the 1903 low water mark of Chesuncook Lake, to a point that is South 36°58'40" West, a distance of 182 feet, more or less, from the point-of-beginning;

Thence, North 36°58'40" East, a distance of 182 feet, more or less, to the POINT-OF BEGINNING.

The tie course from said painted cross to the point-of-beginning having a bearing of, North 48°35'30" West, a distance of 2006.00 feet. The above described parcel of land containing approximately 29 acres. The above described parcel of land is based on a field survey conducted under the supervision of Daniel O. Bridgham, PLS #1027, and shown on a Plat dated August 31, 2001. All bearings are calculated from UTM observations. All monuments set were 5/8 inch metal rebar with yellow plastic caps affixed to them, with "D. Bridgham, PLS #1027" imprinted in the caps.

2.18 Harrington Lake Dam Easement

An exclusive Hydroelectric Easement (as defined in Section 15), located upon, over, under, through and across the following described parcel:

A certain Parcel of land situated in Township 4, Range 11 WELS, County of Piscataquis, State of Maine, being part of land now or formerly owned by GNP. Bounded and described more particularly as follows: Beginning at a U.S.G.S. Benchmark set into the southerly wing of the Dam, with a listed elevation of 1036.00 feet, located at UTM coordinate 16,692,945.54 North and 1,591,423.08 East;

Thence, along the shore of Harrington Lake, at an elevation equal to a N.F.P.E. of 1036 feet U.S.G.S. datum in a generally southerly direction to a #5 rebar set approximately 25 feet from the high water mark of the Lake, being on a tie-line bearing of South 16°24'20" East, and a distance of 471.28 feet from the above mentioned benchmark;

Thence, South 84°48'00" West, a distance of 293.76 feet to a rebar set; Thence, North 07°16'10" West, a distance of 1028.37 feet to a rebar set; Thence, North 21°25'50" East, a distance of 947.13 feet to a rebar set;

Thence, South 49°49'20" East, a distance of 302.12 feet to a rebar set approximately 20 feet from the shore, and located at UTM coordinate N 16,694,173.66, E 1,591,710.38 feet;

Thence, along the shore of Harrington Lake, at an elevation equal to a N.F.P.E. of 1036 feet U.S.G.S. datum, in a generally southerly direction to the point of beginning, being on a tie-line bearing of, South 13°10'00" West, and a distance of 1261.28 feet from the last mentioned rebar set. The above described parcel containing 9.5 acres more or less.

The above described parcel of land is based on a field survey conducted under the supervision of Daniel O. Bridgham PLS #1027, and shown on a Plat, having a revised date of January 29, 2002. All bearings are calculated from UTM Grid, Nad27, Conus Datum, Zone 19 North. UTM coordinates are expressed in feet. Location control by Trimble XL Pro GPS, with a minimum of 600 observations. The mean of the standard deviations is 0.91 feet. Ground traverse was performed by EDM. All monuments set are 5/8 inch metal rebar with yellow plastic caps affixed to them with "D. Bridgham, PLS # 1027" imprinted in the caps.

Together with flowage rights in T4 R11 and T3 R11 and all flowage rights, whether acquired by Legislative Charter, by deed, by prescription or otherwise, over lands located upstream or downstream of the dam that, historically or currently have been flowed or flooded by Harrington Lake Dam.

2.19 Ripogenus Dam Lot and McKay Station

A certain parcel of land including, without limitation, the dam and dam structures, situated in the Township 3 Range 11 WELS of the County of Piscataquis, State of Maine being part of the land now or formerly owned by Great Northern Paper, Inc. Bounded and described more particularly as follows:

Beginning on the northerly side of Ripogenus Impoundment at UTM coordinates of North 16,669,093.79, East 1,595,119.81, also being, North 29°00'20" West, a distance of 930.20 feet from a brass disk found stamped B82-1942 near the southerly end of the concrete dam at UTM coordinates of North 16,668,280.27, East 1,595,570.86;

Thence, easterly, North 78°36'50" East, a distance of 475.13 feet to a rebar set;

Thence, continuing southerly, South 16°14'20" East, a distance of 30.00 feet to a rebar set;

Thence, North 78°18'50" East, a distance of 351.98 feet to a rebar set on the northerly side of a former wood sluice;

Thence, continuing easterly approximately 20.00 feet northerly from said sluice for the next several courses, North 87°03'10" East, a distance of 260.27 feet to a rebar set;

Thence, continuing, South 85°37'30" East, a distance of 412.09 feet to a rebar set; Thence, continuing, South 63°09'00" East, a distance of 184.13 feet to a rebar set; Thence, continuing, South 60°04'10" East, a distance of 570.35 feet to a rebar set; Thence, continuing, South 65°34'00" East, a distance of

1356.12 feet to a rebar set; Thence, continuing, South 79°45'30" East, a distance of 547.09 feet to a rebar set;

Thence, continuing, South 55°45'20" East, a distance of 391.60 feet to a rebar set and the end of the wooden sluice; Thence, crossing the West Branch of the Penobscot River, South 58°30'40" East, a distance of 1463.70 feet;

Thence, South 00°38'10" East, a distance of 500.00 feet to the high transmission lines to Millinocket;

Thence, continuing along same bearing, South 00°38'10" East, a distance of 200.00 feet to the easterly side of the Golden Road; Thence, westerly along said Golden Road with a tie line of, South 81°38'20" West, a distance of 1659.86 feet;

Thence, northerly, North 08°29'00" East, a distance of 1044.93 feet;

Thence, westerly, North 85°52'30" West a distance of 1030.53 feet to a rebar set on the southerly side of a tower supporting a siren;

Thence, continuing westerly, North 68°06'10" West, a distance of 2254.74 feet to a railroad spike set; Thence, southerly along a roadway, South 07°37'40" West, a distance of 222.73 feet;

Thence, continuing along a roadway, South 00°11'50" West, a distance of 226.27 feet;

Thence, continuing on the same bearing, South 00°11'50" West, approximately 840 feet to the northerly side of the Golden Road; Thence, westerly along the northerly side of the Golden Road to a point that is 250 feet measured perpendicularly, from the high water line of the Ripogenus Impoundment;

Thence, easterly and northerly along a line that is always 250 feet from said high water line to the land described in Section 2.5.2 herein at a point that is South 06°56'10" West from a point that is at or near the intersection of the high water line of said Ripogenus Impoundment and a line on a bearing North 84°44'00" West from a railroad spike;

Thence, North 06°56'10" East along said land described in Section 2.5.2 to such point at or near the high water line of the Ripogenus Impoundment, such point further described as being 50 feet, more or less, distant on a bearing North 84°44'00" West from a railroad spike;

Thence, continuing northerly to include all of the south shoreline west of the Dam Lot, North 06°56'10" East, a distance of 662.96 feet;

Thence, continuing northerly, North 19°42'30" East, a distance of 854.86 feet to the Point of Beginning. The area within the traverse is 175 acres, more or less.

TOGETHER WITH a 4160 volt transmission line extending from McKay Station to Ripogenus Dam as shown on the Plat of the subject parcel.

The above parcel of land is based on a field survey conducted under the supervision of Daniel O. Bridgham, PLS #1027, and shown on a Plat dated August 31, 2001, as revised through May 22, 2002. All bearings are calculated from UTM Grid, NAD 27 Conus datum, Zone 19 North. UTM coordinates are expressed in feet. Location Control by Trimble XL Pro GPS, with a minimum of 600 observations. Expected repeatability is 1.0 feet. Ground traverse was performed with an EDM. All monuments set were 5/8 inch metal rebar with yellow plastic caps affixed to them, with "D. Bridgham, PLS#1027" imprinted in the caps.

2.20 Big Eddy Siren Easement

An easement to construct, maintain and operate a siren tower, including an easement for ingress and egress across lands now or in the future owned by KPC or KT, or their successors or assigns, located upon a certain parcel of land situated in Township 3 Range 11, County of Piscataquis, State of Maine

being known as the Big Eddy Siren, also being part of the land now or formerly owned by GNP Bounded and described more particularly as follows:

BEGINNING at the Big Eddy Siren Tower, located at approximate UTM coordinates North 16,666,820 feet, East 1,606,264 feet, as estimated by GPS;

Thence, in a circle around the tower, having its center at the center of the existing tower as aforementioned, having a radius of 25 feet.

The above described parcel containing an area of 0.04 Acres.

The above described parcel of land is based on a field survey conducted under the supervision of Daniel O. Bridgham, PLS #1027, and shown on a Plat dated "Published August 29, 2001". Coordinates are UTM feet Conus Datum, Zone 19 North. Location Control by Trimble XL Pro GPS, with a minimum of 600 observations. Mean Horizontal Precision is 0.75 feet.

2.21 Holbrook Side Channel Easement

An easement over, under or through the following described parcel, for all purposes required to satisfy Federal Energy Regulatory Commission ("FERC") license obligations under Article 406 of the Ripogenus Project that such parcel be operated and maintained as a fisheries enhancement project area:

A certain parcel of land situated in the Township 3 Range 11, County of Piscataquis, State of Maine being known as the Holbrook Side Channel Lot, also being part of the land now or formerly owned by GNP Bounded and described more particularly as follows: BEGINNING at a #5 rebar set and capped # 1027, located at UTM coordinate 16,666,868.81 North and1,603,013.82 East, as acquired by GPS;

Thence, across the source parcel, a UTM Grid bearing of, North 05°23'10" East, a distance of 297.37 feet to a rebar set located at UTM coordinate 16,667,164.87 North, and 1,603,041.74 East;

Thence, continuing, North 14°35'40" West, a distance of 108.35 feet to a rebar set; Thence, continuing, North 24°09'20" East, a distance of 112.75 feet to a rebar set; Thence, continuing, North 82°13'00" East, a distance of 275.43 feet to a rebar set; Thence, continuing, North 85°31'10" East, a distance of 146.82 feet to a rebar set; Thence, continuing, North 78°55'00" East, a distance of 354.63 feet to a rebar set; Thence, continuing, North 52°14'00" East, a distance of 159.59 feet to a rebar set; Thence, continuing, North 82°30'50" East, a distance of 282.37 feet to a rebar set;

Thence, continuing, South 72°05'00" East, a distance of 466.16 feet to a rebar set on the northwesterly right-of-way of the Telos Road;

Thence, along said Telos Road, South 31°54'30" West, an approximate distance of 250 feet to the West Branch of the Penobscot River;

Thence, westerly along the River to a point being, South 05°23'10" West from the first mentioned rebar set;

Thence, North 05°23'10" East, an approximate distance of 60 feet to the POINT OF BEGINNING. The above described parcel of land containing 13.1 acres more or less.

The above described parcel of land is based on a field survey conducted under the supervision of Daniel O. Bridgham PLS # 1027, and shown on a Plat, dated November 19, 1999, Published August 30, 2001. All bearings are calculated from UTM Grid, NAD27 Conus Datum Zone 19 North. UTM coordinates are expressed in feet. Location Control by Trimble XL Pro GPS, with a minimum of 600 observations. Mean Horizontal Precision is 0.800 feet. Ground traverse was performed with an EDM. All monuments set were 5/8 inch metal rebar with yellow plastic caps affixed to them with "D. Bridgham PLS # 1027 " imprinted in the caps.

2.22 Pockwockamus Take Out Easement

An easement for recreational purposes over, under or through a certain parcel of land situated in T2 R10, County of Piscataquis, State of Maine being part of what is known as Nevers Corner, also being part of the land now or formerly owned by GNP. Bounded and described more particularly as follows:

Beginning at a 1" solid pin found, 12" above the ground, located at UTM 16,643,534.70 feet North and 1,653,192.88 East, as acquired by GPS, also having a UTM Grid tie-line bearing of South 63°23'10"East, and a distance of 246.40 feet to a yellow painted cedar post dividing T2 R10 and T2 R9;

Thence, South 42°58'10" West, a distance of 526.07 feet to a 1" solid pin found 12" above ground level, located at 16,643,149.77 North and 1,652,834.30 East, as acquired by GPS;

Thence, continuing, South 42°58'10" West, an approximate distance of 30 feet to the West Branch of the Penobscot River; Thence, in a generally westerly direction, along said River to a point being, South 42°58'10" West from a #5 rebar set and capped # 1027;

Thence, North 42°58'10" East, an approximate distance of 70 feet to a rebar set also being, North 52°31'50" West, a distance of

199.53 feet from the last iron rod found;

Thence, continuing, North 42°58'10" East, a distance of 495.30 feet to a 1" solid pin found 12" above ground level;

Thence, South 61°08'00" East, a distance of 204.79 to the point of beginning. The above described parcel of land containing 2.5 acres more or less.

Subject to an 80' right-of-way, the center of which being described by the Old Golden Road.

The above described parcel of land is based on a field survey conducted under the supervision of Daniel O. Bridgham, PLS #1027, and shown on a Plat, dated November 19, 1999, Published August 28, 2001. All bearings are calculated from UTM Grid, NAD27 Conus Datum Zone 19 North. UTM coordinates are expressed in feet. Location Control by Trimble XL Pro GPS, with a minimum of 600 observations. Mean Horizontal Precision is 0.336 feet. Ground traverse was performed with an EDM. All monuments set were 5/8 inch metal rebar with yellow plastic caps affixed to them with "D. Bridgham PLS #1027" imprinted in the caps.

2.23 Northeast Corner of T1 R9 - intentionally omitted

2.24 Great Northwoods, LLC Deed

Whether or not described elsewhere herein, together with the following Reserved Parcel Two described and reserved in deed from Great Northern Paper, Inc. to Great Northwoods, LLC dated March 30, 1999 and recorded in the Piscataquis County Registry of Deeds in Book 1191, Page 326:

Ripogenus Project (FERC No. 2572)

a. The land that lies between the high water marks of Chesuncook Lake, Black Pond, Brandy Pond, and the West Branch of the Penobscot River on both sides of said river from Chesuncook Lake upstream to the West Town Line of Township 5 Range 13 WELS, which high water marks are at an elevation equal to the N.F.P.E. of 941.59 feet MSL U.S.G.S. datum, and a line lying 250 feet horizontally outside- of said high water marks of said Chesuncook Lake, Black Pond, Brandy Pond, and the West Branch of the Penobscot River on both sides of said river from Chesuncook Lake upstream to the West Town Line of Township 5 Range 13 WELS.

b. All islands, except Islands listed on Schedule 3 attached hereto and except Gero Island, within the impoundment of the Ripogenus Project, being all islands within Chesuncook Lake, Black Pond, Brandy Pond, and so much of the West Branch of the Penobscot River that lies between

Chesuncook Lake upstream to the West Town Line of Township 5 Range 13 WELS.

c. The real estate located on the shores of Chesuncook Lake, Caribou Lake and Black Pond in T2 R12 WELS, T3 R12 WELS, T3 R13 WELS, and T6 R14 WELS (south half), reserved under deed from Great Northern Nekoosa Corporation to Barbara A. Cassidy, et al., dated December 16, 1988 and recorded in the PCRD in Book 708, Page 174, more fully described in Schedule A thereto, paragraphs Fourth, Fifth, Seventh, Eighth, and Tenth, respectively.

d. All flowage rights, whether acquired by Legislative Charter, by deed, by prescription or otherwise, over lands located upstream or downstream that, historically or currently, have been flowed or flooded by the Ripogenus Dam.

e. A flowage easement for flowage of any lands conveyed herein, upstream or downstream of the dam, that may from time to time be flowed or flooded in the future by this dam, but only to the extent that such lands historically or currently have been flowed or flooded by the dam, and provided that such flowage easement for land upstream of the dam will not extend further than 943.6 feet MSL U.S.G.S. datum.

The interests described in paragraphs (a), (b), (d) and (e) affect property situated in T4 R13 WELS, T5 R13 WELS, and T5 R14 WELS.

## 3. PENOBSCOT AND PISCATAQUIS COUNTIES

### 3.1 T1-R9 Pemadumcook and Ambajejus Lakes

Certain parcels of land on the shore of Pemadumcook and Ambajejus Lakes in the Township of T1-R9 WELS being a strip of land

200.00 feet wide extending from the High Water Line of said Lake landward and to a line at all times 200.00 feet from said high water line of said Lakes.

Excepting from the Ambajejus Lake area that portion of the premises conveyed by deed from Great Lakes Hydro America, LLC to West Branch Historical Preservation Committee dated April 4, 2017 and recorded in the Piscataquis Registry of Deeds in Book 2488, Page 218, but reserving to Great Lakes Hydro America, LLC all appurtenant rights, flowage rights, and flowage easements as set forth therein.

#### 3.1.1 Town Line to Peninsula (ST-55)

Beginning at the Town Line Post on the northerly shore of Pemadumcook Lake on the line between T1 R9 WELS and T1 R10 WELS at UTM coordinates N 16612013.85, E 1653166.24 feet;

Thence, northerly along said Town Line to a point 200.00 feet from the high water line of Pemadumcook Lake;

Thence, southeasterly, along a line always 200.00 feet from the high water line of said Lake to a line between two rebar set; Thence, along said line, South 87°34'40" West, to a rebar set, said rebar being, South 60°27'30" East, a distance of 12667.35 feet from the point of beginning described immediately above and also being the point of commencement for the parcel described immediately below;

Thence, northwesterly along said high water line to the POINT OF BEGINNING.

#### 3.1.2 Peninsula to Ambajejus Point (ST-54)

Beginning at a rebar set on the shore of said Lake at UTM coordinates N 16605782.33, E 1664524.76 feet also being, North 87°34'40 East, a distance of 338.32 feet from the point of commencement described immediately above;

Thence, along a line toward another rebar set, South 87°34'40" West, to point that is 200.00 feet from the high water line of said Lake;

Thence, continuing easterly on a line that is always 200.00 feet from the high water line of Pemadumcook Lake and continuing along Ambajejus Lake;

Thence, South 61°11'40" East, to an iron pipe found;

Thence, continuing on the same course, a distance of 104.36 feet to a rebar set on the shore of Ambajejus Lake, said point being, South 88°20'20" East, a distance of 6355.87 feet from the point of beginning described immediately above and also being the point of commencement for the parcel described immediately below;

Thence, westerly along the high water line of Ambajejus Lake and continuing onto Pemadumcook Lake to the POINT OF BEGINNING.

3.1.3 Ambajejus Point to the Ambajejus Lake Sporting Camp (ST-54)

Beginning at a rebar set on the shore of Ambajejus Lake having UTM coordinates of N 16606192.86, E 1671269.39 feet and also being, North 33°21'00" East, a distance of 712.08 feet from the point of commencement described immediately above;

Thence, North 69°33'40" West, a distance of 123.45 feet to a rebar set;

Thence, continuing on the same course to a point that is 200.00 feet from the high water line of Ambajejus Lake; Thence, Northwesterly, along a line always 200.00 feet from the high water line of said Lake;

Thence, South 76°37'50" East, to a rebar set;

Thence, on the same course, a distance of 122.06 feet to a rebar set on the shore of said Lake, said point being, North 30°49"30" West, a distance of 10107.29 feet from the point of beginning described immediately above, and also being the point of commencement for the parcel described immediately below;

Thence, southeasterly along said high water line to the POINT OF BEGINNING.

3.1.4 Ambajejus Lake Sporting Camps to end of the Future Developed Area (ST-69)

Beginning at a rebar set at UTM coordinates of N 16615503.74, E 1666118.37 feet and also being, North 02°33'30" East, a distance of 632.07 feet from the point of commencement described immediately above;

Thence, South 50°47'20" West, distance of 61.21 feet to a rebar set;

Thence, continuing on the same course to a point that is 200.00 feet from the high water line of said Lake;

Thence, easterly across the West Branch of the Penobscot River and along a line always 200.00 feet from the high water line of said Ambajejus Lake to the westerly edge of the Future Development Area as shown on ST-61;

Thence, South 55°58'10" West, to a rebar set;

Thence, continuing on the same course, a distance of 81.76 feet to a rebar set, said point being, North 60°43'00" East, a distance of 3306.98 feet from the point of beginning described immediately above, and said point also being the point of commencement for Parcel ST-11;

Thence, continuing on the same course to the high water line of said Lake;

Thence, westerly along the high water line of said Lake to the point of beginning described immediately above.

3.1.5 Parcel ST-11

Beginning at a rebar set on the shore of said Lake at UTM coordinates of N 16616787.89, E 1671146.49 feet, and said point being, South 81°09'30" East, a distance of 2169.54 feet from the point of commencement described immediately above;

Thence, North 53°34'40 West, to a point that is 200.00 feet from the high water line of said Lake; Thence, easterly and southerly along a line always 200.00 feet from the high water line of said Lake;

Thence, North 33°29'40" West, to an iron pipe found which is, South 18°52'10 East, a distance of 932.68 feet from the point of beginning described immediately above and also being the point of commencement for Parcel ST-12 described immediately below; Thence, continuing on the same course, a distance of 44.72 feet to the high water line of said Lake;

Thence, northerly and westerly along said high water mark to the POINT OF BEGINNING.

3.1.6 Parcel ST-12

Beginning at a rebar set on the shore of said Lake being at UTM coordinates N 16613952.71, E 1679256.94 feet, and being, South 75°57'40 East, a distance of 8049.24 feet from the point of commencement described immediately above;

Thence, N 74°20'40" West, to a point 200.00 feet from the high water line of said Lake; Thence, northerly and easterly along a line always 200.00 feet from said high water line; Thence, South 43°27'30" West, to a rebar set;

Thence, continuing on the same course, a distance of 148.10 feet to a rebar set between the access road and the shore of the Lake, said point being, North 73°45'20" East, a distance of 957.87 feet from the point of beginning, also being the point of commencement for Parcel ST-10 described immediately below;

Thence, westerly and southerly along the high water line of said Lake to the POINT OF BEGINNING.

3.1.7 Parcel ST-10

Beginning at a rebar set on the shore of said Lake being at UTM coordinates of N 16611645.10, E 1681713.47 and being, South 30°49'30" East, a distance of 2999.29 feet from the point of commencement described immediately above;

Thence, North 41°08'00" East, a distance of 55.25 feet to an iron pipe found on the side of the Golden Road;

Thence, continuing on the same course across the Golden Road and onto the State Park Road to a point 200.00 feet from the high water line of said Lake;

Thence, southeasterly along a line always 200.00 feet from the high water line of said Lake; Thence, South 68°11'30" West, to a rebar set on the side of the Golden Road;

Thence, continuing on the same course, a distance of 36.21 feet to an iron pipe found, being, South 36°29'30" East, a distance of

157.18 feet from the point of beginning described immediately above, also being the point of commencement for Parcel ST-09 described immediately below;

Thence, northwesterly along the high water line of said Lake to the POINT OF BEGINNING.

3.1.7a. Parcel ST-09

Beginning at a rebar found capped #1027, 10 feet from the shore of Ambajejus Lake, at UTM

coordinates N 16,609,613.22 feet, E 1,679,354.67 feet; also being South 52°09'00" West, a distance of 3105.59 feet from the point of commencement listed immediately above;

Thence, North 35°31'20" West, a distance of 97.83 feet to a rebar found capped #1027;

Thence, continuing along the same course, North 35°31'20" West, to a point which is 15 feet from the centerline of Fire Road 17A, so called;

Thence, generally northeasterly and easterly along a line which is parallel to and 15 feet from the centerline of said road, to a point which is 200 feet from the high water line of said Ambajejus Lake;

Thence, generally southeasterly and southerly along a line always 200 feet from the high water line of said Lake to the edge of a developed zone;

Thence, North 71°33'30" West, to a rebar set near the shore of said Ambajejus Lake, said rebar having UTM coordinates of N 16,609,386.91', E 1,679,518.35', and being the point of commencement for parcel ST-07-01 described immediately below; Thence, continuing on the same course, North 71°33'30" West, to the high water line of said Lake; Thence, generally northerly and northwesterly along the high water line of said Lake;

Thence, North 35°31'20" West, a distance of 10 feet, more or less to the POINT OF BEGINNING.

3.1.8 Parcel ST-07-01

Beginning at a rebar set 57 feet from the shore of the Lake beside an access driveway at UTM coordinates of N 16609085.87, E 1679568.00 feet, also being South 09°22'00" East, a distance of 305.11 feet from the point of commencement listed immediately above;

Thence, along the side of said driveway, North 56°09'00" East, a distance of 69.36 feet to an iron pipe found; Thence, continuing on the same course to a point being 200.00 feet from the high water line of said Lake;

Thence, southerly along a line always 200.00 feet from the high water line of said Lake; Thence, North 89°06'00" West, to an iron pipe found;

Thence, continuing on the same course, a distance of 102.54 feet to an iron pipe found on the shore of said Lake, said iron being, South 28°13'00" East, a distance of 248.24 feet from the point of beginning described immediately above and also being the point of commencement for Parcel ST-07-02 described immediately below;

Thence, northerly and westerly along said high water line;

Thence, North 04°16'00" West, a distance of 57.39 feet to the POINT OF BEGINNING.

3.1.9 Parcel ST-07-02

Beginning at a rebar set 30 feet from the shore of the Lake and beside a driveway, said rebar at UTM coordinates of N 16608562.62, E 1679788.36 feet and also being, South 18°41'10" East, a distance of 321.45 feet from the point of commencement described immediately above;

Thence, along the side of said driveway, South 00°15'20" West, a distance of 167.32 feet; Thence, South 35°12'40" East, to a point 200.00 feet from the high water line of said Lake; Thence, southwesterly along a line always 200.00 feet from the high water line of said Lake; Thence, North 47°23'10" West, to an iron pipe found;

Thence, continuing on the same course, a distance of 105.90 feet to an iron pipe found on the shore of said Lake, being South 36°12'50" West, a distance of 472.58 feet from the point of beginning described immediately above and also being the point of commencement for Parcel ST-08 described immediately below;

Thence, northeasterly along said high water line;

Thence, East, a distance of 27.01 feet to the POINT OF BEGINNING.

3.1.10 Parcel ST-08

Beginning at a an iron pipe found at UTM coordinates N 16601449.21, E 1678657.33 feet and being, South 07°12'40" West, a distance of 6785.81 feet from the point of commencement described immediately above;

Thence, North 18°27'20" West, to a point being 200.00 feet from the high water line of said Lake; Thence, easterly and southerly along a line always 200.00 feet from the high water line of said Lake;

Thence, North 86°27'10" West, to a rebar set being, South 70°10'20" East, a distance of 1302.54 feet from the point of beginning and also being the point of commencement of parcel ST-06 described immediately below;

Thence, northerly and westerly along the high water line of said Lake to the POINT OF BEGINNING.

3.1.11 Parcel ST-06

Beginning at a rebar set between a driveway and the shore of the Lake at UTM coordinates N 16600466.42, E 1679998.58 feet and being, South 12°05'50 East, a distance of 553.25 feet from the point of commencement described immediately above; Thence, North 68°38'20" East, to a point being 200.00 feet from the high water line of said Lake;

Thence, southerly along a line always being 200.00 feet from the high water line of said Lake;

Thence, North 78°53'50" West, to a rebar set on the shore of said Lake which is South 17°53'00" East, a distance of 345.52 feet from the point of beginning described immediately above and also being the point of commencement for Parcel ST-05 described immediately below;

Thence, northerly, along the high water line of said Lake to the POINT OF BEGINNING.

3.1.12 Parcel ST-05

Beginning at an iron pipe found on the shore of the lake at UTM coordinates N 16597834.51, E 1679250.76 feet and being, South 20°20'40" West, a distance of 2456.29 feet from the last point of commencement described immediately above;

Thence, South 62°14'00" East, a distance of 141.65 feet to an iron pipe found;

Thence, South 65°53'50" East, to a point being 200.00 feet from the high water line of said Lake;

Thence, southerly, westerly, and northerly along a line always 200.00 feet from the high water line of said Lake; Thence, along the side of a gravel pit to a rebar set;

Thence, North 67°30'00' East, a distance of 361.90 to a rebar set on the southerly side of the access road, being, South 62°15'40" West, a distance of 729.27 feet from the point of beginning described immediately above and also being the point of commencement for Parcel ST-04 described immediately below;

Thence, to the shore of the Lake;

Thence, following the high water line southerly, easterly, and northerly to the POINT OF BEGINNING.

3.1.13 Parcel ST-04

Beginning at a rebar set between the shore and a driveway at UTM coordinates N 16598310.00, E

1,676,805.36 feet, also being, North 65°38'30" West, a distance of 1975.83 feet from the point of commencement described immediately above;

Thence, along the side of said driveway, South 11°19'20" West, a distance of 96.13 feet to a rebar set; Thence, continuing on the same course, to a point that is 200.00 feet from the high water line of said Lake; Thence, westerly along a line always 200.00 feet from the high water line of said Lake;

Thence, North 56°22'20" East, to a rebar set on the shore of said Lake, being, South 89°40'20" West, a distance of 660.55 feet from the point of beginning described immediately above and also being the point of commencement for Parcel ST-03 described immediately below;

Thence, easterly, along the high water line of said Lake to the POINT OF BEGINNING.

3.1.14 Parcel ST-03

Beginning at an iron pipe found on the shore of said Lake at a UTM coordinate of N 16597570.40, E 1674957.12 feet and being, South 58°1220" West, a distance of 1397.38 feet from the last described point of commencement described immediately above; Thence, South 87°42'30" East, to a point being 200.00 feet from the high water line of said Lake;

Thence, southerly, westerly, and northerly along a line always 200.00 feet from the high water line of said Lake; Thence, South 70°27'00" West, to a rebar set on the northerly side of the access road;

Thence, continuing on the same course, a distance of 84.33 feet to a rebar set, said rebar being, North 47°20'40" East, a distance of 449.46 feet from the point of beginning and also being the point of commencement for Parcel ST-02-01 described immediately below;

Thence continuing on the same course to the high water line of said Lake;

Thence, continuing southerly, easterly, and northerly along the high water line of said Lake to the POINT OF BEGINNING.

3.1.15 Parcel ST-02-01

Beginning at a rebar set on the shore of the Lake being at UTM coordinates N 16597186.19, E 1672959.90 feet, and being, South 87°15'50" West, a distance of 1668.58 feet from the point of commencement described immediately above;

Thence, South 08°25'50" East, to a point that is 200.00 feet from the high water line of said Lake; Thence westerly along a line that is always 200.00 feet from the high water line of said Lake; Thence, North 26°44'50" East, to a rebar set on the northerly side of the access road.

Thence, continuing on the same course, a distance of 151.71 feet to a rebar set on the shore of said Lake, being, South 80°41'30" West, a distance of 1460.96 feet from the point of beginning described immediately above and also being the point of commencement for Parcel ST-02-02 described immediately below;

Thence, easterly along said high water line to the POINT OF BEGINNING

3.1.16 Parcel ST-02-02

Beginning at a rebar set on the shore of said Lake at UTM coordinates N 16597021.56, E 1671254.27 feet, and being, North 74°48'20" West, a distance of 273.47 feet from the point of commencement described immediately above;

Thence, South 38°07'20" East, in the direction of a rebar set to a point being 200.00 feet from the high water line of said Lake; Thence, westerly, along a line always 200.00 feet from the high water line of said Lake;

Thence, North 31°41'10" East, along a line between two rebar set to a rebar set on the shore of said Lake, said rebar being, North 79°20'20" West, distance of 368.65 feet from the point of beginning and also being the point of commencement for Parcel ST-02- 03 described immediately below;

Thence, easterly along the high water line of said Lake to the POINT OF BEGINNING.

3.1.17 Parcel ST-02-03

Beginning at a rebar set on the shore of said Lake at UTM coordinates N 16,597,022.83, E 1670225.05 feet and being, South 84°16'10" West, a distance of 670.28 feet from the point of commencement described immediately above;

Thence, South 08°35'40" West, a distance of 99.80 feet to an iron pipe found;

Thence, South 25°06'40" East, toward or through a rebar set at a point that is 200.00 feet from the high water line of said Lake; Thence, northwesterly along a line that is always 200.00 feet from the high water line of said Lake; Thence, North 12°59'00" East, to a rebar set;

Thence, continuing on the same course, a distance of 96.07 feet to a rebar set between the Lake and the Road, said point being, North 56°51'50" West, a distance of 432.86 feet from the point of beginning and also being the point of commencement for Parcel ST-01 described immediately below;

Thence, to the shore of the Lake;

Thence, southeasterly along the high water line to the POINT OF BEGINNING.

3.1.18 Parcel ST-01

Beginning at a rebar set on the northerly side of the access road at UTM coordinates N16597416.57, E 1668965.24 feet and being, North 80°04'10" West, a distance of 911.00 feet from the point of commencement described immediately above;

Thence, South 11°37'30" East, to a point that is 200.00 feet from the high water line of said Lake; Thence, westerly along a line that is always 200.00 feet from the high water line of said Lake;

Thence, North 10°47'10" East, to a rebar set;

Thence, continuing on the same course, a distance of 156.93 feet to a rebar set on the shore of said Lake, said rebar being, North 67°27'40" West, a distance of 162.68 feet from the point of beginning and also being the point of commencement for the call to the Town Line;

Thence, easterly along the high water line;

Thence, South 11°37'30" East, a distance of 69.47 feet to the POINT OF BEGINNING.

3.1.19 Township 1, Range 9 and Indian Purchase 4 Town Line

Being at UTM coordinates of N 16594,014.45, E 1671778.00 feet and being, South 40°32'20" East, a distance 4558.73 feet from the point of commencement described immediately above.

3.1.20 Southeast Corner of the Township - intentionally omitted

3.1.21 Islands

Together with all islands except Islands listed in Schedule 3 attached hereto and in Section 14.3 herein, and including in this grant without limitation 20 islands identified by the following UTM coordinates in feet:

Northings Eastings

#1 16614220 1680180

3.1.22 Recreation Area No. 3 on North Twin Lake - T1 R9 Piscataquis County - intentionally omitted

3.2 North Twin Development

3.2.1 North Twin Dam Parcel Township 3 Indian Purchase

A certain lot or parcel of land with buildings and improvements thereon, including, without limitation,

the dam and dam structures, situated in the Township 3 Indian Purchase, County of Penobscot, State of Maine and being more particularly described as follows: Beginning at a point northwesterly of the North Twin Dam, which point is on or near the shore of North Twin Lake, also known as Elbow Lake, said point is further described as being located at coordinates of N: 717,622.52 feet, E: 911,941.02 feet of the Maine State Plane Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83); Thence S 28° 03' 54" E, a distance of 597.45 feet to an angle point at or near the southeasterly shoreline of said Elbow Lake; Thence S 45° 38' 29" E, a distance of 202 feet, more or less, to a point defined by the intersection of the line herein described with the northwesterly sideline of the Bangor & Aroostook Railroad right of way;

Thence N 71° 43' E, more or less, by and along the northwesterly sideline of the said Bangor & Aroostook Railroad right of way, a distance of 327 feet, more or less, to a point of curvature in said right of way line;

Thence running in a northeasterly direction by and along the northwesterly sideline of said Bangor & Aroostook Railroad right of way following an 1860.14 foot radius curve to the left, an arc distance of 1574.04 feet to a point of tangency of said curve; Thence N 23° 14' E, more or less, by and along the northwesterly sideline of the said Bangor & Aroostook Railroad right of way along a line that crosses over the West Branch of the Penobscot River, a distance of 736 feet, more or less, to a point on said sideline;

Thence N 89° 38' 32" W, a distance of 180 feet, more or less, to an angle point; Thence N 80° 18' 03" W, a distance of 181.39 feet to an angle point;

Thence S 87° 59' 23" W, a distance of 193.08 feet to an angle point; Thence S 71° 31' 50" W, a distance of 189.79 feet to an angle point; Thence S 26° 25' 21" W, a distance of 194.49 feet to an angle point; Thence S 63° 04' 13" W, a distance of 324.58 feet to an angle point; Thence S 53° 09' 24" W, a distance of 423.79 feet to an angle point;

Thence N 08° 00' 02" W, a distance of 206.96 feet to a point on the southeasterly sideline of a 200 foot wide transmission line right of way that runs from power station at North Twin Dam to the mill in Millinocket, said point is further described as being at coordinates N: 718,360.07 feet, E: 912,616.76 feet, as referenced to the aforementioned coordinate system;

Thence N 64° 40' 51" W along a line that passes through the center power pole at an angle point in the above referenced transmission line, a distance of 239.34 feet to a point on the northwesterly right of way line of said transmission line; Thence N 18° 09' 57" E, a distance of 821.11 feet to an angle point;

Thence N 13° 33' 35" W, a distance of 94.87 feet to an angle point, said point is further described as being located at coordinates N: 719,334.83 feet and E: 912,634.15 feet, as referenced to the aforementioned coordinate system;

Thence running in an easterly direction, northeasterly direction, northerly direction and northwesterly direction a distance of 2650 feet more or less, and at all times staying 200 feet southerly, easterly and northerly of a flowage area on the easterly side of said Elbow Lake, said line terminates at coordinate values of N: 720,874.36 feet, E: 913,173.78 feet, as referenced to the aforementioned coordinate system;

Thence N 7°05'15" E a distance of 1551.94 feet to an angle point, said point is further described as being located at coordinates N: 722,414.44 feet, E: 913,365.27 feet, as referenced to the aforementioned coordinate system;

Thence N 73° 45' 21" W, a distance of 425 feet, more or less, to a point on the shoreline of the normal impoundment level of said Elbow Lake;

Thence running in a general southerly direction following the shoreline as defined by a normal impoundment level of said Elbow Lake, a distance of 11,420 feet, more or less, to the point of beginning.

The above description parcel encompasses 121 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet, E: 977,164.59 feet which are based on the 1992 readjustment.

Including all rights of access, ingress and egress, and the nonexclusive use and control of a gate for security purposes, across property of now or formerly of KT adjacent to said parcel, said gate to be maintained by GLHA and not to be removed without GLHA's prior written consent.

3.2.2 10 Foot Hydroelectric Easement Strip South of Route 11

North of Ferguson Pond

A 10 foot wide Hydroelectric Easement, over, under or through a parcel situated southerly of Route 11 at the northerly end of Ferguson Pond, so called, and 700 feet, more or less, westerly of the north entrance to the Great Northern Paper Company mill in the Town of Millinocket, County of Penobscot, State of Maine and being more particularly described as follows:

A 10 foot wide strip of land bounded northerly by said Route 11 right of way, easterly by the easterly limits of the FERC Project Boundary at the northerly end of said Ferguson Pond and westerly by the westerly limits of said FERC Project Boundary.

The easement described herein is intended to be a strip of land 10 feet wide adjacent to and southerly of said Route 11 right of way, and contained within the limits of said FERC Project Boundary. To the extent that any parcel otherwise conveyed in fee in this deed includes the foregoing easement, the conveyance otherwise set forth in this deed is hereby modified to be an easement, rather than in fee.

3.2.3 10 Foot Hydroelectric Easement Strip East of Route 11

North Twin Area

A 10 foot wide Hydroelectric Easement, over, under or through a parcel situated easterly of Route 11 at its intersection with the West Branch of the Penobscot River near North Twin Dam, so called, in T3, Indian Purchase, County of Penobscot, State of Maine and being more particularly described as follows: Beginning at a point defined by the intersection of the easterly right of way line of said Route 11 with the Expanded FERC Project Boundary located northerly of the West Branch of the Penobscot River;

Thence in a general southerly direction, by and along said right of way, a distance of 200 feet, more or less, to the normal water line of said river;

Thence easterly, by and along said normal water line, a distance of 10 feet, more or less, to a point;

Thence in a general northerly direction, parallel to, concentric with and at all times 10 feet easterly of said Route 11 right of way, a distance of 200 feet, more or less, to a point on said FERC boundary;

Thence in a general westerly direction, by and along said FERC boundary, a distance of 10 feet, more or less, to the point of beginning.

Also a 10 foot wide Hydroelectric Easement, over, under or through a parcel situated easterly of Route 11 in T3, Indian Purchase, County of Penobscot, State of Maine and being more particularly described as follows:

Beginning at a point defined by the intersection of the easterly right of way line of said Route 11 with the Expanded FERC Project Boundary located southerly of the West Branch of the Penobscot River;

Thence in a general northerly direction, by and along said right of way, a distance of 200 feet, more or less, to the normal water line of said river;

Thence easterly, by and along said normal water line, a distance of 10 feet, more or less, to a point;

Thence in a general southerly direction, parallel to, concentric with and at all times 10 feet easterly of said Route 11 right of way, a distance of 200 feet, more or less, to a point on said FERC boundary;

Thence in a general westerly direction, by and along said FERC boundary, a distance of 10 feet, more or less, to the point of beginning.

The easements described herein are intended to be a strip of land 10 feet wide adjacent to and easterly of said Route 11 right of way, running between said Expanded FERC Project Boundary, and the normal water line of said river. To the extent that any parcel otherwise conveyed in fee in this deed includes the foregoing easement, the conveyance otherwise set forth in this deed is hereby modified to be an easement, rather than in fee.

3.3 Stone Dam (Quakish Lake Dam) Quakish and Ferguson Lake Dikes

Millinocket & Township 3, Indian Purchase, Maine

A certain lot or parcel of land with the buildings and improvements thereon, including, without limitation, the dam and dam structures, situated on the shore of Ferguson Lake and Quakish Lake in the Town of Millinocket and Township 3, Indian Purchase, County of Penobscot, State of Maine and being more particularly described as follows:

Beginning at a point on the shore of Ferguson Lake at coordinates N: 718,768.92 feet, E: 928,553.00 feet, said coordinates referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83); said coordinates are intended to identify the location of the boundary line and may not be at the physical location as defined;

Thence S 2° 08' 12" E, a distance of 150.00 feet to a point;

Thence S 61° 53' 43" W, a distance of 145.68 feet to a point; Thence S 76° 10' 55" W, a distance of 118.06 feet to a point; Thence N 82° 02' 56" W, a distance of 165.62 feet to a point; Thence N 67° 28' 26" W, a distance of 101.20 feet to a point; Thence N 42° 32' 55" W, a distance of 115.26 feet to a point; Thence N 66° 25' 01" W, a distance of 655.40 feet to a point; Thence S 75° 45' 01" W, a distance of 1067.72 feet to a point; Thence N 82° 35' 20" W, a distance of 178.53 feet to a point; Thence S 61° 37' 39" W, a distance of 55.07 feet to a point;

Thence N 65° 12' 23" W, crossing into Township 3, Indian Purchase, a distance of 303.54 feet to a point;

Thence S 41° 54' 50" W along a line southeasterly of and parallel to the northwesterly face of Stone Dam, so called, a distance of 1145.45 feet to a point;

Thence N 48° 05' 10" W, a distance of 100.00 feet to a point;

Thence N 2° 44' 12" W, a distance of 215.69 feet to a point on or near the shore of Quakish Lake having coordinates N: 718,222.20 feet, E: 924,993.50 feet; said coordinates are intended to identify the location and direction of the boundary line and may not be at the physical location as defined;

Thence N 41° 54' 50" E, crossing into the Town of Millinocket, a distance of 1291.00 feet to a point on or near the shore of Quakish Lake having coordinates N:719,182.90 feet, E: 925,855.91 feet; said coordinates are intended to identify the location and direction of the boundary line and may not be at the physical location as defined;

Thence by varying courses in a general northerly direction, by and along the easterly shore of Quakish Lake, a distance of 2412 feet, more or less, to a point on said shore line having coordinates N:

719,814.22 feet, E: 925,498.86 feet; said coordinates are intended to identify the location and direction of the boundary line and may not be at the physical location as defined;

Thence N 59° 10' 17" E, a distance of 799.52 feet to a point on or near the westerly shore of Ferguson Lake having coordinates N: 720,223.95 feet, E: 926,185.41 feet; said coordinates are intended to identify the location and direction of the boundary line and may not be at the physical location as defined;

Thence in a general southerly direction, by and along the westerly shore of Ferguson Lake, a distance of 1637 feet, more or less, to a point on or near said shore line having coordinates N: 719,251.20 feet, E: 926,909.13; said coordinates are intended to identify the location and direction of the boundary line and may not be at the physical location as defined;

Thence S 13° 30' 51" E, a distance of 277.72 feet to a point on or near the southerly shore of Ferguson Lake having coordinates N: 718,981.17 feet, E: 926,974.03 feet; said coordinates are intended to identify the location and direction of the boundary line and may not be at the physical location as defined; Thence in a general easterly direction, by and along said shore line, a distance of 2570 feet, more or less, to the point of beginning.

ALSO a certain parcel situated on the northerly shore of Quakish Lake described as follows:

Beginning at a point on or near said shore line having coordinates N: 720,875.55 feet, E: 924,934.64 feet; said coordinates are intended to identify the location and direction of the boundary line and may not be at the physical location as defined;

Thence N 16° 32' 31" E, a distance of 296.47 feet to a point; Thence N 71° 32' 38" W, a distance of 449.94 feet to a point; Thence S 87° 52' 50" W, a distance of 170.24 feet to a point; Thence S 52° 32' 48" W, a distance of 79.37 feet to a point; Thence S 88° 31' 57" W, a distance of 81.94 feet to a point; Thence N 47° 17' 03" W, a distance of 236.83 feet to a point;

Thence S 42° 33' 01" W, a distance of 901.27 feet to a point on or near the shore line of Quakish Lake having coordinates N: 720,742.23 feet, E: 923,493.73 feet, said coordinates are intended to identify the location and direction of the boundary line and may not be at the physical location as defined;

Thence in a general easterly direction, by and along said shore line, a distance of 1851 feet, more or less to the point of beginning.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet, E: 977,164.59 feet which are based on the 1992 readjustment.

ALSO another parcel of land situated in the Town of Millinocket and Township 3, Indian Purchase, being described as a strip of land 200 feet wide offset from both the shoreline of Quakish Lake for its entire perimeter and the West Branch of the Penobscot River upstream from Quakish Lake to the easterly sideline of the Bangor & Aroostook Railroad right-of-way, excepting the rights of the State of Maine and public to use Route #11 and the utilities associated therewith, the right-of-way of Route #11 being 66.00 feet wide, excepting the area over which the Hydroelectric Easement is conveyed in Section 3.2.3 hereinabove, and also excepting the following described parcels:

Exception 1:

Beginning at a point on the northerly shore of Quakish Lake;

Thence N 5° 23' 40" E to an iron rod having coordinates N: 721,044.84 feet, E: 919,722.83 feet;

Thence continuing N 5° 23' 40" E, a distance of 180.90 feet to an iron rod on or near a line offset 200 feet from said shore line; Thence in a general northeasterly direction, by and along said offset line, a distance of 940 feet, more or less to an iron rod on or near said offset line;

Thence S 20° 08' 27" E, a distance of 102.06 feet to an iron rod having coordinates N: 721,603.50 feet, E: 920,421.06 feet; Thence continuing S 20° 08' 27" E to the shore of said Quakish Lake;

Thence in a general southwesterly direction, by and along said shore line, a distance of 1070 feet, more or less, to the point of beginning.

Exception 2:

Beginning at a point on the northerly shore of Quakish Lake;

Thence N 57° 45' 10" E to an iron rod having coordinates N: 718,900.50 feet, E: 918,528.68 feet;

Thence continuing N 57° 45' 10" E, a distance of 135.02 feet to an iron rod on or near a line offset 200 feet from said shore line; Thence in a general northwesterly, easterly and northwesterly direction, by and along said offset line, a distance of 2870 feet, more or less to an iron rod on or near said offset line;

Thence N 74° 29' 52" E, a distance of 221.39 feet to an iron rod having coordinates N: 720,070.80 feet, E: 918,520.82 feet; Thence continuing N 74° 29' 52" E to the shore of said Quakish Lake;

Thence in a general southeasterly, southwesterly, southeasterly, southwesterly, southeasterly, westerly and northwesterly direction, by and along said shoreline, a distance of 3250 feet, more or less, to the point of beginning.

The coordinates listed in exceptions 1 and 2 above are intended for an approximate location of the parcel described and not for boundary definition.

TOGETHER WITH all islands within Quakish Lake.

ALSO another parcel of land situated on Ferguson Lake in the Town of Millinocket being a strip of land 200 feet wide offset from a portion of the westerly shoreline, being further described as follows: Beginning at a point on or near the westerly shore of said Ferguson Lake said point having coordinates N: 720,223.95 feet, E: 926,185.41 feet, as referenced in the above description; Thence generally northerly along said shore line, a distance of 5700 feet, more or less, to a point;

Thence N 12° 15' 08" E to an iron rod having coordinates N: 722,728.56 feet, E: 926,589.36 feet, these coordinates are intended for approximate parcel location and not boundary definition;

Thence continuing N 12° 15' 08" E, a distance of 59.16 feet to an iron rod on or near a line offset 200 feet from said shore line; Thence in a general southerly direction, by and along said line, a distance of 5900 feet, more or less, to a point on said line; Thence easterly to the point of beginning.

Excepting the following described parcel:

Beginning at a point on the westerly shore of Ferguson Lake;

Thence N 74° 35' 17" W to an iron rod having coordinates N: 721,658.26 feet, E: 926,402.40 feet; Thence continuing N 74° 35' 17" W, a distance of 142.02 feet to an iron rod on or near a line offset 200 feet from said shore line;

Thence in a general northeasterly and northwesterly direction, by and along said offset line, a distance of 740 feet, more or less, to an iron rod on or near said offset line;

Thence N 74° 15' 34" E, a distance of 100.34 feet to an iron rod having coordinates N: 722,172.88 feet, E: 926,253.91 feet; Thence continuing N 74° 15' 34" E to the shore line of said Ferguson Lake;

Thence in a general southeasterly and southwesterly direction, by and along said shoreline, a distance of 810 feet, more or less, to the point of beginning.

The coordinates listed in this exception are intended for an approximate location of the parcel described and not for boundary definition, the iron rod is intended to control and nature of the boundary.

TOGETHER WITH all islands within Ferguson Lake.

To the extent that any portion of the parcels described above in Paragraph 3.3 are located in Township 3, Indian Purchase and are located between State Route 11 and property now or formerly of the Bangor & Aroostook Railroad, such parcels are granted as a Hydroelectric Easement, rather than in fee.

3.4 Ferguson Canal

Millinocket Mill - Millinocket, Maine

A certain lot or parcel of land with buildings and improvements including without limitation dikes thereon situated within the Great Northern Paper Company Mill lot in the Town of Millinocket, County of Penobscot State of Maine and being more particularly described as follows:

Beginning at a point at or near the east shore of Ferguson Lake at the coordinates N: 721,895.5 feet, E: 929,278.1 feet; coordinates are referenced to the Maine State Coordinate System, East Zone, NAD 83, and are intended to establish the location of said beginning point said point is further described as being 1785 feet, more or less, northwesterly of the most northerly corner of the headgate building and 330 feet, more or less southwesterly of the access road leading into the mill site; Thence S 87° 45' 22" E, a distance of 138.71 feet to a point; Thence S 49° 48' 36" E, a distance of 192.05 feet to a point; Thence S 31° 25' 20" E, a distance of 107.53 feet to a point; Thence S 88° 44' 32" E, a distance of 108.57 feet to a point; Thence S 72° 35' 48" E, a distance of 63.75 feet to a point; Thence N 75° 27' 31" E, a distance of 242.20 feet to a point; Thence N 75° 32' 32" E, a distance of 76.37 feet to a point; Thence N 82° 40' 04" E, a distance of 158.74 feet to a point; Thence S 83° 15' 09" E, a distance of 91.28 feet to a point; Thence S 64° 04' 44" E, a distance of 532.53 feet to a point; Thence N 87° 25' 23" E, a distance of 132.53 feet to a point; Thence N 53° 40' 02" E, a distance of 106.60 feet to a point, said point is further described as being 109 feet, more or less, northerly of the most northerly corner of the headgate building; Thence S 40° 27' 15" E, a distance of 401.54 feet to a point; Thence S 38° 54' 35" W, a distance of 142.43 feet to a point; Thence S 58° 01' 04" W, a distance of 157.50 feet to a point; Thence N 73° 37' 40" W, a distance of 913.21 feet to a point, that is northeasterly of a large steel transmission tower; Thence N 89° 03' 42" W, a distance of 72.77 feet to a point; Thence N 32° 23' 58" W, a distance of 152.86 feet to a point at or near the south shoreline of said Ferguson Canal, having coordinates of N:721,466.48 feet, E:930,049.18 feet; Thence continuing on the same course N 32° 23' 58" W, a distance of 118 feet, more or less, to a point on the north shoreline of said Ferguson Canal; Thence westerly by and along the southerly north shoreline of the Ferguson Canal continuing along the shoreline of said Ferguson Lake a distance of 1,375 feet more or less to the point of beginning.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet, E: 977,164.59 feet which are based on the 1992 readjustment.

3.5 North and South Twin Lakes and Elbow Pond In Indian Purchase #3 and #4

Certain parcels of land on North and South Twin Lakes and Elbow Pond being a strip of land 200.00 feet wide extending from the High Water of said Lake landward and to a line at all times 200.00 feet from said high water line of said Lake.

To the extent that any portion of the parcels described below in Paragraphs 3.5.1 to 3.5.19 are located in Township 3, Indian

Purchase or in Township 4, Indian Purchase, and are located between State Route 11 and property now or formerly of the Bangor and Aroostook Railroad, such parcels are granted as a Hydroelectric Easement, rather than in fee.

3.5.1 Parcel ST 57 and ST 67

Said Parcel beginning at an iron pipe found on the North shore of North Twin Lake on the Town Line between T1-R9 WELS and T4 Indian Purchase at UTM coordinates N 16594014.46, E 1671778.00 feet;

Thence, North 75°14'30" East, a distance of 111.43 feet to a rebar set;

Thence, continuing on the same course to a point that is 200.00 feet from the high water line of said Lake, it is noted that the high water line for these lakes is 491.92, MLS U.S.G.S. datum;

Thence, continuing southeasterly and northeasterly and always being 200.00 feet from the high water line of said Lake to the westerly bounds of a developed zone;

Thence, along said zone, South 20°53'20" East, to an iron pipe found;

Thence, continuing on the same course, a distance of 149.60 feet to an iron pipe found, said iron pipe being, South 66°52'50" East, a distance of 1700.05 feet from the point of beginning described immediately above and also being the point of commencement for the next parcel described immediately below;

Thence, continuing on the same course to the high water line of said Lake;

Thence, continuing southwesterly and northwesterly along said Lake high water line to the Town Line between T1-R9 WELS and T4 Indian Purchase;

Thence, along said Town Line North 75°14'30" East to the POINT OF BEGINNING.

3.5.2 Parcel ST 67 and ST 68

Beginning at a rebar set on the North shore of North Twin Lake, said rebar being, North 68°03'20" East, a distance of 201.95 feet from the point of commencement described above and at UTM coordinates of N 16593422.37, E 1673528.82 feet;

Thence, North 20°53'20" West, a distance of 40.00 feet to a rebar set;

Thence, continuing on the same course to a point that is 200.00 feet from the high water line of said Lake;

Thence, continuing southeasterly, southwesterly, easterly, and northerly along said line always being 200.00 from the high water line of said Lake to the westerly bound of a developed zone;

Thence, South 55°29'40" East, to an iron pipe found;

Thence, continuing on the same course, a distance of 159.86 feet to a rebar set, said rebar being, South 65°59'50" East, a distance of 1683.51 feet from the point of beginning described immediately above and also being the point of commencement for the next parcel described immediately below;

Thence, continuing on the same course to the high water line of said Lake;

Thence, continuing southerly, westerly, and northeasterly along the high water line of said Lake to the POINT OF BEGINNING.

3.5.3 Parcel ST 68 and ST 69

Beginning at an iron pipe found on the shore of said Lake being, North 25°06'50" East, a distance of 200.00 feet from the point of commencement described above and at UTM coordinates of N 16592918.66, E 1675151.65 feet;

Thence, North 35°24'00" West, a distance of 149.66 feet to an iron pipe found;

Thence, continuing on the same course to a point 200.00 feet from the high water line of said Lake; Thence, continuing northeasterly, southeasterly, southerly, easterly, northerly, easterly, and southerly along said line always being 200.00 feet from the high water line to the northerly bounds of a developed area;

Thence, North 83°05'00" West, to a rebar set, said rebar being, South 60°38'10" East, a distance of 2263.73 feet from the point of beginning described immediately above and also being the point of commencement for the next parcel described immediately below;

Thence, continuing northerly, westerly, southerly, westerly, northerly, and northwesterly along the high water line of said Lake to the POINT OF BEGINNING.

3.5.4 Parcel ST 70 and Norcross

Beginning at a rebar set on the North shore of Elbow Pond at the high water line, being, North 57°07'50" East, a distance of 1706.34 feet from a rebar set on the shore of North Twin Lake and on the Town Line between T3 and T4 Indian Purchase which is, South 48°20'40" East, a distance of 15293.10 feet from the point of commencement described immediately above and at UTM coordinates of N 16582570.06; E 1689983.96 feet;

Thence, South 80°48'10" West, a distance of 78.48 feet to a rebar set;

Thence, continuing on the same course to a point 200.00 feet from the high water line of said Pond;

Thence, continuing clockwise around Elbow Pond along said line always being 200.00 feet from the high water line to the northeasterly bounds of a developed area known as Norcross at a point, North 13°05'00" West, a distance of 45.30 feet from a cedar stake found at the southeast corner of Norcross;

Thence, continuing northerly along said Line, North 13°05'00" West, a distance of 200.00 feet to a point on the shore of Elbow Pond at the high water line of said Pond being, South 28°29'30" East, a distance of 5987.88 feet from the point of beginning described immediately above and also being the point of commencement for the parcel described immediately below; Thence, along the high water line of said Pond counter clockwise around said Pond to the POINT OF BEGINNING.

This may also include the Dam Site and other developments at the outlet of said Elbow Pond as surveyed by Plisga and Day, Land Surveyors, described at Section 3.2.1.

EXCEPTING the Bangor & Aroostook Railroad properties.

EXCEPTING a certain parcel of land west of North Twin Dam conveyed to Mark D. MacDonald and Lynne C. MacDonald on November 26, 1980 and recorded in the Penobscot County Registry of Deeds at Book 3146, Page 331, described as follows: Commencing at an iron pin on the northerly sideline of Route #11 and 2,750 feet westerly of the northwesterly abutment of the bridge crossing the West Branch of the Penobscot River below North Twin Dam;

Thence, South 79°39'00" West along the northerly line of Route #11 a distance of 201.20 feet to an iron pin;

Thence, North 04°15'00" West a distance of 561.50 feet to an iron pin on the southerly sideline of the Bangor & Aroostook Railroad, said pin being the POINT OF BEGINNING.

Thence, due east along the southerly sideline of the Bangor & Aroostook Railroad to a point 200.00 feet from the high water line of Elbow Pond;

Thence, southwesterly along a line that is always 200.00 feet from said high water line of said Pond to a line South 04°15'00" East from the iron pin marking the beginning point;

Thence, North 04°15'00" East, to the POINT OF BEGINNING. Said parcel containing 0.25 acres, more or less.

3.5.5 Parcel ST 73

Said parcel beginning at a rebar set on the northwesterly shore of an island in North Twin Lake, said rebar having UTM coordinates of N 16,575,648.94 feet, E 1,687,462.77 feet, and being, South 75°21'30" West, a distance of 5615.64 feet from the point of commencement listed immediately above;

Thence, crossing said island, South 00°41'10" West, a distance of 72.75 feet, to a rebar set on the southwesterly shore of said island, having UTM coordinates of N 16,575,576.20', E 1,687,461.90', which rebar will be the point of commencement for the parcel described immediately below;

Thence, continuing on the same course, South 00°41'10" West, to the high water line of North Twin Lake; Thence, generally northerly, westerly, and southwesterly along the high water line of said Lake;

Thence, North 29°22'50" West, to a rebar set on the southeasterly shore of an island;

Thence, North 29°22'50" West, 205.06 feet to a rebar set on the northerly shore of said island; Thence, North 29°22'50" West, to the high water line of North Twin Lake;

Thence, generally northeasterly, southeasterly, and northeasterly along the high water line of said Lake; Thence, South 00°41'00" West, to the POINT OF BEGINNING.

3.5.6 Parcel ST 63-1

Said parcel beginning at a rebar set on or near the westerly right-of-way of the Bangor & Aroostook Railroad and being, South 09°32'30" West, a distance of 6137.09 feet from the point of commencement described immediately above and being at UTM coordinates of N 16569524.03, E 1686444.51 feet; Thence, crossing said Railroad, South 74°16'20" East, a distance of 99.17 feet to a cedar post found and rebar set at the base thereof, on or near the easterly right of way of said railroad, and at the southwest corner of a privately owned parcel;

Thence, along said Private Parcel, South 81°13'10" East, to a point 200.00 feet from the high water line of said Lake;

Thence southwesterly and along a line always being 200.00 feet from the high water line of said Lake; Thence, North 77°36'50" West, to a rebar set on or near the easterly right-of-way of said Railroad;

Thence, on the same course and crossing said Railroad, a distance of 99.39 feet to a rebar set being, South 04°51'20" West, a distance of 233.52 feet from the point of beginning described immediately above and the point of commencement of Parcel ST 63- 2 described immediately below;

Thence, continuing on the same course to the high water line of said Lake; Thence, northeasterly along said high water line;

Thence, South 74°16'20" East, to a rebar set on or near the northerly right-of-way of said Railroad and the POINT OF BEGINNING.

Excepting the Bangor & Aroostook Railroad Properties being a 99.00 foot wide right-of-way described as follows: Beginning at the same point of beginning described immediately above;

Thence, crossing said Railroad, South 74°16'20" East, a distance of 99.17 feet to a cedar post found

and rebar set at the base thereof, on or near the easterly right-of-way of said railroad, and at the southwest corner of a privately owned parcel;

Thence, southerly along said right-of-way on a curve to left, with a tie course of, South 04°34'00" West, a distance of 227.84 feet to a rebar set on or near said easterly right-of-way;

Thence, crossing said right-of-way, North 77°36'50" West a distance of 99.39 feet to a rebar set on or near the westerly right-of- way;

Thence, northerly along said right-of-way and a curve to the right, with a tie course of, North 04°51'20" East, a distance of 233.52 feet to the POINT OF BEGINNING.

3.5.7 Parcel ST 63-2

Said Parcel beginning at a rebar set on or near the westerly right-of-way of said Railroad being, South 03°47'10" West, a distance of 283.49 feet from the point of commencement described immediately above, also being at UTM coordinates N 16569008.47, E 1686406.03 feet;

Thence, crossing said Railroad, South 84°31'00" East, a distance of 98.19 feet to a rebar set on or near the easterly right-of-way of said railroad;

Thence, continuing on the same course to a point 200.00 feet from the high water line of said Lake; Thence southwesterly and along a line always being 200.00 feet from the high water line of said Lake; Thence, North 54°23'30" West, to a rebar set on or near the easterly right-of-way of said Railroad;

Thence, continuing on the same course and crossing said railroad, a distance of 116.03 feet to a rebar set on or near the westerly right-of-way of said railroad and being the point of commencement of Parcel ST 63-3 described immediately below, said rebar being, South 03°52'10" West, a distance of 388.79 feet from the point of beginning immediately above;

Thence, continuing on the same course to the high water line of said Lake; Thence, northerly along said highwater line;

Thence, South 84'31'00" East, to the POINT OF BEGINNING.

Excepting the Bangor & Aroostook Railroad Properties, being a 99.00 foot wide right-of-way described as follows: Beginning at the same point of beginning as described immediately above;

Thence, across said Railroad, South 84°31'00" East, a distance of 98.19 feet to a rebar set on or near the easterly right-of-way of said railroad;

Thence, southerly along said right-of-way, South 03°48'10" West, a distance of 447.07 feet to a rebar set on or near said right-of- way;

Thence, crossing said railroad, North 54°23'30" West, a distance of 116.03 feet to a rebar set on or near the westerly right-of-way of said Railroad;

Thence, northerly along said right-of-way, North 03°52'10" East, a distance of 388.79 feet, to the POINT OF BEGINNING.

3.5.8 Parcel ST 63-3

Said Parcel beginning at a rebar set on or near the westerly right-of-way of said Railroad being, South 03°41'40" West, a distance of 589.50 feet from the point of commencement described immediately above and being at UTM coordinates N 16568032.28, E 1686341.81 feet;

Thence, crossing said Railroad, South 83°09'40" East, a distance of 97.64 feet to a rebar set on or near the easterly right-of-way of said Railroad;

Appendix E.1-2272

Thence continuing on the same course to a point being 200.00 feet from the high water line of said Lake;

Thence, southwesterly and along a line always being 200.00 feet from the high water line of said Lake to the northerly bound of a lease formerly to Barton's Marina;

Thence, along said lease, South 76°36'10" West, to an iron rod found, being South 24°39'20" West, a distance of 491.76 feet from the point of beginning described immediately above and also being the point of commencement of ST 63-4 described immediately below;

Thence, North 56°35'50" West, to the high water line of said Lake; Thence, northerly along said high water line;

Thence, South 83°09'40" East, to the POINT OF BEGINNING.

Excepting the Bangor & Aroostook Railroad Properties being a 99.00 foot wide right-of-way described as follows: Beginning at the same point of beginning as described immediately above;

Thence, crossing said Railroad, South 83°09'40" East, a distance of 97.64 feet to a rebar set on or near the easterly right-of-way of said Railroad;

Thence, southerly along said easterly right-of-way to a point being 200.00 feet from the high water line of said Lake;

Thence, southwesterly and along a line always being 200.00 feet from the high water line of said Lake to the westerly right-of-way of said railroad, having a tie course from the last mentioned rebar of, South 15°57'00" West, a distance of 344.64 feet;

Thence, northerly along said right-of-way, along a curve to the right, having a tie course of, North 00°22'20" West, a distance of

343.00 feet, to the POINT OF BEGINNING.

3.5.9 Parcel ST 63-4

Said Parcel beginning at an iron pipe found in the southwest corner of a lease formerly to Barton's Marina and now or formerly owned by Rick Levasseur and being, South 14°04'30" East, a distance of 642.41 feet from the point of commencement described immediately above and also being at UTM coordinates N 16,566,962.24, E 1,686,292.91 feet;

Thence, along said Lease, North 59°55'40" East, to a point 200.00 feet from the high water line of said Lake; Thence, southeasterly and southerly along a line being always 200.00 feet from the high water line of said Lake; Thence, North 75°38'10" West, to a rebar set;

Thence, on the same course a distance, of 81.34 feet to a rebar set, said rebar being, South 06°46'30" West, a distance of 1351.79 feet from the point of beginning and also being the point of commencement for ST 63-5 described immediately below;

Thence, continuing on the same course to the high water line of the Lake; Thence, northerly along the high water line of said Lake;

Thence, North 59°55'40" East, to the POINT OF BEGINNING.

Excepting the rights of the State of Maine and public to use Route #11 and the utilities associated therewith, the right-of-way of Route #11 being 66.00 feet wide and described as follows:

Commencing at the point of beginning listed immediately above;

Thence, South 25°02'10" East, a distance of 562.70 feet to the point of beginning on the westerly right-

of-way of said Route #11; Thence, along a line always 200.00 feet from the high water line, crossing said right-of-way, with a tie line of, South 39°06'00" East, a distance of 68.38 feet to a point on the easterly right-of-way of said Route #11

Thence, generally southerly, along the easterly right-of-way of said Route #11, along a curve to the left, having a tie course of, South 26°10'50" West, a distance of 883.14 feet to a point, said point being located, North 75°38'10" West, a distance of 28.59 feet from a rebar set;

Thence, crossing said right-of-way, North 75°38'10" West, a distance of 66.00 feet to the westerly right-of-way of said Route #11; Thence, generally northerly, along the westerly right-of-way of said Route #11, along a curve to the right, having a tie course of, North 26°20'00" East, a distance of 925.25 feet to the POINT OF BEGINNING.

3.5.10 Parcel ST 63-5

Said parcel beginning at a rebar set on or near the westerly right-of-way of Route #11, being, South 15°20'10" West, a distance of

286.75 feet from the point of commencement described immediately above, also being at UTM coordinates N 16565343.36, E 1686057.60 feet;

Thence, crossing said Route #11, South 73°52'40" East, a distance of 82.46 feet to a rebar set; Thence, continuing on the same course to a point 200.00 feet from the high water line of said Lake; Thence, southerly along a line always being 200.00 feet from the high water line of said Lake; Thence, North 73°55'50" West, to a rebar set;

Thence, continuing on the same course, crossing said Route #11, a distance of 82.00 feet to a rebar set on or near the westerly right-of-way of said Route #11, being South 15°00'40" West, a distance of 160.97 feet from the point of beginning described immediately above and also being the point of commencement for ST-63-6 described immediately below;

Thence, continuing on the same course, to the high water line of said Lake; Thence, northerly along the high water line of said Lake;

Thence, continuing, South 73°52'40" East, to a rebar set, being the POINT OF BEGINNING.

Excepting the rights of the State of Maine and public to use Route #11 and the utilities associated therewith, the right-of-way of Route #11 being 66.00 feet wide and described as follows:

Beginning at the same point of beginning listed immediately above;

Thence, crossing said Route #11, South 73°52'40" East, a distance of 65.47 feet to the easterly right-of-way of said Route #11; Thence, southerly, along said right-of-way to the southerly bound of the parcel described above, having a tie course of, South 15°02'00" West, a distance of 160.91 feet;

Thence, crossing said right-of-way, North 73°55'50" West, a distance of 65.41 feet to a rebar set on or near the westerly right-of- way of said Route #11;

Thence, northerly, along said right-of-way, having a tie course of, North 15°00'40" East, a distance of 160.97 feet, to the POINT OF BEGINNING.

3.5.11 Parcel ST 63-6

Beginning at point on the shore of said Lake, being, South 28°04'40" West, a distance of 478.34 feet from the point of commencement described immediately above and being at UTM coordinates N 16564765.84, E 1685790.77 feet;

Thence, to Route #11, crossing Route #11, and continuing, South 56°00'00" East to a point being 200.00 feet from the high water line of said Lake;

Thence, southerly along a line being always 200.00 feet from the high water line of said Lake to a rebar set;

Thence, to Route #11, and crossing Route #11, North 30°05'30" West, a distance of 91.78 feet to a rebar set on or near the westerly right-of-way of said Route #11, being South 19°34'30" West, a distance of 290.88 feet from the point of beginning of this parcel and also being the point of commencement for the next site described below.

Thence, on the same course to the high water line of said Lake;

Thence, northerly along said high water line to the POINT OF BEGINNING.

Excepting the rights of the State of Maine and public to use Route #11 and the utilities associated therewith, the right-of-way of Route #11 being 66.00 feet wide and described as follows:

Commencing at the point of beginning listed immediately above;

Thence, South 56°00'00" East, a distance of 59.52 feet to a point on the westerly right-of-way of Route #11, being the point of beginning;

Thence, crossing Route #11, South 56°00'00" East, a distance of 66.18 feet to the easterly right-of-way of said Route #11; Thence, southwesterly along said right-of-way, to the southerly bound of the parcel described above, having a tie course of South 31°48'50" West, a distance of 313.61 feet;

Thence, crossing said Route #11, North 30°05'30" West, a distance of 72.48 feet to a rebar set on or near the westerly right-of-way of said Route #11;

Thence, northeasterly along said right-of-way, North 31°22'10" East, a distance of 282.01 feet to the POINT OF BEGINNING.

3.5.12 Parcel ST 64

Beginning at a rebar set and being on the northerly side of the Turkey Tail Road so called and being, North 48°35'10" West, a distance of 8453.47 feet from the point of commencement described immediately above and being at UTM coordinates of N 16570083.62, E 1679353.56 feet;

Thence, South 17°04'30" East, a distance of 36.83 feet to a rebar set;

Thence, continuing on the same course to a point that is 200.00 feet from the high water line of said Lake; Thence, westerly and always being 200.00 feet from the high water line of said Lake;

Thence, North 49°12'10" East, crossing said Turkey Tail Road to a rebar set,

Thence, continuing on the same course, a distance of 40.35 feet to a rebar set, said rebar being the point of commencement for the parcel ST 65-1 as described below and also being, North 71°54'20" West, a distance of 348.54 feet from the point of beginning above;

Thence, continuing on the same course to the high water line of said Lake; Thence, easterly along said high water line;

Thence, South 17°04'30" East, to the POINT OF BEGINNING.

3.5.13 Parcel ST 65-1

Beginning at an iron pipe found on the shore of said Lake being, North 83°25'30" West, a distance of 6459.00 feet from the point of commencement described immediately above and at UTM coordinates of N 16570931.35, E 1672605.73 feet;

Thence, South 12°40'10" East, a distance of 171.00 feet to a rebar set;

Thence, continuing on the same course to a point that is 200.00 feet from the high water line of said Lake;

Thence, continuing westerly and northerly along said line always being 200.00 feet from the high water line to the easterly bound of a cottage lease;

Thence along said lease, North 13°34'00" West, to an iron pipe found;

Thence continuing on the same course, a distance of 149.18 to an iron pipe found being, North 59°52'20" West, a distance of 1575.58 feet from the point of beginning described immediately above and also being the point of commencement for ST 65-2 described immediately below;

Thence, continuing on the same course to the high water line of said Lake;

Thence, continuing generally easterly and northerly along said high water line to the easterly bounds of Lease No. 2233; Thence, continuing northerly along the easterly bounds of said Lease Lot to the high water line of said Lake;

Thence, continuing generally in a northerly direction along the high water line of said Lake to the southerly bound of Lease No. 2910;

Thence, continuing easterly along the southerly bound of said Lease Lot to a rebar set on the high water line of said Lake being, North 17°38'10" West, a distance of 915.71 feet from the iron pipe found described immediately above and at UTM coordinates of N 16572594.84, E 1670965.55 feet;

Thence, continuing generally in a southerly and easterly direction along the high water line of said Lake to the POINT OF BEGINNING.

3.5.14 Parcel ST 65-2

Beginning at an iron pipe found on the West side of said Lease mentioned immediately above being, South 29°35'20" West, a distance of 200.85 feet from the point of commencement described above, said point also being at UTM coordinates N 16571547.51, E 1671143.82 feet;

Thence, South 19°31'10" East, to a point that is 200.00 feet from the high water line of the North side of the causeway; Thence, continuing westerly on said line being always 200.00 feet from said high water line;

Thence, North 47°39'40" East, to a rebar set on the South side of the access road;

Thence, on the same course crossing the road, a distance of 79.59 feet to a rebar set on the edge of the Lake being, North 89°40'50" West, a distance of 324.29 feet from the point of beginning, also being the point of commencement for ST 71 and ST 72 described immediately below;

Thence, going along said high water line on the causeway easterly and northerly to a point on the shore near the point of beginning;

Thence, South 89°40'50" East, to the POINT OF BEGINNING.

3.5.15 Parcel ST 71 and ST 72

Said Parcel beginning at a rebar set on the shore of said Lake being, North 87°20'10" West, a distance of 2775.62 feet from the point of commencement described immediately above, said rebar also being at UTM coordinates N 16571678.35, E 1668046.91 feet;

Thence, South 69°30'00" East, a distance of 64.10 feet to a rebar set;

Thence, continuing on the same course to a point being 200.00 feet from the high water line of said Lake;

Thence, going southerly, westerly, and northerly along said line always being 200.00 feet from the high water line of said Lake to a developed zone;

Thence, continuing along said zone, South 07°51'50" East, to a rebar set;

Thence, continuing on the same course, a distance of 75.00 feet to a rebar set, said rebar being, North 01°57'10 East, a distance of 5204.17 feet from the point of beginning, also being the point of commencement for ST 72 and ST 66 described immediately below;

Thence, continuing on the same course to the high water line of said Lake;

Thence, going westerly, southerly, and easterly along the high water line of said Lake; Thence, South 69°30'00" East, to the POINT OF BEGINNING.

3.5.16 Parcels ST 72 and ST 66

Said Parcel beginning at a rebar set on the shore of said Lake being, North 31°06'00" East, a distance of 278.56 feet from the point of commencement described immediately above, said rebar also being at UTM coordinates N 16577118.02, E 1668368.02 feet; Thence, South 86°00'50" West, a distance of 51.02 feet to a rebar set;

Thence, continuing on the same course to a point being 200.00 feet from the high water line of said Lake;

Thence, going northerly and easterly along said line always being 200.00 feet from the high water line of said Lake to the northwesterly line of a developed area with a rebar set at each end of the line;

Thence, South 31°26'50" West, along said line to a rebar set, said rebar being, South 83'42'10" East, a distance of 11926.09 feet from the point of beginning described immediately above and also being the point of commencement for ST 66 and ST 56 described immediately below;

Thence, going westerly and southerly along the high water line of said Lake; Thence, South 86°00'50" West, to the POINT OF BEGINNING.

3.5.17 Parcels ST 66 and ST 56

Said Parcel beginning at a rebar set on the shore of said Lake being, North 31°26'50" East, a distance of 373.77 feet from the point of commencement described immediately above, said rebar also being at UTM coordinates N 16576128.66, E 1680417.14 feet; Thence, South 31°26'50" West, to a point 200.00 feet from the high water line of said Lake;

Thence, going northwesterly along said line always being 200.00 feet from the high water line of said Lake; Thence, North 00°10'00" West, to an iron pipe found;

Thence, continuing on the same course, a distance of 200.66 feet to a rebar set, said rebar being, North 27°18'20" West, a distance of 15820.14 feet from the point of beginning described immediately above and being the point of commencement for ST 56 described immediately below;

Thence, continuing on the same course to the high water line of said Lake; Thence, going Southeasterly along the high water line of said Lake; Thence, South 31°26'50" West, to the POINT OF BEGINNING.

3.5.18 Parcel ST 56

Said Parcel beginning at a rebar set on the shore of said Lake being, South 87°30'20" West, a distance of 608.96 feet from the point of commencement described immediately above, said rebar also being at UTM coordinates N 16590159.43, E 1672551.38 feet;

Thence, South 39°05'20" West, a distance of 79.88 feet to a rebar set;

Thence, continuing on the same course to a point 200.00 feet from the high water line of said Lake; Thence, going westerly along said line always being 200.00 feet from the high water line of said Lake to the line between T1-R9 WELS and T4 Indian Purchase; Thence, going easterly along said Line to a cedar post found and a rebar set being, North 73°23'50", a distance of 7857.32 feet from the point of beginning described immediately above and being the point of beginning for the closing course described immediately below;

Thence, going southeasterly along the high water line of said Lake to the POINT OF BEGINNING.

3.5.19 Closing Course

Beginning at the point of beginning described immediately above;

Thence, along the Town Line between T1-R9 WELS and T4 Indian Purchase, North 76°35'50" East, a distance of 6945.49 feet to the point of beginning of the first parcel in this series.

3.5.20 Islands

Together with all islands except islands listed in Schedule 3 attached hereto and in Section 14.3 herein and including in this grant without limitation 20 islands identified by the following UTM coordinates in feet:

Northings Eastings

#1 16591380 1677000

#2 16582420 1686500

#3 omitted

#4 16583500 1691230

#5 16584170 1692850

#6 16583370 1692280

#7 16582640 1694580

#8 16582700 1695930

#9 16582090 1695380

#10 16581130 1693950

#11 16580760 1693430

#12 16580790 1695570

#13 16580470 1694580

#14 16579310 1694170

#15 16579350 1693370

#16 16577120 1684380

#17 omitted

#18 16576190 1684420

#19 omitted

#20 16575700 1687130

#21 16576880 1668220

#22 16575730 1668490

#23 16574090 1667300

3.5.21 Recreation Area No. 4

A certain parcel of land situated in the Town of T4 Indian Purchase, County of Penobscot, State of Maine, on the westerly shore of South Twin Lake also known as Recreation Area No. 4 as shown on Exhibit G Sheet 2 of 10 Penobscot Mills Project Boundary Map North Twin Development. Described more particularly as follows:

Beginning at a rebar set marking the northwest corner of said Recreation Area No. 4 at UTM coordinates North 16576457.77, East 1666813.94 feet;

Thence, easterly on a UTM grid bearing of North 52°26'30" East, a distance of 1810.20 feet to a rebar set on the shore of South Twin Lake at North 16577561.23, East 1668248.93 feet to the high water line at MSL elevation of 491.92 feet U.S.G.S. datum; Thence, southerly along said high water line coming to a rebar set being the northeast corner of a developed area (see Parcel ST- 72);

Thence, continuing westerly along said high water line coming to a rebar set being the southwest corner of said developed area; Thence, southerly along said high water line;

Thence, continuing in a westerly direction along said high water line; Thence, in a northerly direction along said high water line;

Thence, westerly along the high water line;

Thence, in a northerly direction along the high water line, to the Point of Beginning. The above-described parcel of land containing 36 acres, more or less.

EXCEPTING said developed area, also being a certain parcel of leased land described as follows:

Said Parcel beginning at a rebar set near the shore of said Lake, being at UTM coordinates N 16577118.02. E 1668368.02 feet; Thence, North 86°00'50" East to the high water line of said Lake at MSL elevation of 491.92 feet U.S.G.S. datum;

Thence, continuing in an easterly, southerly, and westerly direction along said high water line to a point;

Thence, North 07°51'50" West to a rebar set, said rebar being at UTM coordinates North 16576879.50 East 1668224.13 feet; Thence, North 31°06'00" East, a distance of 278.56 feet to the POINT OF BEGINNING. Said parcel of land containing approximately 1 acre.

The above-described parcel of land is based on a field survey conducted under the supervision of Daniel O. Bridgham, PLS #1027, and shown on a Plat dated September 17, 2001. All bearings are UTM Grid. All monuments set were 5/8 inch metal rebar with yellow plastic caps affixed to them, with "D. Bridgham, PLS #1027" imprinted in the caps. September 20, 2001.

3.5.22 Recreation Area No. 5

A certain parcel of land situated in the Township Indian Purchase No. 4, County of Penobscot, State of Maine on the southeasterly shore of South Twin Lake also known as Recreation Area No. 5 as shown on Exhibit G Sheet 2 of 10 Penobscot Mills Project Boundary Map North Twin Development.

Described more particularly as follows:

Beginning on the high water line of South Twin Lake at an MSL elevation of 491.92 U.S.G.S. and the southerly bound of Lease Lot No. 424;

Thence, along the southerly bound of said Lease in an easterly direction, South 83°09'40" East, to a rebar set on the westerly right- of-way of Bangor & Aroostook Railroad being 100 feet wide, said rebar being at UTM coordinates North 16568032.28, East 1686341.81 feet;

Thence, continuing in a southerly direction along said right-of-way to the westerly right-of-way of Route #11 being 66 feet wide and being, North 14°24'30" West, a distance of 1402.05 feet from the above-described rebar set;

Thence, continuing in a southerly direction along said Route #11 right-of-way to a rebar set on the westerly bounds of said right-of- way at the northerly bounds of Lease Lot No. 125A, said rebar being at UTM coordinates North 16565619.89, East 1686133.44 feet, said rebar being, South 06°46'30" West, a distance of 1351.79 feet, then being, South 14°04'30" East, a distance of 642.41 feet, then being South 24°39'20" West, a distance of 491.76 feet from the first rebar set above;

Thence, continuing in a westerly direction along the northerly bounds of said Lease Lot, North 75°38'10" West, to the high water line of said Lake at the MLS elevation of 491.92 U.S.G.S.;

Thence, continuing in a northerly direction along the high water line of said Lake to the Point of Beginning. Said Parcel containing 19 acres, more or less.

The above-described parcel of land is based on a field survey conducted under the supervision of Daniel O. Bridgham, PLS #1027, and shown on a Plat dated September 17, 2001. All bearings are UTM Grid. All monuments set were 5/8 inch metal rebar with yellow plastic caps affixed to them, with "D. Bridgham, PLS #1027" imprinted in the caps. September 19, 2001.

EXCEPTING a certain parcel of land formerly leased to Barton's Marina, more particularly bounded and describe in deed from Maine Timberlands Company to Richard B. Levasseur dated August 2002 and recorded in the Penobscot County Registry of Deeds in Book 8307, Page 22, on August 7, 2002.

TOGETHER WITH rights reserved in said deed to Levasseur recorded in Book 8307, Page 22, in and to the 'Camp Road/Old R/R Spur" as more fully described therein.

3.6 T1-R10 Pemadumcook Lake

Certain parcels of land on the shore of Pemadumcook Lake in Township T1-R10 WELS being a strip of land 200.00 feet wide extending from the High Water Line of said Lake landward and to a line at all times 200.00 feet from said high water line of said Lake.

3.6.1 Town Line to ST-50

Beginning on the southerly shore of Pemadumcook Lake on the Town Line between T1-R9 WELS and T1-R10 WELS;

Thence, southerly along said Town Line to a point that is 200.00 feet from the high water line of said Lake, the highwater line for this Lake is at MSL elevation of 491.92 feet U.S.G.S. datum;

Thence, northwesterly along a line that is always 200.00 feet from the high water line of said Lake;

Thence, along a line between two rebars set, South 66°16'50 East, to a rebar set at UTM coordinates N 16601751.55, E 1648915.61 feet on the shore of said Lake, said rebar being the point of commencement of the parcel described immediately below;

Thence, southeasterly along said high water line to the Town Line; Thence, southerly along said Town Line to the POINT OF BEGINNING.

3.6.2 ST-50 to ST-51

Beginning at a rebar set on the shore of said Lake at UTM coordinates N 16,601,600.22, E 1649260.03 feet, said rebar being, North 66°16'50" West, a distance of 376.20 feet from the point of commencement described immediately above;

Thence, along a line between two rebars, set South 66°16'50" East, to a point that is 200.00 feet from the high water line of said Lake;

Thence, northwesterly along a line that is always 200.00 feet from the high water line of said Lake; Thence, North 54°15'30" East, to a rebar set;

Thence, continuing on the same course, a distance of 141.71 feet to a rebar set on the shore of said Lake, being, North 80°57'40" West, a distance of 2802.48 feet from the point of beginning, and also being the point of commencement for the parcel described immediately below;

Thence, southeasterly along the high water line of said Lake; Thence, South 66°16'50" East, to the POINT OF BEGINNING.

3.6.3 ST-51 to ST-52

Beginning at a rebar set at UTM coordinates N 16603560.02, E 1645466.00 feet and being, North 26°29'30" West, a distance of 1528.70 feet from the point of commencement described immediately above;

Thence, South 42°07'40" West, a distance of 56.89 feet to a rebar set;

Thence, continuing on the same course to a point that is 200.00 feet from the high water line of said Lake;

Thence, northwesterly, along a line that is always 200.00 feet from the high water line of said Lake; Thence, North 48°46'50" East, to a rebar set;

Thence, continuing on the same course a distance of 145.30 feet to a rebar set and an iron pipe found on the shore of said Lake, said items being, North 53°35'10 West, a distance of 4526.15 feet from the point of beginning described immediately above, and also being the point of commencement for the parcel described immediately below;

Thence, southeasterly, to and along the high water line of said Lake to the POINT OF BEGINNING.

3.6.4 ST-52 to ST-53

Beginning at a rebar set at UTM coordinates N 16606394.54, E 1641685.26 feet, being, North 43°05'40" West, a distance of

202.40 feet from the point of commencement described immediately above; Thence, South 55°46'10" West, a distance of 71.73 feet to a rebar set;

Thence, continuing on the same course, to a point that is 200.00 feet from the high water line of said Lake;

Thence, continuing westerly and clockwise around said Lake along a line that is always 200.00 feet from the high water line of said Lake;

Thence, South 18°15'30" East, to a rebar set;

Thence, continuing on the same course, a distance of 93.01 feet to a rebar set on the shore of said Lake, being, North 23°33'10" West, a distance of 8823.74 feet from the point of beginning described immediately above, and also being the point of commencement for the parcel described immediately

below;

Thence, easterly and counterclockwise around said Lake to and along the high water line of said Lake to the POINT OF BEGINNING.

3.6.5 ST-53 to Town Line

Beginning at a rebar set on the shore of said Lake at UTM coordinates N 16614196.92, E 1639768.72 feet, and being, South 79°54'40" East, a distance of 1634.55 feet from the point of commencement described immediately above;

Thence, North 06°44'00" West, a distance of 51.51 feet to a rebar set;

Thence, continuing on the same course, to a point that is 200.00 feet from the high water line of said Lake;

Thence, easterly along a line always 200.00 feet from the high water line of said Lake to the blazed and painted Town Line between T1-R10 WELS and T1-R9 WELS;

Thence, southerly along said Town Line to a rebar set on the shore of said Lake;

Thence, westerly to and along the high water line of said Lake to the POINT OF BEGINNING.

3.6.6 Islands

Together with all islands except Islands listed in Schedule 3 attached hereto and in Section 14.3 herein, and including in this grant without limitation 14 islands identified by the following UTM coordinates in feet:

Northings Eastings

#1 16611140 1651840

#2 16610630 1651530

#3 rebar set 16609360.55 1651711.20

#4 16600170 1653210

#5 omitted

#6 16600810 1652830

#7 16600940 1652160

#8 16598730 1653020

#9 16609690 1636210

#10 16609900 1635730

#11 16610520 1635730

#12 16610810 1635960

#13 16612230 1639370

#14 16614950 1634510

#15 16599680 1652360

3.6.7 Recreation Area No. 1

A certain parcel of land situated in the Town of T1-R10, County of Piscataquis, State of Maine on the westerly shore of Pemadumcook Lake also known as Recreation Area No. 1 as shown on Exhibit G sheet 2 of 10, Penobscot Mills Project Boundary Map North Twin Development. Bounded and described more particularly as follows:

Beginning at a rebar set marking the northwest corner of said Recreation Area No. 1 at UTM coordinates of North 16611603.38 and East 1636171.79 feet;

Thence, easterly on a UTM grid bearing of North 77°47'40" East, a distance of 1614.21 feet to a rebar set on the shore of Pemadumcook Lake at North 16611944.67, East 1637749.51 feet at MSL elevation of 491.92 feet U.S.G.S. datum; Thence, in a southerly direction along the high water line;

Thence, continuing westerly with the high water line;

Thence, northerly along the high water line to the Point of Beginning. The above-described parcel of land containing 20 acres, more or less.

The above-described parcel of land is based on a field survey conducted under the supervision of Daniel O. Bridgham, PLS #1027, and shown on a Plat dated September 18, 2001. All bearings are UTM Grid. All monuments set were 5/8 inch metal rebar with yellow plastic caps affixed to them, with "D. Bridgham, PLS #1027" imprinted in the caps. September 20, 2001.

3.6.8 Recreation Area No. 2

A certain parcel of land situated in the Town of T1-R10, County of Piscataquis, State of Maine on the North shore of Pemadumcook Lake also known as Recreation Area No. 2 as shown on Exhibit G Sheet 2 of 10, Penobscot Mills Project Boundary Map Twin Development. Described more particularly as follows:

Beginning at a rebar set marking the northwest corner of said Recreation Area No. 2 at UTM coordinates of North 16609925.56 East 1656465.90 feet;

Thence, easterly on a UTM grid bearing of South 56°11'20" East, a distance of 997.85 feet to a rebar set on the shore of Pemadumcook Lake at North 16610480.81, East 1655636.80 feet at MSL elevation of 491.92 feet U.S.G.S. datum; Thence, westerly along the high water line;

Thence, continuing northerly along the high water line;

Thence, southerly along the high water line, to the Point of Beginning. The above-described parcel of land containing 25 acres, more or less.

The above-described parcel of land is based on a field survey conducted under the supervision of Daniel O. Bridgham, PLS #1027, and shown on a Plat dated September 18, 2001. All bearings are UTM Grid. All monuments set were 5/8 inch metal rebar with yellow plastic caps affixed to them, with "D. Bridgham, PLS #1027" imprinted in the caps. September 19, 2001.

3.7 Penobscot Mills Pumping Station

A certain parcel of land together with buildings and improvements situated in Township 1 Range 9, County of Piscataquis, State of Maine being known as the Penobscot Mills Pumping Station, also being part of the land now or formerly owned by GNP, bounded and described more particularly as follows: BEGINNING at a #5 rebar set and capped #1027, located at UTM coordinate 16,613,596.05 North and 1,682,013.38 East, as acquired by GPS;

Thence, North 18°53'10" West, a distance of 26.00 feet to a rebar set at UTM coordinate 16,613,575.32 North and 1,681,954.95 East, as acquired by GPS, said rebar being 20.00 feet from the centerline of the pipes according to a plan by Kleinschmidt Associates dated November 1, 1991;

Thence, parallel to said pipes, South 70°27'50" West, a distance of 347.12 feet to a rebar set on the easterly right-of-way of the State Park Road as described in Volume 403, Page 283 of the Piscataquis County Registry of Deeds in Dover Foxcroft;

Thence, across said State Park Road, South 70°27'50" West, a distance of 60.30 feet to a rebar set on the westerly right-of-way of said State Park Road;

Thence, crossing the Golden Road, South 70°27'50" West, a distance of 68.66 feet to a rebar set on the westerly edge of the Golden Road;

Thence, along said Golden Road, South 23°26'20" East, a distance of 222.97 feet to the southerly edge of the Spencer Cove boat launch;

Thence, South 73°42'30" West, a distance of 173.27 feet to a rebar set on the shore of Ambejejus Lake;

Thence, continuing, South 73°42'30" West, an approximate distance of 10 feet to the high water mark of Ambejejus Lake; Thence, in a generally northerly direction, along the high water mark of Ambejejus Lake at an elevation equal to the N.F.P.E. of 491.92 feet U.S.G.S. datum to a point being South 09°46'00" East, an approximate distance of 10 feet from a rebar set;

Thence, North 09°46'00" West, an approximate distance of 10 feet to a rebar set on the shore of the Lake, said rebar being on a tie line of, North 12°10'30" West, a distance of 601.06 feet from the last rebar mentioned;

Thence, continuing, North 09°46'00" West, a distance of 77.32 feet to a rebar set;

Thence, North 57°41'50" East, a distance of 24.04 feet to a rebar set on the westerly edge of said Golden Road; Thence, along said Road, South 25°06'30" East, a distance of 406.90 feet to a rebar set;

Thence, across the Golden Road, North 70°27'50" East, a distance of 65.95 feet to a rebar set on the westerly right-of-way of said State Park Road;

Thence, across said State Park Road, North 70°27'50" East, a distance of 60.61 feet to a rebar set on the easterly right-of-way of said State Park Road;

Thence, continuing, North 70°27'50" East, a distance of 314.28 feet to a rebar set; Thence, North 19°52'10" West, a distance of 302.00 feet to a rebar set;

Thence, North 49°43'40" East, a distance of 128.31 feet to a rebar set; Thence, South 53°06'30" East, a distance of 193.36 feet to a rebar set;

Thence, North 79°21'30" East, an approximate distance of 20 feet to the high water mark of Millinocket Lake;

Thence, in a generally southerly direction, along the high water mark of Millinocket Lake, at an elevation equal to the N.F.P.E. of

480.00 feet U.S.G.S. datum, to a point, being North 70°27'50" East, an approximate distance of 20 feet from a rebar set;

Thence, South 70°27'50" West, an approximate distance of 20 feet to a rebar set, said rebar being on a two section tie line starting from the last rebar mentioned, thence, South 02°46'10" East, a distance of 99.63 feet to a rebar set and capped #1027 set under the bend in the center conductor of the Owners electrical transmission line, thence, South 08'38'00" West, a distance of 200.69 feet to a rebar set; Thence, continuing, South 70°27'50" West, a distance of 62.00 feet to the point of beginning. The above described parcel of land containing 3.0 acres, more or less.

The above described parcel of land is based on a field survey conducted under the supervision of Daniel O. Bridgham, PLS #1027, and shown on a Plat dated November 24, 1999; Published August 29, 2001. All bearings are calculated from UTM Grid, NAD27 Conus Datum, Zone 19 North. UTM coordinates are expressed in feet. Location Control by Trimble XL Pro GPS, with a minimum of 600 observations. Mean Horizontal Precision is 0.538 feet. Ground traverse was performed with an EDM.

All monuments set were 5/8 inch metal rebar with yellow plastic caps affixed to them, with "D. Bridgham, PLS #1027" imprinted in the caps.

3.8 Millinocket Lake Dam

A certain Parcel of land including, without limitation, the dam and dam structures, situated in Township 1, Range 8 WELS, County of Penobscot, State of Maine, being part of land now or formerly owned by GNP. Bounded and described more particularly as follows:

BEGINNING at a 5/8 inch rebar set and capped #1027, located at UTM coordinate 16,618,361.42 North and 1,708,393.22 East; Thence, South 39°41'50" East, a distance of 242.25 feet to a rebar set, and located at UTM coordinate 16,618,175.03 North and 1,708,547.55 East;

Thence, South 57°57'20" West, a distance of 849.99 feet to a rebar set; Thence, North 17°51'50" West, a distance of 234.34 feet to a rebar set; Thence, North 56°59'10" East to the shore of Millinocket Lake;

Thence, a generally easterly direction, along the high water mark of the Lake at an elevation equal to the N.F.P.E. of 480.00 feet

U.S.G.S. datum;

Thence, North 56°59'10" East, to the point of beginning.

The above described parcel containing 3.5 acres more or less.

The above described parcel of land is based on a field survey conducted under the supervision of Daniel O. Bridgham PL S # 1027, and shown on a Plat, having a revised date of October 8, 1999 and published August 28, 2001. All bearings are calculated from UTM Grid, Nad27, Conus Datum, Zone 19 North. UTM coordinates are expressed in feet. Location control by Trimble XL Pro GPS, with a minimum of 600 observations. The mean Horizontal Precision is 1.01 feet. Ground traverse was performed by EDM. All monuments set are 5/8 inch metal rebar with yellow plastic caps affixed to them, with "D. Bridgham PLS # 1027" imprinted in the caps.

3.9 T1-R8, T1-R9, and T2-R9 on Millinocket Lake

Certain parcels of land on the shore of Millinocket Lake in the Townships of T1-R8, T1-R9, and T2-R9 WELS being a strip of land

200.00 feet wide extending from the High Water of said Lake landward and to a line at all times a distance of 200.00 feet from said high water mark of said Lake.

3.9.1 Northeast Corner

Beginning at a rebar set on the shore of Millinocket Lake on the painted and blazed line found between Township T1-R8 and Township T2-R8 at UTM coordinates N 16624648.80, E 1707194.74 feet;

Thence, along said Town Line, North 83°42'10" East, a distance of 286.18 feet to a rebar set being approximately a distance of

200.00 feet from the high water mark of said Lake;

Thence, southerly, easterly, and, westerly, along a line that is always a distance of 200.00 feet from the high water mark of said Lake; (See Plan ST-66)

Thence, North 31°20'40" East, to a rebar set;

Thence, continuing on the same course, a distance of 91.73 feet to a rebar set on the shore of said Lake, being, South 13°27'10" East, a distance of 5324.43 feet from the point of beginning, and also being the point of commencement for the East Side of the Dam Parcel described immediately below;

Thence, easterly, westerly and northerly, along the high water mark of said Lake to the point of beginning.

TOGETHER WITH two peninsulas extending southerly from the town line into Millinocket Lake approximately one half mile westerly of the northerly end of the parcel described immediately above.

3.9.2 Dam Site East Side (ST-67)

Beginning at a rebar set on the shore of said Lake at UTM coordinates N 16618397.74, E 1708250.55 feet, also being, South 09°40'30" West, a distance of 1088.20 feet from the point of commencement described immediately above;

Thence, North 42°33'40" East, a distance of 105.64 feet to a rebar set;

Thence, continuing on the same course to a point that is a distance of 200.00 feet from the high water mark of said Lake; Thence, southerly, always being a distance of 200.00 feet from said high water mark to the Millinocket Lake Dam Lot;

Thence, along said Dam Lot, North 39'41'50" West, a distance of 170 feet more or less to a rebar set; Thence, continuing along said Dam Lot, South 56°59'10" West, a distance of 130.00 feet more or less to the high water mark of said Lake, said point being, South 17°26'20" East, a distance of 112.31 feet from the point of beginning, and also being the point of commencement for the West Side of the Dam Parcel described immediately below;

Thence, northerly along the high water mark of said Lake to the point of beginning.

3.9.3 Dam Site West Side (ST-67)

Beginning at a point on the shore of said Lake on the northerly bound of said Lake Dam Lot, at UTM coordinates N 16,618,083.32, E 1,707,965.21 feet, and said point being, South 56°59'10" West, a distance of 380.43 feet from the point of commencement described immediately above;

Thence, continuing along said Dam Lot northerly bound, South 56°5910" West, to a point that is a distance of 200.00 feet from the high water mark of said Lake;

Thence, northerly, along a line that is always a distance of 200.00 feet from the high water mark of said Lake;

Thence, North 20°00'00" East, to a rebar set on the shore of said Lake, said point being, North 37°17'50" West, a distance of

486.22 feet from the point of beginning, and also being the point of commencement for the Parcel ST-58 described immediately below;

Thence, southerly, along the high water mark of said Lake to the point of beginning. 3.9.4 Parcel ST-58

Beginning at a rebar set on the shore of said Lake, at UTM coordinates N 16,619,676.07, E 1,697,917.40 feet, being, North 82°57'00" West, a distance of 9827.46 feet from the point of commencement described immediately above; Thence, South 70°14'10" East, a distance of 106.87 feet to a rebar set;

Thence, continuing on the same course to a point that is a distance of 200.00 feet from the high water

mark of said Lake; Thence, southwesterly and northwesterly along a line that is always a distance of 200.00 feet from the high water mark of said Lake;

Thence, North 73°56'00" East, to a rebar set;

Thence, continuing on the same course, a distance of 105.27 feet to a rebar set on the shore of said Lake, being South 56°30'10' West, a distance of 1135.22 feet from the point of beginning described immediately above, and also being the point of commencement of Parcel ST-59 described immediately below;

Thence, easterly and northeasterly, along the high water mark of said Lake to the point of beginning.

3.9.5 Parcel ST-59

Beginning at a rebar set on the shore of said Lake, at UTM coordinates of N 16,618,355.06, E 1,696,126.53 feet, and being, South 50°33'20" West, a distance of 1093.16 feet from the point of commencement described immediately above;

Thence, North 32°43'40" East, a distance of 108.07 feet to a rebar set;

Thence, continuing on the same course to a point that is a distance of 200.00 feet from the high water mark of said Lake, Thence, southwesterly and northwesterly, along a line that is always a distance of 200.00 feet from the high water mark of said Lake;

Thence, North 55°04'00" East, to a rebar set;

Thence, continuing on the same course, a distance of 102.55 feet to a rebar set on the shore of said Lake, said rebar being, South 28°51'00" West, a distance of 1832.21 feet from the point of beginning described immediately above, and also being the point of commencement for Parcel ST-62 described immediately below;

Thence, easterly and northeasterly, along the high water mark of said Lake to the point of beginning.

3.9.6 Parcel ST-62

Beginning at a rebar set on the shore of said Lake at UTM coordinates N 16,615,143.29, E 1,694,243.92 feet, and also being, South 31°51'30" West, a distance of 1891.93 feet from the point of commencement described immediately above;

Thence, North 47°14'10" East, a distance of 108.51 feet to a rebar set;

Thence, continuing on the same course to a point that is a distance of 200.00 feet from the high water mark of said Lake; Thence, easterly, southerly, and westerly, to the easterly bound of a parcel owned Fee Simple by others;

Thence, North 01°26'20" West, through a rebar set to an iron pipe found on the shore of said Lake, said iron pipe being, South 46°42'00" West, a distance of 1607.39 feet from the point of beginning and the point of commencement for Parcel ST-60 described immediately below;

Thence, easterly, northerly and westerly, along the high water mark of said Lake to the point of beginning.

3.9.7 Parcel ST-60

Beginning at a rebar set on the shore of said Lake at UTM coordinates N 16,611,146.53, E 1,688,386.32 feet, being South 58°18'30" West, a distance of 5509.37 feet from the point of commencement described immediately above;

Thence, South 05°30'00" East, a distance of 106.80 feet to a rebar set;

Thence, continuing on the same course to a point that is a distance of 200.00 feet from the high water mark of said Lake; Thence, northwesterly along a line that is always a distance of 200.00 feet from the high water mark of said Lake; Thence, South 86°39'50" East, to a rebar set;

Thence, continuing on the same course, a distance of 79.99 feet to a rebar set on the shore of said Lake, being, North 49°13'30" West, a distance of 1008.31 feet from the point of beginning, and also being the point of commencement for Parcel ST-68 described immediately below;

Thence, southeasterly along the high water mark of said lake to the point of beginning.

3.9.8 Parcel ST-68

Beginning at a rebar set at UTM coordinates of N 16,613,927.12, E 1,681,786.15 feet, and being, North 63°51'40" West, a distance of 3432.82 feet from the Town Line rebar set between T1-R9 and T1-R8, which is, North 76°00'10" West, a distance of 2870.70 from the point of commencement described immediately above;

Thence, South 19°52'10" East, to a point a distance of 200.00 feet from the high water mark of said Lake; Thence, westerly, northerly, and then easterly always staying a distance of 200.00 feet from the high water mark of said Lake;

Thence, South 43°16'40" East, to a rebar set near the shore of the Lake, said rebar being North 07°55'10" East, a distance of

380.26 feet from the point of beginning, also being the point of commencement of the next parcel described immediately below; Thence, continuing to the high water mark;

Thence, westerly, southerly, and easterly along said high water mark; Thence, South 19°52'10" East, to the point of beginning.

3.9.9 Big Parcel in T1-R9

Beginning at a rebar set on the shore of said Lake at UTM coordinates of N 16,614,749.61, E 1,681,917.50 feet, also being, North 22°23'50" East, a distance of 482.24 feet from the point of commencement described immediately above;

Thence, South 63°37'40" West, in the direction of another rebar set to a point that is a distance of 200.00 feet from the high water mark of said Lake;

Thence, northerly, westerly, and easterly always 200.00 feet from the high water mark of said Lake to the Town Line between T1- R8 and T1-R9;

Thence, along said Town Line, South 00°06'10" West, to a rebar set on the shore of said Lake, said rebar being, North 25°55'30" East, a distance of 6937.83 feet from the point of beginning, said rebar also being the point of beginning for the next parcel described below;

Thence, westerly, southerly, and easterly along said high water mark to the point of beginning.

3.9.10 Small Parcel in T1-R8 on the West Shore

Beginning at the rebar described immediately above at UTM coordinates N 16,620,989.20, E 1,684,950.82 feet;

Thence, along said Town Line, North 00°06'10" West, to a point that is a distance of 200.00 feet from the high water mark of said Lake;

Thence, easterly, northerly, and westerly always 200.00 feet from the high water mark of said Lake to said Town Line;

Thence, North 00°06'10" West, to a rebar set on the shore of said Lake, being North 00°06'10" West, a distance of 2437.66 feet from the point of beginning described immediately above and also being the point of beginning for the next parcel described immediately below;

Thence, easterly, southerly, and westerly, along said high water mark to the point of beginning.

3.9.11 Parcel in T1-R9 WELS and T2-R9 WELS on the West Shore

Beginning at a rebar set as described immediately above at UTM coordinates N 16,623,426.85, E 1,684,946.47 feet;

Thence, South 00°06'10" East, along said Town Line to a point that is a distance of 200.00 feet from the high water mark of said Lake;

Thence, northwesterly and northeasterly, along a line that is always a distance of 200.00 feet from the high water mark of said Lake across the Town Line between T1-R9 WELS and T2-R9 WELS to the Town Line between T2-R9 WELS and T2-R8 WELS; Thence, along said Town Line, South 09°16'20" East, to a rebar set;

Thence, continuing on the same course, a distance of 99.54 feet to a rebar set on the shore of said Lake, said point being, North 00°10'50 West, a distance of 11115.82 feet from the point of beginning;

Thence, southwesterly and southeasterly, along the high water mark of said Lake crossing the Town Line between T2-R9 WELS and T1-R9 WELS to the point of beginning.

3.9.12 Islands

Together with all islands except Islands listed in Schedule 3 attached hereto and in Section 14.3 herein, and including within this grant without limitation 16 islands identified by the following UTM coordinates in feet:

Northings Eastings

#1 16622630 1706580

#2 16620560 1707560

#3 16619400 1697220

#4 16619920 1696500

#5 16618920 1695700

#6 16617680 1695580

#7 16618120 1693980

#12 16617900 1686740

#13 16614180 1687620

#14 16613530 1687900

#15 16617480 1683940

#16 16615550 1682230

3.10 Millinocket Mill

3.10.1 Millinocket Mill Site - Intentionally omitted

3.10.2 Little Italy Substation Millinocket Mill - Millinocket, Maine

(a) An exclusive Hydroelectric Easement located upon, over, under, through and across the following described parcel, with the exception of the Easement Exception Areas specifically identified below, and

(b) a blanket easement as described in that certain blanket cross easement deed and agreement from GNP to GNE of dated January 31, 2002 and recorded in the Penobscot County Registry of Deeds in Book 8064, Page 241, covering portions of the Millinocket Mill site:

A certain lot or parcel of land with improvements thereon situated within the Great Northern Paper Company Mill lot in the Town of Millinocket, County of Penobscot State of Maine and being more particularly described as follows:

Beginning at a point at or near a fence corner of the most northerly corner of an electrical sub-station, said point is located at coordinates N: 722,438.7 feet, E: 932,241.6 feet; coordinates are referenced to the Maine State Coordinate System, East Zone, NAD 83, and are intended to establish the approximate location of said beginning point;

Thence S 41° 16' 11" E by and along said chain link fence, a distance of 26.44 feet to an angle point in said fence; Thence S 31° 53' 38" E by and along said chain link fence, a distance of 11.06 feet to an angle point in said fence; Thence S 19° 18' 10" E by and along said chain link fence, a distance of 93.99 feet to an angle point in said fence;

Thence S 38° 31' 45" E by and along said chain link fence, a distance of 158.96 feet to an angle point in said fence, said point is further described as being the most easterly corner of said sub-station;

Thence S 51° 37' 37" W by and along said chain link fence, a distance of 88.21 feet to an angle point in said fence; Thence S 76° 24' 55" W by and along said chain link fence, a distance of 64.08 feet to an angle point in said fence; Thence N 38° 37' 47" W by and along said chain link fence, a distance of 94.87 feet to an angle point in said fence; Thence N 51° 58' 15" E by and along said chain link fence a distance of 6.31 feet to the southwesterly side of a building;

Thence N 38° 35' 13" W by and along the southwesterly side of said building, a distance of 14.69 feet to most westerly corner of said building;

Thence N 51° 17' 04" E by and along the northwesterly side of said building, a distance of 30.88 feet to the most northerly corner of said building;

Thence S 38° 35' 13" E by and along the northeasterly side of said building, a distance of 14.69 feet to chain link fence; Thence N 50° 30' 28" E by and along said chain link fence, a distance of 8.02 feet to an angle point in said fence; Thence N 37° 17' 43" W by and along said chain link fence, a distance of 36.31 feet to an angle point in said fence;

Thence N 02° 29' 16" W by and along said chain link fence, a distance of 17.23 feet to an angle point in said fence; Thence N 39° 10' 19" W by and along said chain link fence, a distance of 81.47 feet to the southeasterly side of a building;

Thence S 50° 35' 09" W by and along the southeasterly side of said building 9.83 feet to most southerly corner of said building; Thence N 38° 52' 39" W by and along the southwesterly side of said building, a distance of 12.72 feet to most westerly corner of said building;

Thence N 51° 07' 14" E by and along the northwesterly side of said building, a distance of 9.82 feet to the a chain link fence; Thence N 38° 52' 46" W by and along said chain link fence, a distance of 17.18 feet to an angle point in said fence;

Thence N 50° 52' 36" E by and along said chain link fence, a distance of 122.42 feet to point of beginning.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet, E: 977,164.59 feet which are based on the 1992 readjustment.

3.10.3 Power Station

Millinocket Mill - Millinocket, Maine

(a) An exclusive Hydroelectric Easement located upon, over, under, through and across the following described parcel, with the exception of the Easement Exception Areas specifically identified below, and

(b) a blanket easement as described in that certain blanket cross easement deed and agreement from GNP to GNE of dated January 31, 2002 and recorded in the Penobscot County Registry of Deeds in Book 8064, Page 241, covering portions of the Millinocket Mill site:

A certain lot or parcel of land with buildings and improvements thereon situated within the Great Northern Paper Company Mill lot in the Town of Millinocket, County of Penobscot State of Maine and being more particularly described as follows:

Beginning at a point at or near the northwesterly corner of the Power Station, said point is located at coordinates N: 722,093.9 feet, E: 931,761.4 feet; coordinates are referenced to the Maine State Coordinate System, East Zone, NAD 83, and are intended to establish the approximate location of the beginning point;

Thence N 51° 09' 52" E by and along said power station foundation, a distance of 175.59 feet to the most northerly building corner of said Power Station;

Thence continuing on the same course N 51° 09' 52" E, a distance of 77.31 feet to a point at or near the northeasterly face of a retaining wall;

Thence S 38° 57' 48" E by and along said retaining wall, a distance of 23.93 feet to a point near the corner of said retaining wall; Thence S 52° 15' 29" W by and along said retaining wall, a distance of 77.33 feet to a point on the northeasterly side of said Power Station foundation;

Thence S 38° 57' 48" E by and along said building foundation of the northeasterly wall of the said Power Station, a distance of

239.60 feet to the most easterly corner of said Power Station;

Thence S 50° 58' 14" W by and along the southeasterly foundation wall of said Power House, a distance of 175.29 feet to the most southerly building corner of said Power Station;

Thence N 39° 01' 46" W by and along said building foundation of the southwesterly side of said Power Station, a distance of

262.65 feet to the point of beginning.

Bearings referenced in the above description were computed from a traverse established for a survey

of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet, E: 977,164.59 feet which are based on the 1992 readjustment.

3.10.4 New Substation - Intentionally omitted.

3.10.5 Substation No. 4 Parcel Millinocket Mill Site

A certain lot or parcel of land with the improvements situated in Millinocket, Penobscot County, Maine more particularly described as follows:

Beginning at a point on the southwesterly line of the Ferguson Canal parcel, so called, which point is also the point of beginning of the Easement Area 2, so called, said point of beginning is further described as being at coordinates N: 721,100.57 feet and E: 931,005.98 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence S 50° 32' 25" W by and along a line that lies on the southeasterly side of the road running to said Stone Dam, which line is also the northwesterly line of the parcel herein described, a distance of 282.35 feet to the most westerly corner of the parcel herein described;

Thence S 50° 35' 19" E, a distance of 39.71 feet to a point further described as having coordinates N: 720,895.91 feet and E: 930,818.67 feet according to the aforementioned coordinate system;

Thence S 50° 35' 19" E, a distance of 391.64 feet to the westerly most corner of a chain link fence that surrounds the sub-station on the parcel herein described;

Thence S 57° 48' 57" E by and along said chain link fence, a distance of 108.74 feet to a point on said chain link fence, said point is further described as being a point on Easement Area 1, said point is further described as having coordinates N: 720,621.56 feet E: 931,174.08 according to aforementioned coordinate system;

Thence continuing on the same bearing S 57° 48' 57" E by and along said chain link fence and Easement Area 1, a distance of

100.00 feet to a corner of said fence;

Thence N 31° 49' 10" E by and along said chain link fence and Easement Area 1, a distance of 215.04 feet to a corner of said fence;

Thence continuing on the same bearing N 31° 49' 10" E, a distance of 93.87 feet to a point; Thence N 47° 44' 30" W, a distance of 130.00 feet to a point;

Thence N 34° 04' 08" W, a distance of 205.00 feet to a point;

Thence N 2° 22' 44" E, a distance of 74.28 feet to a point on the said Ferguson Canal Parcel;

Thence S 58° 01' 04" W, by and along said Ferguson Canal Parcel a distance of 157.50 feet to an angle point on the said Ferguson Canal Parcel;

Thence N 73° 37' 40" W, by and along said Ferguson Canal Parcel a distance of 77.17 feet to the point of beginning. Sub-Station No. 4 contains 4.30 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated

MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment.

3.10.6 Frequency Converter Parcel Millinocket Mill Site

(a) An exclusive Hydroelectric Easement located upon, over, under, through and across the following described parcel, with the exception of the Easement Exception Areas specifically identified below, and

(b) a blanket easement as described in that certain blanket cross easement deed and agreement from GNP to GNE of dated January 31, 2002 and recorded in the Penobscot County Registry of Deeds in Book 8064, Page 241, covering portions of the Millinocket Mill site:

A certain lot or parcel of land with improvements situated in Millinocket, Penobscot County, Maine more particularly described as follows:

Beginning-at a point on the Easement Area 1, so called, said point of beginning is further described as having coordinates N: 721,102.77 feet and E: 931,235.17 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence S 38° 08' 00" E by and along a northeasterly line of said Easement Area 1, a distance of 155.00 feet to a point; Thence N 51° 52' 00" E by and along a northwesterly line of said Easement Area 1 Parcel, a distance of 102.00 feet to a point; Thence N 38° 08' 00" W, a distance of 155.00 feet to a point;

Thence S 51° 52' 00"W, a distance of 102.00 feet to the point of beginning. The Frequency Converter Parcel contains 0.36 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment.

3.10.7 Substation No. 2-3 Parcel Millinocket Mill Site

(a) An exclusive Hydroelectric Easement located upon, over, under, through and across the following described parcel, with the exception of the Easement Exception Areas specifically identified below, and

(b) a blanket easement as described in that certain blanket cross easement deed and agreement from GNP to GNE of dated January 31, 2002 and recorded in the Penobscot County Registry of Deeds in Book 8064, Page 241, covering portions of the Millinocket Mill site:

A certain lot or parcel of land with improvements situated in Millinocket, Penobscot County, Maine more particularly described as follows:

Beginning at a point on the Easement Area 1, so called, said point of beginning is further described as having coordinates N: 721,027.11 feet and E: 931,484.74 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence S 38° 24' 42" E by and along a northeasterly line of said Easement Area 1, a distance of 223.08 feet to a point; Thence N 51° 04' 29" E by and along a northwesterly line of said Easement Area 1, a distance of 54.00 feet to a point; Thence N 39° 26' 20" W, by and along a southwesterly line of said Easement Area 1, a distance of 61.56 feet to a point; Thence continuing on the same bearing N

39° 26' 20" W, a distance of 161.52 feet to point;

Thence S 51° 04' 29" W, a distance of 50.00 feet to the point of beginning. The Substation 2-3 Parcel contains 0.27 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment.

3.10.8 T33 Transformer Parcel Millinocket Mill Site

(a) An exclusive Hydroelectric Easement located upon, over, under, through and across the following described parcel, with the exception of the Easement Exception Areas specifically identified below, and

(b) a blanket easement as described in that certain blanket cross easement deed and agreement from GNP to GNE of dated January 31, 2002 and recorded in the Penobscot County Registry of Deeds in Book 8064, Page 241, covering portions of the Millinocket Mill site:

A certain lot or parcel of land with improvements situated in Millinocket, Piscataquis County, Maine more particularly described as follows:

Beginning at a point on the Easement Area 1, so called, said point of beginning is further described as having coordinates N:

720,966.41 feet and E: 931,675.15 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence S 36° 38' 49" E by and along a northeasterly line of said Easement Area 1, a distance of 48.00 feet to a point; Thence N 53° 21' 11" E a distance of 40.00 feet to a point;

Thence N 36° 38' 49" W a distance of 48.00 feet to a point;

Thence S 53° 21' 11" W, a distance of 40.00 to the point of beginning. The T33 Transformer Parcel contains 0.04 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment.

3.10.9 Penstock Easement Easement Area 5 Millinocket Mill Site

(a) An exclusive Hydroelectric Easement located upon, over, under, through and across the following described parcel, with the exception of the Easement Exception Areas specifically identified below, and

(b) a blanket easement as described in that certain blanket cross easement deed and agreement from GNP to GNE of dated January 31, 2002 and recorded in the Penobscot County Registry of Deeds in Book 8064, Page 241, covering portions of the Millinocket Mill site:

A certain lot or parcel of land with improvements situated in Millinocket, Penobscot County, Maine more particularly described as follows:

Beginning at a point on the northeasterly line of the Ferguson Canal Parcel, so called, which point is northeasterly of the Head Gate House, so called, said point of beginning is further described as being at coordinates N: 721,356.89 feet and E: 931,231.59 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American

Datum of 1983 (NAD 83);

Thence N 52° 31' 35" E, a distance of 875.98 feet to the most southerly corner of the Power Station Parcel, so called;

Thence N 39° 01' 46" W by and along the southwesterly line of said Power Station Parcel, a distance of 214.28 feet to a point on said line;

Thence S 52° 31' 35" W, a distance of 881.31 feet to a point on the northeasterly line of the Ferguson Canal Parcel;

Thence S 40° 27' 15" E by and along the northeasterly line of said Ferguson Canal Parcel, a distance of 214.49 feet to the point of beginning. Penstock Easement Area 5 contains 4.32 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment.

3.10.10 Millinocket Easement Exception Areas 3.10.10.1. Easement Exception Area "A"

Oil Storage Tanks Millinocket Mill Site

Beginning at a point on the northerly line of Easement Area 1, so called, having coordinates of N:719,974.10 feet and E: 933,044.77 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence N 55° 19' 53" E, a distance of 228.63 feet to a point; Thence N 34° 40' 07" W, a distance of 140.92 feet to a point; Thence N 36° 39' 44" E, a distance of 149.89 feet to a point; Thence N 58° 08' 22" E, a distance of 191.75 feet to a point; Thence N 65° 37' 10" W, a distance of 399.04 feet to a point; Thence N 42° 21' 31" W, a distance of 120.86 feet to a point; Thence N 80° 22' 18" W, a distance of 383.03 feet to a point; Thence S 73° 22' 23" W, a distance of 180.33 feet to a point;

Thence N 75° 22' 07" W, a distance of 227.85 feet to a point; Thence S 56° 28' 09" E, a distance of 226.35 feet to a point; Thence S 36° 14' 52" E, a distance of 460.18 feet to a point; Thence S 50° 28' 45" W, a distance of 203.63 feet to a point;

Thence S 73° 17' 04" E, a distance of 576.18 feet to the point of beginning. Easement Exception Area "A" contains 10.756 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment.

3.10.10.2 Easement Exception Area "B"

(Mill Site Southerly to the West Branch of the Penobscot River) Millinocket Mill Site

Beginning at a point on the southwesterly line of Easement Area 7, so called, at its intersection with the southerly line of Easement Area 1, so called, said point having coordinates of N: 719,628.40 feet and E: 935,842.27 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence S 88° 13' 35" W, a distance of 2951.57 feet to a point; Thence N 1° 46' 25" W, a distance of 140.40 feet to a point; Thence N 74° 01' 20" W, a distance of 540.56 feet to a point; Thence N 59° 32' 41" W, a distance of 1103.35 feet to a point;

Thence N 45° 48' 30" W, a distance of 338.76 feet to a point on a chain link fence said point being further described as a point on the southwesterly line Sub-Station No. 4, said point is further described as being located at coordinates of N: 720,621.56 feet and E: 931,174.08 according to aforementioned coordinate system;

Thence N 57°48' 57" W by and along said chain link fence, a distance of 108.74 feet to a corner of said fence;

Thence N 50° 35' 19" W, a distance of 340.90 feet to a point being the southeasterly corner of Easement Area 4, so called, said point having coordinates of N: 720,895.91 feet and E: 930,818.67 feet, according to aforementioned coordinate system; Thence S 49°13' 53" W, a distance of 42.79 feet to a point;

Thence S 49° 00' 52" W, a distance of 288.23 feet to a point; Thence S 56° 04' 37" W, a distance of 110.43 feet to a point; Thence S 18° 32' 03" W, a distance of 28.91 feet to a point; Thence S 48° 27' 21" W, a distance of 147.01 feet to a point; Thence S 44° 00' 30" W, a distance of 746.57 feet to a point; Thence S 62° 19' 46" W, a distance of 450.69 feet to a point; Thence S 53° 33' 03" W, a distance of 152.67 feet to a point; Thence S 41° 32' 21" W, a distance of 128.46 feet to a point; Thence S 24° 52' 06" W, a distance of 293.05 feet to a point; Thence S 14° 25' 23" W, a distance of 309.69 feet to a point; Thence S 38° 08' 40" W, a distance of 319.14 feet to a point; Thence S 61° 10' 40" W, a distance of 153.45 feet to a point;

Thence S 72° 25' 30" W, a distance of 148.60 feet to a point on the Stone Dam Parcel, so called;

Thence S 2° 08' 12" E by and along said Stone Dam Parcel, a distance of 4.61 feet to an angle point in said line; Thence S 61° 53' 43" W by and along said Stone Dam Parcel, a distance of 145.68 feet to an angle point in said line; Thence S 76° 10' 55" W by and along said Stone Dam Parcel, a distance of 118.06 feet to an angle point in said line;

Thence N 82° 02' 56" W by and along said Stone Dam Parcel, a distance of 54.14 feet to its intersection with Easement Area 4, so called;

Thence S 72° 25' 30" W, a distance of 78.92 feet to a point; Thence N 69° 39' 41" W, a distance of 160.69 feet to a point; Thence N 64° 32' 46" W, a distance of 742.30 feet to a point;

Thence N 66° 39' 15" W, a distance of 74.36 feet to a point on the Stone Dam Parcel, so called;

Thence S 75° 45' 01" W by and along said Stone Dam Parcel, a distance of 983.20 feet to an angle point in said line;

Thence N 82° 35' 20" W by and along said Stone Dam Parcel, a distance of 16.89 feet to its intersection with Easement Area 4, so called;

Thence S 63° 57' 44" W, a distance of 40.87 feet to a point; Thence S 89° 04' 15" W, a distance of 104.50 feet to a point;

Thence N 74° 20' 20" W, a distance of 64.29 feet to the southwesterly end of said Easement Area 4;

Thence S 56° 38' 27" W, a distance of 52.71 feet, more or less, to the thread of the West Branch of the Penobscot River and the town line between the Town of Millinocket and T3 Indian Purchase;

Thence in a general southeasterly and southerly direction, by and along the thread of said river, a distance of 5900 feet, more or less, to the northerly boundary of the Back Channel Wildlife Parcel, so called;

Thence N 76° 51' 44" E by and along said Back Channel Wildlife Parcel boundary, a distance of 2320 feet, more or less, to an angle point in said line;

Thence S 74° 49' 13" E by and along said Back Channel Wildlife Parcel boundary, a distance of 8703 feet, more or less, to the thread of the West Branch of the Penobscot River and the town line between the Town of Millinocket and T3 Indian Purchase; Thence in a general northeasterly direction, by and along the thread of said river, a distance of 4480 feet, more or less, to its intersection with the southerly boundary of Easement Area 7, so called;

Thence N 50° 32' 17" W by and along said Easement Area 7, a distance of 427 feet, more or less, to an angle point in said line; Thence N 54° 48' 17" W by and along said Easement Area 7, a distance of 3245.39 feet to an angle point in said line;

Thence N 35° 11' 55" E by and along said Easement Area 7, a distance of 252.73 feet to an angle point in said line;

Thence N 54° 48' 05" W by and along said Easement Area 7, a distance of 2125.62 feet to the point of beginning. Easement Area "B" contains 1490 acres, more or less.

Bearings referenced in the above descriptions were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment.

3.11 Millinocket (Central Street Woodlands Office):

A certain lot or parcel of land, together with buildings and improvements situated in Millinocket, Penobscot County, Maine more particularly described as follows:

The westerly portion of Lot #1, Block 202 (153' 4" x 400') shown in Plan Book 20, Page 11, and more particularly described in a deed from Barnett Enterprises, Inc., dated September 10, 1974, recorded in Book 2490, Page 178 on September 12, 1974, situated in the Town of Millinocket, County of Penobscot, and State of Maine, and further described as follows:

Beginning at an iron pin located at the northwesterly corner of land now or formerly of GNP, being Lot numbered one (1), in Block numbered two hundred two (202) as laid down on a Plan of Land of Great Northern Paper Company at said Millinocket, and recorded in the Penobscot County Registry of Deeds, Plan Book 20, Page 11;

thence S 66° 14' 00" E a distance of 153.33 feet to an iron pin; thence S 23° 46' 00" W a distance of 400.00 feet to an iron pin; thence N 66° 14' 00" W distance of 153.33 feet to an iron pin; thence N 23° 46' 00" E a distance of 400.00 feet to the point of beginning.

3.12 Back Channel Wildlife Management Area T3 Indian Purchase and Millinocket, Maine

A certain lot or parcel of land with improvements situated southeasterly of Quakish Lake in the Town of Millinocket and Township 3, Indian Purchase, County of Penobscot, State of Maine and being more particularly described as follows:

Beginning at an iron rod easterly of a gravel road, said rod having coordinates N: 714,665.82 feet, E: 922,766.80 feet, said coordinates referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence S 1° 52' 41" W, a distance of 3,841.73 feet to an iron rod easterly of said gravel road; Thence N 88° 58' 08" E, a distance of 4,574.95 feet to an iron rod;

Thence S 29° 25' 40" E, a distance of 4,785 feet, more or less, to the northerly line of Hopkins Academy Grant;

Thence in a general easterly direction, by and along the northerly line of said Hopkins Academy Grant, a distance of 11,433 feet, more or less to the thread of Trapper Brook, so called;

Thence in a general northerly direction, by and along the thread of said Trapper Brook, a distance of 4,040 feet, more or less, to the thread of the West Branch of the Penobscot River at coordinate N: 712,455.27 feet, E: 939,206.00 feet, said coordinates are intended to identify the location of the boundary line and may not be at the physical location as defined;

Thence N 74° 49' 13" W, crossing into the Town of Millinocket, a distance of 8,703 feet, more or less, to a point on the southerly boundary of the Millinocket mill site, said point having coordinates N: 714,734.10 feet, E: 930,806.73 feet;

Thence S 76° 51' 44" W by and along said mill boundary, a distance of 2,320 feet, more or less, to the thread of the West Branch of the Penobscot River:

Thence in a general westerly and northwesterly direction, by and along the thread of the West Branch of the Penobscot River, a distance of 6,160 feet, more or less, to the intersection of this line with the southerly boundary of the Stone Dam Parcel;

Thence N 65° 12' 23" W, by and along said southerly boundary, crossing into Township 3, Indian Purchase, a distance of 50 feet, more or less, to an angle point in said boundary;

Thence S 41° 54' 50" W by and along said boundary, a distance of 1,145.45 feet to a point;

Thence N 48° 05' 10" W by and along said boundary, a distance of 21.71 feet to a point, said point being located S 9° 23' 06" W, a distance of 135.50 feet from a pk nail in the southwesterly end of said Stone Dam;

Thence S 9° 23' 06" W, a distance of 3,085.49 feet to a point;

Thence S 82° 13' 59" W, a distance of 1,808.71 feet to the point of beginning. Containing 2,350 acres, more or less.

EXCEPTING a certain parcel of land containing approximately 0.92 acres just north of Nollesemic Stream on the shore of Shad Pond and described in lease to Ryan W. Robbins (Lease No. 82).

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet, E: 977,164.59 feet which are based on the 1992 readjustment.

3.13 East Millinocket Mill Site Dam Parcel

Substation Parcels

(a) A Hydroelectric Easement located upon, over, under, through and across the following described parcels, with the exception of the Easement Exception Areas specifically identified below, and

(b) a blanket easement as described in that certain Blanket Cross Easement Deed and Agreement between Great Northern Paper, Inc. and GNE, LLC dated January 31, 2002 and recorded in the Penobscot County Registry of Deeds in Book 8064, Page 241, and covering a portion of the East

Millinocket Mill site:

3.13.1. East Millinocket Dam

An exclusive Hydroelectric Easement located upon, over, under, through and across a certain lot or parcel of land being a portion of the East Millinocket mill site in the Town of East Millinocket, County of Penobscot, State of Maine and being more particularly described as follows:

Beginning at the outside corner of a brick building at the northerly end of the dam at East Millinocket with coordinates of N: 712,766.31 feet and E: 964,925.90 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence N 26° 49' 07" E by and along the side of the said building, a distance of 4.48 feet to an inside corner of said building; Thence S 63° 23' 29" E by and along the side of said building, a distance of 27.79 feet to an outside corner of said building; Thence N 26° 48' 08" E by and along the side of said building, a distance of 0.66 feet to a point at or near the edge of a concrete retaining wall;

Thence S 63° 12' 08" E through the wall of an adjacent building and approximately along and beyond a concrete wall, a distance of

121.80 feet to a point that is on the approximate extension northeasterly of the down stream face of the power house building; Thence S 26° 28' 32" W, by and along said exterior wall, a distance of 27.00 feet to an inside corner of a brick wall;

Thence S 63° 31' 28" E by and along the side of said building, a distance of 17.30 feet to an outside corner of said building; Thence N 26° 23' 29" E by and along the side of said building, a distance of 21.13 feet to an inside corner of said building; Thence S 63° 16' 08" E a distance of 39.42 feet to another exterior wall of said building;

Thence S 29° 26' 02" W by and along the side of said building, a distance of 6.44 feet to an outside corner of said building; Thence S 63° 16' 08" E by and along the side of said building, a distance of 65.98 feet to an inside corner of said building; Thence S 24° 59' 05" W by and along the side of said building, a distance of 15.57 feet to an outside corner of said building; Thence S 62' 57' 12" E by and along the side of said building, a distance of 68.70 feet to an outside corner of said building; Thence N 26° 39' 25" E, a distance of 16.5 feet;

Thence S 63° 20' 35" E, a distance of 43.90 feet to a side of said building;

Thence S 26° 39' 25" W by and along the side of said building, a distance of 22.90 feet to an outside corner of said building; Thence S 63° 20' 35" E by and along the side of said building, a distance of 38.49 feet to an outside corner of said building; Thence S 76° 32' 03" E, a distance of 238.36 feet to the southeasterly corner of a chain link fence surrounding a sub-station; Thence N 27° 20' 25" E approximately along and on an extension of said sub-station fence, a distance of 114.85 feet to a point; Thence S 71° 34' 45" E, a distance of 285.00 feet to a point;

Thence S 17° 18' 05" W crossing the northerly bank of said river easterly of the East Millinocket dam, a distance of 459 feet, more or less, to the thread of said river and the town line between East Millinocket and TA, R7, WELS;

Thence in a general westerly direction, by and along said town line and crossing the East Millinocket Dam, a distance of 1025 feet, more or less, to a point on the boundary of the East Millinocket and Dolby Dam Parcel, so called;

Thence N 27° 16' 50" E by and along said boundary, crossing the impoundment behind said dam, a distance of 362 feet, more or less, to the point of beginning. The above described parcel contains 8.4 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment.

3.13.2 Electric Substation 1 (Easterly of Dam) East Millinocket

A certain lot or parcel of land being a portion of the East Millinocket mill site in the Town of East Millinocket, County of Penobscot, State of Maine and being more particularly described as follows: Beginning at a point on the northerly boundary of the East Millinocket and Dolby Dam Parcel, so called, at the southeasterly corner of a chain link fence surrounding an electric substation, having coordinates: N: 712,494.01 feet and E: 965,522.76 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence N 76° 32' 03" W, a distance of 93.37 feet to a point;

Thence N 27° 12' 38" E, a distance of 64.38 feet to a point; Thence S 82° 48' 47" E, a distance of 96.72 feet to a point;

Thence S 27° 20' 25" W, a distance of 75.31 feet to the point of beginning. The above described parcel contains 0.146 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment.

3.13.3 Electric Substation 3 (Westerly of Dam) East Millinocket

A certain lot or parcel of land being a portion of the East Millinocket mill site in the Town of East Millinocket, County of Penobscot, State of Maine and being more particularly described as follows: Beginning at a point on the northerly shore of the West Branch of the Penobscot River, said point being located 450 feet, more or less, westerly from the northwest end of the dam, said point having coordinates: N: 712,893.85 feet and E: 964,534.80 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence in a general westerly direction, by and along said shore line, a distance of 145 feet, more or less, to a point on said shore, said point being located N 81° 26' 36" W, a distance of 143.23 feet from the point of beginning;

Thence N 26° 16' 04" E, a distance of 143.12 feet to a point; Thence S 65° 26' 01" E, a distance of 136.50 feet to a point;

Thence S 26° 16' 04" W, a distance of 103.60 feet to the point of beginning. The above described parcel contains 0.4 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment.

3.13.4 East Millinocket Easement Exception Areas 3.13.4.1 Easement Exception Area "A" (Wastewater Treatment Facility)

East Millinocket Mill

A certain lot or parcel of land being a portion of the East Millinocket mill site in the Town of East Millinocket, County of Penobscot, State of Maine and being more particularly described as follows:

That portion of said East Millinocket Mill Site situated easterly of the following described line:

Beginning at a point on the southerly right of way line of the Bangor and Aroostook Railroad, said point having coordinates N: 713,105.65 feet and E: 966,651.66 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence S 33° 55' 21" W, a distance of 1069 feet, more or less, to a point on the northerly shore of the West Branch of the Penobscot River. Easement Exception Area "A" contains 44 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment.

3.13.4.2 Easement Exception Area "B" (Area North and East of Training Center) East Millinocket Mill

A certain lot or parcel of land being a portion of the East Millinocket mill site in the Town of East Millinocket, County of Penobscot, State of Maine and being more particularly described as follows: Beginning at a point easterly of the training center, so called, having coordinates N: 712,895.05 feet and E: 966,396.13 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence N 70° 57' 58" W, a distance of 557.43 feet to a point; Thence S 18° 54' 26" W, a distance of 154.50 feet to a point; Thence S 83° 28' 30" E, a distance of 217.80 feet to a point; Thence S 22° 13' 33" E, a distance of 119.17 feet to a point;

Thence N 72° 30' 29" E, a distance of 330.85 feet to the point of beginning. Easement Exception Area "B" contains 1.515 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment.

3.13.4.3 Easement Exception Area "C" (Area Southwesterly of Training Center) East Millinocket Mill

A certain lot or parcel of land being a portion of the East Millinocket mill site in the Town of East Millinocket, County of Penobscot, State of Maine and being more particularly described as follows: Beginning at a point northwesterly of the training center, so called, having coordinates N: 712,890.88 feet and E: 965,789.46 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence S 43° 54' 26" W, a distance of 355.01 feet to a point; Thence S 52° 46' 35" E, a distance of 50.14 feet to a point; Thence N 67° 24' 33" E, a distance of 298.48 feet to a point;

Thence N 22° 00' 46" W, a distance of 184.92 feet to the point of beginning. Easement Exception Area

"C" contains 0.836 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment

3.13.4.4 Easement Exception Area "D" (Recycle Fiber Plant and Storage Tanks) East Millinocket Mill

Two certain lots or parcels of land being a portion of the East Millinocket mill site in the Town of East Millinocket, County of Penobscot, State of Maine and being more particularly described as follows:

Beginning at a point on the southerly right of way line of the Bangor and Aroostook Railroad, easterly a crossing located northwesterly of the Recycle Fiber Plant, so called, said point having coordinates N: 714,482.96 feet and E: 963,621.18 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence S 27° 49' 27" E, a distance of 494.42 feet to a point;

Thence S 50° 48' 45" E, a distance of 425.47 feet to a point; Thence S 66° 32' 25" E, a distance of 578.56 feet to a point;

Thence N 88° 51' 50" E, a distance of 514.90 feet to a point westerly of the main mill entrance; Thence N 32° 24' 38" W, running westerly of said entrance, a distance of 282.10 feet to a point;

Thence N 53° 45' 03" W, a distance of 79.58 feet to a point on said Bangor and Aroostook Railroad right of way; Thence S 20° 39' 06" W by and along said right of way, a distance of 50.82 feet to a point;

Thence in a general westerly direction by and along said right of way on a non-tangent curve to the right with a radius of 1532.69 feet an arc distance of 300.13 feet to a point, said curve having a chord bearing N 70° 10' 25" W and a chord distance of 299.65 feet;

Thence S 25° 30' 51" W by and along said right of way a distance of 44.91 feet to a point; Thence N 50° 50' 39" W by and along said right of way, a distance of 461.00 feet to a point;

Thence N 62° 42' 55" W by and along said right of way, a distance 510.00 feet to a point of curvature;

Thence in a general westerly direction by and along said right of way on a tangent curve to the left with a radius of 1383.19 feet an arc distance of 280.73 feet to the point of beginning. The above described parcel contains 11.533 acres, more or less.

ALSO another parcel of land being a portion of the East Millinocket mill site in the Town of East Millinocket, County of Penobscot, State of Maine and being more particularly described as follows: Beginning at a point on the southerly right of way line of the Bangor and Aroostook Railroad, said point having coordinates N: 713,811.26 feet and E: 965,170.45 feet;

Thence S 53° 59' 21" W, a distance of 34.73 feet to a point easterly of the main mill entrance; Thence S 36° 00' 39" E, running easterly of said entrance, a distance of 319.50 feet to a point; Thence N 51° 31' 13" E, a distance of 157.57 feet to a point;

Thence N 33° 43' 40" E, a distance of 156.22 feet to a point on said Bangor and Aroostook Railroad right of way;

Thence N 82° 09' 54" W by and along said right of way, a distance of 373.33 feet to the point of beginning. The above described parcel contains 1.304 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment.

3.13.4.5 Easement Exception Area "E" (Bark Pile)

East Millinocket Mill

A certain lot or parcel of land being a portion of the East Millinocket mill site in the Town of East Millinocket, County of Penobscot, State of Maine and being more particularly described as follows:

Beginning at a point on the southerly side of a road leading from said mill to the Dolby Dam, so called, said point having coordinates N: 714,810.51 feet and E: 961,249.41 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence S 71° 45' 14" E, southerly of said road, a distance of 609.87 feet to a point; Thence S 74° 47' 02" E, southerly of said road, a distance of 492.66 feet to a point; Thence S 88° 24' 01" E, southerly of said road, a distance of 566.64 feet to a point; Thence S 63° 33' 30" E, southerly of said road, a distance of 331.46 feet to a point; Thence S 29° 51' 22" E, a distance of 73.64 feet to a point;

Thence S 19° 57' 30" W, a distance of 811.42 feet to a point; Thence S 10° 05' 41" E, a distance of 218.68 feet to a point; Thence S 42° 58' 36" E, a distance of 236.76 feet to a point;

Thence S 6° 55' 02" W, a distance of 181.02 feet to a point on the northerly shore of the West Branch of the Penobscot River; Thence in a general northwesterly direction, by and along said shoreline, a distance of 2640 feet, more or less, to a point on said shoreline, said point being located N 61° 19' 31" W, a distance of 2320.29 feet from the last described point; Thence N 13° 15' 42" E, a distance of 786.05 feet to the point of beginning.

Easement Exception Area "E" contains 48 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment.

3.13.4.6 Easement Exception Area "F" (Near Dolby Dam)

East Millinocket Mill

A certain lot or parcel of land being a portion of the East Millinocket mill site in the Town of East Millinocket, County of Penobscot, State of Maine and being more particularly described as follows: Beginning at an iron rod found on the southerly right of way line of the Bangor and Aroostook Railroad leading from said mill past the Dolby Dam, so called, said point having coordinates N: 717,165.86 feet and E: 957,447.58 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence S 30° 00' 26" W, a distance of 224.00 feet to a point;

Thence S 52° 02' 22" E, running northerly of a road leading from the Mill Site to Dolby Dam, a distance of 253.28 feet to a point; Thence S 33° 39' 28" E, running northerly of said road, a distance of 472.18 feet to a point;

Thence S 60° 15' 46" E, running northerly of said road, a distance of 1352.67 feet to a point;

Thence N 87° 54' 29" E, running northerly of said road, a distance of 426.47 feet to a point westerly of a spur line from said Bangor and Aroostook Railroad;

Thence N 71° 58' 57" E, running westerly of said spur line, a distance of 557.25 feet to a point;

Thence N 4° 16' 32" E, a distance of 102.45 feet to a point on the southerly right of way line of said Bangor and Aroostook Railroad;

Thence N 66° 43' 54" W by and along said right of way, a distance of 952.98 feet to a point of curvature;

Thence by and along said right of way on a tangent curve to the left with a radius of 1860.58 feet, an arc distance of 214.42 feet to a point of tangency;

Thence N 73° 20' 09" W by and along said right of way, a distance of 565.94 feet to a point of curvature;

Thence by and along said right of way on a tangent curve to the right with a radius of 1959.58 feet, an arc distance of 549.96 feet to a point of compound curvature;

Thence by and along said right of way on a curve to the right with a radius of 2914.43 feet, an arc distance of 466.57 feet to the point of beginning. Easement Exception Area "F" contains 27.850 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment.

3.13.5 Dolby Pond Shoreline and Partridge Brook Flowage East Millinocket

A Hydroelectric Easement, located upon, over, under, through and across the following described parcels in Paragraphs 3.13.5.1 through 3.13.5.4:

3.13.5.1 FERC Boundary Southeasterly Strip, Partridge Cove

East Millinocket, Maine

A certain lot or parcel of land being a 200 feet wide strip of land situated on the southerly side of the Partridge Cove flowage, so called, in the Town of East Millinocket, County of Penobscot, State of Maine and being more particularly described as follows: Beginning at a point on the easterly side of said Partridge Cove Flowage having coordinates N: 724,948.19 feet and E: 957,902.08 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence N 46° 02' 22" W, a distance of 222 feet, more or less, to a point on the southerly shore of the said Partridge Cove flowage, said point is further described as being located at contour elevation 336.2 feet;

Thence running in a southwesterly direction by and along the southwesterly shore of said Partridge Cove flowage as defined by contour elevation 336.2 feet, a distance of 2160 feet, more or less, to a point defined by the intersection of said contour elevation

336.2 with the northeasterly right of way line of State Route 157 as depicted on Maine State Highway Commission Right of Way Map for State Highway 315, S.H.C. File No. 10-98, Sheet 4 of 9, dated

November 1954 and recorded in Plan Book 22, Page 57 of the Penobscot County Registry of Deeds;

Thence in a southeasterly direction, by and along said State Route 157 right of way, a distance of 200 feet, more or less, to a point defined by the intersection of said right of way line with the line offset 200 feet from said contour elevation 336.2 feet;

Thence in a general easterly and northeasterly direction, at all times 200 feet southeasterly and easterly of said contour elevation

336.2 feet, a distance of 1750 feet, more or less, to the point of beginning.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment.

3.13.5.2 FERC Boundary Northerly Strip, Partridge Cove East Millinocket, Maine

A certain lot or parcel of land being a 200 feet wide strip of land situated on the northeasterly and northerly and westerly side of the Partridge Cove flowage, so called, in the Town of East Millinocket, County of Penobscot, State of Maine and being more particularly described as follows:

Beginning at a point on the easterly side of said Partridge Cove Flowage having coordinates N: 725,788.08 feet and E: 958,250.41 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD83):

Thence N 77° 11' 55" W, a distance of 205 feet, more or less, to a point on the easterly shore or the said Partridge Cove flowage, said point is further described as being located at contour elevation 336.2 feet;

Thence running in a northeasterly direction, northwesterly direction, westerly direction, southeasterly direction and southwesterly direction by and along the easterly, northerly and westerly shore of said Partridge Cove flowage as defined by contour elevation

336.2 feet to the northeasterly right of way line of State Route 157 as depicted on Maine State Highway Commission Right of Way Map for State Highway 315, S.H.C. File No. 10-98, Sheet 4 of 9, dated November 1954 and recorded in Plan Book 22, Page 57 of the Penobscot County Registry of Deeds;

Thence in a northwesterly direction, by and along said right of way line a distance of 200 feet, more or less, to a point defined by the intersection of said right of way line with the line offset 200 feet from said contour elevation 336.2 feet;

Thence in a general northerly direction, northeasterly direction, easterly direction, southeasterly direction and southerly direction, at all times 200 feet from said contour elevation 336.2 feet, to the point of beginning.

3.13.5.3 FERC Boundary Northeasterly Strip, Dolby Pond East Millinocket, Maine

A certain lot or parcel of land being a strip of land of varying width situated on the northeasterly and easterly side of Dolby Pond, so called, in the Town of East Millinocket, County of Penobscot, State of Maine and being more particularly described as follows: Beginning at a point defined by the intersection of the northwesterly right of way line of the Bangor and Aroostook Railroad, as depicted on the Bangor & Aroostook Railroad Company Right of Way and Track Map, Schoodic Stream Junction to East Millinocket, sheets V.2.h/1 and V.2.h/2, dated June 30, 1916, with the easterly shore of said Dolby Pond, further described as being located at contour elevation 336.2 feet, said point having

coordinates N: 720,379.5 feet, E: 956,822.0 feet;

Thence running in a northerly and northwesterly direction by and along said Dolby Pond by and along said contour elevation 336.2 feet, a distance of 8460 feet, more or less, to a point defined by the intersection of said contour line with the town line between the towns of East Millinocket and TA R7;

Thence running in a northerly direction by and along the easterly line of said TA R7, a distance of 333 feet, more or less, to a point defined by the intersection of said town line with the southwesterly right of way line of said Bangor & Aroostook Railroad;

Thence in a southeasterly direction, southerly direction and southwesterly direction, by and along said Bangor & Aroostook Railroad right of way, a distance of 6700 feet, more or less, to the point of beginning.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment.

3.13.5.4 Islands in Dolby Pond Millinocket and East Millinocket

TOGETHER WITH all islands within the portion of Dolby Pond situated in Millinocket and East Millinocket.

3.14 Dolby and East Millinocket - Mill Dam (New Substation)

3.14.1 Mill Dam Parcel

Township A, Range 7, Dolby Dam, East Millinocket

A certain lot or parcel of land with buildings and improvements thereon, including, without limitation, the dam and dam structures situated in the Town of East Millinocket and Township A, Range 7, WELS, County of Penobscot, State of Maine and being more particularly described as follows:

Beginning at a ¾ inch rebar set by Plisga & Day, Land Surveyors in 1991 along the southwesterly sideline of a Bangor & Aroostook Railroad right of way, said rebar marking the northwesterly corner of the second parcel of land described in a quit claim deed from Great Northern Nekoosa Corporation to Great Northern Paper Company, dated December 19, 1991 and recorded in Book 4966, Page 114 of the Penobscot County Registry of Deeds;

Thence S 30° 00' 26" W, a distance of 299.00 feet to a point; Thence S 59° 59' 34" E, a distance of 121.00 feet to a point;

Thence S 30° 00' 26" W crossing the West Branch of the Penobscot River a distance of 669.51 feet to a point at or near the intersection of this line with the southwesterly normal water line of the said river, said point having coordinates of N: 716,266.66 feet, E: 957,068.00 feet of the Maine State Plane Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence in a generally southeasterly and easterly direction by and along the normal water line of the said river and impoundment, a distance of 9200 feet, more or less, to a point at or near the intersection of said normal water line with the boundary line of the parcel described herein which crosses to the thread of said river northwesterly of the East Millinocket dam, said point having coordinates of N: 712,165.68 feet, E: 964,616.15 feet;

Thence N 27° 16' 50" E, a distance of 314 feet, more or less, to the thread of said river, also being the town line between East Millinocket and TA R7, WELS;

Thence in a general easterly direction, by and along the thread of said river, crossing said East Millinocket Dam, a distance of 1025 feet, more or less, to a point;

Thence S 17° 18' 05" W, a distance of 248 feet, more or less, to a point having coordinates: N: 711,830.46 feet E: 965,635.48 feet;

Thence S 70° 31' 14" W, a distance of 118.00 feet to a point;

Thence S 28° 36' 10" W crossing a line of steel structures supporting an electric power line coming from the Weldon Dam, so called, a distance of 349.23 feet to a point being 85 feet southwesterly and normal to the centerline of said power line structures; Thence N 84° 38' 20" W, a distance of 10.82 feet to a point 100 feet southerly and normal to an angle point in said power line; Thence continuing along the same course, 100 feet southerly of, and parallel to, the said power line, a distance of 1433.21 feet to a point;

Thence S 23° 32' 21" W, a distance of 68.41 feet to a point 165 feet southerly and normal to said power line;

Thence N 84° 38' 20" W parallel to and 165 feet southerly of the said power line, a distance of 1435.54 feet to a point; Thence N 51° 44' 55" W parallel to and 165 feet southerly of the said power line, a distance of 4966.06 feet to a point; Thence N 55° 50' 01" W parallel to and 165 feet southerly of the said power line, a distance of 1457.65 feet to a point; Thence N 60° 00' 03" W parallel to and 165 feet southerly of the said power line, a distance of 642.70 feet to a point;

Thence N 85° 13' 45" W parallel to and 165 feet southerly of the said power line, a distance of 1911 feet, more or less, to a point which is defined by the intersection of this line and a property boundary line;

Thence N 5° 09' E, more or less, by and along said boundary line, a distance of 890 feet, more or less, to the southerly normal water line of the Dolby Dam impoundment;

Thence in a generally easterly direction, by and along the normal water line of the said impoundment, a distance of 2400 feet, more or less, to a point at or near the intersection of said normal water line with the boundary line of the parcel described herein which crosses the impoundment northwesterly of the said Dolby Dam, said point having coordinates of N: 716,271.05 feet, E: 956,558.61 feet;

Thence N 29° 45' 13" E crossing the said impoundment, a distance of 1162.34 feet to a point at or near the intersection of this line with the northerly normal water line of the said impoundment, said point having coordinates of N: 717,280.16 feet, E: 957,135.45 feet;

Thence N 36° 14' 20" E, a distance of 142.08 feet to a point along the southwesterly sideline of the said Bangor & Aroostook Railroad right of way;

Thence in a southeasterly direction, by and along a curve of the said railroad right of way, with concavity to the northeast, a radius of 2914.43 feet and an arc distance of 323.34 feet to the point of beginning, said curve having a chord bearing S 44° 54' 18" E, a chord distance of 232.17 feet.

SUBJECT to a portion of an 80 foot wide transmission line granted by Great Northern Nekoosa Corporation to the Bangor Hydro- Electric Company, dated April 26, 1979 and recorded at the Penobscot Registry of Deeds in Volume 2974, Page 238 and identified therein as "STRIP D."

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet, E: 977,164.59 feet which are based on the 1992 readjustment.

TOGETHER WITH all islands within said East Millinocket impoundment lying within the Town of East Millinocket.

3.14.2 New Substation

Township A, Range 7

A certain lot or parcel of land situated southerly of the Penobscot River and southerly of the dam across the Penobscot River at Great Northern Paper Company at the East Millinocket Mill Site, said parcel is located in Township A, Range 7, County of Penobscot, State of Maine and being more particularly described as follows:

Beginning at a point on the southerly line of the East Millinocket Dam Parcel, so called, said point is also described as being located S 85° 39' 12" W, more or less, a distance of 593 feet, more or less, from the center of a steel transmission tower designated as No. 55, said point of beginning is further described as being located at coordinates N: 711,540.13 feet, E: 964,764.29 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence N 84° 38' 20" W by and along the southerly line of the East Millinocket Dam Parcel, a distance of 848.67 feet to an angle point in the southerly line of said parcel;

Thence S 23° 32' 21" W by and along the southerly line of the East Millinocket Dam Parcel, a distance of 68.41 feet to an angle point in the southerly line of said parcel;

Thence N 84° 38' 20" W by and along the southerly line of the East Millinocket Dam Parcel, a distance 190.03 feet to a point on said line;

Thence S 21° 12' 49" W, a distance of 437.74 feet to the southwesterly corner of the parcel herein described, said point is further described as being on the southerly line of an 80 foot wide Bangor Hydro-Electric Company easement described as Strip D in a deed of easement recorded at the Penobscot Registry of Deeds in Volume 2974, Page 238;

Thence S 85° 07' 38" E by and along the southerly line of said Bangor Hydro-Electric Company, a distance of 1044.15 feet to a point on said line;

Thence N 21° 12' 49" E, a distance of 496.06 feet to the point of beginning.

SUBJECT to prior easement rights of Bangor Hydro-Electric Company as described in deeds recorded at the Penobscot Registry of Deeds in Volume 2974, Page 238.

3.15 Mattaceunk Dam Parcel (New Substation Easement) Mattawamkeag, Maine and Woodville, Maine

3.15.1 Mattaceunk Dam Parcel

A certain lot or parcel of land with buildings and improvements thereon, situated on the westerly side of Route #157 in the Town of Mattawamkeag and the Town of Woodville, County of Penobscot, State of Maine and being more particularly described as follows: Beginning at a concrete highway monument found on the southwesterly sideline of Route #157 in the Town of Mattawamkeag at

P.C. Station 880+32.16 as shown on the Maine State Highway Commission Right of Way Map for State Highway "315", S.H.C. File No. 10-140, sheet 1 of 4, dated January 1962, said concrete monument having coordinates of N: 694,225.42 feet, E: 1,008,190.00 feet of the Maine State Plane Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence in a general southeasterly direction, by and along the southwesterly sideline of said Route #157, along a curve to the right with a radius of 2814.62 feet, an arc distance of 968.53 feet and a

chord with a bearing of S 42° 09' 50" E and length of 963.76 feet to a point of tangency;

Thence S 32° 18' 21" E by and along the southwesterly sideline of said Route 157, a distance of 888.82 feet to a point of curvature; Thence along a curve to the left with a radius of 3869.40 feet, an arc distance of 405.89 feet to a point defined by the intersection of the southwesterly sideline of said Route #157 with the projection of a fence line from the northeasterly side of said Route #157; Thence S 75° 41' 53" W by and along the projection of said fence line, a distance of 66 feet, more or less, to the normal water line of the West Branch of the Penobscot River;

Thence in a general northwesterly direction, by and along said normal water line, a distance of 693 feet, more or less, to a point defined by the intersection of said normal water line with the boundary line of the parcel described herein which crosses said Penobscot River southeasterly of the Mattaceunk Dam, said point having coordinates of N: 693,003.05 feet, E: 1,009,122.94 feet, said coordinates are intended to identify the location and direction of the boundary line and may not be at the physical intersection as defined;

Thence S 57° 41' 39" W, a distance of 409.02 feet to a point;

Thence S 82° 24' 02" W, crossing into the Town of Woodville, a distance of 608.04 feet to a point located 108 feet, more or less, westerly of the normal water line on the southwesterly side of said Penobscot River having coordinates of N: 692,704.04, E: 1,008,174.54;

Thence N 30° 50' 29" W, a distance of 609.83 feet to a point; Thence N 47° 29' 11" W, a distance of 418.78 feet to a point; Thence S 38° 40' 52" W, a distance of 469.82 feet to a point; Thence N 51° 27' 47" W, a distance of 625.98 feet to a point; Thence N 47° 32' 26" W, a distance of 187.67 feet to a point;

Thence N 37° 39' 46" W, a distance of 168.76 feet to a point on the southwesterly line of a transmission line right of way;

Thence N 11° 44' 12" E, normal to said right of way line, a distance of 60.00 feet to the centerline of said right of way having coordinates N: 693,852.91 feet, E: 1,006,540.57 feet, said point being located S 11° 44' 12" W, a distance of 22.6 feet, more or less, from the center of Tower #2 of said transmission line;

Thence continuing N 11° 44' 12" E, a distance of 60.00 feet to a point on the northeasterly side of said right of way;

Thence N 22° 01' 50" E, a distance of 93.00 feet to a point at or near the normal water line of said Penobscot River, said point having coordinates of N: 693,997.86 feet and E: 1,006,587.66 feet;

Thence N 35° 23' 15" E, a distance of 1037.64 feet crossing back into the Town of Mattawamkeag to a point defined by the intersection of the line herein described with the town line between Mattawamkeag and Molunkus, said point is further described as being at or near normal water line on the northeasterly side of said Penobscot River, said point having coordinates N: 694,843.81 feet, E: 1,007,188.57 feet; Thence N 76° 25' 20" E by and along said town line, a distance of 164.46 feet to a point on the southwesterly sideline of said Route #157;

Thence S 52° 01' 18" E by and along said Route #157, a distance of 1067.65 feet to the point of beginning.

Subject to an easement granted by the Great Northern Paper Co. to the Bangor Hydro-Electric Company over a 225 foot wide strip of land for a transmission line right of way, said easement is dated April 18, 1968 and recorded at the Penobscot Registry of Deeds in Volume 2129, Page 468.

The above described parcel contains 66 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey

of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet, E: 977,164.59 feet which are based on the 1992 readjustment.

The position of the Mattawamkeag/Molunkus town line referenced herein is based on the location of a blazed line crossing Route #157.

3.15.2 New Substation Easement - intentionally omitted

NOTE: GLHA released all its rights in 3.15.2 to MTC in the Easement Agreement, Release of Option and Confirmatory Release Deed dated January 2, 2003 and recorded in said Registry of Deeds in Book 8532, Page 256.

3.16 Rice Farm Road (Dead Man's Corner) Boat Launch

A certain lot or parcel of land encompassing a boat launch facility and related parking and access roads and drives situated in the Town of Millinocket, County of Penobscot, State of Maine, being generally located on the southwesterly side of the Rice Farm Road, so called, being more specifically bounded and described as follows:

Beginning at a point on the southwesterly side of said Rice Farm Road at a distance of 33 feet, more or less, normal to said road centerline and at State Plane Coordinates, N 719416.26 feet, E 943750.55 feet as referenced to the Maine State Plane Coordinate System, Maine, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD83);

Thence by and along the southwesterly sideline of said Rice Farm Road, S 31° 14' 32" E, a distance of 66.83 feet to a point of curvature;

Thence by and along said road sideline following a curve that is concave to the northeast, having a radius of 311.50 feet, and an arc length of 121.66 feet, to a point;

Thence, S 01°59'24" E, a distance of 95 feet, more or less, to the high water mark of the Penobscot River;

Thence in a generally westerly direction by and along said high water line, a distance of 110 feet, more or less, to a point defined by the intersection of the said high water line with the next course described herein;

Thence N 38° 57' 37" W, a distance of 193 feet, more or less, to an angle point;

Thence N 50° 55' 38" E a distance of 137.82 feet to the point of beginning. The above described parcel contains 0.79 acres, more or less.

Also granting an easement for the use, repair, maintenance, and improvement of any portion of the boat launch facilities that may fall below the present (2001) high water line of said Penobscot River.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet, E: 977,164.59 feet which are based on the 1992 readjustment.

3.17 Dolby Boat Launch

A certain lot or parcel of land encompassing a boat launch facility and related parking and access roads and drives situated in the Town of Millinocket, County of Penobscot, State of Maine, being

generally located on the southwesterly side of Dolby Pond, so called, northeasterly of State Routes 11 and 157, and generally northeasterly of the intersection of said Routes 11 & 157 with the Bangor & Aroostook Railroad, so called, being more particularly bounded and described as follows:

Beginning at the intersection of the northeasterly sideline of said Routes 11 & 157 as shown on a plan entitled: "State Highway Commission Right of Way Map, State Highway "315", S.H.C. File No. 10-98", Dated November 1954, with the northeasterly sideline of the Bangor & Aroostook Railroad as defined on a plan entitled; "Right of way and Track Map, Schoodic Stream Junction to East Millinocket", dated June 30, 1916, said point of intersection also being at Maine State Plane Coordinates N 728515.63 feet, E 951691.11 feet, referenced to the Maine State Coordinate System East Zone, said coordinate system is based on the North American Datum of 1983 (NAD83);

Thence by and along said line of the Bangor and Aroostook Railroad following a curve that is concave to the northeast, having a radius of 905.43 feet, for an arc distance of 175.09 feet, said arc also having a chord bearing of N 25° 18' 18" W and a distance of

174.81 feet, to an angle point;

Thence N 50° 29' 26" E, a distance of 54 feet, more or less, to the high water line of said Dolby Pond;

Thence by and along said high water line in a generally southeasterly direction a distance of 375 feet, more or less, to the intersection of said water line with said northeasterly line of said Routes 11 & 157;

Thence by and along said line of Routes 11. & 157, following a curve that is concave to the southwest, with a radius of 1323.57 feet, and a chord bearing of N 59° 41' 41" W and a distance of 178 feet, more or less, an arc distance of 178 feet, more or less, to the point of beginning.

Also granting an easement for the use, repair, maintenance, and improvement of any portion of the boat launch facilities that may fall below the high water line of said Dolby Pond.

The above described parcel of land encompasses 0.71 acres, more or less.

**4. PENOBSCOT AND PISCATAQUIS COUNTY**

Transmission Line Easements

Transmission line easements, located upon, over, under, through and across the transmission line easement parcels described in Paragraphs 4.1 to 4.9 in Penobscot and Piscataquis Counties (hereinafter, "Transmission Line Easements"), for the following purposes:

Easements to construct (including new utility lines), maintain, operate and upgrade from time to time for electrical transmission, one or more lines consisting of overhanging and/or underground wires (including, without limitation, high voltage electric transmission wires and appurtenances), pipes, cables or facilities with necessary or convenient poles, stanchions, fixtures and supports, with the right to transmit electricity and intelligence over and through said lines, and to clear and dispose of interfering branches and other growth from time to time, with permission to enter upon the said lands for the above purposes (whether or not on existing roads now serving, connecting to or traversing said lines).

Also the right to build roads as may be reasonably required to exercise said easement rights, excavate, clear and trim trees, shrubs and other growth within the easement limits as necessary or convenient to accomplish any work related to the within-granted easements, provided that all such work shall be in accordance with all applicable licenses, laws, codes, ordinances and other governmental requirements, and performed in a good and workmanlike manner.

SUBJECT TO the following conditions:

(1) Use of the easements shall be at the sole risk of the easement user; and

(2) The easement user shall obtain and maintain in full force and effect all governmental approvals and financial responsibility requirements required by all applicable laws for construction and use of the easements.

4.1 Transmission Line Easement Mattaceunk Dam to East Millinocket Woodville, Medway and TA R7 WELS

The following is a description of a 120 foot wide right of way for a Transmission Line Easement and for utility services as defined in Title 33 M.R.S.A. §458, excluding gas, diesel, natural gas, fuel and any other petroleum products, but including the right to transmit utilities, energy, electricity and intelligence, which said transmission line easement is 60 feet either side of the following described centerline, and said transmission line easement is located in the Towns of Woodville, Medway and TA R7 WELS in the County of Penobscot, State of Maine and is more particularly described as follows:

Beginning at a point on the centerline of the said transmission line, said point further described as being located at coordinates of N: 693,852.91 feet, E: 1,006,540.57 feet of the Maine State Plane Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83); Thence N 78° 15' 48" W along the centerline of the herein described easement, as said centerline crosses from the Town of Woodville into the Town of Medway, a distance of 8164.08 feet to an angle point in said centerline;

Thence N 78° 00' 34" W along the centerline of the herein described easement, as said centerline crossing State Route 116, a distance of 5334.31 feet to an angle point in said centerline;

Thence N 36° 47' 29" W along the centerline of the herein described easement, as said centerline crossing Pattagumpus Stream, a distance of 1160.15 feet to an angle point in said centerline; Thence N 66° 06' 19" W along the centerline of the herein described easement, as said centerline crossing State Route 116, State Route 116 a second time and Interstate 95, a distance of 20695.51 feet to an angle point in said centerline;

Thence N 47° 03' 31" W along the centerline of the herein described easement, as said centerline crossing Powersville Road, a distance of 2189.30 feet to an angle point in said centerline;

Thence N 58° 33' 11" W along the centerline of the herein described easement, as said centerline crossing from the Town of Medway into TA R7 WELS, a distance of 7881.89 feet to the terminus of said easement, said terminus is located at coordinates of N: 711,537.24 feet, E: 965,385.81 feet, as reference to the aforementioned coordinate system;

ALSO the following transmission line easements over, under or through land of others as follows:

a. Deed of Ralph C. Twist to Great Northern Paper Company dated May 28, 1938 and recorded in Book 1131, Page 238;

b. Deed of Henry Day to Great Northern Paper Company dated April 23, 1938 and recorded in Book 1131, Page 112;

c. Deed of Robert F. Reardon, Sr. to Great Northern Paper Company dated June 4, 1938 and recorded in Book 1133, Page 303;

d. Deed of Hughie E. York and Roscoe L. York to Great Northern Paper Company dated August 18, 1938 and recorded in Book 1134, Page 125;

e. Deed of Cathy L. Small to GNP dated May 22, 1998 and recorded in Book 6728, Page 165;

f. Deed of Eugene Smith to GNP dated February 24, 1998 and recorded in Book 6728, Page 166;

g. Deed of George Merritt to GNP dated February 24, 1998 and recorded in Book 6728, Page 167;

h. Deed of John A. Oxley to GNP dated February 28, 1998 and recorded in Book 6728, Page 168;

i. Deed of Michael Kimball to GNP dated March 6, 1998 and recorded in Book 6728, Page 169;

j. Deed of Andrew York to GNP dated February 27, 1998 and recorded in Book 6728, Page 170; and

k. Deed of Lee Jay McLaughlin to GNP dated March 18, 1999 and recorded in Book 6997, Page 99.

Subject to any easement rights that may have been granted to the Bangor Hydro-Electric Company for a transmission line that runs parallel and southwesterly of a portion of the line herein described and for transmission lines that cross the line herein described.

Subject to the rights of the public for the State and Federal highways that cross the easement line described herein.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet, E: 977,164.59 feet which are based on the 1992 readjustment.

4.2 Transmission Line Easement

Crossing Webber Timberland TA R7 WELS

GLHA acknowledges that Katahdin Forest Management LLC has no interest in the following parcels described below in sections 4.2.1 and 4.2.2.

4.2.1 First Easement Parcel

A certain parcel or strip of land for a Transmission Line Easement and, to the fullest extent allowed under the rights of KPC and KT for utility services as defined in Title 33 M.R.S.A. §458 including the right to transmit utilities, fuel, energy, electricity and intelligence, more particularly described as follows: Beginning at an iron pin on the township line between Township A, Range 7,

W.E.L.S. and Indian Purchase Township Number 3, said pin being 100 feet, more or less, northerly along said township line from the northern most electric power transmission line and being the point of beginning;

thence, North 77° 02' E, 1,431 feet, more or less, along the northerly boundary of a two hundred sixty-five foot (265') wide right of way, to a point;

thence, North 83° 02' East, 3,294 feet, more or less, along the northerly boundary of a two hundred sixty-five foot (265') wide right of way, to a point;

thence, South 86° 03' East, 9,507 feet, more or less, along the northerly boundary of a two hundred sixty-five foot (265') wide right of way, to a point on the center line of Township A, Range 7, W.E.L.S.; thence, South 08° 08' West, 265 feet, more or less, along the center line of Township A, Range 7, W.E.L.S., to a point located at the intersection of the center line and the southerly boundary of a two hundred sixty-five foot (265') wide right of way;

thence, North 86° 03' West, 9,552 feet, more or less, along the southerly boundary of a two hundred sixty-five foot (265') wide right of way, to a point;

thence, South 83° 02' West, 3,204 feet, more or less, along the southerly boundary of a two hundred

sixty-five foot (265') wide right of way, to a point;

thence, South 77° 02' West, 1,418 feet, more or less, along the southerly boundary of a two hundred sixty-five foot (265') wide right of way, to a point on the township line between Township A, Range 7, W.E.L.S. and Indian Township Number 3;

thence, North along said township line, 265 feet, more or less, to the point of beginning. The Utility Easement Strip contains 86.58 acres, more or less.

Bearings refer to the Maine Coordinate System, East Zone (Transverse Mercator), 1000-Meter Universal Transverse Mercator Grid.

The above-described First Easement Parcel is also described as follows:

A certain lot or parcel of land being a 265 foot wide strip of land for an electrical transmission line easement situated in TA R7 WELS in the county of Penobscot State of Maine, said easement area is more particularly described as follows:

Beginning at a #6 rebar with an aluminum cap stamped "PLS 1030" set in the town line between T3 Indian Purchase and TA R7 WELS, said iron rod is further described as being located N 74° 41' 53" E, a distance of 2.89 feet, more or less, from the most northerly pole of a three pole structure numbered 81 on the Bangor Hydro-Electric Company transmission line, said point of beginning is further identified as being located at coordinates of N: 716,033.96 feet, E: 940,830.17 feet of the Maine State Plane Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence N 11° 43' W, more or less, by and along said town line, a distance of 422.77 feet to a point defined by the intersection of said town line with the northerly line of the easement described herein;

Thence S 50° 31' 51" E, a distance of 200.39 feet to an angle point located northerly of steel transmission tower D23; Thence N 77° 33' 04" E, a distance of 1131.08 feet to an angle point located northerly of steel transmission tower D21; Thence N 82° 08' 10" E, a distance of 3235.00 feet to an angle point located northerly of steel transmission tower D17; Thence S 86° 06' 19" E, a distance of 5226.85 feet to an angle point located northerly of said steel transmission tower D10; Thence S 86° 02' 08" E, a distance of 3649.04 feet to an angle point located northerly of steel transmission tower D5;

Thence S 85° 13' 45" E, a distance of 859.5 feet, more or less, to a point defined by the intersection of the line herein described and the westerly line of land now or formerly of Great Northern Paper, Inc.;

Thence southerly by and along land of said Great Northern Paper, Inc., a distance of 265 feet, more or less, to a point on the southerly line of the easement herein described, said point is further described as being 265.00 feet southerly as measured on a line that is perpendicular to the last course herein described;

Thence N 85° 13' 45" W, a distance of 855.8 feet, more or less, to an angle point located southerly of steel transmission tower D5; Thence N 86° 02' 08" W, a distance of 3647.02 feet, more or less, to an angle point located southerly of steel transmission tower D10;

Thence N 86° 06' 19" W, a distance of 5199.40 feet, more or less, to an angle point located southerly of steel transmission tower D17;

Thence S 82° 08' 10" W, a distance of 3197.10 feet, more or less, to an angle point located southerly of steel transmission tower D21;

Thence S 77° 33' 04" W, a distance of 1249 feet, more or less, to a point on said town line between TA R7 WELS and T3 Indian Purchase and the point of beginning.

SUBJECT in part to an easement granted to the Bangor Hydro-Electric Company by the Webber Heirs, said easement is described in a deed recorded at the Penobscot Registry of Deeds in Volume

2161, Page 364.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet, E: 977,164.59 feet which are based on the 1992 readjustment.

4.2.2 Second Easement Parcel

A certain lot or parcel of land being a 200 foot wide strip of land for a Transmission Line Easement and, to the fullest extent allowed under the rights of KPC and KT for utility services as defined in Title 33 M.R.S.A. §458 including the right to transmit utilities, fuel, energy, electricity and intelligence, situated in TA R7 WELS in the county of Penobscot State of Maine, said easement area is more particularly described as follows:

Beginning at a point on the town line between Indian Purchase No. 3 and TA R7 WELS, said point is further described as being located S 11° 43' E, more or less, as measured along said town line a distance of 40 feet, more or less, from the center of an 80 foot wide Bangor Hydro-Electric Co. easement described in a deed from the Webber heirs and recorded at the Penobscot Registry of Deeds in Volume 2161, Page 364, said point of beginning is further identified as being located at coordinates of N: 715,990.26 feet, E: 940,839.23 feet of the Maine State Plane Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence N 77° 30' 30" E by and along the southerly line of said Bangor Hydro-Electric Company easement, a distance of 1267 feet, more or less, to an angle point in said easement;

Thence N 82° 12' 45" E by and along the southerly line of said Bangor Hydro-Electric Company easement, a distance of 3138.2 feet to an angle point in said easement;

Thence S 86° 09' 30" E by and along the southerly line of said Bangor Hydro-Electric Company easement, a distance of 5227.6 feet to an angle point in said easement;

Thence S 86° 05' 20" E by and along the southerly line of said Bangor Hydro-Electric Company easement, a distance of 3647.3 feet to an angle point in said easement;

Thence S 85° 13' 50" E by and along the southerly line of said Bangor Hydro-Electric Company easement, a distance of 855 feet, more or less, a point defined by the intersection of the line herein described with the westerly line of land now or formerly of Great Northern Paper Co.;

Thence S 5° 09' W, more or less, by and along land of said Great Northern Paper Co., a distance of 200 feet, more or less, to a point on the southerly line of the easement herein described, said point is further described as being 200.00 feet southerly as measured on a line that is perpendicular to the last course herein described;

Thence N 85° 13' 50" W, a distance of 852 feet, more or less, to an angle point in said easement; Thence N 86° 05' 20" W, a distance of 3645.7 feet to an angle point in said easement;

Thence N 86° 09' 30" W, a distance of 5207.2 feet to an angle point in said easement; Thence S 82° 12' 45" W, a distance of 3109.6 feet to an angle point in said easement;

Thence S 77° 30' 30" W, a distance of 1261 feet, more or less, to a point on said town line between TA R7 WELS and T3 Indian Purchase;

Thence N 11° 43' W, more or less, by and along the town line between TA R7 WELS and Indian Purchase No. 3, a distance of 200.02 feet, more or less, to the point of beginning.

Bearings referenced in the above description were computed from a traverse established for a survey

of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet, E: 977,164.59 feet which are based on the 1992 readjustment.

4.3 Transmission Line Easement

Township A, Range 7 Town Line to Millinocket Mill Township 3, Indian Purchase and Millinocket, Maine

A certain lot or parcel of land being a 265 foot wide strip of land for a Transmission Line Easement and for utility services as defined in Title 33 M.R.S.A. §458, excluding gas, diesel, natural gas, fuel and any other petroleum products, but including the right to transmit utilities, energy, electricity and intelligence, situated in Township 3, Indian Purchase and the Town of Millinocket in the county of Penobscot, State of Maine, said easement area is more particularly described as follows:

Beginning at a #6 rebar with an aluminum cap stamped "PLS 1030" set in the town line between T3 Indian Purchase and TA R7 WELS, said iron rod is further described as being located N 74° 41' 53" E, a distance of 2.89 feet, more or less, from the most northerly pole of a three pole structure numbered 81 on the Bangor Hydro-Electric Company transmission line, said point of beginning is further identified as being located at coordinates of N: 716,033.96 feet, E: 940,830.17 feet of the Maine State Plane Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence N 50° 31' 51" W, a distance of 746.77 feet to an angle point on an island in the West Branch of the Penobscot River; Thence N 54° 48' 17" W, crossing into the Town of Millinocket, a distance of 2,473.19 feet to a point on the easterly boundary of the Millinocket Mill Parcel;

Thence N 31° 52' 03" E by and along said Mill Parcel, a distance of 265.45 feet to a point, said point being located S 31° 52' 03" W, a distance of 9.21 feet from an iron rod at the easterly corner of said Mill Parcel;

Thence S 54° 48' 17" E, a distance of 2,498.49 feet to an angle point on an island in the West Branch of the Penobscot River; Thence S 50° 31' 51" E, crossing into Township 3, Indian Purchase, a distance of 427.25 feet to a point on the town line between Township 3, Indian Purchase, and TA R7 WELS;

Thence S 11° 43' E by and along said town line, a distance of 422.77 feet to the point of beginning.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet, E: 977,164.59 feet which are based on the 1992 readjustment.

Subject to any easement rights that may have been granted to the Bangor Hydro-Electric Company for a transmission line that runs parallel and southwesterly of the line herein described and for transmission lines that may cross the line herein described.

4.4 Transmission Line Easement Millinocket Mill - Millinocket, Maine

GLHA acknowledges that KT has no interest in the following parcels described below in sections 4.4.1 through 4.4.6 inclusive.

4.4.1 Transmission Line Easement Area 1 Millinocket Mill Site

A certain lot or parcel of land with buildings and improvements thereon situated in Millinocket, Penobscot County, Maine for a Transmission Line Easement and for the right to transmit intelligence and communications by wire or fiber, and natural gas, more particularly described as follows:

Beginning at a point that is along the southwesterly boundary of a transmission line easement area that runs from East Millinocket to Millinocket, so called, said transmission line is further described as being Easement Area 7 herein described, said point is also described as being northerly of a water clarifier of the mill treatment plant, said point of beginning is further described as being at coordinates N: 719,628.40 feet and E: 935,842.27, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence S 88° 13' 35" W, a distance of 2951.57 feet to a point; Thence N 1° 46' 25" W, a distance of 140.40 feet to a point; Thence N 74° 01 20" W, a distance of 540.56 feet to a point; Thence N 59° 32' 41" W, a distance of 1103.35 feet to a point;

Thence N 45° 48' 30" W, a distance of 338.76 feet to a point on a chain link fence said point being further described as a point on the Sub-Station No. 4 Parcel, said point has coordinates N: 720,621.56 feet and E: 931,174.08 feet according to aforementioned coordinate system;

Thence S 57° 48' 57" E by and along said chain link fence of said Sub-Station No. 4, a distance of 100.00 feet to a corner of said fence;

Thence N 31° 49' 10" E by and along said chain link fence of said Sub-Station No. 4, a distance of 215.04 feet to an angle point in said fence;

Thence continuing on the same bearing N 31° 49' 10" E, a distance of 93.87 feet to a point; Thence N 47° 44' 30" W, a distance of 130.00 feet to a point;

Thence N 34° 04' 08" W, a distance of 205.00 feet to a point;

Thence N 59° 05' 55" E, a distance of 28.72 feet to the most westerly corner of the Frequency Converter Parcel, so called, said point is further described as being the point of beginning of the Frequency Converter Parcel and is located at coordinates of N: 721,102.77 feet and E: 931,235.17 feet according to aforementioned coordinate system;

Thence S 38° 08' 00" E by and along the southwesterly line of the Frequency Converter Parcel, a distance of 155.00 feet to the most southerly corner of said Frequency Converter Parcel;

Thence N 51° 52' 00" E by and along the southeasterly line of the Frequency Converter Parcel, a distance of 102.00 feet to the most easterly corner of said Frequency Converter Parcel;

Thence S 77° 12' 23" E, a distance of 75.5 feet to the most westerly corner of Sub-Station No. 3-4, so called, said point is further described as being located at coordinates N: 721,027.11 and E: 931,484.74 according to aforementioned coordinate system; Thence S 38° 24' 42" E by and along the southwesterly line of said Sub-Station No. 3-4, a distance of 223.08 feet to the most southerly corner of said Sub-Station No. 3-4;

Thence N 51° 04' 29" E by and along the southeasterly line of said Sub-Station No. 3-4, a distance of 54.00 feet to the most easterly corner of said Sub-Station No. 3-4;

Thence N 39° 26' 20" W by and along the northeasterly line of said Sub-Station No. 3-4, a distance of 61.56 feet to a point on the northeasterly side of said Sub-Station No. 3-4;

Thence N 56° 17' 33" E, a distance of 58.79 feet to the most westerly corner of the T33 Transformer Parcel, said point is further described as being located at coordinates N: 720,966.41 and E: 931,675.15 according to aforementioned coordinate system; Thence S 36° 38' 49" E, a distance of 48.00 feet to the most southerly corner of said T33 Transformer Parcel;

Thence S 29° 36' 22" W, a distance of 117.45 feet to a point; Thence S 36° 33' 46" E, a distance of 435.66 feet to a point; Thence S 58° 06' 37" E, a distance of 583.83 feet to a point; Thence S 73° 17' 04" E, a distance of 672.16 feet to a point; Thence N 55° 19' 53" E, a distance of 627.08 feet to a point; Thence N 23° 46' 54" E, a distance of 485.69 feet to a point; Thence N 47° 45' 03" W, a distance of 564.10 feet to a point; Thence N 52° 50' 04" W, a distance of 839.28 feet to a point;

Thence N 40° 13' 08" W, a distance of 612.45 feet to a point on the southeasterly side of Sub-Station No. 1 (A.K.A. Little Italy Substation), so called;

Thence N 76° 24' 55" E by and along the southeasterly side of said Sub-Station No. 1, a distance of 52.78 feet to an angle point is the southeasterly line of said sub-station;

Thence N 51° 37' 37" E by and along the southeasterly side of said Sub-Station No. 1, a distance of 52.84 feet to a point a point on said line;

Thence S 40° 13' 08" E, a distance of 576.04 feet to a point; Thence S 52° 49' 16" E, a distance of 834.87 feet to a point; Thence S 47° 45' 03" E, a distance of 486.12 feet to a point;

Thence N 11° 36' 42" W, a distance of 279.96 feet to a point on the southwesterly side of the transmission line running from East Millinocket to Millinocket, said transmission line is further described as being Easement Area 7 herein described;

Thence S 71° 00' 43" E by and along the southwesterly line of said transmission line, a distance of 116.18 feet to a point on said line;

Thence S 11° 36' 42" E, a distance of 372.34 feet to a point; Thence S 24° 25' 54" W, a distance of 572.32 feet to a point; Thence S 48° 35' 46" W, a distance of 490.62 feet to a point;

Thence N 87° 41' 48" E, a distance of 2127.89 feet to a point on the southwesterly side of the transmission line running from East Millinocket to Millinocket, said transmission line is further described as being Easement Area 7 herein described;

Thence S 54° 50' 00" E by and along the southwesterly line of said transmission line, a distance of 468.59 feet to an angle point in said line;

Thence S 21° 07' 38" E by and along the southwesterly line of said transmission line, a distance of 125.00 feet to the point of beginning. Transmission Line Easement Area 1 contains 49.81 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment.

4.4.2 Transmission Line Easement Area 2 Millinocket Mill Site

A certain lot or parcel of land with buildings and improvements thereon situated in Millinocket, Penobscot County, Maine for a Transmission Line Easement and for the right to transmit intelligence and communications by wire or fiber, and natural gas, more particularly described as follows:

Beginning at a point on the southwesterly line of the Ferguson Canal Parcel, so called, which point is on the south easterly side of the road that runs southwesterly from the Millinocket Mill Site to Stone Dam, so called, said point of beginning is further described as being at coordinates N: 721,100.57 feet and E: 931,005.98 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence S 50° 32' 25" W by and along a line that lies on the southeasterly side of the road running to

said Stone Dam, said line is also the northwesterly line of the Sub-Station No. 4 Parcel, so called, a distance of 282.35 feet to the most westerly corner of said Sub-Station No. 4 Parcel;

Thence N 50° 35' 19" W, a distance of 11.03 feet to a corner of Transmission Line Easement Area 4, herein described;

Thence N 60° 46' 21" W, a distance of 303.09 feet to an angle point in said transmission line easement; Thence N 68° 41' 11" W, a distance of 418.80 feet to an angle point in said transmission line easement; Thence N 47° 28' 47" W, a distance of 234.58 feet, more or less, to a point defined by the intersection of said line with Ferguson Canal, so called;

Thence running in a northeasterly direction by and along the northwesterly line of said Ferguson Canal, a distance of 165 feet, more or less, to a point defined by the intersection of said northwesterly line of said Ferguson Canal with the southwesterly line of the said Ferguson Canal Parcel, said point is at or near coordinates N: 721,466.48 feet and E: 930,049.18 feet according to the aforementioned coordinate system, said point is further described as being N 50° 42' 12" E, a distance of 125.69 feet from the previously described point on the shore of said Ferguson Canal;

Thence S 32° 23' 58" E by and along the southwesterly line of said Ferguson Canal Parcel, a distance of 152.86 feet to an angle point in said lot;

Thence S 89° 03' 42" E by and along the southwesterly line of said Ferguson Canal Parcel, a distance of 72.77 feet to an angle point in said lot;

Thence S 73° 37' 40" E by and along the southwesterly line of said Ferguson Canal Parcel, a distance of 836.04 feet to the point of beginning. Transmission Line Easement Area 2 contains 3.66 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment.

4.4.3 Transmission Line Easement Area 3 Millinocket Mill Site

A certain lot or parcel of land with buildings and improvements thereon situated in Millinocket, Penobscot County, Maine for a Transmission Line Easement and for the right to transmit intelligence and communications by wire or fiber, and natural gas, more particularly described as follows:

Beginning at a point on the northeasterly line of the Ferguson Canal Parcel, so called, which point is westerly of the Head Gate House at the easterly end of said Ferguson Canal, said point of beginning is further described as being at coordinates N: 721,705.88 feet and E: 929,993.19 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence N 47° 38' 06" W, a distance of 490.23 feet to a point on the southwesterly side of the main mill entrance road;

Thence N 62° 23' 30" W, a distance of 71.78 feet to an angle point in said transmission line easement located on the southwesterly side of said main mill entrance road;

Thence N 55° 24' 35" W, a distance of 200.00 feet to an angle point in said transmission line easement located on the southwesterly side of said main mill entrance road;

Thence N 49° 51' 50" W, a distance of 936.01 feet to an angle point in said transmission line easement located on the southwesterly side of said main mill entrance road;

Thence N 53° 33' 55" W, a distance of 172.42 feet to an angle point in said transmission line easement located on the southwesterly side of said main mill entrance road;

Thence N 40° 38' 48" W, a distance of 349.61 feet to an angle point in said transmission line easement located on the southwesterly side of said main mill entrance road, said point is further described as being located near the Security Building at the main gate on said entrance road;

Thence N 46° 37' 12" W, a distance of 368.39 feet to a point defined by the intersection of said transmission line easement with the southerly sideline of State Route 11;

Thence running in a westerly direction by and along the southerly sideline of said State Route 11 following a 1465.52 foot radius curve to the right, an arc distance of 338.12 feet to a point on said sideline, said point is further described as being N 77° 39' 50" W, a distance of 337.37 feet from the previously described point on said curve;

Thence S 18° 56' 45" W, a distance of 48 feet, more or less, to the high water line on the shore of Ferguson Lake, so called; Thence running in a southeasterly direction by and along the high water line of the northeasterly shore of said Ferguson Lake a distance of 3055 feet, more or less, to a point defined by the intersection of said high water line with the northeasterly line of the Ferguson Canal Parcel, so called, said point is at or near coordinates N: 721,895.5 feet and E: 929,278.1 feet according to the aforementioned coordinate system, said point is further described as being S 45° 35' 23" E, a distance of 2198.23 feet from the previously described point on the shore of the said Ferguson Lake;

Thence S 87° 45' 22" E by and along the northeasterly line of the said Ferguson Canal Parcel, a distance of 138.71 feet to an angle point in said parcel;

Thence S 49° 48' 36" E by and along the northeasterly line of the said Ferguson Canal Parcel, a distance of 192.05 feet to an angle point in said parcel;

Thence S 31° 25' 20" E by and along the northeasterly line of the said Ferguson Canal Parcel, a distance of 107.53 feet to an angle point in said parcel;

Thence S 88° 44' 32" E by and along the northeasterly line of the said Ferguson Canal Parcel, a distance of 108.57 feet to an angle point in said parcel;

Thence S 72° 35' 48" E by and along the northeasterly line of the said Ferguson Canal Parcel, a distance of 63.75 feet to an angle point in said parcel;

Thence N 75° 27' 31" E by and along the northeasterly line of the said Ferguson Canal Parcel, a distance of 211.15 feet to the point of beginning. Transmission Line Easement Area 3 contains 10.5 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment.

4.4.4 Stone Dam Transmission Line Easement Easement Area 4

Millinocket Mill Site

A certain lot or parcel of land with buildings and improvements thereon situated in Millinocket, Penobscot County, Maine for a Transmission Line Easement, more particularly described as follows:

Beginning at a point that is southerly of Ferguson Canal, so called, and on the southeasterly side of the road leading to Stone Dam, so called, said point is located at coordinates N: 720,895.91 feet and

E: 930,818.67 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83); Thence S 49°13' 53" W, a distance of 42.79 feet to a point;

Thence S 49° 00' 52" W, a distance of 288.23 feet to a point; Thence S 56° 04' 37" W, a distance of 110.43 feet to a point; Thence S 18° 32' 03" W, a distance of 28.91 feet to a point; Thence S 48° 27' 21" W, a distance of 147.01 feet to a point; Thence S 44° 00' 30" W, a distance of 746.57 feet to a point; Thence S 62° 19' 46" W, a distance of 450.69 feet to a point; Thence S 53° 33' 03" W, a distance of 152.67 feet to a point; Thence S 41° 32' 21" W, a distance of 128.46 feet to a point; Thence S 24° 52' 06" W, a distance of 293.04 feet to a point;

Thence S 14° 25' 23" W, a distance of 309.69 feet to a point; Thence S 38° 08' 40" W, a distance of 319.14 feet to a point; Thence S 61° 10' 40 W, a distance of 153.45 feet to a point; Thence S 72° 25' 30" W, a distance of 538.46 feet to a point; Thence N 69° 39' 41" W, a distance of 160.69 feet to a point; Thence N 64° 32' 46" W, a distance of 742.30 feet to a point; Thence N 66° 39' 15" W, a distance of 111.46 feet to a point; Thence S 83° 18' 13" W, a distance of 184.31 feet to a point; Thence S 79° 01' 04" W, a distance of 255.40 feet to a point; Thence S 75° 33' 34" W, a distance of 164.63 feet to a point; Thence S 74° 52' 13" W, a distance of 122.92 feet to a point; Thence S 73° 03' 40" W, a distance of 147.72 feet to a point; Thence S 59° 34' 30" W, a distance of 33.97 feet to a point; Thence S 35° 57' 09" W, a distance of 47.90 feet to a point; Thence S 63° 57' 44" W, a distance of 68.74 feet to a point; Thence S 89° 04' 15" W, a distance of 104.50 feet to a point; Thence N 74° 20' 20" W, a distance of 64.29 feet to a point; Thence N 15° 39' 40" E, a distance of 50.00 feet to a point; Thence S 74° 20' 20" E, a distance of 57.00 feet to a point; Thence N 89° 04' 15" E, a distance of 86.08 feet to a point; Thence N 63° 57' 44" E, a distance of 45.14 feet to a point; Thence N 35° 57' 09" E, a distance of 45.88 feet to a point; Thence N 59° 34' 30" E, a distance of 50.34 feet to a point; Thence N 73° 03' 40" E, a distance of 154.42 feet to a point; Thence N 74° 52' 13" E, a distance of 124.01 feet to a point; Thence N 75° 33' 34" E, a distance of 166.44 feet to a point; Thence N 79° 01' 04" E, a distance of 256.91 feet to a point; Thence N 83° 15' 45" E, a distance of 201.39 feet to a point; Thence S 66° 39' 15" E, a distance of 126.79 feet to a point; Thence S 64° 32' 46" E, a distance of 740.06 feet to a point; Thence S 69° 39' 41" E, a distance of 141.28 feet to a point; Thence N 72° 25' 30" E, a distance of 516.54 feet to a point; Thence N 61° 10' 40" E, a distance of 138.34 feet to a point; Thence N 38° 08' 40" E, a distance of 298.46 feet to a point; Thence N 14° 25' 23" E, a distance of 303.76 feet to a point; Thence N 24° 52' 06" E, a distance of 304.94 feet to a point; Thence N 41° 32' 21" E, a distance of 141.05 feet to a point; Thence N 53° 33' 03" E, a distance of 161.77 feet to a point; Thence N 62° 19' 46" E, a distance of 446.46 feet to a point; Thence N 44° 00' 30" E, a distance of 740.45 feet to a point; Thence N 48° 27' 21" E, a distance of 135.59 feet to a point; Thence N 18° 32' 03" E, a distance of 32.54 feet to a point; Thence N 56° 04' 37" E, a distance of 124.34 feet to a point; Thence N 49° 00' 52" E, a distance of 285.24 feet to a point; Thence N 49° 13' 53" E, a distance of 34.23 feet to a point;

Thence S 50° 35' 19" E, a distance of 50.74 feet to the point of beginning.

EXCEPTING from the above described parcel any portion of the described easement that lies within the bounds of the Stone Dam Parcel so called.

Transmission Line Easement Area 4 contains 6.71 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment.

4.4.5 Transmission Line Easement Easement Area 6

Millinocket Mill Site

A certain lot or parcel of land with buildings and improvements thereon situated in Millinocket, Penobscot County, Maine for a Transmission Line Easement, more particularly described as follows:

Beginning at the most southerly corner of Sub-Station No. 1 (A.K.A. the Little Italy Sub-Station), said point of beginning is further described as being at coordinates N: 722,126.57 feet and E: 932,263.54 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence N 38° 37' 47" W by and along said chain link fence surrounding the aforementioned substation parcel, a distance of 94.87 feet to an angle point in said fence;

Thence N 51° 58' 15" E by and along said chain link fence a distance of 6.31 feet to the southwesterly side of a building;

Thence N 38° 35' 13" W by and along the southwesterly side of said building, a distance of 14.69 feet to the most westerly corner of said building;

Thence N 51° 17' 04" E by and along the northwesterly side of said building, a distance of 30.88 feet to the most northerly corner of said building;

Thence S 38° 35' 13" E by and along the northeasterly side of said building, a distance of 14.69 feet to a chain link fence; Thence N 50° 30' 28" E by and along said chain link fence, a distance of 8.02 feet to an angle point in said fence; Thence N 37° 17' 43" W by and along said chain link fence, a distance of 36.31 feet to an angle point in said fence; Thence N 02° 29' 16" W by and along said chain link fence, a distance of 17.23 feet to an angle point in said fence;

Thence N 39° 10' 19" W by and along said chain link fence, a distance of 81.47 feet to the southeasterly side of a building;

Thence S 50° 35' 09" W by and along the southeasterly side of said building 9.83 feet to the most southerly corner of said building; Thence N 38° 52' 39" W by and along the southwesterly side of said building, a distance of 12.72 feet to the most westerly corner of said building;

Thence N 51° 07' 14" E by and along the northwesterly side of said building, a distance of 9.82 feet to a chain link fence; Thence N 38° 52' 46" W by and along said chain link fence, a distance of 17.18 feet to an angle point in said fence, said point is further described as being the northwesterly corner of the aforementioned substation parcel;

Thence S 59° 55' 52" W along a line the crosses Millinocket Stream, so called, a distance of 217.52 feet to a corner of the Power Station Parcel;

Thence S 38° 57' 48" E by and along said Power Station Parcel, a distance of 23.93 feet to a corner of said parcel; Thence S 52° 15' 29" W by and along said Power Station Parcel, a distance of 77.33 feet to a corner of said parcel;

Thence S 38° 57' 48" E by and along said Power Station Parcel, a distance of 239.60 feet to the most easterly corner of said parcel;

Thence N 57° 47' 33" E along a line that crosses back over said Millinocket Stream, a distance of 237.05 feet to the point of beginning. Transmission Line Easement Area 6 contains 1.60 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment.

4.4.6 Transmission Line Easement Easement Area 7

Millinocket Mill Site

A certain lot or parcel of land with buildings and improvements thereon situated in Millinocket, Penobscot County, Maine for a Transmission Line Easement and for the right to transmit intelligence and communications by wire or fiber, and natural gas, more particularly described as follows:

Beginning at the most northerly corner of Sub-Station No. 1 (A.K.A. the Little Italy Sub-Station), said point of beginning is further described as being at coordinates N: 722,438.69 feet and E: 932,241.62 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence S 50° 52' 36" W by and along the northwesterly line of the aforementioned sub-station a distance of 122.42 feet to the northwesterly corner of said sub-station;

Thence S 59° 55' 52" W by and along Easement Area No. 6 described herein, a distance of 40 feet, more or less, to a point on the easterly edge of Millinocket Stream, so called;

Thence running in a northerly direction by and along the easterly shore of said Millinocket Stream, a distance of 311 feet, more or less, to a point defined by the intersection of the shore of said stream with the next course herein described, said point is further described as being N 0° 18' 17" E, a distance of 300.88 feet from the previously described point on the shore of said stream; Thence S 46° 44' 30" E, a distance of 220 feet, more or less, to a point on the southwesterly line of the Town of Millinocket Pump Station Lot, said pump station lot is described as Lot 2 in a deed recorded at the Penobscot Registry of Deeds in Volume 2656, Page 165;

Thence continuing on the same course S 46° 44' 30" E by and along said Pump Station Lot, a distance of 166.00 feet to the most southerly corner of said lot;

Thence S 54° 51' 47" E, a distance of 4083.25 feet to an angle point in said easement line; Thence N 87° 41' 48" E, a distance of

343.00 feet to an angle point in said easement line;

Thence S 54° 47' 01" E, a distance of 2322.71 feet to a point defined by the intersection of said easement line with the northwesterly line of land of the Inhabitants of the Town of Millinocket (Treatment Plant Site) as described in a deed recorded at the Penobscot Registry of Deeds in Volume 2656, Page 165;

Thence S 52° 19' 30" W, by and along the northwesterly line of said Treatment Plant Site, a distance of 214.89 feet to an angle point in said easement;

Thence S 54° 51' 47" E, a distance of 700.92 feet to a #6 rebar found at a corner of the easement herein described; Thence S 31° 51' 43" W, a distance of 320.62 feet to an angle point in the easement herein described;

Thence S 54° 48' 17" E by and along the southwesterly line of a Bangor Hydro-Electric Company easement identified as Easement Strip "C" in a deed recorded at the Penobscot Registry of Deeds in Volume 2974, Page 238, a distance of 2446.02 feet to an angle point in said Bangor Hydro-Electric Company easement, said angle point is located on a small island in the middle of the Penobscot River, so called, said angle point is further described as being located at coordinates N: 716,485.25 feet and E: 940,207.03 of the aforementioned coordinate system;

Thence S 50° 32' 17" E by and along the southwesterly line of said Bangor Hydro-Electric Company easement, a distance of 387 feet, more or less, to a point defined by the intersection of said easement with the town line between Millinocket and T3 Indian Purchase;

Thence running in a southwesterly direction by and along said town line, a distance of 206 feet, more

or less, to a point on said town line that is 200.00 feet southwesterly as measured on a line that is perpendicular to the previous course herein described, said point is further described as being S 26° 06' 55" W, a distance of 205.55 feet from the previously described point on said town line;

Thence N 50° 32' 17" W by and along a line that is parallel to and 200 feet southwesterly of the northeasterly line of the easement herein described, a distance of 427 feet, more or less, to an angle point located on said island in the said Penobscot River; Thence N 54° 48' 17" W, a distance of 3245.39 feet to an angle point in the easement herein described, said angle point is near a waste treatment lagoon located on the Millinocket Mill Site;

Thence N 35° 11' 55" E, a distance of 252.73 feet to an angle point in the easement herein described;

Thence N 54° 48' 05" W, a distance of 2125.62 feet to an angle point in the easement herein described, said point is also described as being a corner of Easement Area 1 herein described, said point is further described as being located at coordinates N: 719,628.40 feet and E: 935,842.27 feet of the aforementioned coordinate system;

Thence N 21° 07' 38" W by and along said Easement Area 1, a distance 125.00 feet to an angle point in the line of said easement; Thence N 54° 50' 00" W by and along said Easement Area 1, a distance 468.59 feet to an angle point in the line of said easement; Thence N 54° 50' 00" W, a distance of 1952.83 feet to a corner of Easement Area 1 herein described;

Thence N 71° 00' 43" W by and along said Easement Area 1 herein described, a distance of 116.18 feet to an angle point in the line of said easement;

Thence N 56° 22' 20" W, a distance of 1222.83 feet to an angle point in the southwesterly line of the easement herein described; Thence N 44° 06' 44" W, a distance of 453.14 feet to a point on the southeasterly line of Sub-Station No. 1 (A.K.A. the Little Italy Sub-Station);

Thence N 51° 37' 37" E by and along the southeasterly line of said sub-station, a distance of 26.41 feet to the most easterly corner of said sub-station;

Thence N 38° 31' 45" W by and along the northeasterly side of said sub-station, a distance of 158.96 feet to an angle point; Thence N 19° 18' 10" W by and along the northeasterly side of said sub-station, a distance of 93.99 feet to an angle point; Thence N 31° 53' 38" W by and along the northeasterly side of said sub-station, a distance of 11.06 feet to an angle point; Thence N 41° 16' 11" W by and along the northeasterly side of said sub-station, a distance of 26.44 feet to the point of beginning.

SUBJECT to prior easement rights of Bangor Hydro-Electric Company as described in deeds recorded at the Penobscot Registry of Deeds in Volume 2974, Page 238 from easement strips "A", "B" and "C".

SUBJECT to sewer line easements granted to the Inhabitants of the Town of Millinocket in a deed recorded at the Penobscot Registry of Deeds in Volume 2790, Page 221.

Transmission Line Easement Area 7 contains 69.23 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment.

4.5 Transmission Line Easement North Twin Dam to Millinocket Mill

T3 Indian Purchase, Maine and Millinocket, Maine

The following is a description of a 200 foot wide right of way for a Transmission Line Easement and for utility services as defined in Title 33 M.R.S.A. §458, excluding gas, diesel, natural gas, fuel and any

other petroleum products, but including the right to transmit utilities, energy, electricity and intelligence, which said transmission line easement is 100 feet either side of the following described centerline, and said transmission line easement is located in the T3 Indian Purchase and Millinocket in the County of Penobscot, State of Maine and is more particularly described as follows:

Beginning at a point on the centerline of the said transmission line in T3 Indian Purchase, said point further described as being located at coordinates of N: 718,411.25 feet, E: 912,508.58 feet of the Maine State Plane Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence N 58° 38' 19" E along the centerline of the herein described easement, a distance of 1032.42 feet to an angle point in said centerline;

Thence N 54° 10' 27" E along the centerline of the herein described easement, a distance of 5462.77 feet to an angle point in said centerline;

Thence S 51° 31' 23" E along the centerline of the herein described easement, crossing the Bangor & Aroostook Railroad right of way, a distance of 179.28 feet to an angle point in said centerline;

Thence N 79° 33' 13" E along the centerline of the herein described easement, crossing from T3 Indian Purchase into the Town of Millinocket, a distance of 7618.13 feet to an angle point in said centerline;

Thence N 77° 35' 59" E along the centerline of the herein described easement, a distance of 820.67 feet to an angle point in said centerline;

Thence S 73° 50' 43" E along the centerline of the herein described easement and crossing State Route 11, a distance of 673.82 feet to an angle point in said centerline;

Thence N 89° 06' 22" E along the centerline of the herein described easement a, distance of 813 feet, more or less, to the terminus of said easement located at coordinates N: 723,417.29 feet, E: 927,713.30 feet, as referenced to the aforementioned coordinate system;

SUBJECT to rights of the Bangor & Aroostook Railroad Company for the right of way that passes through and across the transmission line described herein.

SUBJECT to the rights of the public for the State Route 11 that cross the easement line described herein.

EXCEPTING AND RESERVING rights of access granted to the Millinocket Water District described in the following deeds: Book 716, Page 399; Book 1449, Page 371; Book 1543, Page 100; Book 5298, Page 326; and Book 5298, Page 327.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet, E: 977,164.59 feet which are based on the 1992 readjustment.

4.6 Transmission Line Easement Ripogenus Transmission Line:

A certain strip of land for a Transmission Line Easement and for utility services as defined in Title 33 M.R.S.A. §458, excluding gas, diesel, natural gas, fuel and any other petroleum products, but including the right to transmit utilities, energy, electricity and intelligence and containing electrical transmission cables, being always 200.00 feet wide and extending from Route #11 in Millinocket to McKay Station. Said land being part of that now or formerly owned by GNP, and the centerline of said 200.00 foot wide strip being described more particularly as follows:

Beginning at a rebar set on the northerly Right-of-Way of said Route #11 and also being on the centerline of a 200 foot wide utility transmission line now or formerly owned by GNP, located at UTM coordinates N 16584999.61, E 1711644.04 feet;

Thence, along the centerline of said Transmission Line and crossing the Golden Road at a UTM Grid bearing of North 46°22'10" West and a distance of 1332.33 feet to a bend in said Transmission Line; Thence, along said Centerline and crossing, the Bangor and Aroostook Railroad and the Town Line between T3 Indian Purchase and Millinocket, North 44°05'20" West, a distance of 11641.68 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline and crossing the State Park Road, North 39°39'40" West, a distance of 4082.90 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline and crossing Smith Brook, North 54°14'10" West, a distance of 4156.56 feet to a rebar set on the Town Line between T3 Indian Purchase and T1 R8;

Thence, continuing along said Centerline and crossing the Town Line between T1 R8 and T1 R9 and the State Park Road, North 54°08'10" West, a distance of 15987.20 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline and crossing the State Park Road, North 19°26'30" West, a distance of 1923.77 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, North 20°00'20" West, a distance of 381.55 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, North 21°47'50" West, a distance of 578.73 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, North 21°59'10" West, a distance of 345.70 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline and crossing Twin Pines Camp Road, North 18°21'10" West, a distance of 800.24 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline and crossing Millinocket Lake, North 16°37'00" West, a distance of 819.20 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline and crossing the boat launch parking lot and the State Park Road, North 42°49'00" West, a distance of 873.42 feet to a rebar set at a bend in said Transmission Line; Thence, continuing along said Centerline and crossing the Golden Road, North 49°59'40" West, a distance of 3045.80 feet to a rebar set at a bend in said Transmission Line at UTM Coordinates N 16616393.18, E 1679116.86;

Thence, continuing along said Centerline and crossing the Sawdust Pile Road and the Smelting Road, North 28°15'10" West, a distance of 6689.51 feet to a rebar set at a bend in said Transmission Line; Thence, continuing along said Centerline and crossing the Town Line between T1 R9 and T2 R9 and Grant Brook, North 45°00'00" West, a distance of 6032.56 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline and crossing the Golden Road, the State Park Road, Pockwockamus Brook, and Sunday Pond Road, North 19°21'00" West, a distance of 14301.76 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline and crossing the State Park Road and the Abol Dump Road, North 47°58'20" West, a distance of 15095.47 feet to a rebar set at a bend in said Transmission Line at UTM Coordinates N 16650151.49, E 1655732.74; Thence, continuing along said Centerline and crossing the Town Line between T2R9 and T2R10, North 69°43'40" West, a distance of 4827.27 feet

to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline and crossing the Abol Dump Road, the Golden Road, and the West Branch of the Penobscot River, North 89°07'30" West, a distance of 2824.47 feet to a rebar set at a bend in said Transmission Line; Thence, continuing along said Centerline and crossing the Golden Road and the Old Golden Road, North 75°33'40" West, a distance of 4123.87 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, North 70°38'50" West, a distance of 1148.84 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline and crossing the Golden Road and the Pitman Mountain Road, North 75°33'20" West, a distance of 3929.15 feet to a rebar set at a bend in said Transmission Line; Thence, continuing along said Centerline, North 80°27'40" West, a distance of 1180.96 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, North 75°33'00" West, a distance of 863.59 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, North 75°29'20" West, a distance of 504.03 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, North 75°39'20" West, a distance of 2340.82 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, North 75°37'30" West, a distance of 1413.83 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, South 82°22'20" West, a distance of 1924.02 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, South 83°24'50" West, a distance of 447.04 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, South 81°35'30" West, a distance of 424.25 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, South 82°40'10" West, a distance of 3405.38 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, North 73°40'30" West, a distance of 511.71 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, North 73°13'20" West, a distance of 2462.84 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, North 74°07'50" West, a distance of 535.96 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline and crossing the old Golden Road, North 40°41'10" West, a distance of 806.57 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline and crossing Horserace Brook, North 40°41'20" West, a distance of 745.99 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline and crossing the old Golden Road, North 40°25'20" West, a distance of 1367.76 feet to a rebar set at the Town Line between T2R10 and T2R11 in said Transmission Line;

Thence, continuing along said Centerline, North 40°46'20" West, a distance of 622.23 feet to a rebar set at the Town Line between T2R11 and T3R11 on said Transmission Line;

Thence, continuing along said Centerline, North 40°54'00" West, a distance of 598.21 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, North 45°14'30" West, a distance of 444.11 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, North 49°27'50" West, a distance of 313.15 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, North 51°54'10" West, a distance of 386.71 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, North 56°37'30" West, a distance of 541.85 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, North 61°28'50" West, a distance of 848.06 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, North 61°04'20" West, a distance of 466.37 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, North 61°55'30" West, a distance of 562.86 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, North 66°46'50" West, a distance of 2098.80 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, North 61°42'00" West, a distance of 458.69 feet to a rebar set at a bend in said Transmission Line at UTM Coordinates N 16662057.98, E 1615868.82;

Thence, continuing along said Centerline, North 61°13'20" West, a distance of 3128.87 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, North 56°32'10" West, a distance of 1266.06 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, North 61°33'00" West, a distance of 508.27 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, North 61°35'10" West, a distance of 1067.68 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, North 61°04'10" West, a distance of 437.48 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline and crossing the Golden Road, North 61°33'30" West, a distance of 1803.35 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, 61°26'10" West, a distance of 1060.10 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline and crossing the Golden Road, South 86°03'20" West, a distance of 446.97 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, 86°24'30" West, a distance of 894.26 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, South 86°38'50" West, a distance of 2373.81 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, South 86°20'40" West, a distance of 1377.78 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline and crossing the Golden Road, North 80°32'20" West, a distance of 1757.45 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline, North 67°31'50" West, a distance of 598.13 feet to a rebar set at a bend in said Transmission Line;

Thence, continuing along said Centerline and crossing the McKay Station Road and the Surge Tank Road, North 67°48'00" West, a distance of 1318.97 feet to a rebar set at the 3 pole structure at the end of said Transmission Line and also being the POINT OF ENDING.

The above described parcel of land is based on a field survey conducted under the supervision of Daniel O. Bridgham, PLS #1027, and shown on Plats labeled one of four through four of four dated May 19, 2000. All bearings are by GPS. All monuments set were 5/8 inch metal rebar with yellow plastic caps affixed to them, with "D. Bridgham, PLS #1027" imprinted in the caps.

4.7 Transmission Line Easement

TA R7 WELS Transmission Line (Parcel A):

A certain lot or parcel of land for a Transmission Line Easement and for utility services as defined in Title 33 M.R.S.A. §458, excluding gas, diesel, natural gas, fuel and any other petroleum products, but including the right to transmit utilities, energy, electricity and intelligence, situated in TA R7 WELS in the county of Penobscot, State of Maine, said easement area is more particularly described as follows:

Beginning at the southwesterly corner of the above described Sub-Station Parcel and on the southerly line of an 80 foot wide Bangor Hydro-Electric Company easement described as Strip D in a deed of easement recorded at the Penobscot Registry of Deeds in Volume 2974, Page 238, said point of beginning is further identified as being located at coordinates of N: 711,166.37 feet, E: 963,544.42 feet of the Maine State Plane Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence N 21° 12' 49" E by and along the westerly line of said Sub-Station Parcel, a distance of 250.10 feet to a point on said line; Thence N 85° 07' 38" W, a distance of 964.02 feet to a point on the southwesterly line of an 80 foot wide Bangor Hydro-Electric Company easement described as Strip D in a deed of easement recorded at the Penobscot Registry of Deeds in Volume 2974, Page 238;

Thence N 51° 57' 23" W by and along the southwesterly line of said Bangor Hydro-Electric Company 80 foot wide easement, a distance of 5558.65 feet to an angle point in said 80 foot wide easement;

Thence N 56° 17' 53" W by and along the southwesterly line of said Bangor Hydro-Electric Company 80 foot wide easement, a distance of 941.65 feet to an angle point in said 80 foot wide easement;

Thence N 58° 25' 02" W by and along the southwesterly line of said Bangor Hydro-Electric Company 80 foot wide easement, a distance of 816.40 feet to an angle point in said 80 foot wide easement, said angle point is further described as being southwesterly of Dolby Dam, so called;

Thence N 85° 11' 04" W by and along the southerly line of said Bangor Hydro-Electric Company 80 foot wide easement, a distance of 1932.9 feet, more or less to a point defined by the intersection of said line with the easterly line of land now or formerly of Webber Timberlands;

Thence S 5° 09' W, more or less, by and along land of said Webber Timberlands, a distance of 200 feet, more or less, to a point on the southerly line of the easement herein described, said point is further described as being 200.00 feet southerly as measured on a line that is perpendicular to the last

course herein described;

Thence S 85° 11' 04" E, a distance of 1886.5 feet, more or less, to an angle point in the southerly line of the easement parcel herein described, said angle point is further described as being southwesterly of Dolby Dam, so called;

Thence S 58° 25' 02" E, a distance of 765.11 feet to an angle point in the southwesterly line of the easement parcel herein described;

Thence S 56° 17' 53" E, a distance of 930.37 feet to an angle point in the southwesterly line of the easement parcel herein described;

Thence S 51° 57' 23" E, a distance of 6049.29 feet to an angle point in the southwesterly line of the easement parcel herein described;

Thence S 85° 07' 38" E, a distance of 3706.47 feet to a point on the southwesterly line of a 120 foot wide transmission line easement that runs from the Weldon Dam, so called, to East Millinocket;

Thence N 58° 33' 11" W by and along the southwesterly line of said 120 foot wide transmission line, a distance 447.07 feet to a point on said line, said point is further described as being on the southerly line of an 80 foot wide Bangor Hydro-Electric Company easement described a deed of easement from Powers et al recorded at the Penobscot Registry of Deeds in Volume 2150, Pages 564 and 566;

Thence N 85° 07' 38" W by and along the southerly line of said Bangor Hydro-Electric Company easement granted by said Powers et al and the southerly line of an 80 foot wide Bangor Hydro-Electric Company easement described as Strip D in a deed of easement recorded at the Penobscot Registry of Deeds in Volume 2974, Page 238, a distance of 1676. 43 feet to a point on the southerly line of said Bangor Hydro-Electric easement; said point is further described as being the southeasterly corner of aforementioned Sub-Station Parcel;

Thence continuing on the same course N 85° 07' 38" W by and along the southerly line of said Sub-Station Parcel, a distance of 1044.15 feet to the point of beginning.

SUBJECT to prior easement rights of Bangor Hydro-Electric Company as described in deeds recorded at the Penobscot Registry of Deeds in Volume 2974, Page 238 and Volume 2150, Pages 564 and 566.

The above described area contains 64.42 acres, more or less.

4.8 Optional Transmission Line Easement - intentionally omitted TA R7 WELS, Medway, T2 R9 NWP

NOTE: Reference is made to the Easement Agreement, Release of Option and Confirmatory Release Deed by and among GNP, MTC & GLHA dated January 2, 2003 and recorded in Penobscot County Registry of Deeds in Book 8532, Page 256.

4.9 Transmission Line Easement

T3 Indian Purchase Transmission Line (Parcel C):

A certain lot or parcel of land being a 200 foot wide strip of land for a Transmission Line Easement and for utility services as defined in Title 33 M.R.S.A. §458, excluding gas, diesel, natural gas, fuel and any other petroleum products, but including the right to transmit utilities, energy, electricity and intelligence situated in T3 Indian Purchase in the county of Penobscot State of Maine, said easement area is more particularly described as follows:

Beginning at a point on the town line between T3 Indian Purchase and TA R7 WELS, said point is further described as being located S 11° 43' E, more or less, as measured along said town line a distance of 40 feet, more or less, from the center of an 80 foot wide Bangor Hydro-Electric Co. easement described in a deed from the Webber heirs and recorded at the Penobscot Registry of

Deeds in Volume 2161, Page 364, said point of beginning is further identified as being located at coordinates of N: 715,990.26 feet, E: 940,839.23 feet of the Maine State Plane Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence S 77° 33' 30" W by and along the southerly line of a Bangor Hydro-Electric Company 80 wide easement identified as "Strip C" in a deed recorded at the Penobscot Registry of Deeds in Volume 2974, Page 238, a distance of 25 feet, more or less, to an angle point in said easement;

Thence N 50° 32' 17" W by and along the southerly line of said Bangor Hydro-Electric Company easement, a distance of 400 feet, more or less, to a point defined by the intersection of said line with the thread of the Penobscot River, said point is further described as being the bound between the towns of Millinocket and T3 Indian Purchase;

Thence running in a southwesterly direction by and along said town line, a distance of 206 feet, more or less, to a point defined by the intersection of said town line with a line that is 200 feet southwesterly as measured on a line that is perpendicular to the previous course herein described;

Thence S 50° 32' 17" E, a distance of 450 feet, more or less, to an angle point in said easement;

Thence N 77° 30' 30" E, a distance of 120 feet, more or less, a point defined by the intersection of the line herein described with the westerly line of land now or formerly of Webber heirs, said point is further described as being on the town line between TA R7 WELS and T3 Indian Purchase;

Thence N 11° 43' W, more or less, by and along the town line between TA R7 WELS and T3 Indian Purchase, a distance of 200 feet, more or less, to the point of beginning.

The above described parcel of land contains 2.3 acres, more or less.

4.10 Assignment of Rights under Easement Deed and Agreement

KPC and KT assign to GLHA their rights with respect to transmission line easements described in paragraphs 2 and 3 of a certain Deed, Easement Deed and Agreement between John M. Webber and Bangor Savings Bank et al. and GNP, MTC and GNE, dated as of December 27, 2001 and recorded in the Penobscot County Registry of Deeds in Book 8031, Page 39, and the Piscataquis County Registry of Deeds in Book 1360, Page 79.

4.11 Conditional Assignment of Rights to Require Removal of Rails and Reversion

With respect to the foregoing transmission line easements described in Paragraphs 4.1 to 4.10, which cross parcels now owned by Bangor & Aroostook Railroad ("B&A"), subject to the conditions below, KPC assign to GLHA all rights granted under the deeds listed below and recorded in the Penobscot County Registry of Deeds in the book and page indicated, to require removal of the rails and to compel a reverter of such parcels to KPC:

Book 703, Page 151 - Deed from Great Northern Paper Company to Bangor & Aroostook Railroad dated April 9, 1901.

Deed dated April 29, 1948 and recorded in Book 1283, Page 336 of the Penobscot County Registry of Deeds. Deed dated April 29, 1948 and recorded in Book 1283, Page 338 of the Penobscot County Registry of Deeds.

Book 1683, Page 25 - Deed from Great Northern Paper Company to Bangor & Aroostook Railroad dated June 25, 1959.

Book 1683, Page 27 - Deed from Great Northern Paper Company to Bangor & Aroostook Railroad Company dated June 25, 1959. Book 1803, Page 392 - Deed from Great Northern Paper Company to Bangor & Aroostook Railroad dated September 26, 1961.

SUBJECT TO the condition that in the event that:

(a) B&A asserts that the transmission lines located within such easements must be removed, and

(b) KPC fails to assert its right to require removal of the B&A rails and to compel a reverter of the parcels described in such deeds to KPC, then GLHA may assert such right as KPC's assignee.

**5. DAM LOT INCLUSIONS**

Also, all of GLHA's right, title and interest in and to the following grant:

As to all properties containing dam lots also:

(a) Whether or not described elsewhere herein, all beds of dam impoundments, except for the Dolby and East Millinocket impoundments, where parcels above the high water mark of the impoundments are conveyed and GNP held title to flowed lands below such high water mark, or KPC holds title to flowed lands below such high water mark; and

(b) All flowage rights, whether acquired by Legislative Charter, by deed, by prescription or otherwise, over lands located upstream or downstream of the dam that, historically or currently, have been flowed or flooded by a dam in Somerset, Penobscot, Piscataquis or Aroostook Counties.

**6. RESERVED EASEMENTS**

Also, all of GLHA's right, title and interest in and to the following grant, and excepting the interests reserved therein: RESERVING, however, to KPC and KT, the following easements described in Paragraph 6.1 to 6.4, SUBJECT TO the following conditions:

(1) Use of the easements shall be at the sole risk of the easement user;

(2) The easement user shall obtain and maintain in full force and effect all governmental approvals and financial responsibility requirements required by all applicable laws for construction and use of the easements;

(3) GLHA shall have the right to use the areas subject to such easements in common with KPC and KT and may cross and recross such areas with persons, equipment and vehicles;

(4) Use of the easement areas shall be in accordance with applicable laws and regulations and subject to modification from time to time pursuant to FERC License or other governmental action.;

(5) KPC's and KT's use of the easements shall not interfere with the use of GLHA's property in the ordinary conduct of the operation and management of a hydroelectric system;

(6) Except to the extent specifically provided in Paragraph 6.1, KPC's and KT's use and exercise of the easements shall be consistent with their prior use of real estate and fixtures subject to the easement, and not a change of use unless GLHA consents in writing to a change of use of the easements, which consent may be withheld for any reason; and

(7) KPC and KT severally agree for themselves, their successors and assigns, to indemnify and hold harmless GLHA, its successors and assigns, from any and all liability, costs, harm, damage and expense to GLHA relating to the exercise by KPC, KT, or their respective successors or assigns, of their rights under these easements.

6.1 Sunk Wood Easement

An easement to remove any sunk wood located within impoundments conveyed to GNE, which sunk wood KPC, KT, and GLHA agree to treat as personal property of KPC, pursuant to 33 M.R.S.A. § 455, 12 M.R.S.A. § 1867 and any applicable regulations, including an easement for ingress and egress across lands now or in the future owned by GLHA, or its successors or assigns, and including the right to operate watercraft and other machinery as may be reasonably required to exercise said easement rights, provided that all such removal shall be in accordance with all applicable licenses, laws, codes, ordinances and other governmental requirements, and performed in a good and workmanlike manner.

6.2 Slurry Pipeline Easement

A fifty foot (50') wide easement, centered on a slurry pipeline currently existing (the "Pipeline Easement"), for the purpose of laying, constructing, maintaining, operating, altering, replacing, repairing, reconstructing, relocating, and removing, (i) one or more pipelines with above-grade or below-grade valves, fittings and (ii) pipeline data acquisition equipment, pipeline safety devices, pipeline markers and other appurtenances, all of which KPC, KT, and GLHA agree shall be and remain the property of KPC, pursuant to 33 M.R.S.A. § 455, as may be convenient or necessary for the manufacture of pulp or paper, over, under, through, across, and upon any premises conveyed to GLHA and situated in Millinocket, Township A Range 7 W.E.L.S., or East Millinocket, Penobscot County, Maine. The easement rights granted herein shall include the rights (i) to use and maintain the existing roadway within said easement to permit the inspection and maintenance of the pipeline; (ii) altering, enlarging, and replacing, repairing, and removing the pipeline within said easement, and (iii) the rights to clear said easement, to remove any trees adjacent thereto, which at the discretion of the Grantee are a menace to the operation of the pipeline or lines.

6.3 Calcium Pond at North Twin Dam

An easement to store and remove calcium chloride from a storage pond located on the North Twin Dam Parcel described above in Paragraph 3.2, which calcium chloride KPC, KT, and GLHA agree to treat as personal property of KPC and KT, pursuant to 33

M.R.S.A. § 455, including an easement for ingress and egress on foot and by vehicle across such North Twin Dam parcel as may be reasonably required to exercise said easement rights. The storage pond is located within the parcel described below:

Calcium Pond Exception Parcel

North Twin Dam Site Twp 3 Indian Purchase

Beginning at a point on the northerly right of way line of the Bangor & Aroostook Railroad right of way, said point of beginning is 533 feet as measured northeasterly along said railroad right of way from the southwesterly corner of the North Twin Dam Parcel, so called said point of beginning is further described as being located at coordinates of N: 717,132.19 feet, E: 912,867.98 feet of the Maine State Plane Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence N 21° 24' 30" W, a distance of 105.8 feet to the northwesterly corner of the parcel herein described; Thence N 57' 33' 15" E, a distance of 105.0 feet to the northeasterly corner of the parcel herein described;

Thence S 17° 21' 15" E, a distance of 118.4 feet to a point on the northerly line of the said Bangor & Aroostook Railroad right of way;

Thence running in a southwesterly direction by and along said right of way following a 1860.14 foot radius curve to the right, an arc distance of 95.0 feet to the point of beginning.

ALSO granting herewith, a right of way over, under or through the existing road that runs from the parcel herein described to the northwesterly sideline of State Route 11, so called.

The above described parcel contains 0.25 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet, E: 977,164.59 feet which are based on the 1992 readjustment.

6.4 Storage Area at Dolby Dam

An easement for purposes of storage of equipment, consistent with prior use by GNP, in an existing building located in East Millinocket on the Dolby Dam parcel described in Paragraph 3.14.1 of this deed, including an easement for ingress and egress on foot and by vehicle across said Dolby Dam parcel as may be reasonably required to exercise said easement rights.

**7. APPURTENANT EASEMENTS AS TO ALL PROPERTIES (AS APPLICABLE)**

Also, all of GLHA's right, title and interest in and to the following grant:

TOGETHER WITH a non-exclusive easement over, under or through the land conveyed by GNP to (a) Somerset Woodlands, LLC by deed dated March 30, 1999 and recorded in Book 2541, Page 221 of the Somerset County Registry of Deeds, and (b) Great Northwoods, LLC by deed dated March 30, 1999 and recorded in Book 1191, Page 326 for access, ingress and egress between each of the "Reserved Parcels" described in said deeds and the roads and other transportation easement areas reserved in said deeds and to provide such other rights in said land as are reasonably necessary for GLHA, its successors and assigns, to operate, service and maintain the facilities on the parcels hereby conveyed in a manner substantially consistent with GNP's past practices, subject to modification from time to time pursuant to FERC license or other governmental action.

**8. RESERVED EASEMENTS ACROSS LANDS OF KT**

Also, all of GLHA's right, title and interest in and to the following grant:

TOGETHER WITH a non-exclusive easement over, under or through properties formerly owned by MTC or now owned by KT and conveyed by GNP to MTC by deeds dated January 5, 2001, and recorded in the Penobscot County Registry of Deeds in Book 7580, Page 284 and in the Piscataquis County Registry of Deeds in Book 1295, Page 3, and dated January 10, 2001, and recorded in the Somerset County Registry of Deeds in Book 2757, Page 14, as corrected by corrective deed dated September 6, 2001, from GNP to MTC, and recorded in the Penobscot County Registry of Deeds in Book 7866, Page 135, by corrective deed dated September 6, 2001, from GNP to MTC, and recorded in the Penobscot County Registry of Deeds in Book 7866, Page 143, by corrective deed dated September 6, 2001, from GNP to MTC, and recorded in the Piscataquis County Registry of Deeds in Book 1336, Page 199, by corrective deed dated September 6, 2001, from GNP to MTC, and recorded in the Piscataquis County Registry of Deeds in Book 1336, Page 207, by corrective deed dated September 6, 2001, from GNP to MTC, and recorded in the Somerset County Registry of Deeds in Book 2851, Page 19, by corrective deed dated September 6, 2001, from GNP to MTC, and recorded in the Somerset County Registry of Deeds in Book 2851, Page 27, and further corrected by corrective deeds from GNP to MTC dated January 30, 2002 and recorded in the Piscataquis County Registry of Deeds in Book 1365, Page 336; recorded in the Penobscot County Registry of Deeds in Book 8063, Page 89 (all of the foregoing, collectively, "MTC Properties"), for the use of existing vehicle roadways and for the construction and use of vehicle roadways up to thirty-five (35) feet wide for access and ingress to and egress to the Reserved Hydroelectric System, provided that: (a) GLHA shall not cut any trees or timber except those inside any such roadway and any timber cut shall be cut into logs of standard length and decked along the easement for disposal by KT at its sole discretion; (b) KPC and KT shall have the right to use said roadways in common with GLHA and may cross and recross said roadways with persons, equipment, vehicles, logs and timber; (c) any such roadways shall be constructed and used by GLHA in accordance with applicable laws and regulations and with proper drainage; (d) GLHA's use of this easement shall not interfere with the use of KT's property in the ordinary conduct of the operation, management, regeneration and harvesting of a tree farm; (e) GLHA 's use and exercise of this easement shall be consistent with GNP's use of the Reserved Hydroelectric System (as that term is used in the deeds from GNP to MTC referenced above), and not a change of use; and (f) GLHA agrees for itself, its successors and assigns, to indemnify and hold harmless KT, its successors and assigns, from any and all liability, costs, harm, damage and expense to KT relating to the exercise by GLHA, or its successors or assigns, of their rights under this access easement.

The foregoing easement is intended to cover all properties now owned by KT in Penobscot, Piscataquis and Somerset Counties, State of Maine.

**9. RESERVED EASEMENTS ACROSS LANDS OF GNP or KPC**

Also, all of GLHA's right, title and interest in and to the following grant:

TOGETHER WITH a non-exclusive easement over, under or through properties formerly owned by GNP or now owned by KPC not otherwise subject to similar easement and described elsewhere in this deed, for the use of existing vehicle roadways and for the construction and use of vehicle roadways up to thirty-five (35) feet wide for access and ingress to and egress to the hydroelectric system hereby conveyed, provided that: (a) GLHA shall not cut any trees or timber except those inside any such roadway and any timber cut shall be cut into logs of standard length and decked along the easement for disposal by KT at its sole discretion; (b) KPC and KT shall have the right to use said roadways in common with GLHA and may cross and recross said roadways with persons, equipment, vehicles, logs and timber; (c) any such roadways shall be constructed and used by GLHA in accordance with applicable laws and regulations and with proper drainage; (d) GLHA's use of this easement shall not interfere with the use of KPC and KT's property in the ordinary conduct of the operation, management, regeneration and harvesting of a tree farm; (e) GLHA 's use and exercise of this easement shall be consistent with GNP's use of the hydroelectric system hereby conveyed, and not a change of use; and (f) GLHA agrees for itself, its successors and assigns, to indemnify and hold harmless KPC, its successors and assigns, from any and all liability, costs, harm, damage and expense to KPC relating to the exercise by GLHA, or its successors or assigns, of their rights under this access easement.

The foregoing easement is intended to cover all properties now owned by KPC in Penobscot County, State of Maine.

**10. GOLDEN ROAD UTILITY EASEMENTS**

Also, all of GLHA's right, title and interest in and to the following grant:

The Golden Road utility easements reserved as set forth in the deeds (a) to Great Northwoods, LLC dated March 30, 1999 and recorded in Book 1191, Page 326 of the Piscataquis County Registry of Deeds, and to Somerset Woodlands LLC dated March 30, 1999 and (b) recorded in Book 2541, Page 221 of the Somerset County Registry of Deeds.

**11. ROAD AND UTILITY EASEMENTS**

Also, all of GLHA's right, title and interest in and to the following grant:

TOGETHER WITH, in common with KPC, KT and others, a perpetual, non-exclusive access easement for passage by foot and vehicle, including construction, logging and other trucks and equipment, over and across all roads and paths as they presently exist or as they may exist from time to time or may in the future be constructed in the property described in deeds from GNP to Great Northwoods, LLC and Somerset Woodlands LLC, recorded in the Piscataquis County Registry of Deeds, Book 1191, Page 326, and the Somerset County Registry of Deeds, Book 2541, Page 221, including without limitation, the Western Portion of the Golden Road, and the non-exclusive right, in common with KPC, KT and others, to use prescriptive rights, easements, licenses, or other rights of KPC or KT over, under or through roads of third parties, including, without limitation, the Western Portion of the Golden Road, to the extent such use does not overburden any such prescriptive right, provided, however, that nothing contained in this easement shall serve to restrict, or be construed to restrict, KPC's or KT's ability to exercise the rights granted by this easement in a manner consistent with the existing and historical exercise of such rights by GNP or its successors.

Each easement user agrees for itself, its successors and assigns, to indemnify and hold harmless the primary easement holder, its successors and assigns, from any and all liability, costs, harm, damage and expense relating to the exercise by the easement user, or its successors or assigns, of their rights under this access easement.

For purposes of the foregoing, "Western Portion of the Golden Road" shall mean the western portion of the Golden Road from the western boundary of the State of Maine to a point on the southern boundary of the East half of Township 3, Range 12, W.E.L.S., and "Golden Road" shall mean the road running westerly from the town of Millinocket, Maine to a point on the Westerly boundary of Township 5, Range 20 at St. Zacharie on the border of Quebec Province, Canada, as more specifically described below.

TOGETHER WITH, in common with KPC, KT and others, a perpetual non-exclusive easement over, under or through the lands along the Eastern Portion of the Golden Road and in areas in the vicinity of the Eastern Portion of the Golden Road, for passage by foot and vehicle, including construction, logging and other trucks and equipment, and provided that the proposed use does not unreasonably interfere with access to the premises owned by KPC or KT, their successors and assigns, and a perpetual exclusive easement (a) to construct (including new utility lines), maintain, operate and upgrade from time to time for electrical transmission and, excepting gas, diesel, natural gas, fuel and any other petroleum products, for utility services as defined in Title 33 M.R.S.A.

§458 ("Utility Services"), one or more lines consisting of overhanging and/or underground wires (including, without limitation, high voltage electric transmission wires and appurtenances), pipes, cables or facilities with necessary or convenient poles, stanchions, fixtures and supports, with the right to transmit utilities, Utility Services excluding gas, diesel, natural gas, fuel and any other petroleum products, energy, electricity and intelligence over and through said lines, and to clear and dispose of interfering branches and other growth from time to time, with permission to enter upon the said lands for the above purposes (whether or not on existing roads now serving, connecting to or traversing said

lines), and (b) to use such easement areas for all purposes related to or arising from use of GLHA's Hydroelectric Easements as defined in Section 15 herein and use of GLHA's hydro system assets. To the extent GLHA reasonably believes that applicable land use or deed restrictions, environmental concerns or construction needs so require, subject to approval of KPC or KT (which approval shall not be unreasonably withheld, delayed or conditioned), the exclusive easement shall extend to areas not in the vicinity of the Eastern Portion of the Golden Road to the extent reasonably required.

KPC and KT shall be under no obligation to perform maintenance of their roads for the improvements of GLHA. Each party using any road, or portions of a road, shall be responsible to maintain and repair, including snow removal, to the extent of such party's use thereof, and each landowner or primary easement holder shall have the right but not the obligation to repair and maintain such road or portion of a road. The landowner shall have the right to relocate from time to time such road or portion of a road at its sole cost and expense. Any such relocation may be done only after reasonable notice, shall be undertaken in such a manner and at such time so as to minimize the disruption of traffic flow and shall not materially impair the utility of this easement, except to the extent required for dam safety and dam security measures. Nothing in this Deed shall limit or modify any right of contribution the parties may have against third parties relative to such costs and expenses. No party shall be required to maintain any roads to any particular standard for the use of third parties.

By its acceptance of this Deed GLHA agrees, for itself, and its successors and assigns, that its entry on land of KT and/or KPC, and use of the Easements shall be SUBJECT TO the following conditions:

(1) GLHA's use of the Easements shall at all times be conducted so as not to materially interfere with the ordinary conduct of the operation, management, regeneration and harvesting of the tree farm on lands of KT and KPC. GLHA use of the Easements shall be subject to rules and regulations adopted by KT and KPC which are generally applicable to users of KT and KPC roads and easements, provided that such rules and regulations and amendments thereto are reasonable. Such rules and regulations may provide for seasonal closures and temporary road closures for construction and maintenance purposes. KT and KPC shall make commercially reasonable efforts to provide notice to GLHA, its successors and assigns, of their rules and regulations.

(2) GLHA's use of the Easements shall be at the sole risk of GLHA. GLHA agrees that KT and KPC shall not be liable to GLHA for any claims arising from use of the Easements by GLHA, its employees, agents, contractors, subcontractors, insurers and its heirs, successors and assigns, including but not limited to claims for personal injury, death, damage to property or loss of business, except to the extent such damage is caused by gross negligence or the willful misconduct of KT, KPC, or their agents, contractors or employees. GLHA agrees to hold harmless KT and KPC, their affiliates, directors, officers, trustees, employees, contractors, successors and assigns from (a) any claims and costs and expenses (including reasonable attorneys' fees) arising from use of the Easements by GLHA or its employees, contractors, agents, successors and assigns, except to the extent caused by the gross negligence or willful misconduct of KT or KPC, their agents, contractors, or employees, and (b) any costs and expenses (including reasonable attorneys' fees) incurred by KT or KPC in connection with curing any default of GLHA hereunder or enforcing KT or KPC's rights under this Deed.

(3) GLHA hereby agrees to indemnify, defend and hold harmless KT and KPC, their affiliates, directors, officers, trustees, employees, successors and assigns from and against any and all claims, actions, injuries, losses, damages, costs, fines, penalties and settlements, including without limitation, attorneys' fees and the costs of investigation, response and remediation, (hereinafter "Claims"), arising from or in any manner related to the construction, reconstruction, use, operation or maintenance of any structures, and transmission lines, or the transportation, loading, unloading, delivery, storage or handling of any material, by GLHA, its contractors, agents, employees, successors or assigns, including without limitation, the release of any hazardous substances (as the same may be defined by federal, state or local law or regulations), natural gas, petroleum products or other fuel in, on or under the premises subject to the easements hereunder, except to the extent such damage is caused by gross negligence or the willful misconduct of KT, KPC, or their agents, contractors or employees.

(4) KT and KPC shall retain title to all merchantable timber and forest products within the Easements and GLHA will not remove merchantable timber or other forest products severed from the Easements without the prior written agreement of KT and KPC.

For purposes of the foregoing, "Eastern Portion of the Golden Road" shall mean the eastern portion of the Golden Road from the southern boundary of the East half of Township 3, Range 12, W.E.L.S. to its eastern terminus in the Town of Millinocket, Maine, at the junction of State Highway Route 11, and "Golden Road" shall mean the road running westerly from the town of Millinocket, Maine to a point on the Westerly boundary of Township 5, Range 20 at St. Zacharie on the border of Quebec Province, Canada, as more specifically described below.

DESCRIPTION OF THE GOLDEN ROAD

The Golden Road is an existing private roadway running generally northwesterly from the Town of Millinocket, Penobscot County,

State of Maine, to a termination on the westerly boundary of T5 R20 WELS and the westerly boundary of the State of Maine, in the counties of Penobscot, Piscataquis and Somerset, being more specifically described as follows:

COMMENCING in the Town of Millinocket, at the junction of State of Maine Highway Route 11, then running generally northwesterly across the Town of Millinocket to the mutual western Townsite boundary and the boundary of Indian Purchase No. 3; Thence running generally northwesterly across Indian Purchase No. 3, southerly of Smith Pond, to the southern boundary of T1 R8 WELS;

Thence running generally northwesterly across the southwest corner of T 1 R 8 WELS to the eastern boundary of T1 R9 WELS; Thence running northwesterly across T1 R9 WELS, crossing over the land area between Ambajejus Lake and Millinocket Lake, to the southern boundary of T2 R9 WELS;

Thence continuing northwesterly from the southern boundary of T2 R9 WELS to the eastern boundary of T2 R10 WELS;

Thence continuing northwesterly from the eastern boundary of T2 R10 WELS, crossing over and running alongside and southerly of the West Branch of the Penobscot River to the eastern boundary of T2 R11 WELS;

Thence continuing northwesterly across the northeast corner of T2 R11 WELS, from the eastern boundary of T2 R11 WELS, to the southern boundary of T3 R11 WELS;

Thence across T3 R11 WELS, northwesterly and westerly along the southern side of the West Branch of the Penobscot River to the eastern boundary of T 3 R 12 WELS, at a point south of the Ripogenus Lake;

Thence southwesterly across T3 R12 WELS, from the eastern boundary of T3 R12 WELS and southeasterly of Chesuncook Lake, to the northern boundary of T2 R12 WELS;

Thence continuing southwesterly across T2 R12 WELS, from the northern boundary of T2 R12 WELS, to the intersection with Kokadjo/Greenville Road, so called, near the southeast corner of Caribou Lake;

Thence turning northwesterly, from above said junction, along the southern and western sides of Caribou Lake, to the southern boundary of T3 R12 WELS;

Thence continuing northwesterly across the southwest corner of T3 R12 WELS, on the western side of said Caribou Lake, to the eastern boundary of T3 R13 WELS;

Thence continuing northwesterly across T3 R13 WELS to the eastern boundary of T3 R14 WELS;

Thence continuing northwesterly and westerly across Lobster Township (T3 R14 WELS), crossing the West Branch of the Penobscot River, at Hannibals Crossing, so-called, to the eastern boundary of

Burbank (Northeast Carry Township or T3 R15 WELS);

Thence continuing across Burbank (Northeast Carry Township or T3 R15 WELS), northerly of the West Branch of the Penobscot River, generally northwesterly and westerly to the eastern boundary of Seboomook (T0 R4 NBKP);

Thence continuing northwesterly across Seboomook (T0 R4 NBKP), to the eastern boundary of Boyd (Plymouth Township or T1 R4 NBKP), at a point northerly of Seboomook Lake;

Thence westerly across Boyd (Plymouth Township or T1 R4 NBKP), northerly of Seboomook Lake, to the eastern boundary of Pittston Academy Grant (T2 R4 NBKP);

Thence northwesterly across the northeastern corner of Pittston Academy Grant (T2 R4 NBKP) to the southern boundary of T4 R17 WELS;

Thence continuing northwesterly across the southwest corner of T4 R17 WELS, to the eastern boundary of T4 R18 WELS (Comstock Township) at a point northeasterly of the North Branch of the Penobscot River;

Thence continuing northwesterly and westerly, from the eastern boundary of T4 R18 WELS (Comstock Township), crossing said North Branch of the Penobscot River, and continuing to the eastern boundary of Dole Brook Township (T3 R5 NBKP);

Thence continuing northwesterly across the northeast corner of Dole Brook Township (T3 R5 NBKP) to the southern boundary of T5 R19 WELS;

Thence continuing northwesterly across the southwest corner of T5 R19 WELS, to the eastern boundary of T5 R20 WELS; Thence continuing northwesterly from the eastern boundary of T5 R20 WELS to said termination on the western boundary of T5 R20 WELS and the western boundary of the State of Maine.

**12. OPTION TO ACQUIRE EASEMENTS OR FEE INTERESTS**

Also, all of GLHA's right, title and interest in and to the following grant:

Also assigning the options reserved under the aforesaid deeds to Somerset Woodlands, LLC and Great Northwoods, LLC set forth in deeds from GNP to Great Northwoods, LLC and Somerset Woodlands LLC, recorded in the Piscataquis County Registry of Deeds, Book 1191, Page 326, and the Somerset County Registry of Deeds, Book 2541, Page 221 as follows:

"Upon request by Grantor, its successors to or assigns of the Hydroelectric System, or any portion thereof, Grantee, or its successors or assigns of the Timberlands described in Part A above, shall grant to Grantor, its successors to or assigns, such easements, rights of way, leases, licenses or rights to use such real property as may be necessary to satisfy requirements that are in the future imposed by FERC, or any successor agency, for the term of any of Grantor's FERC licenses (and any renewals) for the operation of the Hydroelectric System, or any portion thereof, but such easements, rights of way, leases, licenses or rights to use such real property shall extend only to lands within 200 feet of the normal high water mark of any impoundments in the Hydroelectric System. Grantor agrees to make reasonable efforts to avoid having to obtain any such interests in said Timberlands to satisfy such FERC-imposed requirements. In the event that Grantor is not able, after reasonable efforts, to satisfy FERC requirements through use of such easements, rights of way, leases, licenses or rights to use such real property, Grantor shall have the right to acquire title to the minimum amount of such lands as is necessary to satisfy FERC requirements for any of Grantor's Hydroelectric System assets, but such right shall extend only to lands within 200 feet of the high water mark at the N.F.P.E. of any impoundments in the Hydroelectric System. To the extent that Grantor is required to acquire title to any such lands ("Regulatory Requirements Property"), Grantor shall pay Grantee, its successors in or assigns of said Timberlands, an amount equal to the number of measured acres of fee interest comprising such Regulatory Requirements Property multiplied by the fair market value of such

measured acreage. The provisions of this paragraph shall survive the delivery of this deed, but shall lapse after January 1, 2005 for those portions of the Hydroelectric System within the Storage Project, FERC No. P-2634 and shall lapse after January 1, 2001 for all other portions of the Hydroelectric System."

**13. ASSIGNMENT OF SPECIAL CHARTER RIGHTS (ALL COUNTIES) - INTENTIONALLY OMITTED**

**14. FUTURE DEVELOPMENT AREAS RESTRICTIVE COVENANT - INTENTIONALLY OMITTED**

**15. GENERAL PROVISIONS AS TO ALL EASEMENTS BENEFITING GLHA**

Also, all of GLHA's right, title and interest in and to the following grant:

As used in this deed, the term "Hydroelectric Easement" means an easement for supporting, operating, repairing, maintaining, constructing, reconstructing, replacing, dismantling, relocating, inspecting and otherwise utilizing and exploiting any hydroelectric assets now or to be located on the parcel subject to such easement or on any parcel in the hydro system, and including, without limitation, for persons, vehicles, equipment and materials and for ingress and egress and parking.

Notwithstanding any provision contained herein, KPC and KT agree for themselves, their successors and assigns, that GLHA, its successors, and assigns, have the right to perform any and all acts required by an order of the FERC or its successor affecting the conveyed premises without the prior approval of KPC or KT.

KPC and KT agree for themselves, their successors and assigns, to comply with and observe all statutes, ordinances, regulations, orders and/or decrees of the federal, state and city governments, or any departments, bureaus or agencies thereof, in any way affecting the use and maintenance of the premises, or any machinery or equipment therein, whether now in force or which may in the future be promulgated.

With respect to all easements granted in this deed, pursuant to 33 M.R.S.A. § 455, KPC and KT agree to treat all of the fixtures and equipment relating to hydroelectric operations and located within the easement parcels as personal property of GLHA, whether or not affixed to the real estate hereby conveyed, all of which personal property is being conveyed to GLHA by bill of sale of even date herewith. KPC and KT expressly reserve all merchantable timber located within any easement granted in this deed, which merchantable timber shall be the property of KT, its successors and assigns.

GLHA's use of the easements shall not interfere with the use of KPC's property in the ordinary conduct of business or industrial operations.

**16. SUBDIVISION RESTRICTIVE COVENANT - INTENTIONALLY OMITTED**

**17. SHARED ACCESS EASEMENT RIGHTS OVER LAND OF OTHERS**

Also, all of GLHA's right, title and interest in and to the following grant:

To the fullest extent the deeds referenced herein allow, KPC and KT hereby grant to GLHA, in common with KPC, KT, their successors and assigns and others entitled thereto, the following nonexclusive rights of access crossing land of third parties to provide ingress and egress in accordance with the terms and provisions, all as more fully described in the following deeds:

a. Easement granted by Emery Lee and Sons, Inc. to Great Northern Nekoosa Corporation, dated October 23, 1989 and recorded in the Penobscot County Registry of Deeds in Book 4559, Page 127; and

b. Right-of-way granted by Merton Osnoe to Great Northern Paper Company, dated May 4, 1961, and recorded in Penobscot Registry of Deeds in Book 1786, Page 77.

c. Easement Deed and Agreement from G. Pierce Webber, et al., to Great Northern Paper, Inc. dated October 24, 2001 and recorded in Penobscot County Registry of Deeds in Book 7957, Page 339.

d. Deed, Easement Deed and Agreement from John M. Webber, et al., dated December 27, 2001 and recorded in Penobscot County Registry of Deeds in Book 8031, Page 39;

e. Deed, Easement Deed and Agreement from John M. Webber, et al., to Maine Timberlands Company, Great Northern Paper, Inc. and GNE, LLC dated December 27, 2001 and recorded in Piscataquis County Registry of Deeds in Book 1360, Page 79; and

f. Deed, Easement Deed and Agreement from Barbara A. Cassidy, et al., to Maine Timberlands Company, Great Northern Paper, Inc. and GNE, LLC dated December 27, 2001 and recorded in Piscataquis County Registry of Deeds in Book 1360, Page 111.

BLANKET CROSS EASEMENT

Easements conveyed by Great Northern Paper, Inc. to GNE, LLC by Blanket Cross-Easement Deed and Agreement dated January 31, 2002 and recorded in Penobscot County Registry of Deeds in Book 8064, Page 241 upon the Mill Real Estate in East Millinocket and Millinocket, Maine described as follows:

Mill Real Estate

(Millinocket and East Millinocket exclusive of new carve-out areas)

Millinocket Mill Site

A certain lot or parcel of land with the improvements thereon, situate in the Town of Millinocket, County of Penobscot, State of Maine, more particularly described as follows:

BEGINNING at an iron rod set on the generally southerly line of State Route 11, in said Millinocket, which rod is 33 feet right of p.c. station 1349+99.71, as shown on a plan of said highway recorded in Penobscot County Registry of Deeds, Plat Book 21, Page 4; thence generally easterly by and along the southerly line of said highway following a curve to the left with a radius of 1465.69 feet, an arc distance of 766.39 feet to an iron rod set;

thence South 47°18'30" East a distance of 1,550.0 feet to an iron rod set on the westerly extension of the southerly line of Oak Street in said Millinocket, as said street line is shown on plan recorded in Penobscot County Registry of Deeds, Plan Book 6, Page 44;

thence North 60°54'15" East by and along said westerly extension and by and along the southerly line of Oak Street, a distance of 1490.0 feet to the intersection of the southerly line of said Oak Street with the easterly line of Oxford Street;

thence North 29°05'45" West by and along the easterly line of Oxford Street, a distance of 710.0 feet to the southerly line of Elm Street as depicted on said plan recorded in Penobscot County Registry of Deeds, Plan Book 6, Page 44;

thence North 60°54'15" East by and along the southerly line of Elm Street, a distance of 186.0 feet to the northwesterly corner of Lot Number 13, in Book 37, as shown by said plan recorded in Penobscot County Registry of Deeds, Plan Book 6, Page 44; thence South 29°05'45" East by and along the westerly boundaries of Lots Numbered 1 through 13, inclusive of said Block 37, and a continuation of said boundary, a distance of 664.75 feet to point on the westerly extension of the southerly line of Block 59 as said Block is shown on a plan recorded in Penobscot County Registry of Deeds, Plan Book 14, Page 21;

thence North 60°54'15" East along said extension and by and along the southerly line of said Block 59, a distance of 640.67 feet to the easterly line of Congress Street as depicted in the plan recorded in

Penobscot County Registry of Deeds, Plan Book 10, Page 7;

thence North 29°05'45" West a distance of 150.0 feet to the southerly line of Cherry Street, as shown by said plan recorded in Penobscot County Registry of Deeds, Plan Book 10, Page 7;

thence North 60°'54'15" East by and along the southerly line of Cherry Street, a distance of 155.6 feet to a point of curve;

thence southeasterly by a curve to the right with a radius of 135.0 feet, an arc distance of 218.13 feet to a point of tangency which is approximately 35 feet westerly of the easterly line of York Street as said York Street is shown on a plan recorded in Penobscot County Registry of Deeds, Plan Book 16, Page 39;

thence South 26°31 15" East, approximately paralleling the easterly line of York Street as shown by said plan, a distance of 640.1 feet to an iron rod set;

thence South 3°49'15" East, along a line westerly of and approximately paralleling the Coal Ash Road, so-called, a distance of

544.5 feet to an iron rod set;

thence South 87°27'15" East a distance of 44.3 feet to an iron bolt on northerly-most corner of the "Main Pumping Station" lot as depicted on a plan recorded in Penobscot County Registry of Deeds, Map File 569E;

thence southeasterly by a curve to the left in the westerly line of said lot, which curve has a radius of 128.0 feet, an arc distance of

92.17 feet to a point of tangency;

thence South 46°44'30" East by and along the westerly line of said Main Pumping Station lot, a distance of 166.0 feet to an iron bolt;

thence North 16°45'30" East by and along the southerly line of said Main Pumping Station lot, a distance of 3.6 feet to a point on a line which is generally parallel to and 105 feet easterly of the center line of the steel frame towers on the Millinocket-East Millinocket electrical transmission line;

thence South 54°49'45" East by and along said line which is generally parallel to and 105 feet easterly of the center line of the steel frame towers on the Millinocket-East Millinocket electrical transmission line, a distance of 7,317.7 feet to an iron rod set; thence South 31°52'00" East a distance of 1,913.2 feet to an iron rod set;

thence continuing the same course, South 31°E 52'00" East, a distance of 381.7 feet to a point in Millinocket Stream;

thence South 76°52'00" West a distance of 225.8 feet to an aluminum disk cemented into a boulder on the westerly side of said Stream;

thence continuing the same course, South 76°52'00" West, a distance of 8,300.9 feet to an iron road set on the westerly side of the West Branch of Penobscot River;

thence continuing on the same course, South 76°52'00" West, a distance of 315 feet, more or less, to the thread of said River as defined by An Act to Incorporate the Town of Millinocket, Chapter 377, Private and Special Laws of the State of Maine (1901); thence generally northwesterly following the thread of said River as recited by said Act, a distance of 6,203 feet, more or less, to the southeasterly face of the Quakish Lake Dam;

thence northeasterly by the southeasterly face of said dam, a distance of 100 feet, more or less, to the southwesterly fact of a concrete retaining wall on the southerly said of the inlet canal to Ferguson

Lake;

thence southeasterly by and along the southwesterly face of said retaining wall, a distance of 244 feet, more or less, to an angle in said wall;

thence northeasterly by the southeasterly face of said concrete retaining wall, a distance of 30 feet, more or less, to high water line of Ferguson;

thence in a generally easterly and northeasterly direction by and along high water line of Ferguson Lake, a distance of 8.186 feet, more or less, to the westerly end of the outlet canal from Ferguson Lake;

thence northwesterly across the mouth of said canal, a distance of 120 feet, more or less, to high water line of Ferguson Lake; thence generally northwesterly by and along high water line of Ferguson Lake, a distance of 4,312 feet, more or less, to a point which is South 18°57'00" West from p.c. station 1349+99.71, as shown on a plan of said highway recorded in Penobscot County Registry of Deeds, Plan Book 21, Page 4; thence North 18°57'00" East, a distance of 50 feet, more or less, to the point of beginning. For the sole purpose of providing a geometrically precise description, and not to be construed as a boundary of the above described tract, the course and distance between the iron rod defining the point of beginning and the iron rod adjacent to the southwesterly corner of the within described parcel is South 7°03'37" East, 9,270.1 feet.

Bearings referenced herein are oriented to Grid North, Maine State Coordinate System of 1927, East Zone, as determined by a survey of the within described lot by Plisga & Day, Land Surveyors.

Save And Except The Following Millinocket Easement Exception Areas (A) and (B):

3.10.10.1 Easement Exception Area "A" Oil Storage Tanks

Millinocket Mill Site

Beginning at a point on the northerly line of Easement Area 1, so called, having coordinates of N: 719,974.10 feet and E: 933,044.77 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence N 55° 19' 53" E, a distance of 228.63 feet to a point; Thence N 34° 40' 07" W, a distance of 140.92 feet to a point; Thence N 36° 39' 44" E, a distance of 149.89 feet to a point; Thence N 58° 08' 22" E, a distance of 191.75 feet to a point; Thence N 65° 37' 10" W, a distance of 399.04 feet to a point; Thence N 42° 21' 31" W, a distance of 120.86 feet to a point; Thence N 80° 22' 18" W, a distance of 383.03 feet to a point; Thence S 73° 22' 23" W, a distance of 180.33 feet to a point; Thence N 75° 22' 07" W, a distance of 227.85 feet to a point; Thence S 56° 28' 09" E, a distance of 226.35 feet to a point; Thence S 36° 14' 52" E, a distance of 460.18 feet to a point; Thence S 50° 28' 45" W, a distance of 203.63 feet to a point;

Thence S 73° 17' 04" E, a distance of 576.18 feet to the point of beginning. Easement Exception Area "A" contains 10.756 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment.

3.10.10.2 Easement Exception Area "B"

(Mill Site Southerly to the West Branch of the Penobscot River) Millinocket Mill Site

Beginning at a point on the southwesterly line of Easement Area 7, so called, at its intersection with the southerly line of Easement Area 1, so called, said point having coordinates of N: 719,628.40 feet and E: 935,842.27 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence S 88° 13' 35" W, a distance of 2951.57 feet to a point; Thence N 1° 46' 25" W, a distance of 140.40 feet to a point;

Thence N 74° 01 20" W, a distance of 540.56 feet to a point; Thence N 59° 32' 41" W, a distance of 1103.35 feet to a point;

Thence N 45° 48' 30" W, a distance of 338.76 feet to a point on a chain link fence said point being further described as a point on the southwesterly line Sub-Station No. 4, said point is further described as being located at coordinates of N: 720,621.56 feet and E: 931,174.08 according to aforementioned coordinate system;

Thence N 57°48' 57" W by and along said chain link fence, a distance of 108.74 feet to a corner of said fence;

Thence N 50° 35' 19" W, a distance of 340.90 feet to a point being the southeasterly corner of Easement Area 4, so called, said point having coordinates of N: 720,895.91 feet and E: 930,818.67 feet, according to aforementioned coordinate system; Thence S 49°13' 53" W, a distance of 42.79 feet to a point;

Thence S 49° 00' 52" W, a distance of 288.23 feet to a point; Thence S 56° 04' 37" W, a distance of 110.43 feet to a point; Thence S 18° 32' 03" W, a distance of 28.91 feet to a point; Thence S 48° 27' 21" W, a distance of 147.01 feet to a point; Thence S 44° 00' 30" W, a distance of 746.57 feet to a point; Thence S 62° 19' 46" W, a distance of 450.69 feet to a point; Thence S 53° 33' 03" W, a distance of 152.67 feet to a point; Thence S 41° 32' 21" W, a distance of 128.46 feet to a point; Thence S 24° 52' 06" W, a distance of 293.05 feet to a point; Thence S 14° 25' 23" W, a distance of 309.69 feet to a point; Thence S 38° 08' 40" W, a distance of 319.14 feet to a point; Thence S 61° 10' 40" W, a distance of 153.45 feet to a point;

Thence S 72' 25' 30" W, a distance of 148.60 feet to a point on the Stone Dam Parcel, so called;

Thence S 2° 08' 12" E by and along said Stone Dam Parcel, a distance of 4.61 feet to an angle point in said line; Thence S 61° 53' 43" W by and along said Stone Dam Parcel, a distance of 145.68 feet to an angle point in said line; Thence S 76° 10' 55" W by and along said Stone Dam Parcel, a distance of 118.06 feet to an angle point in said line;

Thence N 82° 02' 56" W by and along said Stone Dam Parcel, a distance of 54.14 feet to its intersection with Easement Area 4, so called;

Thence S 72° 25' 30" W, a distance of 78.92 feet to a point; Thence N 69° 39' 41" W, a distance of 160.69 feet to a point; Thence N 64° 32' 46" W, a distance of 742.30 feet to a point;

Thence N 66° 39' 15" W, a distance of 74.36 feet to a point on the Stone Dam Parcel, so called;

Thence S 75° 45' 01" W by and along said Stone Dam Parcel, a distance of 983.20 feet to an angle point in said line;

Thence N 82° 35' 20" W by and along said Stone Dam Parcel, a distance of 16.89 feet to its intersection with Easement Area 4, so called;

Thence S 63° 57' 44" W, a distance of 40.87 feet to a point; Thence S 89° 04' 15" W, a distance of 104.50 feet to a point;

Thence N 74° 20' 20" W, a distance of 64.29 feet to the southwesterly end of said Easement Area 4;

Thence S 56° 38' 27" W, a distance of 53 feet, more or less, to the thread of the West Branch of the Penobscot River and the town line between the Town of Millinocket and T3 Indian Purchase;

Thence in a general southeasterly and southerly direction, by and along the thread of said river, a distance of 5900 feet, more or less, to the northerly boundary of the Back Channel Wildlife Parcel, so called;

Thence N 76° 51' 44" E by and along said Back Channel Wildlife Parcel boundary, a distance of 2320 feet, more or less, to an angle point in said line;

Thence S 74° 49' 13" E by and along said Back Channel Wildlife Parcel boundary, a distance of 8390 feet, more or less, to the thread of the West Branch of the Penobscot River and the town line between the Town of Millinocket and T3 Indian Purchase; Thence in a general northeasterly direction, by and along the thread of said river, a distance of 4480 feet, more or less, to its intersection with the southerly boundary of Easement Area 7, so called;

Thence N 50° 32' 17" W by and along said Easement Area 7, a distance of 427 feet, more or less, to an angle point in said line; Thence N 54° 48' 17" W by and along said Easement Area 7, a distance of 3245.39 feet to an angle point in said line;

Thence N 35° 11' 55" E by and along said Easement Area 7, a distance of 252.73 feet to an angle point in said line;

Thence N 54° 48' 05" W by and along said Easement Area 7, a distance of 2125.62 feet to the point of beginning. Easement Area "B" contains 1420 acres, more or less.

Bearings referenced in the above descriptions were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment.

East Millinocket Site

A certain lot or parcel of land with the improvements thereon, situate in the Town of East Millinocket, County of Penobscot, State of Maine, more particularly described as follows:

BEGINNING at an iron rod set at the intersection of the East Millinocket-Medway Town line with the southwesterly line of Bangor & Aroostook Railroad as said railroad is described in a deed recorded in Penobscot County Registry of Deeds, Volume 770, Page 300, which point of intersection is further identified with reference to the Maine State Coordinate System of 1927 (East Zone) as x=483,929.56, y=650,820.53;

thence North 58°18'13" West by and along the line of said Railroad, a distance of 708.31 feet to a point of curve; thence northwesterly by and along the line of said Railroad following a curve to the right with a radius of 1,959.58 feet, an arc distance of 817.85 feet to a point of tangency;

thence North 34°23'16" West by and along the line of said Railroad, a distance of 267.95 feet to a point of curve;

thence northwesterly by and along the line of said Railroad following a curve to the left with a radius of 1,860.58 feet, an arc distance of 698.11 feet to a point of tangency;

thence North 55°53'20" West by and along the line of said Railroad a distance of 672.8 feet to a point of curve;

thence westerly by and along the line of said Railroad following a curve to the left with a radius of 905.87 feet, an arc distance of 415.5 feet to a point of tangency;

thence North 82°10'20" West by and along the lien of said Railroad, a distance of 373.33 feet to a point of curve;

thence by and along the line of said Railroad following a curve to the right with a radius of 1482 18 feet an arc distance of 161.60 feet to a point on the easterly line of the rough -parcel of land described in a deed recorded in Penobscot County Registry of Deeds, Volume 770, Page 300;

thence South 20°38'40" West, by and along the boundary of said fourth parcel, a distance of 50.82 feet to a point;

thence following the southerly boundary of said fourth parcel along a curve to the right with a radius of 1,532.69 feet, an arc distance of 300.00 feet to a point;

thence South 25°30'25" West, by and along the boundary of said fourth parcel, a distance of 44.91 feet to a point;

thence North 50°51'05" West, by and along the boundary of said fourth parcel, a distance of 451.0 feet to a point in the southerly line of the Bangor & Aroostook Railroad main line right of way;

thence North 62°43'20" West by and along the southerly line of said Railroad, a distance of 510.0 feet to a point of curve;

thence by and along the line of said Railroad following a curve to the left with a radius of 1,383.19 feet, an arc distance of 438.52 feet to a point of tangency;

thence North 80°53'25" West by and along the southerly line of said railroad, a distance of 1,435.47 feet to a point of curve; thence by and along the line of said Railroad following a curve to the right with a radius of 1,482.19 feet, an arc distance of 709.41 feet to a point of tangency;

thence North 53°27'49" West by and along the line of said Railroad, a distance of 1,381.88 feet to a point of curve;

thence by and along the line of said Railroad following a curve to the left with a radius of 1,860.58 feet, an arc distance of 431.06 feet to a point of tangency;

thence North 66°44'20" West by and along the line of said Railroad, a distance of 952.98 feet to a point of curve;

thence by and along the line of said Railroad following a curve to the left with a radius of 1,8660.58 feet, an arc distance of 214.42 feet to a point of tangency;

thence North 73°20'35" West, by and along the line of said Railroad, a distance of 565.94 feet to a point of curve;

thence by and along the line of said Railroad following a curve to the right with a radius of 1,959.58 feet, an arc distance of 549.96 feet to a point of compound curvature;

thence by and along the line of said Railroad following a curve to the right with a radius of 2,914.43 feet, an arc distance of 466.57 feet to an iron rod set on a line which is generally parallel with and 240.0 feet easterly from the westerly-most face of the power house building on the northerly end of Dolby Dam, so-called;

thence South 30°00'00" West, by and along said lien which is generally parallel to said building face, a distance of 525.0 feet to a n iron rod set on the northerly bank of the West Branch of the Penobscot River;

thence continuing on the same course, South 30°00'00" West, a distance of 175 feet, more or less, to the thread of the West Branch of the Penobscot River as defined by An Act to incorporate the Town of East Millinocket, Chapter 377, Private and Special Laws of the State of Maine (1907);

thence generally southeasterly by and along the thread of said River as defined by the above-referenced Act, a distance of 13,100 feet, more or less, to its intersection with the East Millinocket-Medway Town line;

thence North 0°15'34" East by and along said town line, a distance of 354 feet, more or less, to an iron rod set in place of a broken wood post found on said town line on the northerly bank of said River; thence continuing the same course, North 0°15'34" East, by and along said town line, a distance of 813.22 feet to the point of beginning. For the sole purpose of providing a geometrically precise description and not to be construed as a boundary of the above described tract, the course and distance between the iron rod set on the northerly bank of the West Branch of Penobscot River on the line which is generally parallel to and 240 feet easterly of the westerly face of the Dolby Dam power house and the iron rod set in place of the broken wood post on the East Millinocket- Medway Town line is South 61°56'27" East, a distance 12,609.00 feet.

Bearings referenced herein are oriented to Grid North, Maine State Coordinate System of 1927, East Zone, as determined by a survey of the within described lot by Plisga & Day, Land Surveyors.

Save And Except The Following East Millinocket Easement Exception Areas (A)-(F)

3.13.4 East Millinocket Easement Exception Areas

3.13.4.1 Easement Exception Area "A" (Wastewater Treatment Facility)

East Millinocket Mill

A certain lot or parcel of land being a portion of the East Millinocket mill site in the Town of East Millinocket, County of Penobscot, State of Maine and being more particularly described as follows: That portion of said East Millinocket Mill Site situated easterly of the following described line:

Beginning at a point on the southerly right of way line of the Bangor and Aroostook Railroad, said point having coordinates N: 713,105.65 feet and E: 966,651.66 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence S 33° 55' 21" W, a distance of 1069 feet, more or less, to a point on the northerly shore of the West Branch of the Penobscot River. Easement Exception Area "A" contains 44 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment.

3.13.4.2 Easement Exception Area "B" (Area North and East of Training Center) East Millinocket Mill

A certain lot or parcel of land being a portion of the East Millinocket mill site in the Town of East Millinocket, County of Penobscot,

State of Maine and being more particularly described as follows: Beginning at a point easterly of the training center, so called, having coordinates N: 712,895.05 feet and E: 966,396.13 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence N 70° 57' 58" W, a distance of 557.43 feet to a point; Thence S 18° 54' 26" W, a distance of 154.50 feet to a point; Thence S 83° 28' 30" E, a distance of 217.80 feet to a point; Thence S 22° 13' 33" E, a distance of 119.17 feet to a point;

Thence N 72° 30' 29" E, a distance of 330.85 feet to the point of beginning. Easement Exception Area

"B" contains 1.515 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment

3.13.4.3 Easement Exception Area "C" (Area Southwesterly of Training Center) East Millinocket Mill

A certain lot or parcel of land being a portion of the East Millinocket mill site in the Town of East Millinocket, County of Penobscot, State of Maine and being more particularly described as follows:

Beginning at a point northwesterly of the training center, so called, having coordinates N: 712,890.88 feet and E: 965,789.46 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence S 43° 54' 26" W, a distance of 355.01 feet to a point; Thence S 52° 46' 35" E, a distance of 50.14 feet to a point; Thence N 67° 24' 33" E, a distance of 298.48 feet to a point;

Thence N 22° 00' 46" W, a distance of 184.92 feet to the point of beginning. Easement Exception Area "C" contains 0.836 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment

3.13.4.4 Easement Exception Area "D" (Recycle Fiber Plant and Storage Tanks) East Millinocket Mill

Two certain lots or parcels of land being a portion of the East Millinocket mill site in the Town of East Millinocket, County of Penobscot, State of Maine and being more particularly described as follows:

Beginning at a point on the southerly right of way line of the Bangor and Aroostook Railroad, easterly of a crossing located northwesterly of the Recycle Fiber Plant, so called, said point having coordinates N: 714,482.96 feet and E: 963,621.18 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence S 27° 49' 27" E, a distance of 494.42 feet to a point; Thence S 50° 48' 45" E, a distance of 425.47 feet to a point; Thence S 66° 32' 25" E, a distance of 578.56 feet to a point;

Thence N 88° 51' 50" E, a distance of 514.90 feet to a point westerly of the main mill entrance;

Thence N 32° 24' 38" W, running westerly of said entrance, a distance of 282.10 feet to a point;

Thence N 53° 45' 03" W, a distance of 79.58 feet to a point on said Bangor and Aroostook Railroad right of way; Thence S 20° 39' 06" W by and along said right of way, a distance of 50.82 feet to a point;

Thence in a general westerly direction by and along said right of way on a non-tangent curve to the right with a radius of 1532.69 feet an arc distance of 300.13 feet to a point, said curve having a chord bearing N 70° 10' 25" W a chord distance of 299.65 feet; Thence S 25° 30' 51" W by and along said right of way a distance of 44.91 feet to a point;

Thence N 50' 50' 39" W by and along said right of way, a distance of 461.00 feet to a point;

Thence N 62° 42' 55" W by and along said right of way, a distance 510.00 feet to a point of curvature;

Thence in a general westerly direction by and along said right of way on a tangent curve to the left with a radius of 1383.19 feet an arc distance of 280.73 feet to the point of beginning. The above described parcel contains 11.533 acres, more or less.

ALSO another parcel of land being a portion of the East Millinocket mill site in the Town of East Millinocket, County of Penobscot, State of Maine and being more particularly described as follows:

Beginning at a point on the southerly right of way line of the Bangor and Aroostook Railroad, said point having coordinates N: 713,811.26 feet and E: 965,170.45 feet;

Thence S 53° 59' 21" W, a distance of 34.73 feet to a point easterly of the main mill entrance; Thence S 36° 00' 39" E, running easterly of said entrance, a distance of 319.50 feet to a point; Thence N 51° 31' 13" E, a distance of 157.57 feet to a point; Thence N 33° 43' 40" E, a distance of 156.22 feet to a point on said Bangor and Aroostook Railroad right of way;

Thence N 82° 09' 54" W by and along said right of way, a distance of 373.33 feet to the point of beginning. The above described parcel contains 1.304 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment.

3.13.4.5 Easement Exception Area "E" (Bark Pile)

East Millinocket Mill

A certain lot or parcel of land being a portion of the East Millinocket mill site in the Town of East Millinocket, County of Penobscot, State of Maine and being more particularly described as follows:

Beginning at a point on the southerly side of a road leading from said mill to the Dolby Dam, so called, said point having coordinates N: 714,810.51 feet and E: 961,249.41 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence S 71° 45' 14" E, southerly of said road, a distance of 609.87 feet to a point; Thence S 74° 47' 02" E, southerly of said road, a distance of 492.66 feet to a point; Thence S 88° 24' 01" E, southerly of said road, a distance of 566.64 feet to a point; Thence S 63° 33' 30" E, southerly of said road, a distance of 331.46 feet to a point; Thence S 29° 51' 22" E, a distance of 73.64 feet to a point;

Thence S 19° 57' 30" W, a distance of 811.42 feet to a point; Thence S 10° 05' 41" E, a distance of 218.68 feet to a point; Thence S 42° 58' 36" E, a distance of 236.76 feet to a point;

Thence S 6° 55' 02" W, a distance of 181.02 feet to a point on the northerly shore of the West Branch of the Penobscot River; Thence in a general northwesterly direction, by and along said shoreline, a distance of 2640 feet, more or less, to a point on said shoreline, said point being located N 61° 19' 31" W, a distance of 2320.29 feet from the last described point;

Thence N 13° 15' 42" E, a distance of 786.05 feet to the point of beginning. Easement Exception Area "E" contains 48 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated

MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment.

3.13.4.5 Easement Exception Area "F" (Near Dolby Dam)

East Millinocket Mill

A certain lot or parcel of land being a portion of the East Millinocket mill site in the Town of East Millinocket, County of Penobscot, State of Maine and being more particularly described as follows: Beginning at an iron rod found on the southerly right of way line of the Bangor and Aroostook Railroad leading from said mill past the Dolby Dam, so called, said point having coordinates N: 717,165.86 feet and E: 957,447.58 feet, said coordinate system is referenced to the Maine State Coordinate System, East Zone, said coordinate system is based on the North American Datum of 1983 (NAD 83);

Thence S 30° 00' 26" W, a distance of 224.00 feet to a point;

Thence S 52° 02' 22" E, running northerly of a road leading from the Mill Site to Dolby Dam, a distance of 253.28 feet to a point; Thence S 33° 39' 28" E, running northerly of said road, a distance of 472.18 feet to a point;

Thence S 60° 15' 46" E, running northerly of said road, a distance of 1352.67 feet to a point;

Thence N 87° 54' 29" E, running northerly of said road, a distance of 426.47 feet to a point westerly of a spur line from said Bangor and Aroostook Railroad;

Thence N 71° 58' 57" E, running westerly of said spur line, a distance of 557.25 feet to a point;

Thence N 4° 16' 32" E, a distance of 102.45 feet to a point on the southerly right of way line of said Bangor and Aroostook Railroad;

Thence N 66° 43' 54" W by and along said right of way, a distance of 952.98 feet to a point of curvature;

Thence by and along said right of way on a tangent curve to the left with a radius of 1860.58 feet, an arc distance of 214.42 feet to a point of tangency;

Thence N 73° 20' 09" W by and along said right of way, a distance of 565.94 feet to a point of curvature;

Thence by and along said right of way on a tangent curve to the right with a radius of 1959.58 feet, an arc distance of 549.96 feet to a point of compound curvature;

Thence by and along said right of way on a curve to the right with a radius of 2914.43 feet, an arc distance of 466.57 feet to the point of beginning. Easement Exception Area "F" contains 27.850 acres, more or less.

Bearings referenced in the above description were computed from a traverse established for a survey of the above-described parcel that was oriented to grid north, Maine State Plane Coordinate System, East Zone, NAD83. Distances referenced herein are grid distances. The connection to the Maine State Plane Coordinate System East Zone, NAD83, is based upon a control monument designated MEDWAY RM 2 which has published coordinates of N: 706,894.72 feet and E: 977,164.59 feet which are based on the 1992 readjustment.

**18. RELEASE OF EASEMENTS**

Also, all of GLHA's right, title and interest in and to the following grants:

a. Deed, Easement Deed and Agreement from John M. Webber, et al., dated December 27, 2001 and recorded in Penobscot County Registry of Deeds in Book 8031, Page 39;

b. Deed, Easement Deed and Agreement from John M. Webber, et al., to Maine Timberlands Company, Great Northern Paper, Inc. and GNE, LLC dated December 27, 2001 and recorded in Piscataquis County Registry of Deeds in Book 1360, Page 79; and

c. Deed, Easement Deed and Agreement from Barbara A. Cassidy, et al., to Maine Timberlands Company, Great Northern Paper, Inc. and GNE, LLC dated December 27, 2001 and recorded in Piscataquis County Registry of Deeds in Book 1360, Page 111.

d. Blanket cross easement deed and agreement from GNP to GNE dated January 31, 2002 and recorded in the Penobscot County Registry of Deeds in Book 8064, Page 241.

**19. APPURTENANT EASEMENT PARCELS**

Appurtenant Drainage Easement (3.10.5 Substation No. 4 Millinocket Mill)

Together with the rights and easements as set forth in an Easement Deed from Our Katahdin to Great Lakes Hydro America, LLC dated March 10, 2020 and recorded in the Penobscot County Registry of Deeds in Book 15467, Page 186.

Appurtenant Drainage Easement (3.14.2 New Substation)

Together with the rights and easements as set forth in an Easement Deed from Katahdin Forest Management, LLC dated March 11, 2020 and recorded in the Penobscot County Registry of Deeds in Book 15468, Page 26.

Schedule B

Mortgage (ME) of Great Lakes Hydro America, LLC

Permitted Exceptions

Those exceptions enumerated on Schedule B of Fidelity National Title Insurance Company Loan Policy No. ME21031756 issued to the Mortgagee other than (i) the exception relating to the Lien for real estate taxes which become due after the date hereof, to the extent the same are not paid by the Mortgagor when due; (ii) any change in the state of facts affecting the Mortgaged Property that would be disclosed by an accurate, current survey from the state of facts disclosed on the surveys described in Exhibit B-1 to said Policy, other than such changes which do not individually or in the aggregate with all other Permitted Liens materially detract from the value of the Mortgaged Property affected thereby or materially interfere with the use of the Mortgaged Property in the ordinary conduct of business; (iii) exception nos. 6, 151b, 166b, 205, 214, 226b, 238, 255 and 264b; and (iv) except to the extent the rights described therein do not materially and adversely affect the use and operation of the Mortgaged Property as currently improved, used, operated and maintained, exception no. 8.

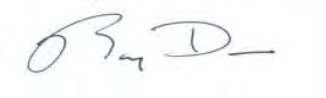
Washington, DC 20426

**Subject:** **Ripogenus Hydroelectric Project (FERC No. 2572-133)**
**Penobscot Mills Hydroelectric Project (FERC No. 2458-247)**
**Updated Study Report Meeting Notification and Waiver Request**

Dear Acting Secretary Reese:

Great Lakes Hydro America, LLC (GLHA), Licensee of the Ripogenus Hydroelectric Project (No. 2572) and the Penobscot Mills Hydroelectric Project (No. 2458) (collectively referred to as the "Projects"), herein files notification of the dates and location for the upcoming Updated Study Report (USR) Meeting. In addition, GLHA requests a waiver from the applicable portions of 18 CFR §5.15(f) in order to avoid a scheduling conflict for USR Meeting participants.

Consistent with the Federal Energy Regulatory Commission's (FERC) Integrated Licensing Process (ILP), the USR is due to be filed with FERC by April 21, 2024. In accordance with 18 CFR §5.15(f), GLHA is required to hold the USR Meeting within 15 days of the filing of the USR (by May 6, 2024). GLHA has been made aware that the 2024 International Symposium on Ecohydraulics and Fish Passage Conference will be held in Quebec City, Canada from May 5 to 9, 2024. To avoid conflict with the conference, as well as the filing of the Projects' Draft License Application by May 3, 2024, GLHA is proposing to hold the USR Meeting on May 15 and 16, 2024 and subsequently file the USR Meeting Summary by May 31, 2024.



Consistent with the recent Operations Model Workshop hosted by GLHA in support of the relicensing, the USR Meeting will be held in person in Bangor, ME, and an option for virtual participation will be provided. GLHA will communicate the specific meeting location and agenda for the May 15-16, 2024 USR Meeting in the filing of the USR. In order to hold the USR Meeting on May 15 and 16 and file the USR Meeting Summary by May 31, GLHA is requesting a waiver from the applicable portions of 18 CFR §5.15(f).

On March 12, 2024, GLHA notified (via email) interested stakeholders of this information and requested comments be provided by March 20, 2024. One comment was received by Mr. Michael Hudson indicating no issue with the proposed schedule. Copies of this correspondence are enclosed.

| **Subject:** | Ripogenus & Penobscot Mills Projects Relicensing - Notice of USR Meeting Date |
| **Date:** | Tuesday, March 12, 2024 12:10:00 PM |

Dear Stakeholder:

Great Lakes Hydro America, LLC (GLHA), Licensee for the Ripogenus and Penobscot Mills Hydroelectric Projects, is contacting you in regards to the timing and location of the upcoming Updated Study Report (USR) Meeting required by 18 CFR 5.15(f) for the FERC Relicensing of the Projects. **Please reply with any comments you have on this information within 7 days of receipt of this email (by March 20, 2024).** Subsequently, GLHA will file this information/request and copies of stakeholder correspondence with the Federal Energy Regulatory Commission (FERC) to obtain approval of the proposed schedule modification described below.

Consistent with FERC's Integrated Licensing Process (ILP), GLHA will be filing the USR by April 21, 2024*. In accordance with 18 CFR § 5.15(f), GLHA is required to hold the USR Meeting within 15 days of the filing of the USR (by May 6, 2024). GLHA has been made aware that the 2024 International Symposium on Ecohydraulics and Fish Passage Conference will be held in Quebec City, Canada from May 5 to 9, 2024, which will be attended by numerous stakeholders and GLHA team members. To avoid conflict with the fish passage conference, as well as the filing of the Projects' Draft License Application by May 3, 2024, GLHA is proposing to hold the USR Meeting on May 15 and 16, 2024 and subsequently file the USR Meeting Summary by May 31, 2024. The USR Meeting will be held in-person in Bangor, ME, and an option for virtual participation will be provided.

Below is a table providing the currently required relicensing schedule and GLHA's proposed schedule modification.

**Please reply with any comments you have on this information within 7 days of receipt of this email (by March 20, 2024).**

Thank you for your interest and participation in the ongoing FERC relicensing of the Ripogenus and Penobscot Mills Projects.

Hi Cate,

This schedule seems fine to me. I plan on attending in person on May 15th and 16th.

Thanks,
Mike Hudson

OFFICE OF ENERGY PROJECTS

Project Nos. 2572-133 and 2458-247 – Maine
Ripogenus Hydroelectric Project
Penobscot Mills Hydroelectric Project
Great Lakes Hydro America, LLC

**VIA FERC Service**

Randall Dorman, Brookfield Renewable
Great Lakes Hydro America, LLC
1024 Central Street
Millinocket, ME 04462

**Reference: Extension of Time to Hold Updated Study Report Meeting and File USR Meeting Summary**

Dear Mr. Dorman:

On March 25, 2024, Great Lakes Hydro America, LLC (GLHA) filed a request to modify the Process Plan and Schedule for relicensing the Ripogenus (P-2572) and Penobscot Mills (P-2458) Projects (collectively, the Projects). The current schedule includes a deadline of April 21, 2024, for filing the Updated Study Report (USR). Based on this USR filing date, the deadline for holding the USR meeting is May 6, 2024.[1] GLHA states that holding the USR meeting during the week of May 6 would conflict with the 2024 *Ecohydraulics and Fish Passage Conference* held in Quebec City, Canada from May 5 to 9, 2024, which multiple USR participants are planning to attend. Therefore, to avoid a scheduling conflict for USR meeting participants, GLHA requests to hold the USR meeting May 15 and 16, 2024.

GLHA's March 25, 2024 filing provides documentation that stakeholders were notified of GLHA's proposal to modify the relicensing schedule. GLHA received no objections to its proposed schedule change. Moreover, GLHA's proposed modification to the schedule would result in no reduction in stakeholder opportunity for review and comment on the USR because the USR would be filed on time by April 21, 2024, and the USR comments would continue to be due on June 21, 2024. The schedule, thereafter, would remain unchanged. Therefore, to accommodate scheduling conflicts for USR

[1] *See* 18 CFR § 5.15(f).

meeting participants, the process plan and schedule for the Projects is modified as follows:

- Deadline for the USR meeting is May 16, 2024.
- Deadline for the USR meeting summary is May 31, 2024.

If you have questions regarding this matter, you may contact Allan Creamer at (202) 502-8365, or allan.creamer@ferc.gov.

Sincerely,

NICHOLAS JAYJACK

Subject: Comments on P-2572-133 flow modeling requests

Dear Acting Secretary Reese:

I have read the various flow modeling requests submitted by agencies and stakeholders during the past few weeks. I offer the following comments based on my understanding of the elements under review specific to the West Branch Penobscot River downstream from Ripogenus Dam, and a qualitatively similar (though geographically different) circumstance I dealt with as a senior fisheries biologist for more than 30 years.

1. First and foremost I believe the system should be managed to provide the best possible and practical ecological conditions for the aquatic and associated communities affected by "upstream" lake levels and discharges from McKay Station. Robust fish and aquatic communities will benefit a diverse food chain plus an array of water based recreational users as well as lake-shore property owners.

2. In my view the West Branch Penobscot River should not be managed as if it were an industrial conveyance. I believe all aquatic ecologists and biologists would prefer flow regimes that do not experience intra-day fluctuations of 100% or more in contrast to what sometimes, and all too frequently occurs. For example, flow data for July and August 2022 show that on about 2/3 of the days flows from McKay Station increased by 800-1,600 cfs, with attendant flow decreases of similar magnitude. Under these circumstances the aquatic community, particularly macroinvertebrates, was likely altered favoring species tolerant of drastic flow changes.

3.Beyond the absolute magnitude of intra-day flow fluctuations, flow records show that many of these increases and decreases were achieved within 1 hour. These "knife-edge" changes bear little resemblance to natural hydrologic conditions. I recognize this is a regulated system, but such abrupt changes in flow may or may not have been fully anticipated in prior licensing deliberations. In fact, the existing license was based on and issued when stable flows were required for paper making production. Elsewhere for example, sudden flow decreases occurred on the West Branch Delaware River when the so-called Office of the Delaware River Master no longer directed very large releases (primarily from Cannonsville Reservoir) to meet mandated flow targets downstream in the Delaware River at Montague and Trenton, New Jersey. Stranding of aquatic organisms occurred when large releases were abruptly curtailed, public awareness of this was heightened, and eventually the relevant parties acknowledged the need for and adopted ramping rate protocols (see Flexible Flow Management Program at the Delaware River Basin Commission and US Geological Survey

websites listed below). Stable flows would however limit the need for ramping rate protocols to extraordinary circumstances rather than daily occurrences.

4.The Flexible Flow Management Program utilizes data inputs including reservoir storage levels and projected hydrologic conditions to meet multiple objectives, first and foremost being the ability to reliably provide drinking water to millions of people. High quality fishery resources were facilitated by cold water releases from the Delaware system reservoirs, similar to what occurs in the West Branch Penobscot River. Efforts to secure reservoir releases, hence flow regimes, that enhanced habitat and thermal conditions for cold water fishes in the Delaware River system spanned decades. These efforts involved extensive computer modeling and negotiation, and had to balance the diverse needs of the parties to the underlying agreements- no small task. Obviously New York is not Maine; but, from a regulatory (or licensing) perspective multiple and potentially competing interests are involved in the two situations described above. Carefully managed lake levels and relatively stable, robust flow through McKay Station would address the seasonal needs of the whitewater rafting/boating interests, foster improved salmon populations and angling opportunities, protect lake shore property owners, while also supplying electricity to consumers. All of the preceding interests would provide economic benefits locally and more broadly.

5.A number of agencies, organized stakeholder organizations, and individuals forwarded modeling requests focused on more gradual draw-downs of Ripogenus impoundments and constant flows through McKay Station. I am very hopeful that modeling results will point to management recipes that avoid large short-term flow changes, that will be attainable (practical) under “normal” hydrologic conditions, and will be at least acceptable to key interests when hydrologic conditions are less favorable.

Thank you for the opportunity to comment on this important matter.

***Via eFiling***

Debbie-Anne A. Reese, Acting Secretary
Federal Energy Regulatory Commission
888 First Street, NE
Washington, DC 20426

**Subject:** **Ripogenus Hydroelectric Project (FERC No. 2572-133)**
**Penobscot Mills Hydroelectric Project (FERC No. 2458-247)**
**Updated Study Report**

Dear Acting Secretary Reese:

Great Lakes Hydro America, LLC (GLHA), the Licensee of the Ripogenus Hydroelectric Project (FERC No. 2572) and the Penobscot Mills Hydroelectric Project (FERC No. 2458) (collectively referred to as the "Projects"), herein files with the Federal Energy Regulatory Commission (FERC) the Updated Study Report (USR) for the relicensing of the Projects. The Projects are located on the West Branch Penobscot River and Millinocket Stream in Piscataquis and Penobscot counties, Maine.

On June 11, 2021, GLHA filed the Notices of Intent (NOIs) and a Pre-Application Document (PAD), which initiated the formal relicensing proceeding to obtain two separate new licenses for the continued operation of the Projects through FERC's Integrated Licensing Process (ILP). On March 23, 2022, GLHA filed the Revised Study Plan (RSP), and on May 13, 2022, FERC issued the Study Plan Determination (SPD).

Pursuant to the RSP, and as approved and modified by FERC's SPD, GLHA performed study activities in 2022-2023. Available results from the study activities were provided in the Initial Study Report (ISR), which was filed with FERC on April 24, 2023. GLHA performed additional study activities in 2023-2024, for which available results are provided in the enclosed USR pursuant to 18 CFR §5.15(f).

GLHA will conduct a USR Meeting to discuss the available study results. Given the number of studies to be presented during the USR Meeting, the meeting will be held over two days on May 15 and 16, 2024. The meeting will start each day at 9:00 AM and is anticipated to end each day at 5:00 PM. **The meeting will be held *in-person* at the Richard E. Dyke Center for Family Business at Husson University, located at One College Circle in Bangor, Maine 04401**. Although GLHA strongly encourages in-person participation, a virtual option will also be provided.

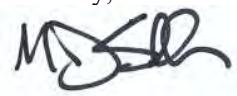
In order to plan accordingly, GLHA respectfully requests that agencies or stakeholders who plan on attending the meeting to RSVP (indicating either in-person or virtual attendance) by contacting Cate Russell at Cate.Russell@hdrinc.com or by phone at (207) 239-3792 on or before May 8, 2024.

**GREAT LAKES HYDRO AMERICA, LLC**
1024 Central Street, Millinocket, ME 04462
T +1 207.723.4341 F +1 207.723.4597 brookfieldrenewableUS.com

The agenda for the USR Meeting is included within the USR and is provided below:

| Date/Time[1] | Meeting Agenda |
|---|---|
| **Wednesday, May 15, 2024** | |
| Morning (9:00 – 12:00) | Welcome, Safety, Purpose of Meeting, Introductions, Relicensing Schedule |
| | Projects Overview |
| | Operations Model Study Update (model run results to be provided at a later date) |
| | USGS Gage Feasibility Study |
| | Water Quality Study (Riverine Water Temperature and Dissolved Oxygen Study, Benthic Macroinvertebrate Assessment) |
| 12:00 – 1:00 | Lunch break (on your own) |
| Afternoon (1:00 – 5:00) | Angler Flow Evaluation Study in West Branch Downstream of Stone Dam |
| | North Twin Impoundment Tributary Access Survey |
| | Upstream Eel Passage Assessment Study |
| | Recreation Study |
| | Whitewater Boating Assessment Study |
| **Thursday, May 16, 2024** | |
| Morning (9:00 – 12:00) | Welcome, Safety, Purpose of Meeting, Introductions, Relicensing Schedule |
| | Projects Overview |
| | Aesthetics Study |
| | Terrestrial, Wildlife, and Botanical Resources Study |
| | Riparian and Littoral Habitat Assessment Study |
| | Marsh Bird Survey Study |
| 12:00 – 1:00 | Lunch break (on your own) |
| Afternoon (1:00 – 5:00) | Umbazooksus Lake Mitigation Evaluation Study |
| | Furbearer Survey Study |
| | Wood Turtle Habitat and Presence Study |
| | Environmental Justice Study |

1. GLHA anticipates presenting the studies consistent with times identified in the agenda; however, the agenda should be used as a general guide. Based on the duration of the study presentations, the schedule may be modified (e.g., a select number of studies planned for the afternoon may be presented prior to the scheduled lunch break). GLHA encourages stakeholders to participate for the entirety of the meeting or given day in order to not miss a study of interest.



Concurrent with this filing, GLHA is providing a copy of this letter to all parties listed in the attached distribution list. Parties can download an electric copy of the public portions of the USR from FERC's eLibrary system at https://www.ferc.gov/ferc-online/elibrary by conducting a search using the docket numbers P-2458 and/or P-2572.

Considering that the USR provides a detailed description of the overall progress of the required studies, a separate Study Progress Report will not be filed on May 1, 2024, as the information would be duplicative of this filing. Pursuant to the ILP schedule, GLHA will file the next Study Progress Report with FERC on or about August 1, 2024.

Debbie-Anne Reese, Secretary May 1, 2024
Federal Energy Regulatory Commission
888 First Street, N.E., Room 1A
Washington, DC 20426 RE

**Subject:** Ripogenus Project (P-2572) Comments and Study Suggestions on the Proposed Ramping Study Plan Issued Via Email on April 24, 2024.

Dear Secretary Reese: Via Electronic Filing

The proposed Ramping Study Plan (RSP) sent by Jessie Wechsler in an April 24, 2024, was recently forwarded to me as I was not on the distribution list. Based on my 25 plus years of on-site experience as then Great Northen Papers (GNP) fisheries biologist, I am offering comments and suggestions.

First and foremost, the 1991 FERC License Application clearly states that Alevin (salmon fry as they leave from the egg pit) emerge from the redd sometime between June 5 and June 10th. These 25 mm "fry" are extremely vulnerable to flow changes. I find it incredibly reckless to propose a flow study that is designed to protect salmonid resources during the early weeks of fry growth and dispersal.

Errata: The Licensee continues to misrepresent critical facts. There is NO Landlock salmon (salmon) spawning in streams tributary to the West Branch of the Penobscot below McKay Station. In fact, only Nesowadenhunk Stream was a candidate stream during GNP 1980s studies, and while salmon routinely sought "summer" refuge in the stream's outflow, no signs of salmon spawning were observed in several searches.

Additionally, the RSP referenced that a "one hourly flow change of greater than 25% occurred only 14.9% of the time between 2014 and 2022." While probably true, the statement is misleading. The analysis included hydraulic condition e.g., reduced storage, spill events where any shift of flow would have either been impractical or impossible. Low impoundment elevations, subsequent low flow conditions, and spill events are not relevant to the present study plan and ramping issues.

Lastly, I disagree that "operations data filed with the ISR meeting summary" show that typical operation consists of a two unit mode. Previously provided figures and tables simply refute that statement.

As presented, the RSP lacks the timing, sampling sites and collection methods needed to provide FERC staff with a robust data set.

Timing: June sampling is during both the peak of fish and aquatic communities activity as well as angler activity. As noted above, newly emerged salmonid fry are vulnerable to flow change. Thus, the risk is not only to the aquatic environment, but each event is likely to disrupt several days of angler activity ( boating is also a consideration). During the historic GNP July 4th and Labor Day mill "shutdowns" it took several days for "fishing" to return to "normal". While the proposed ramping study is shorter in duration, why risk the loss of 200 angler days of what was historically (there is no current creel survey information available), quality fishing?

Therefore, I suggest late September or early October as a RSP study window of opportunity. I say this knowing that such a delay will grant the Licensee further delay in the issuance of a new license. However, aquatic resources must be a priority.

The RSP is silent on the starting time of flow shifts. For reasons explained below, I suggest that trial flows begin mid-morning after peak insect drift and end late afternoon before peak insect drift.

Aquatic insects provide critical forage for juvenile salmon and as maintenance food items to adult salmon during summer periods. The RSP addresses aquatic communities only in terms of mortalities. They then continue by quoting Smokorowski et al (2011) implying that they are familiar with work done by Smokorowki, Marty and others on the Magpie and Batchawana Rivers. Impressive work, sponsored by the Licensee.

The Licensee correctly identified Smokorowski and other's work but failed to include their reports of increased aquatic communities "drift" and population shifts resulting from unramped peaking. The literature is replete with publications concerning aquatic insect drift (or movement) caused by peaking as well as emergency outages. This phenomenon should be addressed in the RSP. My filing of February 14, 2022 (accession No. -20220214-5027) provided details of impacts resulting from unramped peaking and regulated flows and

an accompanying list of peer reviewed references. I see no need to repeat well-known science.

I suggest the RSP be modified and include aquatic community drift before, during, and after flow changes. For all sample sites, duplicate metered(,) drift nets should be set in a fixed position for two hour periods just prior to flow increases; emptied and set again immediately as flow rises; removed before a flow change, and then reset for a two hour period after flows are increased. As mentioned above, to avoid bias caused by the sometimes -crepuscular/diel aquatic insect behavior, sampling should be mid-day.

As designed, the RSP includes only about 10 percent of critical salmonid spawning areas (Vol IX 1991 Ripogenus Project Application Table 16) and perhaps a third of salmonid nursey and aquatic insect habitat. This oversight can easily be corrected by including the two flow sensitive areas (either the gravel bar above Line Pool or the relatively long gravel area beginning at the end of Line Pool ) immediately above Nesowadenhunk Deadwater“ and removing the “below Big Eddy Site”. This minor change will include the “Horserace”, prime nursery habitat, and the major spawning areas, Little A Deadwater and the two combined “head of Nesowadenhunk Deadwater” sites. The third major spawning area is the pool immediately below Abol Bridge and is downstream of the reaches of apparent study interest although it is thought to be critical to the North Twin Impoundment salmon population.

Please ensure that the 2024 year class of salmon receives the needed flow protection and that the impact of sudden flow change on aquatic insects is considered. Thank you for the opportunity to comment and offer suggestions based on my 25 years of experience as the onsite-fisheries biologist.

Washington, DC 20426

**Subject:** **Ripogenus Hydroelectric Project (FERC No. 2572-133)**
**Penobscot Mills Hydroelectric Project (FERC No. 2458-247)**
**Draft License Application**

Dear Acting Secretary Reese:

Great Lakes Hydro America, LLC (GLHA), the Licensee of the Ripogenus Hydroelectric Project (FERC No. 2572) and the Penobscot Mills Hydroelectric Project (FERC No. 2458) (collectively referred to as the "Projects"), herein files with the Federal Energy Regulatory Commission ("FERC" or "Commission") the Draft License Application (DLA) for the relicensing of the Projects. The Projects are located on the West Branch Penobscot River and Millinocket Stream in Piscataquis and Penobscot counties, Maine.

Each Project's current FERC license was issued on October 22, 1996, and expires on September 30, 2026. On June 11, 2021, GLHA filed the Notices of Intent and a Pre-Application Document, which initiated the formal relicensing proceeding using FERC's Integrated Licensing Process to obtain two separate new licenses for the continued operation of the Projects.

In accordance with 18 Code of Federal Regulations (CFR) §5.16, GLHA is herein filing the DLA with FERC for the Projects. Pursuant to 18 CFR §5.16(e), stakeholders may file comments with FERC on the DLA within 90 days of the DLA filing date (by August 1, 2024).

Concurrent with this filing, GLHA is providing a copy of this letter to all parties listed in the attached distribution list. Parties can download an electric copy of the public portions of the DLA from FERC's eLibrary system at https://www.ferc.gov/ferc-online/elibrary by conducting a search using the docket numbers P-2458 and/or P-2572.

Federal Energy Regulatory Commission
888 First Street, NE
Washington, DC 20426

**Subject:** **Ripogenus Hydroelectric Project (FERC No. 2572-133)**
**Penobscot Mills Hydroelectric Project (FERC No. 2458-247)**
**Response to Stakeholder-Requested Alternative Operating Scenarios**

Dear Acting Secretary Reese:

Great Lakes Hydro America, LLC (GLHA), Licensee of the Ripogenus Hydroelectric Project (No. 2572) and the Penobscot Mills Hydroelectric Project (No. 2458) (collectively referred to as the "Projects"), herein provides responses to the alternative operating scenarios requested by stakeholders to be evaluated using the operations model developed for the Projects.

**Background**

On June 11, 2021, GLHA filed the Notices of Intent and a Pre-Application Document (PAD), which initiated the formal relicensing proceeding to obtain two separate new licenses for the continued operation of the Projects through FERC's Integrated Licensing Process (ILP). On March 23, 2022, GLHA filed the Revised Study Plan (RSP), and on May 13, 2022, FERC issued the Study Plan Determination (SPD). Pursuant to the RSP and as approved and modified by FERC's SPD, GLHA performed first season study activities in 2022 with available results provided in the Initial Study Report (ISR) filed with FERC on April 24, 2023. Subsequent to filing the ISR, stakeholders filed comments on the ISR and new study requests, and on September 19, 2023, FERC issued the second SPD.

Pursuant to the RSP and FERC-issued SPDs, GLHA developed an operations model designed to evaluate alternative operating scenarios in support of the ongoing relicensing of the Projects. During the May 2, 2023, ISR Meeting, GLHA described how the operations model was developed, calibrated, and verified. Building off the information presented during the ISR Meeting, GLHA hosted a 2-day workshop on January 31 and February 1, 2024, to further explain the model inputs, calibration, and verification as well as the process for requesting alternative operating scenarios to potentially be evaluated using the operations model. On February 5, 2024, GLHA filed with FERC a copy of the information presented and discussed during the workshop and requested that stakeholders submit their alternative operating scenario requests by March 6, 2024.

**Alternative Operating Scenario Requests**

Stakeholders filed requests for alternative operating scenarios to be evaluated using the operations model – resulting in a total of 36 unique model run requests. GLHA reviewed the stakeholder requests and herein provides a summary of the requested alternative operating scenarios, a summary of the scenarios that will be evaluated

GREAT LAKES HYDRO AMERICA, LLC
1024 Central Street, Millinocket, ME 04462
T +1 207.723.4341 F +1 207.723.4597 brookfieldrenewableUS.com

using the operations model, and GLHA's assumptions (where applicable) related to model coding associated with the requested scenarios.

As discussed with stakeholders during the Operations Model Workshop, the operations model and its use for evaluating alternative operating scenarios at this time is to weigh the ***relative*** impact or sensitivity and response of the system to modified operating scenarios. In other words, use of the operations model tool at this time is to identify the "book ends" of the system (i.e., operations that are feasible or not feasible based on water availability) in support of identifying the operating scenario to be implemented during the new license term.

As presented in the attachment, GLHA has identified 15 of the 36 requested scenarios to be evaluated through the operations model. Based on a review of the requested scenarios, GLHA determined that certain scenarios were either too similar and would not provide discernible differences in results or were considered inconsistent with the basic design of the store-and-release system and its established water use goals. Additionally, the requested scenarios specific to providing flows from Ripogenus Dam and Stone Dam would primarily be limited to a reduction in power generation and are expected to have little impact on the water availability in the system; therefore, GLHA does not believe that evaluating these requested scenarios via the operations model will provide informative model results. In lieu of performing model runs limited to generation impacts, the impacts associated with the various requested flow scenarios downstream of the Ripogenus and Stone dams can be determined via a simplified calculation.

**Information Related to Vertical Datum**

In his letter dated March 13, 2024, Mr. Ben Worrell of Rudman Winchell indicated that historical records note the normal full pond elevation at the Ripogenus impoundment should be 944 feet; however, Mr. Worrell does not indicate the vertical datum associated with this information.

By way of background, impoundment elevation is based on vertical datum for which there are various sources of vertical datum that determine elevation. Per a review of historical records in relation to vertical datums, GLHA determined that the elevations referenced in the historical records noted in Mr. Worrell's letter were in relation to Great North Paper Company (GNP)-established (local) vertical datum. However, elevations associated with Project facilities as noted in the existing FERC license and other Project-related documents filed with FERC are in relation to National Geodetic Vertical Datum of 1929 (NGVD 29), which is often referenced as "USGS Datum," because it refers to the datum used by the U.S. Geological Survey at that time. Enclosed is a table that provides the conversion of GNP vertical datum to USGS vertical datum (defined as NGVD 1929). Based on this information, the normal full pond elevation at the Ripogenus impoundment is and has been elevation 941.59 feet NGVD 29, which is equivalent to elevation 944 feet GNP. Therefore, GLHA disagrees with the assertions made by Mr. Worrell in his March 13, 2024, letter regarding the historical normal full pond elevation.

**Information Related to Normal Full Pond Elevation**

Numerous stakeholders requested alternative operating scenarios that would fill and maintain the Ripogenus impoundment elevation at or above 941.59 feet NGVD 29. Although normal full pond elevation at Ripogenus impoundment is defined as 941.59 feet NGVD 29, GLHA targets an operating full pond elevation of 939.00 feet to allow sufficient freeboard to avoid spill events and to limit the potential for downstream flooding and the activation of the Project's Emergency Action Plan. Therefore, for modeling purposes, GLHA will continue to use 939.00 feet as the target full pond elevation of the impoundment.

**Schedule for Operations Model Run Results**

GLHA will perform the operation model runs for the identified alternative operating scenarios, as further described in the enclosed information. GLHA anticipates completion of the model runs in June 2024 with results filed with FERC by June 28, 2024. Subsequent to filing model run results with FERC, GLHA will coordinate a virtual meeting with interested stakeholders to review the model run results.

Concurrent with this filing, GLHA is providing a copy of this letter to all parties listed in the enclosed distribution list. Parties can download an electric copy of this filing from FERC's eLibrary system at https://www.ferc.gov/ferc-online/elibrary by conducting a search using the docket numbers P-2458 and/or P-2572.

If you have any questions regarding this information, please contact me by email at michael.scarzello@brookfieldrenewable.com.

Sincerely,

Michael Scarzello, Licensing Manager

Debbie-Anne A. Reese, Acting Secretary
Federal Energy Regulatory Commission
888 First Street, NE
Washington, DC 20426

**Subject:** **Ripogenus Hydroelectric Project (FERC No. 2572-133)**
**Penobscot Mills Hydroelectric Project (FERC No. 2458-247)**
**Supplement to Updated Study Report**

Dear Acting Secretary Reese:

On April 22, 2024, Great Lakes Hydro America, LLC (GLHA), Licensee of the Ripogenus Hydroelectric Project (No. 2572) and the Penobscot Mills Hydroelectric Project (No. 2458) (collectively referred to as the "Projects"), filed the Updated Study Report (USR) for the Projects[1]. In support of the ongoing relicensing process, GLHA is filing this supplement to the April 22nd filing.

In the Federal Energy Regulatory Commission's ("FERC" or "Commission") September 19, 2023, second Study Plan Determination (SPD)[2], FERC included the following language regarding a new McKay Station Fish Stranding Mitigation Study.

> The first study season findings of the Fish Stranding Study highlight the potential need to mitigate the fish and invertebrate stranding and mortality described above [section 5.15(e)(2)]. Therefore, we recommend that GLHA conduct a second study season McKay Station Fish Stranding Mitigation Study to identify and assess measures to minimize the level of fish and macroinvertebrate stranding and mortality that occurs when McKay Station trips offline. GLHA would consult with the U.S. Fish and Wildlife Service (FWS), Maine DIFW, and Maine TU to determine: (1) what effect the unplanned outages at McKay Station have on the fish and macroinvertebrate populations in the West Branch downstream from McKay Station; and (2) if appropriate, identify potential ways to address fish and macroinvertebrate stranding and mortality downstream from McKay Station. The results of this effort would be added to the first season findings in a final Fish Stranding Study Report provided with the Updated Study Report (USR).

For the reasons outlined below, GLHA proposes to complete the McKay Station Fish Stranding Mitigation Study in conjunction with the McKay Station Ramping Study. Upon completion of the study, GLHA will file the results of the McKay Station Fish Stranding Mitigation Study as an attachment to the McKay Station Ramping Study Report, which as indicated in Table 4-1 of the USR, is ongoing and the report will be filed as a supplement to the USR upon completion.

[1] Accession Number: 20240422-5168
[2] Accession Number: 20230919-3046

**GREAT LAKES HYDRO AMERICA, LLC**
1024 Central Street, Millinocket, ME 04462
T +1 207.723.4341 F +1 207.723.4597 brookfieldrenewableUS.com

- Consistent with the Commission's September 19, 2023 SPD, GLHA will be performing the McKay Station Ramping Study in consultation with Trout Unlimited (TU) and Maine DIFW. Given that the McKay Station Fish Stranding Mitigation Study requires GLHA to consult with FWS, Maine DIFW, and TU to determine what effect the unplanned outages at McKay Station have on the fish and macroinvertebrate populations in the West Branch downstream from McKay Station, GLHA believes that the results of the 2024 McKay Station Ramping Study are necessary to support this phase of the study. In addition, GLHA believes that completion of the McKay Station Ramping Study is necessary to better understand the effects that require mitigation and is a necessary precursor to performing additional evaluation of potential mitigation measures. GLHA will combine the results of the 2024 McKay Station Ramping Study with the information obtained to date in support of this process.
- GLHA understands that that potential mitigation measures associated with unplanned outages at McKay Station is a topic being considered by both FERC's Division of Hydropower Administration and Compliance (DHAC) and Division of Hydropower Licensing (DHL). Whereas DHAC is interested in potential near term measures (i.e., under the Project's existing license), DHL's interests are focused on measures that may be appropriate to include in the Project's new license. GLHA's January 19, 2024 filing[3] provides a summary of the consultation activities performed to date in response to DHAC's August 22, 2023 correspondence[4].
- Infrequent, unplanned outages at McKay Station are not a new issue and, to the contrary, were carefully considered prior to and during the previous relicensing. Many of the environmental measures currently in place at the Project were specifically developed to mitigate the potential effects of Project operations, including sudden changes in water levels due to unplanned outages. Some of these in-place protective measures, such as the automated minimum flows from McKay Station, were established to support downstream aquatic populations that may be impacted by Project operations. But one key mitigation measure not so obviously related to this issue is the Holbrook side channel. During the previous relicensing, the development and operation of the Holbrook side channel was the subject of a Section 10(j) recommendation made by the Department of Interior and was required by Article 406 of the Project's existing license. FERC and the relicensing parties at the time identified the Holbrook side channel as the appropriate mitigation measure to address variable flows from McKay Station. The benefits of this mitigation measure were validated by GLHA's 2022 *Fish Stranding Study,* which demonstrated that changes in river flow during an unplanned outage do not affect water levels in the Holbrook Side Channel, and no stranding of fish or macroinvertebrates was observed. GLHA believes that the Holbrook side channel currently provides effective mitigation for this issue and should be central to any decisions regarding potential future mitigation measures related to planned and unplanned flows from McKay Station.

GLHA looks forward to discussing the study at the USR Meeting. In addition, GLHA looks forward to completing the McKay Station Fish Stranding Mitigation Study and will file the results of the study as an attachment to McKay Station Ramping Study upon completion.

Washington, DC 20426

**Subject: Ripogenus Hydroelectric Project (FERC No. 2572-133) Comments on Great Lakes Hydro America May 3, 2024, Response to Stakeholder-Requested Alternative Operating Scenarios**

Dear Secretary Reese: Via Electronic Filing

The Great Lake Hydro America (Licensee) filing of May 3, 2024, stated which of the stakeholder and agency requested model runs would be simulated. This was extremely disappointing as it substitutes Licensee's goals in place of historic operations. In doing so the Licensee uses indefensible parameters that will force the model to produce results favorable to hydroelectric generation and future Licensee requirements. Should the Licensee be allowed to "run" the Operations Model as stated in the May 3, 2024, filing; non-power values, fish and aquatic resources will be purposely excluded.

Two unsupported comments in the Licensee's filing which impact fish, aquatic communities, angling opportunity and (probably) boating goals are alarming. The Licensee continues to use 939 ft as the Ripogenus Impoundment full pond operating elevation and states that McKay Station outflows of 1400-1600 cfs are impossible.

If allowed to use its own arbitrarily created parameters, model runs results will be meaningless. FERC staff will have only biased information

that considers power needs to construct a 30-year license. This will eliminate any chance of balancing the uses of the resource.

The Licensee states "*GLHA targets an operating full pond elevation of 939.00 feet*
*to allow sufficient freeboard to avoid spill events and to limit the potential for downstream flooding….*" The Phrase "an operating full pond elevation" is simply another wording for the Impoundment will only be filled to an elevation of 941.6 (or 944 ft) for three to four weeks a year. No change in operations; just different wording. In effect, the Licensee proposal(,) is a 2.6-foot reduction in the Ripogenus Impoundment elevation. This allows the Licensee to hide from regulation, 3 billion cubic feet of water. I worked closely with the Great Northen Paper hydro system for 25 years. Possible maximum flood(s) was never an issue. Ripogenus Dam and the remote woodlands downstream were not as risk should such an event occur. If the Licensee has a peer-reviewed study that demonstrates dam safety issues they should make this available to the agencies, stakeholders, and FERC staff.

The reduction in allowable Ripogenus Dam elevation and storage makes little sense. It is impossible to imagine a mark-driven hydroelectric operator giving up 3 BCF of useable storage. Not only will environmental and recreational guilds lose storage and resultant flow; the loss generation will be felt in stockholder's value. The operational shift to a 939 ft Ripogenus Impoundment as a full elevation is not credible.

The Maine Department of Inland Fisheries and Wildlife and the US Fish and Wildlife Service requested model runs where base flows increased in 200 cfs increments. The Licensee responded that *Based on turbine unit limitations, flows of 1400 and 1600 cfs are not feasible from McKay Station".* Based on Appendix A: Operations Model Study - Operations Model Logic and Validation Report, Figures 5. 42-44, that statement is incorrect. While flows of 1400 or 1600 cfs may be operationally undesirable due to reduced turbine efficiencies, no information is provided as why such flows cannot be produced to meet environmental objectives.

The conglomeration of statements made by Licensee initially involved in developing an operational model were that the modeling output would be based on historic information e.g. storage, inflow. Historic data has been massaged to fit future operation goals. Rather than using data over the last 10 (2014-2023) or 20 (2005-2023) time period, the Licensee preemptively interjected its own Ripogenus Project water management scheme.

In the 1996 Environmental Impact Statement, that was based on the GNP Water Use Plan, FERC staff concluded that Ripogenus and North Twin Projects (P-2458) storage were capable of meeting all elevation and flow goals other than Backchannel (P-2458) flows in "dry years". The use of project storage to support market driven peaking operations was obviously not considered. Peaking flows, turbine efficiency and the avoidance of spillage should not be parameters used in initial modeling runs.

In my initial (October 9, 2021) and subsequent filings, I requested an independent peer-reviewed water management plan. The Licensee's May 3, 2024, and earlier filings are an endorsement of my requests. The development of an Operational Model and its iterations are not the time or place for the Licensee to impose its goals, backed up by questionable assumptions. The agencies, stakeholders and FERC staff need unbiased model results as a starting point when making reasonable requests designed to protect environmental and recreational goals.

As requested in earlier filings, I repeat my request for an independent peer review water management analysis.

Thank you for the opportunity to comment and make suggestions.

Ed Spear

RE. Penobscot Mills Project (P-2458). Comments on the North Twin Tributary Access Study Report Appendix E-7 of the Final Study Report

Dear Secretary Reese: Via Electronic Filing

In their initial Penobscot Mills Project (P-2458) Pre-Application Document comments, Maine Department of Fisheries and Wildlife('s) (MeDIFW) requested a survey of North Twin impoundment landlocked salmon (salmon) tributaries. The final study plan goal was description of barriers that might block or hinder adult salmon pre spawning movement into tributaries at various impoundment elevations. This request duplicated studies conducted as part of the 1991 FERC licensing event. However, in order to determine if there was subtle, physical impedance, MeDIFW requested that (adult) salmon be radio tagged and tracked. Radio tagging would track delays in upstream movement and possible shoreline spawning activity.

The North Twin Tributary Access study report (Appendix E-7) filed as part of the Final Study Report represents a great deal of effort and ingenuity as well as some outstanding graphics. Largely as the result of the failure to include MeDIFW's radio telemetry request, study results produced new questions and NO answers. Additionally, this report contains substantial errors and misleading statements.

Rainbow Lake, this famous trout pond, is the major tributary to Nahmakanta Lake. There is a small outlet dam, and MeDIFW recently installed a barrier screen to prevent upstream landlocked salmon (salmon) passage. The Rainbow lake storage and its contribution to the North Twin Impoundment is shown in Figure Attachment 3-67 of Appendix B:Operations Model Study.

Nahmakanta Lake is managed for salmon, Lake, and Brook trout; with only lake trout stocked in recent years. While there is no outlet dam, inflow from

the impounded Rainbow Lake contributes to downstream flow. Nahmakanta Stream was one of three inlet streams included in North Twin Tributary Access study. I find statements in Appendix E-7 contradictory. If the small dams on Dole Brook make the North Branch regulated, why doesn't the small dam on Rainbow lake make Nahmakanta Stram regulated? The Licensee continues with "historical flow date are not available", Figure Attachment 3-67 seems to refute that claim.

The report continues (App E-7) by discussing spawning periods citing MeDIFW (Enfield). The information provided (it) is largely irrelevant as the North Twin Tributary Study where access is much more important than the physical act of spawning. The Licensee would have the reader believe that salmon enter the river and then immediately spawn. This is unfounded and misleading. Salmon are known to enter spawning waters such as the Roach River, the Upper West Branch of the Penobscot River, and Ragged Stream (see Ripogenus Application) early in September when temperatures and flows (often manipulate) are suitable. Thus, any (salmon) redd survey provides NO information on the key issues: the time, source, fish, and any delays in gaining tributary access. Study report of eight (8) Nahmakanta Stram redds simply demonstrate that four – sixteen salmon (salmon often build multiple redds) of unknown origin spawned.

The Licensee continues with results. Despite a great deal of quality high tech effort there were no results that related to the issues at hand: source fish, timing, and accessibility of adult (pre-spawning) salmon to North Twin Impoundment salmon spawning tributaries.

Summary of the 2023 Tributary Accessibility Study

| Water | Salmon present | Time present | Redds found | Source of salmon |
|---|---|---|---|---|
| Joe-Mary inlet | Unknown | - | - | - |
| Nahmakanta Stream | YES | Unknown | 8 | Unknown |
| West Branch | Unknown | - | None found | _ |

The above table provides no new information while raising serious new questions.

1. What is the source of the salmon that spawned in Nahmakanta Stream? Warner and Havey (1985) referred to salmon use of outlet spawning areas. The observed redds were possibly outlet spawner from Nahmakanta Lake or strays from the West Branch.
2. The number of redds (8) found in the .75 mile Nahmakanta Stream reach is well below the average density found in the West Branch downstream of McKay Station; 50-60/mile (Table 16, 1991 Ripogenus Application). This raises serious doubts about the ability of the North Twin tributaries to provide juvenile recruits to the impoundment's adult salmon population.
3. Despite promises to investigate Joe-Mary and the West Branch "tributaries", other than depth, substrate and velocity profiles, no information is provided. Do North Twin Impoundment (pre-spawning) salmon enter these water successfully, or do they attempt to move upstream and fail, due to some factors other than depth, velocity, or other physical barriers?

The study report includes high quality graphics and photos but no new information. The study as propose was a sham and a miss direction away from flow and lake level management critical to environmental and recreational issues. Near useless study results are simply the result of the Licensee's refusal to implement the MeDIFW request for radio tagging.

The MeDIFW request was both logical and necessary for fisheries management goals (self-sustaining salmon populations). Should FERC staff concur they should request that the study be conducted using radio tags. Source fish should be at minimum, from the Pemadumcook and South Twin basins; perhaps 30 fish from each basin. When possible, sexual maturity should be noted. Movement of tagged fish should be monitored at the entrance of the three tributary study streams and in the North Twin Dam forebay.

At some point in the licensing process the Renobscot Mills Project Application and its study reports could undergo formal review. It is unlikely that (independent) professional organization such as the American Fisheries

Society or the National Academy of Science would accept the Licensee's position regarding the refusal to use telemetry in the North Twin Impoundment Tributary Access Study.

I urge FERC to require a tributary access study using radio tagging. The study should begin in September and continue beyond the spawning period ensuring that successful post spawning outmigration occurred.

Thank you for the opportunity to comment and once again urge for a comprehensive North Twin landlocked salmon Tributary Access Study

**Reference: Communication with Penobscot Indian Nation**

To the Tribal Leaders Addressed:

As part of relicensing the Ripogenus and Penobscot Mills Hydroelectric Projects, Commission staff solicited study requests and comments on the Pre-Application Document (PAD).[1] The Penobscot Indian Nation, through its representative Mr. Daniel McCaw, Fisheries Program Manager of the Penobscot Indian Nation, submitted comments on the PAD, study requests, and Proposed Study Plan.[2] Mr. McCaw requested, among other things, that a socioeconomic working group be established, and noted Environmental Justice concerns associated with the projects. These concerns were

[2] *See* Penobscot Indian Nation Comment, Dockets P-2458-247 and Docket P-2572-133 (Oct. 13, 2021); Penobscot Indian Nation Comment, Docket P-2458-247 (Feb. 22, 2022).

considered as Commission staff developed the Study Plan Determination (SPD) for the projects.

Specifically, we required in the SPD that Great Lakes Hydro America, LLC (GLHA) conduct an Environmental Justice study in consultation with the Penobscot Indian Nation and other interested relicensing stakeholders. Since Mr. McCaw's last filing in 2022, we have reached out by telephone to Mr. McCaw on two occasions, each time leaving a voice message, and have not received a response. Additionally, GLHA reached out to the Penobscot Indian Nation via telephone and email in March and April of 2024; however, GLHA reports that Penobscot Indian Nation has not yet responded to this outreach.[3]

By this letter, we are trying to ensure that the Penobscot Indian Nation is receiving these project updates and invitations to participate in the relicensing process. We would like to know if there is an alternative preferred method of communication than documents posted to the eLibrary docket or phone calls to Mr. McCaw. Finally, we wanted to highlight that Updated Study Report meeting is planned for May 15 and 16, 2024 with options to participate both virtually and in-person in Bangor, Maine.[4]

Comment on **Great Lakes Hydro America May 16, 2024,** Updated Study Report **meeting with a focus on McKay Station spawning and incubation flow of** 1422 cubic feet per second

Dear Secretary Reese: Via Electronic Filing

During the May 16, 2024 Updated Study Report (USR) meeting a stakeholder asked when the current Ripogenus Project West Branch of the Penobscot River (West Branch) spawning and Incubation flow (1422 cfs) would be discussed. A very reasonable request, sharply rebuked. Several members of the Great Lakes Hydro American's USR team (the Licensee) responded that there would be no discussion and the stakeholder(s) should simply "read the Application". As with many of the Licensee's statements and positions, this was both incorrect and misleading.

As a then Great Northen Paper (GNP) fisheries Biologist, I collected the fisheries information and co-authored the 1991 Ripogenus Project License Application Fisheries Report. This report included extensive data collection, including Landlocked salmon (salmon) redd surveys, during the 1977-1991 period.

I then participated in the subsequent licensing process that included formulating/refining flow and lake level targets. This was during the period when GNP's paper making energy needs were 24/365, flow interruptions were rare. Outages of any type impacted paper making production power demands and river flow was restored as soon as possible.

During the crafting of 1996 Ripogenus Project license articles it become apparent to the resource agencies and FERC Staff that the historic minimum flow of 200 cfs was inadequate and new minimum flow limits needed to be established. The inherit assumption (later proved to be in error) was that base flows would remain in the 2500 cfs range to meet GNP's paper making needs. Minimum flow requirements were increased, long term outages were set at 1100 cfs (later reduced to 1000 cfs to optimize turbine efficiency). Spawning and incubation flows were arbitrarily set using a generic US Fish and Wildlife's Aquatic Base Flow recommendations, 1422

cfs. Minimum operating flows e.g., 2400 cfs were never considered as the thought of a shuttered mill was too horrific to consider.

During the May 16, 2024 USR meeting, several members of the Licensee's team insisted that information on the 1422 spawning and Incubation flow could be found in the 2021 Pre-Application and accompanying documents. This is incorrect and represents a continuation of the narrative "everything is great, no new studies are needed. Trust us". In fact, there is simply **no information on the suitability** of the 1422 cfs ABF flow. The burden of proof to demonstrate the validity of their proposed flow (1422 cfs) lies with the Licensee.

Any spawning flow, including the ABF, being presented in the Draft License Application needs to be verified. Rather than the Licensee "cherry picking" study sites, I urge FERC to recommend the areas immediately above and or below Line Pool, critical spawning areas. Salmon need accelerating velocities to provide flow during redd construction and to maintain interstitial flow during incubation. Any meaningful flow study should include depth and corresponding nose velocities at and (one foot) upstream of substrates judged suitable for spawning at 1422 cfs and 1800 cfs. Substrates should be quantified including the percentage of fines and organic material. Should flows be lower than the study flow, area selected as suitable for salmon spawning should be confirmed post spawning e.g. late November. Given the Licensee's technological capabilities, the area(s) should be mapped.

The Holbrook Bypass Spawning and Incubation Channel (Holbrook Bypass), Article 406 of the Ripogenus License, was a cornerstone of the final License. This critical mitigation measure was designed to improvement juvenile (parr) recruitment, a factor limiting the abundance of West Branch salmon. This critical juvenile salmon production area was designed to operate at historic GNP Mill flows, flows in the 2500 cfs range. The Licensee's change in project operation from relatively stable base flows to a peaking regime eliminates the Holbrook Bypass design benefit. Should salmon continue to use the Holbrook Bypass at these low flows, protection of incubating eggs needs to be confirmed in the event that November-April McKay flows fall to the 1000 -1422cfs range.

Other than studies conducted under the historic (GNP) stable base flows conditions, there is virtually no information relating to West Branch spawning and

incubation flows below McKay Station.  These two critical salmon life stages have not been a focus of studies, subsequent discussions and or future license requirements. This represents a major data gap. I urge FERC Staff to request this much-needed information.

Thank you for the opportunity to comment on protection of these critical salmon life stages and the need for vital current information.

Jeffrey Norment, Glenburn, ME.
McKay station dam water releases and water management needs to be more consistent to ensure not only power production, but also to ensure maximum water conditions to ensure the world famous downstream fishery and white water rafting and kayaking are maintained. Since Brookfield took over management of the dam, there have been significant fluctuations in flows that have adversely affected the existing native brook trout and landlocked salmon fishery. Water is often too low during critical times of year, especially during the heat of summer, and is adversely affecting fish recruitment. More strict minimum flow and more consistent flows during critical spawning and to ensure survival of younger age classes of fish is needed. Thank you for considering this request during re-licensing.

Washington, DC 20426

**Subject:** **Ripogenus Hydroelectric Project (FERC No. 2572-133)**
**Penobscot Mills Hydroelectric Project (FERC No. 2458-247)**
**Updated Study Report Meeting Summary**

Dear Acting Secretary Reese:

Great Lakes Hydro America, LLC (GLHA), the Licensee of the Ripogenus Hydroelectric Project (No. 2572) and the Penobscot Mills Hydroelectric Project (No. 2458) (collectively referred to as the "Projects"), herein files with the Federal Energy Regulatory Commission (FERC) the Updated Study Report (USR) Meeting Summary for the relicensing of the Projects. The Projects are located on the West Branch Penobscot River and Millinocket Stream in Piscataquis and Penobscot counties, Maine.

On June 11, 2021, GLHA filed the Notices of Intent and a Pre-Application Document (PAD), which initiated the formal relicensing proceeding to obtain two separate new licenses for the continued operation of the Projects through FERC's Integrated Licensing Process (ILP). On March 23, 2022, GLHA filed the Revised Study Plan (RSP) and on May 13, 2022, FERC issued the Study Plan Determination (SPD). Pursuant to the RSP, and as modified and approved by FERC's SPD, GLHA performed study activities in 2022 and early 2023 for which available results from the study activities were provided in the Initial Study Report filed with FERC on April 24, 2023.

Pursuant to FERC's second SPD issued on September 19, 2023, GLHA performed additional study activities in 2023 and early 2024 for which available results from the study activities were provided in the Updated Study Report (USR) filed with FERC on April 22, 2024. On May 15-16, 2024, GLHA held the USR Meeting in Bangor, Maine with FERC staff and other relicensing participants and is filing the enclosed USR Meeting Summary.

Concurrent with this filing, GLHA is providing a copy of this letter to all parties listed in the attached distribution list. Parties can download an electric copy of the public portions of the USR Meeting Summary from FERC's eLibrary system at https://www.ferc.gov/ferc-online/elibrary by conducting a search using the docket numbers P-2458 and/or P-2572.

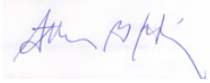
Ms. Debbie-Anne Reese
Acting Secretary Federal Energy Regulatory Commission
888 First Street, N.E.
Washington, D.C. 20426

**Via online submission to: http://www/ferc.gov**

Subject: **Status of Consultation for Studies for the Ripogenus Project (P-2572) and the Penobscot Mills Project (P-2458)**



Dear Acting Secretary Reese:

On behalf of its six chapters and over 2,000 members, Maine Council of Trout Unlimited (TU) submits the attached email thread regarding studies for the Ripogenus Project (P-2572) and the Penobscot Mills Project (P-2458) filed for Great Lakes Hydro America, LLC by Brookfield Renewable ("Brookfield" or "Applicant") so that it is part of the record.

TU had asked Brookfield through its contractor Jesse Wechsler for a response to his email regarding consultation and the Ramping Study by May 31, 2024 and that has not been not forthcoming. We reiterate this request.

TU asked at the Updated Study Report Meeting that Brookfield provide the bases for Ripogenus Project flows of 1422 cfs, 1300 cfs and 1000 cfs that are in the current license. Rather than respond to the request, Brookfield stated that it was in the record without reference to where it was located. TU reiterates that request which was included in the attached email.

Respectfully,

Stephen G. Heinz
Maine TU Council FERC Coordinator

---

Jesse,

Thank you for the clarification.

TU expected be able to conduct substantive discussions of the Ramping Study combined with year two of the Stranding Study at the USR Meeting based on the content of Brookfield's Filing of May 3 that stated: “GLHA looks forward to discussing the study at the USR Meeting." Despite TU noting this at the very beginning of the meeting, no substantive discussion occurred beyond Brookfield stating that the study would likely be delayed until September and that consultation with stakeholders was ongoing. TU had proposed September of early October, the same timeframe that the year 1 Stranding study was conducted. TU supports this later date because milder weather conditions would be less likely to cause mortality of salmon parr and macro-invertebrates, and would not be during the fishing season, but we will not object to conducting it in late July or August. Consultation between Brookfield and TU was minimal for the Stranding Study, but did result in moving some of the study area from areas where strandings were not expected to areas where they were. For the Wadability/Fishability Study, consultation was virtually non-existent: participants were not given key details of the study until they arrived to participate such as specific locations or flows. One of the Brookfield contractors stated at the USR Meeting that none of the volunteers objected to the study methods when it was conducted. It is unrealistic to think that volunteers showing up in the field to participate in a study could do the analysis required in the field on the fly.

The Ramping Study that TU received with your April 26 email assumed TU volunteer participation. TU was not asked if it wished to participate in data collection for the study. TU may want to sample other areas when the study is conducted as we did with the Stranding Study. Conducting relicensing studies is the responsibility of the applicant. TU currently has no paid employees in Maine and any support which we supply is on our members' own time and at their own expense. Few live within easy driving distance of the Ripogenus Project, and most have to find lodging at their own expense to participate in West Branch studies. They are under no obligation to participate and should not be counted on to collect data and certainly without asking if we wished to be used in that manner. We may put independent observers in the field as we did for the Stranding Study where we covered different areas than the formal study did and would appreciate advance notice of its timing and details.

Our participation in the Wadability/Fishability Study was driven by our conclusion that contractor observers would be unqualified to make determinations of either wadeability or fishability over any range of flow. We were not consulted on the details of the study and were disappointed that the range of flows was limited to under 400 cfs. TU’s general comments on the study were that ‘the validity would be dependent on the range of flows provided.’ We anticipated that the three flows that would be provided would cover a larger range. Although bladder systems are not generally used to control flows from dams, Brookfield does use it to control flows within the system to control Millinocket Development ramping rates:

> "Whenever abnormal conditions occur such that a flow cannot be passed through the generators at the Millinocket Powerhouse to achieve the 2,000 cfs minimum flow, the inflatable rubber flashboard system shall be deflated to release flows in an expeditious effort to minimize downriver effects on water quality and aquatic habitat. Except for the initial 2-minute siren warning and a safety flow of 200 cfs for 15 minutes, such flows will not be ramped. The protection of downriver water quality and aquatic habitat is a higher priority than prevention of channel scouring and destruction of vegetation in the Back Channel. During periods of high seasonal flows, the initial 2-minute siren warning and safety flow of 200 cfs for 15 minutes will also be used. Following this 15-minute release, increases of 400 cfs per hour will be made until either the required flow is met, the elevation at Stone Dam is less than 459.45 feet, or the inflatable rubber flashboard system is fully deflated, if necessary. *The ramping up of seasonal flows in the Back Channel will be done only after the hydraulic capacity of those units available has been attained.*” [Source: https://lowimpacthydro.org/wp-content/uploads/2020/07/20190603-Initial-LIHI-Application-Millinocket-Dolby.pdf -page 29, italics supplied].

Less than half the flow that maximized macro invertebrate habitat or adult landlocked salmon habitat that Brookfield Aquatic Habit Study indicated was provided for the Wadability/Fishability Study.

I was surprised that Ed Spear was not included on your April 26 email. Ed has spent more time and done more study of the West Branch fishery than anyone, and his knowledge and experience are invaluable. TU agrees with the comments in his FERC filing of May 1 that supported our requests that the study be conducted in late September or early October. They also reflect TU’s analysis that there is no value in sampling the Big Eddy Pool and alternative sites should be included:

> 'As designed, the RSP includes only about 10 percent of critical salmonid spawning areas (Vol IX 1991 Ripogenus Project Application Table 16) and perhaps a third of salmonid nursey and aquatic insect habitat. This oversight can easily be corrected by including the two flow sensitive areas (either the gravel bar above Line Pool or the relatively long gravel area beginning at the end of Line Pool ) immediately above Nesowadenhunk Deadwater“ and removing the “below Big Eddy Site”. This minor change will include the “Horserace”, prime nursery habitat, and the major spawning areas, Little A Deadwater and the two combined “head of Nesowadenhunk Deadwater” sites. The third major spawning area is the pool immediately below Abol Bridge and is downstream of the reaches of apparent study interest although it is thought to be critical to the North Twin Impoundment salmon population.'

Ed’s comments go on to request inclusion of sampling of macro-invertebrate drift, a key feature of the studies conducted by Smokorowski and others. Incorporating this represents an opportunity to further inform the relicensing, and better determine of the full effects of peaking below McKay station. He goes no to say:

> "Aquatic insects provide critical forage for juvenile salmon and as maintenance food items to adult salmon during summer periods. The RSP addresses aquatic communities only in terms of mortalities. They then continue by quoting Smokorowski et al (2011) implying that they are familiar with work done by Smokorowki, Marty and others on the Magpie and Batchawana Rivers. Impressive work, sponsored by the Licensee.
>
> The Licensee correctly identified Smokorowski and other’s work but failed to include their reports of increased aquatic communities “drift” and population shifts resulting from unramped peaking. The literature is replete with publications concerning aquatic insect drift (or movement) caused by peaking as well as emergency outages. This phenomenon should be addressed in

the RSP. My filing of February 14, 2022 (accession No. 20220214-5027) provided details of impacts resulting from unramped peaking and regulated flows and an accompanying list of peer reviewed references. I see no need to repeat well-known science.

I suggest the RSP be modified and include aquatic community drift before, during, and after flow changes. For all sample sites, duplicate metered, drift nets should be set in a fixed position for two hour periods just prior to flow increases; emptied and set again immediately as flow rises; removed before a flow change, and then reset for a two hour period after flows are increased. As mentioned above, to avoid bias caused by the sometimes crepuscular/diel aquatic insect behavior, sampling should be mid-day."

TU would like to build on Ed's comments. The Ramping Study as written is not a ramping study but an exercise to verify that normal switching between 1, 2 and 3 generator operations does not strand fish. If it shows that stranding does not occur when this happens, then it does not make sense to look at smaller increments of flow change - except at lower flows. As TU stated in its April 30 email:

"TU is still unaware of data supporting the flows that comprise the terms and conditions of the current license. The 400 cfs trip event flows allowed under the current license have been demonstrated to cause extensive mortality to fish and macro-invertebrates. If data exists to justify 1000 cfs as a minimum flow in terms of strandings, then please direct us to the study data that shows that. Similarly, if data exists to justify spawning and incubation flow of 1422 to 1300 cfs, then please direct us to that as well. To our knowledge, the 1422 cfs only reflects the general guidance for minimum flow developed by USFWS for New England waters: the catchment area in square miles. More specific data is needed to condition the new license."

In any case, the scope of the study needs to be expanded to include examination of the range of flows from 1422 cfs down to the 500 cfs that the Stranding Study has conclusively shown to cause extensive mortality, especially to landlocked salmon parr. If this is not incorporated into the Ramping Study, then additional delays to those already caused by the failure go two McKay Station generators on July 8, 2023 will be incurred when it is recognized that the current minimum, spawning and incubation flows are not based on data.

I spoke with Allan Creamer at the USR Meeting on May 16, and he said he had looked and the only flow study he could locate was an IFIM study for Ripogenus Gorge. This is completely the opposite of what Brookfield asserted in response to my multiple requests that Brookfield identify the studies supporting current license flows. We are well into the relicensing process and still lack data justifying the flows in the current license that we expect Brookfield will apply to have continued in the new license.

TU proposed both the Stranding Study and the Ramping Study. We appreciate the opportunity to provide input to the consultation. Please reply by May 31, 2024.

Thanks again,

Steve Heinz

>
> We are surprised that you would choose the weeks of highest aquatic biological activity to conduct the study. The weeks that you propose are during the largest hatches of caddis flies and greatest period of stonefly emergence. The study would perturbate the lifecycle of the insects and the fish that feed on them. Besides that, landlocked salmon fry would be very young then and vulnerable to changes in flow conditions. In mid-June, water temperatures and air temperatures will likely be fairly high so any strandings that might occur would be more likely to result in mortality than if the study were conducted either earlier or later in the year.
>
> These are also the weeks that most Maine trout fishermen want to be on the water, so it is doubtful that TU would be able to recruit enough volunteers to assist with data collection if we supported these dates. Local guide and campground businesses would also likely suffer.

Hi Steve –

Confirming for you that no additional communication has gone out on this topic and providing you with the latest update.

Per MDIFW's recommendations on May 2, we are now looking to perform the study in back-to-back weeks in the 2nd ½ of July or in August. We anticipate two days of field work (1 day in each week). We are currently discussing the timing with GLHA to make sure that this will work operationally and to identify specific dates for the field work. We also need to make sure that the new timeframe will work for the rafting outfitters.

Per the study plan, we are planning to form teams of three (1 staffer from TU, MDIFW, and GLHA/KA) for each of the three study sites.

This timing should also allow us to include the results of the study in the Final License Application, which is due to FERC by 9/30.

Due to planned outages and MDIFW permit restrictions, we are not able to perform the study in October.

I plan to develop a detailed schedule soon and send it back out to the group.

Thank you!
Jesse

All,

At the USR Meeting in Bangor last week, I understood that Jesse Wechsler or Brookfield would get back to us regarding "ongoing consultations" involving the upcoming Ramping Study, and combining it with the rest of the Stranding Study. TU was the organization that proposed both studies.

When I spoke with Dave Scarzello this morning at the FERC DEIS Hearing on the

Shawmut Project in Augusta, he said that something had been sent out earlier this week.

I have looked back through my emails and checked the FERC docket and cannot find any new emails or new FERC filing to the docket related to the Ramping Study.

If an email was sent, please forward it to me at your earliest convenience. TU has inputs.

Thanks,

Steve Heinz

> On behalf of GLHA, I am writing to provide an update and to start coordinating with you on the upcoming ramping study at the Ripogenus Project. As you might recall and as described in documents filed with FERC in 2023 as part of the current relicensing effort, GLHA is planning to study the effects of the following two operational scenarios at the Ripogenus Project on downstream fish and aquatic resources:
>
> - Changing from 3-unit operation (~3,500 cfs) to 2-unit operation (~2,300 cfs) to 1 unit operation (~1,100 cfs) (holding at 2-unit operation for 1 hour before going to 1-unit operation).
> - Changing from 3-unit operation (~3,500 cfs) to 1-unit operation (~1,100 cfs) by simultaneously shutting down the other two units.
>
> The study plan, which has been approved by FERC, is attached as reference.
>
> GLHA originally planned to complete the study in the fall of 2023 but was unable to do so because of excess precipitation and scheduled maintenance activities at the McKay Station, which resulted in one or more turbine units being unavailable for the study.
>
> On April 10 of this year, GLHA consulted with members of the rafting

community (i.e., the New England Outdoor Center and other members) at the annual Whitewater Outfitters Meeting to identify dates for the ramping study that would not affect planned recreational and rafting activities in the West Branch. Based on requests from the rafting community and the need to avoid planned maintenance outages this fall, GLHA is targeting this study to occur on two days over back-to-back weeks in June. Specifically, the planned dates are Wednesday June 12 and Wednesday June 19. A target study schedule is attached, showing the planned timeline for operational changes, river flows, and field monitoring activities.

As described in the study plan, the intent is to develop three small field teams that include one representative from TU, GLHA, and MDIFW for each of the 3 sites. We envision this year's study will rely on small teams working together to evaluate the effects of these flow changes on fish and aquatic resources.

As we continue planning the field study, could you please confirm whether your organization will take part, and if so, provide contact information for specific individuals so that we can coordinate directly with team members?

Please feel free to contact me with any questions.

Thank you!

Dear Mr. Scarzello:

Commission staff has reviewed Great Lakes Hydro America, LLC's (GLHA) Updated Study Report (USR) and associated study reports for the Ripogenus and Penobscot Mills Projects filed April 22, 2024, attended the USR Meeting held May 15 and 16, 2024, and reviewed the USR Meeting Summary filed May 31, 2024. Based on staff's review of the USR, associated study reports, and USR Meeting Summary, as well as discussions at the USR Meeting, staff's comments are provided in Attachment A.

Please contact Allan Creamer at (202) 502-8365, or at allan.creamer@ferc.gov, if you have any questions.

Sincerely,

Stephen Bowler, Chief
South Branch
Division of Hydropower Licensing

Enclosures: Attachment A – Staff's USR and USR Meeting Summary Comments

**Attachment A – Staff's USR (Updated Study Report) and USR Meeting Summary Comments**

McKay Station Flows

1. During the Updated Study Report (USR) Meeting, held May 15 and 16, 2024, the Maine Council of Trout Unlimited (Maine TU) requested information regarding the biological basis for the McKay Station flows required by the existing license.[1] Great Lakes Hydro America, LLC (GLHA) noted, without elaboration, that the requested information was in the record. The record developed during the prior relicensing, including that which supports the existing flow requirements for McKay Station, is voluminous. Thus, we encourage GLHA to work with the stakeholders to find information in record that helps them understand the existing license requirements, including the flows for the West Branch of the Penobscot River downstream from McKay Station. Moreover, to facilitate Commission staff's understanding of the adequacy of the existing McKay Station flow releases, as well as any proposed changes to those releases, the final license application for the Ripogenus Project should include a detailed description of the biological basis for the existing and proposed flows.

McKay Station Fish Stranding Study

2. The USR, filed April 22, 2024, did not specifically list the McKay Station Ramping Rate Study or the McKay Station Fish Stranding Mitigation Study, which were required by the September 19, 2023, Determination on Requests for Study Modifications and New Studies (Study Determination), among the 15 studies to be discussed during the USR Meeting.[2] Instead, GLHA proposes to complete these two studies in 2024 in consultation with the Maine Department of Inland Fish and Wildlife (Maine DIFW), the U.S. Fish and Wildlife Service, and Maine TU, with a report detailing the results filed as a supplement to the USR.[3]

   During the USR Meeting, on May 15, 2024, a Maine TU representative asked GLHA about the schedule for consulting on, and completing, the McKay Station Ramping Rate Study. GLHA responded that the ramping study would be delayed until

[1] Maine TU's June 5, 2024, Filing at 2.

[2] Table 4-1 in the USR lists the McKay Station Ramping Rate Study as on-going, and the McKay Station Fish Stranding Mitigation Study was not mentioned.

[3] *See* GLHA's May 3, 2024, Filing.

September and that consultation was on-going.[4] After consulting with Maine DIFW, the dates for completing the study changed to the latter half of July or August.[5] It appears that Maine TU was not consulted on the schedule change, as required by the Study Determination.[6] Moving forward, please manage these two studies with a proactive and inclusive approach to stakeholder consultation and involvement, including (a) informing Maine TU and other interested stakeholders of these study schedules and any changes, and (b) providing the final study plan(s) to stakeholders prior to implementing the study(ies).

Terrestrial, Wildlife, and Botanical Resources Study

3. During the USR Meeting, on May 16, 2024, Commission staff commented on the benefits of integrated vegetation management in transmission line rights-of-way, particularly in sensitive areas such as habitat for Rare, Threatened, and Endangered species that potentially occur in the project area. Additionally, staff noted that the proposed endangered tricolored bat likely occurs in the project area. Finally, as was stated in the Study Plan Determination,[7] staff reiterated that the final license application should: (1) include an assessment of the potential effects of project operation and maintenance on all federally listed and proposed listed species, and include any proposed protection, mitigation, and enhancement measures to protect those species; and (2) describe all vegetation management practices that occur within the project boundary.

Whitewater Boating Assessment Study

4. In the Determination on Requests for Study Modifications and New Studies, Commission staff stated that a Whittaker Level 2 study for boating the West Branch downstream from Stone Dam would: (a) identify the reach's flow-dependent attributes; (b) assess the feasibility and potential quality of boating opportunities there; and (c) estimate necessary flow ranges for boating the river.[8] The Study Determination required that the Whittaker Level 2 study include boating this reach to

[4] Maine TU's June 5, 2024, Filing at 2.

[5] *Id*. at 4

[6] Director's September 19, 2023, Determination at C-6.

[7] Director's May 13, 2022, Determination at B-31.

[8] Director's September 19, 2023, Determination at B-28.

"Assess the feasibility and potential quality of boating opportunities and estimate flow ranges by boating the river at a single flow." [9]

Whittaker *et al*. (2005) states that a Level 2 on-water study by boat is similar to an on-land boating assessment, with the addition of experienced boaters running the subject reach, often using an evaluation form designed to capture observations from the run. After the run, focused group discussion of the observations would take place to seek findings regarding the boating opportunities, flow ranges, and potential project effects of boating the subject reach.

The USR includes a preliminary second-year Whitewater Boating Study Report.[10] This report mentions that a land-based Whittaker Level 2 study is planned for the summer of 2024. As required by the approved study plan, this land-based assessment should be paired with an on-water study by boat, with experienced boaters at a single flow, using an appropriate evaluation form, and followed by a focused group discussion to assess the reach's boating feasibility, flow-dependent attributes, and the potential flow ranges for boating.

[9] For more information, please refer to Whittaker, D., B. Shelby, and J. Gangemi. 2005. Flows and Recreation: A guide to studies for river professionals. Whittaker, Shelby, Gangemi, & the Hydropower Reform Coalition.

Debbie-Anne A. Reese, Secretary June 20, 2024
Federal Energy Regulatory Commission
888 First Street, NE
Washington, DC 20426,

Ripogenus Hydroelectric Project (FERC No. 2572-133) Comments on Great Lakes Hydro America Supplement to Updated Study Report, May 3, 2024. Re; Ripogenus Hydroelectric Project Article 406, The Holbrook Bypass Channel and the appropriateness of conclusion regarding the functionality of this system as it exists.

Dear Secretary Reese Via electronic filing

This filing attempts to correct assertions made in the Great Lakes Hydro America (Licensee) May 3, 2024 Supplement to Updated Study Report regarding Article 406, Holbrook Bypass Channel (Bypass Channel). Without any empirical proof, the Licensee contends that, despite frequent dewatering, this mitigation measure is providing the intended enhancement to young-of-the-year Landlocked salmon (salmon) production. This is not the case. As the May 3, 2024 filing is part of the record, the Licensee's erroneous conclusion needs to be corrected.

"Current" Bypass Channel fisheries information is limited to an August 4, 2021 Maine Department of Inland Fisheries and Wildlife electrofishing report. This "time available" data collection found numerous juvenile brook trout, no salmon parr, and several young-of-the-year salmon. This is not the structure of fish population described in the 2003 (then) Great Northen Paper filing (Accession No 20030102-01200). Project operation and frequent low flow events have turned the Holbrook Bypass Channel into a brook trout nursery area. This is not the goal of Article 406.

In their May 3, 2024 filing the Licensee attempts to refute claims that low McKay Station flows were/are not in violation of Holbrook Bypass Channel, Article 406, license requirements. The constant violation of Article 406 flow requirements and stranding of fish and aquatic macro invertebrates are two distinct and separate issues and require two separate studies.

The Licensee attempts to dismiss claims of continuous Article 406 violations based on observations made during a (fish) stranding study. The study was designed for mainstem river reaches with rock/boulder lined shorelines and

occasion high gradients and not for a small stream lacking pocket pools and boulders with a wide thalweg. As is often the case, the Licensee makes statements not supported by river flows coupled with Bypass Channel flows, velocities, and depths time series. In future studies, these physical parameters can be linked to Bypass Channel fish and aquatic communities' abundances.

*"The benefits of this mitigation measure were validated by GLHA's 2022 Fish Stranding Study, which demonstrated that changes in river flow during an unplanned outage do not affect water levels in the Holbrook Side Channel, and no stranding of fish or macroinvertebrates was observed. GLHA believes that the Holbrook side channel currently provides effective mitigation for this issue and should be central to any decisions regarding potential future mitigation measures related to planned and unplanned flows from McKay Station"*

The Licensee is gaslighting the stakeholders, agencies, and FERC's compliance and Licensing staffs. The "stranding study" was not designed to determine the status of Bypass Channel juvenile salmon production. In effect, they are turning fantasy into fact; using a negative (no salmonid stranding) to prove juvenile salmon are thriving in the Bypass area. Such statements must be challenged.

The Licensee's Bypass Channel flow statement is absurd and contradicts the laws of physics. As flow in the river is reduced, flow into the bypass channel though submerged pipes must by reduced as it is a function of head (river elevation). And while any change in Bypass flow may not be lethal, it is nevertheless a reduction in aquatic habitat. Continuous flow reductions, often daily, violates Article 406 and its goal of juvenile salmon production. McKay outflows and flows into the Holbrook Bypass are controlled by the Licensee, and any dewatering of this nursery area below the designed McKay Station flow (2500 cfs) is the Licensee's responsibility.

In order for the License's Holbrook Bypass Channel statement be relevant to licensing and compliance issues the following parameters need to be collected:

- The presence or absence of young-of-the-year and parr landlocked salmon must be determined.
- A time series of river flows and corresponding Bypass Channel flows, velocities, and depth measurements.

I urge FERC to disregard the Licensee's unsupported comments regarding "*effective mitigation*" as it relates to the Holbrook Bypass Channel. Article 406

was the cornerstone of the 1996 FERC Licensee and the status of this mitigation measure needs to be determined and then protected in the future.

Thank you for the opportunity to comment on the need to clarify the status of required flows into the Holbrook Bypass Channel and subsequent juvenile salmon production.

AMERICAN WHITEWATER AND APPALACHIAN MOUNTAIN CLUB COMMENTS ON INITIAL STUDY REPORT AND REQUEST FOR FURTHER STUDY FOR THE RIPOGENUS HYDROELECTRIC PROJECT (P- 2572) AND PENOBSCOT MILLS HYDROELECTRIC PROJECT (P-2458)

American Whitewater and Appalachian Mountain Club ("AW/AMC") submit the following comments and requests for additional study pursuant to 18 CFR section 5.15, in response to the April 22, 2024 filing of the Updated Study Report (ISR) for the Ripogenus Hydroelectric Project and Penobscot Mills Hydroelectric Project (FERC Project Nos. P-2572, P-2458) by Great Lakes Hydro America, LLC ("GLHA"). The licensee held an in-person USR meeting in Bangor, Maine on May 15-16, 2024 in which it provided information on the status of the 20 studies required by FERC's May 13, 2022 Study Plan Determination ("SPD").

On October 8, 2021, AW/AMC filed extensive comments on the pre-application and scoping document, as well as submitting three study requests, to collect information needed to develop an understanding of project operations and their impacts on resources to inform the proceedings and compliance with the National Environmental Policy Act. Specifically, AW/AMC requested the applicant complete the following studies: (1) Recreation Facility Inventory, Recreation Use and Needs Assessment, Aesthetics and Reservoir Surface Area Assessment Study; (2) Controlled-flow Whitewater Boating and Access Study; and, (3) Aesthetics Resources Study. In the Study Plan Determination (SPD), FERC adopted with modifications the study requests of AW/AMC.

AW/AMC filed comments following and a study modification request following the Initial Study Report addressing deficiencies in the filed study reports and requesting additional study addressing the following issues:

- Recreation Study: AW/AMC raised concerns that the study failed to collect sufficient data through focus groups, surveys, and interviews as required by the approved *Recreation Study Plan*. Additionally, the study report did not include certain informal recreation areas, such as trails leading to the water downstream from Ripogenus Dam, and requested that the *Recreation Study* include informal recreation access areas identified by stakeholders. In response to AW/AMC

comments and study modification requests, FERC's study modification determination required that the licensee conduct two focus groups and redeploy survey kiosks to collect additional user survey data, including addressing additional recreation access issues.

- Whitewater Boating Study: AW/AMC sought additional study of whitewater boating opportunities below Ripogenus Dam in the Upper Gorge dryway and below Stone Dam in the Penobscot River dewatered river channel. In response to the AW/AMC study modification request, FERC required Brookfield to conduct a Level 2 whitewater boating study below Stone Dam following the Whittaker, et al. methodology used in whitewater boating studies, stating that a "Whittaker Level 2 study would identify the reach's flow-dependent attributes, assess the feasibility and potential quality of boating opportunities there, and estimate flow ranges by *boating the river*. (emphasis added) FERC approved the modification, in part, requiring the licensee to (1) proceed to a Whittaker Level 2 study for this reach; and (2) explore ways to increase access to this reach with stakeholders and study participants. Based on assertions by the licensee that the inflatable, rubber dam at Stone Dam is not designed to provide consistent and predictable flow releases, staff did not recommend a Level 3 study for this reach, nor additional study in the Upper Gorge, Millinocket Stream, or below McKay Station.
- Aesthetic Study: The licensee's Aesthetic Study Report was not conducted according to the Study Plan Determination in that the licensee failed to consult with Maine BPL, AW/AMC, the Camp Associations, and other interested stakeholders. Instead, the licensee completed the study using only its own paid, biased consultants to evaluate the effect of project operations on aesthetic resources. FERC required the licensee to complete the Aesthetics Study according to the study plan detemination.
- Environmental Justice: AW/AMC raised concerns that the study area was overly narrow and that the study failed to address project effects on the Penobscot Indian Nation, other indigenous groups, and individuals. Additionally, the study failed to examine project-related effects associated with current operations. In response to these comments, FERC expanded the study area to a 5-mile radius and required consultation with the Penobscot Indian Nation. FERC, however, did not address concerns raised by AW/AMC regarding the effects of current operations on affected groups.

AW/AMC incorporate by reference our comments filed in response to the Initial Study Report and file these additional comments in response to the licensee's Updated Study Report and Updated Study Report Meeting.

## Comments on the Updated Study Report

1. Operations Model

The licensee has not completed operations model runs requested by stakeholder groups, has only agreed to run only a subset of the requested model runs, and has unnecessarily delayed the completion of this study. The licensee has not provided a detailed explanation of its basis for rejecting some proposed model run scenarios. As such, we regard the operations model as an iterative process and expect that the initial model runs will lead to further refinements that will assist the FERC staff in evaluating alternative operating scenarios as part of its NEPA analysis. Due to the delay in completing these model runs and subsequent revisions, stakeholders will be unable to adequately respond to the licensee's Draft License Application by the August 1st deadline. Stakeholders reserve the right to file additional comments on this study once the licensee completes the requested model runs and any subsequent refinements.

2. USGS Gage Suitability

The licensee's USGS Gage Suitability Study demonstrates the need for additional USGS gages that would enhance public safety and recreational use in impoundment lakes and downstream river reaches at the Ripogenus and Penobscot Mills developments. Notwithstanding these study results, GLHA proposes no additional PM&E measures in its study reports or Draft License Application. Inasmuch as relicensing studies are conducted to allow FERC to complete its NEPA review of environmental impacts and to develop the best adapted plan for the waterway, GLHA cannot simply ignore study results and should propose additional USGS gages and other flow and impoundment reporting to address public safety and recreation use. Specifically, we recommend that GLHA expand its use of the Safe Waters website to report on impoundment levels in waters affected by its hydropeaking operations to inform recreational boater access. Additionally, Safe Waters should report flow levels below Ripogenus Dam in the Upper Gorge Dryway, below Stone Dam in the dewatered West Branch, and below Millinocket Lake dam in Millinocket Stream to provide flow information in the dewatered and impaired river reaches to protect the safety and recreational opportunities of downstream paddlers and anglers. We also recommend that the licensee install additional USGS gages between McKay Station and Big Eddy as well as above the Penobscot Mills project that would inform downstream boaters and anglers of current flow conditions. Our understanding from the USR meeting that the installation of the new USGS will require spanning the river with a cable above the river in a frequently used whitewater boating section requiring that the cable will be installed so as not to adversely impact or create a safety hazard affecting whitewater boating use.

3. Water Quality

GLHA conducted a study assessing water quality below Stone Dam where leakage flows from flashboards range from 17-189 cfs. The study results do not address how the lack of an adequate minimum flow below Stone Dam affects water quality including dissolved oxygen and water

temperature at the lowest flows that fail to even fully cover the river bed and create disconnected pools in places. Despite these limitations, the study results do demonstrate that the West Branch below Stone Dam provides high quality water maintaining the structure and function of the biological community and capable of supporting aquatic life and the restoration of fish species including macroinvertebrates. This study should address how providing adequate minimum flows will further benefit water quality.

4. Angler Flow Evaluation

This study evaluated angling opportunities below on the West Branch below Stone Dam at various flows. This study failed to follow the approved study methodology in that the highest flow evaluated was 392 cfs rather than flows of 420 cfs, 700 cfs, and 1000 cfs as required by the approved study plan. Additionally, the study arbitrarily utilized short casting distances and fixed wading points not typically reflecting experienced anglers and drawing unsupported conclusions about optimal angling flows. GLHA released water into the West Branch below Stone Dam by reducing generation to raise the pool at Quakish Lake and then overtopping the flashboards. GLHA also has the capability to release flows through partial deflation of its inflatable bladder gate that maintains pond level control. GLHA falsely asserts that it lacks the capability of controlling flows through the inflatable bladder gate; however, this assertion is contrary to claims it made in its application for certification to the Low-Impact Hydropower Institute, attached to this filing.[1] We recommend that the licensee repeat the study following the approved methodology and coordinate with Trout Unlimited on the implementation of the study plan.

5. North Twin Impoundment Tributary Access Survey

No comments

6. Upstream Eel Passage Assessment Study

No comments.

7. Recreation

The licensee conducted a second season of the Recreation Study. As discussed in the USR Meeting, the study report should be revised to include results from the 87 surveys collected from non-project recreation sites. Additionally, the report should include an Appendix with the survey forms including any narrative comments provided by respondents. We are also concerned that the study report fails to make specific recommendations for necessary improvements to recreation facilities based on the study results and no such recreation improvements are included in the Draft License Application. Regrettably, GLHA completely ignores the study results that

[1] https://lowimpacthydro.org/wp-content/uploads/2020/07/20190603-Initial-LIHI-Application-Millinocket-Dolby.pdf at p.29.

are intended to inform FERC's NEPA analysis and inform the development of appropriate PM&E measures that address project effects on recreational resources including adequate parking and river access. We also recommend that this study be read in conjunction with the operations model study, angler flow study, whitewater boating study, and the USGS gage study as these studies and potentially others are intended to address project effects on recreational resources. Based on these study results, GLHA should develop a Recreation Management Plan after consultation with stakeholder recreation groups and resource agencies that proposes specific measures that will be implemented post-license addressing issues identified in the relicensing studies. The issues addressed in the plan should include flow and impoundment level notification, safety signage, parking, sanitation, recreation flow releases, and improvements to access in impoundments, bypassed reaches in the Upper Gorge, Stone Dam, and Millinocket Stream, and riverine reaches affected by project operations.

8. Whitewater Boating

In response to AW/AMC study modification request, FERC required that GLHA conduct a Level 2 whitewater boating study below Stone Dam following the Whittaker study methodology to assess the whitewater boating potential of this dewatered section of the West Branch. The Study Modification Determination stated the following:

> A Whittaker Level 2 study would identify the reach's flow-dependent attributes, assess the feasibility and potential quality of boating opportunities there, and ***estimate flow ranges by boating the river***. Due to the location of this reach near Millinocket and the lack of a sufficient number of interviews to determine potential boating opportunities, we recommend that GLHA: (1) proceed to a Whittaker Level 2 study for this reach; and (2) explore ways to increase access to this reach with stakeholders and study participants. This information should be included in an updated *Whitewater Boating Assessment Report* and filed with the USR… (emphasis added)

Notwithstanding FERC's Study Modification Determination, GLHA has not completed the Level 2 whitewater boating evaluation below Stone Dam and has yet to hold a planning meeting with AW/AMC to coordinate the study implementation. Even more concerning, the licensee's consultant made clear at the USR Meeting that it does not intend to conduct this study according the Study Modification Determination or the Whittaker methodology.

According to *Flows and Recreation: A Guide to Studies for River Professionals (2005)*, there are three levels to a whitewater boating study: 1) Desktop analysis; 2) Single flow feasibility assessment; and 3) Multiple flow assessment. In the Level 1 assessment, the licensee generally collects existing information on whitewater boating use including published materials and analyzes hydrological data on the availability of flows. In a Level 2 assessment, the licensee works with an expert panel of boaters to identify a target flow and conducts and on-land and on-water assessment of a single flow to determine boatable flows. In a Level 3 assessment, multiple flows are evaluated to more precisely identify minimum acceptable and optimal flows using

single flow and comparative flow assessment forms. At each level, there are off-ramps where additional study is unnecessary for various reasons. Unfortunately, FERC's study plan determination has segmented this process into multiple study phases resulting in unnecessary delay.

At the USR Meeting, GLHA stated that it only intended to conduct an on-land feasibility assessment using a single flow, leakage from the flashboard that range from 17-189 cfs, for its Level 2 study. This approach is contrary to the Whittaker Level 2 methodology and will fail to inform the study results in any meaningful way. Viewing a largely dewatered river reach from the shoreline may be appropriate for a Level 1 study by providing photo documentation of existing conditions, but it will fail to provide information on the potential opportunities for whitewater boating under other modes of operation. Target flows should be determined in coordination with the study group based on existing information, not unilaterally by a licensee intent on avoiding responsibility for the impact of its operations on recreational use and enjoyment. Beyond the issue of target flows, the utility on an on-land assessment is limited, as recognized in the Whittaker methodology as follows:

> **Cautions & limitations** On-land boating assessments may suggest whether a river is boatable, but they are unlikely to provide precise assessments of flow ranges. They are helpful for assessing safety issues for an on-water assessment and narrowing flow ranges for additional study, particularly on more challenging (higher gradient) rivers.

While we do not object to an on-land assessment of a single flow, we believe a flow release of 2000 cfs rather than a leakage flow of 17-189 cfs will potentially provide some information, although we expect it is unlikely to provide precise assessment of minimum acceptable and optimal flow ranges. Inasmuch as there is evidence of prior boating on this river reach and the safety concern primarily at Grand Falls is known and the area is easily scouted, an on-water assessment is appropriate for the Level 2 study phase. An on-water assessment is also consistent with FERC's Study Modification Determination requiring that the study "***estimate flow ranges by boating the river.***"

Although the licensee claims that its rubber dam at Stone Dam is not designed to provide consistent and predictable flow releases, it states in its Draft License Application as follows:

> The 428-foot, 5-inch-long spillway section between the waste gate and gatehouse which previously had wooden flashboards, has been retrofitted with a 2-foot, 9-inch-high, single span, Bridgestone rubber dam system. The system is comprised of one airtight dam fastened to the upstream edge of the spillway using a special clamping system. Air is supplied to the rubber dam for inflation through a fitting in the abutment of the dam that is connected to two high-capacity air blowers. Inflation or deflation of the rubber dam may be done in one of two modes: Manual or Automatic. Remote monitoring and control from Brookfield's National System Control Center (NSCC) is the normal mode of operation. Instead of gate operation, the NSCC operator remotely inflates or deflates the

rubber dam to pass the appropriate flows. Flows from the dam enter the 4.5-mile-long Back Channel before flowing into Shad Pond.

Additionally, GLHA's asserts in its application to the Low-Impact Hydropower Institute for certification that it has the ability to release controlled flows below Stone Dam in the event of an outage at Millinocket, as follows:

> Whenever abnormal conditions occur such that a flow cannot be passed through the generators at the Millinocket Powerhouse to achieve the 2,000 cfs minimum flow, the inflatable rubber flashboard system shall be deflated to release flows in an expeditious effort to minimize downriver effects on water quality and aquatic habitat. Except for the initial 2-minute siren warning and a safety flow of 200 cfs for 15 minutes, such flows will not be ramped. The protection of downriver water quality and aquatic habitat is a higher priority than prevention of channel scouring and destruction of vegetation in the Back Channel. During periods of high seasonal flows, the initial 2-minute siren warning and safety flow of 200 cfs for 15 minutes will also be used. Following this 15-minute release, increases of 400 cfs per hour will be made until either the required flow is met, the elevation at Stone Dam is less than 459.45 feet, or the inflatable rubber flashboard system is fully deflated, if necessary. The ramping up of seasonal flows in the Back Channel will be done only after the hydraulic capacity of those units available has been attained."[2]

GLHA's self-serving obfuscation of its capability for releasing target flows below Stone Dam from its rubber dam fails to obscure its transparent attempt to avoid completing this study and assessing projects effects on whitewater boating opportunity on this dewatered section of the West Branch of the Penobscot River. GLHA should proceed to complete this study in accordance with the study medication determination and approved methosolgy.

9. Aesthetics

GLHA's aesthetics study fails to adequately assess the effect of project facilities and operations on aesthetic resources. For example, the study methodology evaluated reservoir levels on two randomly selected days rather than systematically comparing the effects of impoundment fluctuations at maximum and minimum elevations using the same group of study participants. In the first evaluation, GLHA used its paid consultants as evaluators introducing an element of bias into the study results. Subsequent evaluations by stakeholders provided some balance, but the lack of comparative flow conditions at different impoundment levels as well as the lack of comparative flows below Ripogenus Dam obscures the true effects of GLHA's flow alteration. Additionally, GLHA used only a single KOP in the Upper Gorge and did not include photographs or views from other KOPs. GLHA's rational that there are limited views from the Upper Gorge Trail endeavors to use its own failure to provide

[2] https://lowimpacthydro.org/wp-content/uploads/2020/07/20190603-Initial-LIHI-Application-Millinocket-Dolby.pdf at p.29.

access into the Upper Gorge as a basis for omitting an assessment of the effects of its flow diversion and dewatering of the river on aesthetic enjoyment. Additionally, the study fails to compare aesthetic views of the Upper Gorge under various flow conditions. Stakeholders at the USR Meeting expressed that they have additional photos and videos that should be added as an appendix to the study report and that the licensee should set up a Dropbox or other data sharing location that stakeholders can upload additional video. AW/AMC support that request.

15. Environmental Justice

GLHA's Environmental Justice study was limited to the effects of any proposed construction activities on Environmental Justice target populations within a 5-mile radius of the project. Inasmuch as no construction activities were being proposed, the study found no adverse effects from dust, noise, traffic, siting, etc on disadvantaged communities. While this analysis is useful, it fails to present a complete picture of potential project impacts because it ignores ongoing project operations. While we appreciate that FERC's environmental justice methodology is a work in progress, we believe that this analysis should not only include an analysis of impacts on those residing within a specified radius but also the impact on the wider community including Tribal members and vulnerable populations that utilize project waters for subsistence fishing, recreational enjoyment, and traditional cultural uses and/or artifacts. We encourage GLHA to continue outreach efforts with the Penobscot Indian Nation and other Tribal representatives during the relicensing process.

## Conclusion

We respectfully request that the licensee for the Ripogenus Hydroelectric Project and the Penobscot Mills Hydroelectric Project update the draft studies incorporating the feedback provided in these comments and complete continuing studies consistent with the approved SPD methodology or to continue to further study where study goals and objectives have not been achieved. Completing these studies as described herein by AW/AMC will provide FERC with additional information to complete its NEPA analysis of project impacts to determine appropriate license conditions that are protective of envitonmental values and mitigate project impacts. Thank you for considering these comments.

Respectfully submitted this ___ day of June, 2024

**Subject: Ripogenus Hydroelectric Project (FERC No. 2572-133) Updated Study Report comments.**

Dear Secretary Reese,

The following comments on the Updated Study Report (USR) for Ripogenus Project (P-2572-133) are submitted on behalf of members of the Caribou Chesuncook Lake Camp Association, the Chesuncook Dam Camp Association and the Chesuncook Village Association. These associations represent individuals with a significant investment in time, treasure and commitment to Chesuncook, Caribou and Ripogenus Lakes. Many multigenerational families are part of this stakeholder group. We have extensive experience with, and knowledge of the lakes. Our stakeholder group also includes members of the Maine Wilderness Guides Association, fishing guides, commercial guiding businesses, and other recreational users of the lakes. I have been involved in the ILP since the initial PAD was presented and I, or my wife, have attended every possible stakeholder meeting. This involvement, enhanced by our vast experience as Recreational and Whitewater Guides on project lakes and rivers beginning in the early 1980's, deepens our understanding of the project, the process, and the multiple users and stakeholder groups. Like many in our stakeholder group, I have seen numerous changes in the aesthetics and recreational use of the project in recent years. I will be commenting on the operations that impact these changes and on the Second Year Recreation and Aesthetics Studies.

## The Lakes Above Ripogenus Dam - a highly valued resource of the State of Maine

To understand the recreational and aesthetics impact of project operations one must understand the value of the lakes to the people of Maine. All the lakes, rivers and streams within the project are beautiful and, like Chesuncook Lake, offer multiple, high quality recreational opportunities. The State of Maine Land Use Planning Commission rates Chesuncook and Ripogenus Lakes as Class 2. Management Class 2 lakes are high value, accessible, undeveloped lakes. The Commission conserves the special values of these lakes by significantly restricting the density and intensity of development to one development unit per mile of shoreline. A large portion of Chesuncook Lake is also within a Conservation Easement. Other lakes within the project are Management Class 4, 3 or 1. Management Class 4 lakes are high value, developed lakes, Class 3 lakes are identified as potentially suitable for development. Class 1 lakes share characteristics of Class 2 lakes, except they are less accessible. Chesuncook is unique. It is of highest value, developed mainly on the north and south shores with future development limited, and yet is still

accessible. Further demonstrating the lake's status as a valued fishing, boating and canoeing destination, Maine statute prohibits jet skis from Chesuncook, Caribou and Ripogenus lakes. These lakes are remote, wilderness gems.

Chesuncook Lake's remoteness and undeveloped nature is what makes it so important to the state of Maine. So valued that the State of Maine employs a full-time Lake Ranger, May through October to monitor and maintain the public campsites on Chesuncook Lake, including Umbazookus and Gero Island. This ranger assists the numerous public, private and commercial canoe campers, recreational boaters and fishermen and women who use the lake including Bowdoin College, Colby College, Outward Bound, the Sierra Club, the LL Bean Discovery Program, and numerous private fishing and canoe camps and outfitters.

The lake is steeped in history. The Wabinaki–Thoreau Canoe Trail, a 200 mile network of paddling and hiking routes once used by Henry David Thoreau and members of the Wabinaki Nations, passes through Chesuncook Lake. The lake also hosts the Northern Forest Canoe Trail. This 700 mile trail is the longest water trail in the nation spanning New York to Maine on traditional routes used by Indigenous peoples, settlers and guides.

The pristine beauty of Chesuncook Lake attracts recreational users today to the remote campsites and the developments at the north and south end. At the north end of the lake lies Chesuncook Village. A bustling community with an active church and museum, and a large, quintessential, iconic lodging facility. Just across from the village, is Gero Island, a state Ecological Preserve within public reserved lands, one of only 17 in the state within the Maine Natural Resources Program, hosting 5 of the State of Maine's public campsites.

On the southern end of the lake sits the Chesuncook Dam Village which holds the Chesuncook Lake Boom House Museum honoring the logging history of the area, and hosting over 600 visitors yearly, a commercial fishing and hunting business, many private cottages and is the take-out point for the famous West Branch canoe trip as well as the launching point for lake adventures. Multiple private camps dot the shoreline between the north and south shores.

Numerous private camps line the west shore of Caribou Lake and join a large neighborhood of private camps on the east shore. On a summer day one will see recreationists canoeing, kayaking, motor boating and fishing. Winter brings adventurers snowmobiling, ice fishing and Nordic skiing. The lakes are always alive with those savoring the beauty and recreational opportunities the lakes offer.

The previous licensee understood the recreational value and use of the lakes north of Ripogenus Dam and managed the lakes in a balanced manner with an average drawdown "*during the recreation season from 1972 to 1985 was 3.45 ft. The maximum drawdown of the impoundment during the recreation season for the period of record was 15.25 ft in 1980, an extreme low water year when the impoundment began the season 11.4 ft below the normal high-water elevation.*"

There is also immense economic value to the lakes. A recent study by the University of Maine reveals Maine lake's economic value at a staggering 14 billion. The Bureau of Economic Analysis found Maine is the third most heavily involved state in the recreation industry. The report credits Maine's world-class outdoor recreational assets and predicts Maine's outdoor companies who are innovative and sustainable have "great potential for future growth." A study of outdoor recreation in rural Maine found a potential for doubling the industry in the next ten years, from $2.3 billion in 2017 to $5.6 billion in 2030. Outdoor research also shows that access to the outdoors is a major element in recruiting talent." Outdoor recreation encompassed 4% of the state gross domestic product in 2022. As explained by Jenny Kordick, the executive director of Maine Outdoor Brands, "Outdoor recreation isn't just a pastime; it's the heartbeat of our state's economy." The Piscataquis County Economic Development Council believes in the potential of the region as well and identifies Chesuncook Lake as "one of Maine's recreational highlights."

The recreational value of Chesuncook, Caribou and Ripogenus lakes cannot be overstated. The Maine Department of Agriculture, Conservation and Forestry, in a 2004 policy on FERC hydropower project licensing, directed the Bureau of Parks and Lands "*engagement to be focused on 1) public recreational facilities and access, 2) adequacy of flow releases for boating, and 3) the effect of the project on public lands. The primary concern of the Bureau is to avoid or reduce the adverse impacts of continued, increased or fluctuating impoundment levels and downstream flows on public access, wildlife habitat, forest resources, aesthetic resources, recreational facilities, and public trust rights on these lands."* These lakes matter to the people of the state of Maine. As one of the user survey respondents stated, "*I love any recreational experience I have on Chesuncook Lake. It is an invaluable natural resource to the state of Maine because of its remoteness and beauty. I have been coming to Chesuncook Lake many times a year for the past twenty years, and it's a lake I plan to return to for the rest of my life. It's one of my favorite places in Maine to motorboat, kayak, canoe, paddleboard, and swim in the summer."*

The images below demonstrate the impact of project operations on recreationists, boaters, fishermen and those using remote camping sites cared for by the Maine Bureau of Parks and Lands that were not captured in the study reports. The **safety of campers** as well as the **limited access** are quite apparent.

**Near Cardesa Point BPL campsite at near full lake and again at low water**

**The access between Chesuncook and Caribou Lakes at near full lake and at low water.** Look closely at the second picture where you will see a canoe trying to navigate the narrow channel. The canoeists eventually had to walk their boat. Motorboats could not pass.

**Mouser Island, one of the most heavily used BPL sites on the lake, at high water and at low water.** The rocky shoreline makes walking extremely dangerous and limits access.

**SANDY POINT CAMPSITE, POPULAR WITH MOTORBOATS AND CANOES HIGH AND LOW WATER**

**Looking at the famed Gero Island, part of the Northern Forest Canoe Trail, the Wabinaki-Thoreau Trail, and an Ecological Preserve at high and low water**

One can see from the above images, project operations limit **safe access** to Bureau of Parks and Lands campsites, **threaten the safety** of those recreating, and diminish **the aesthetic value** of the lakes.

## Recreational Study Comments

### User Survey comments

Note: At the USR meeting May 15 and 16, 2024 it was requested omitted surveys be summarized and shared. This request was not included in the Study Summary Notes submitted by Brookfield.

- **All completed surveys are not included in the User Survey Reports.** On page L38 of the Recreation Study we are informed *"A total of 87 surveys were completed for non-Project recreation sites (i.e., Chesuncook Lake Remote Campsites, Big Eddy, Gero Island, Chesuncook Village, private camps). Additionally, there were 10 surveys collected that could not be attributed to a specific recreation site.* ***Results from these 97 surveys are not included in this report."***

There are multiple reasons the above statement is incorrect and why all surveys should be included in the study report.

1. Chesuncook Lake Remote Campsites, Gero Island, Graveyard Point at Chesuncook Village**) are cited as FERC Approved Recreation Sites** for the Ripogenus Project in the first Recreation Study (Appendix P-165 and chart below).

**Table 5.8-1**
**Formal FERC-Approved Project Recreation Sites at the Ripogenus Project**

| Recreation Site Name | Development/Location | Recreation Facilities | Notes |
|---|---|---|---|
| Caribou Lake Put-in | Ripogenus impoundment: Western Shore of Caribou Lake basin on the Golden Road | • Primitive gravel boat put in | Managed by GLHA |
| Chesuncook Dam Point Boat Launch | Ripogenus impoundment (Chesuncook Lake basin) on Chesuncook Lake Road off the Golden Road | • Single lane gravel boat launch.<br>• Parking for multiple trailered vehicles<br>• Informational kiosk<br>• Restroom | Managed by Penobscot River Corridor |
| Chesuncook Lake Remote Campsites | Ripogenus impoundment: 10 campsites at various locations around Chesuncook Lake | • Cleared tent site<br>• Fire pit (at some) | Managed by Penobscot River Corridor |
| Umbazooksus Stream Campsites | Ripogenus impoundment: Northeast end of Umbazooksus Cove | • 2 campsites<br>• Cleared tent sites | Managed by North Maine Woods |

The previous applicant also recognized these sites as stated in their 1991 EIS: *"There are 10 remote campsites on Chesuncook Lake, some of which are water access only. These campsites are primarily accessible via boat and are located around Chesuncook Lake and on Gero Island. These sites are managed by the PRC. These campsites are classified as either Authorized or Permitted. Authorized campsites are allowed to have fires without a permit, while the permitted campsites require users to obtain a fire permit from the Maine Forest Service. These campsites are primarily used in the summer months and enable recreational users to camp out on and along the shores of the lake to fish, hunt, swim, and generally recreate within the Project area. There are two other remote campsites further north in Umbazooksus Cove managed by North Maine Woods. These*

*campsites also provide boat access to the northeastern end of Chesuncook Lake and the Upper West Branch, which enters the lake just north of Chesuncook Village."*

2. The survey itself asks respondents in **question 5 about which site** was visited and includes "Chesuncook Lake Remote Campsites (please respond to Question 9)." Question 9 then asks, "Which remote campsite did you visit and how did you access the site?" Not including the results of these questions in the report **misled many respondents** and **leaves a void in understanding the experience** of remote campsite users. These users are typically at sites multiple days, have a deep understanding of the area and directly experience the impact of project operations. Their surveys should be included in the report.
3. **Big Eddy** is not a FERC approved site, but **IS within project boundaries and IS the mecca for fishermen and women**. Big Eddy is **the** meeting place for fishermen and women. These people know the river intimately and understand project operations and their impact on the fisheries.
4. Respondents from camp owners are well within the project boundaries and as has been clearly demonstrated throughout the licensing process, are directly impacted by project operations.
5. **Respondents from Big Eddy and Camp Associations did not know their responses would not be included as the survey never stated that certain responses would not be included.** Question 27 asks "Which recreation site did you visit on this trip today or visit most recently" and includes an option of "Other."
6. The survey also asks, "If you or other members of your immediate family own or lease a camp adjacent to or in the immediate vicinity of any of the Ripogenus or Penobscot Mills Project impoundments, please select which lake the camp is near?" **No indication was given that responses from those who own or lease a camp would not be included in the report.** In fact, when we requested that surveys be mailed directly to camp owners, we were told to just have owners fill out surveys online or from kiosk sites. It should also be noted that in the previous relicensing, surveys were mailed to all camp owners as well as all residents of Millinocket, East Millinocket and Medway.
7. Over 25% of users at the Ripogenus Project Sites reported staying more than 48 hours. These are the remote campsite users. One wonders how much greater this number would be if all surveys were included.
8. GLHA installed survey kiosks at the Umbazooksus West campsite and **the Graveyard Point Boat Launch**, stating, *"The user survey was designed to collect information on group sizes, recreation activities, length of visit, other recreation sites used, crowdedness, user satisfaction, site quality and condition, user opinions, angling, and regional recreation experiences."* **Why were kiosks installed if surveys were not going to be included in the survey results?**

**<u>Summary paragraphs do not always reflect the comments from the surveys.</u>**

Summary paragraphs paint a rosier picture of user satisfaction than user comments indicate.

**Winter Recreation Survey Comments**

The surveys collected over the winter focused on summer experiences: *"In the second-year Recreation Study Plan, GLHA proposed to analyze the surveys collected in the winter separately from the rest of the surveys. In total, 42 surveys were submitted over the winter (December 2022-February 2023, December 2023-February 2024). However, based on responses to open-ended questions, all except one or two surveys were based on recreation experiences in the summer. Thus, GLHA did not analyze the winter surveys separately."* The fact winter survey responses focused on the summer indicates the immense impact of low water levels during the summer recreational season on lake users.

Winter recreation survey results on Chesuncook, Caribou and Ripogenus lakes are not representative of actual use. 42 surveys collected over two winter seasons is a gross under representation of users. Throughout the winter there were no paper surveys available, kiosks were hidden by snowbanks, and QR codes quickly became unusable due to sun fading. The actual use is much greater. A smaller than normal area was plowed this year resulting in no place to turn a trailer around and congested parking along the road. Finally, towards the end of February a privately owned commercial outfitter arranged for a larger area to be plowed. Winter is a busy time on the lakes. I have seen more than 42 people ice fishing in one day, not the reported 42 people in two years! The survey did not capture the true use.

**Recreational Trails:**

What is now called "the Upper Gorge Trail" was never designed as a trail. It was the access road to build and maintain the overland log chute that Great Northern Paper built to sluice logs around the dry section of the West Branch below Ripogenus Dam. It was then used as the river access at Mckay Station for many years. Ripogenus Gorge is one of few gorges in Maine and certainly a spectacular one. As the image below shows, the "trail" is in disrepair and in need of maintenance. Recreational and scenic access to the gorge should be provided with multiple overlooks and river access points. There is only one short section of the log chute remaining. It should be preserved, and signage added to highlight the history of the area. Given that the economy of the area now depends on the recreation economy we need to take advantage of this outstanding natural resource.

## Operations Model Comments

The Operations Model proposed has been discussed at length in meetings and on numerous submissions. As has been supported by others, we would like to emphasize the need for the model **to use 941.6 as full lake in the Ripogenus Lakes with .5 feet up/down for freshet**. This is the established level in all other licensee submissions from the PAD to the USR. The 2000-2023 Operations Data tells us the lake was filled to near 940 feet 70% of the time on May 15th. In the 1991 License Application the applicant states**: "**Between 1972 and 1985 the impoundment was at or near its **normal high water level (El. 941.59') 11 times out of 14 (78% of the time) on Memorial Day**. The previous licensee was able to fill the lake in May, so should the current one. The energy generation claimed in historical operations is based on 941.6 as well.

At the URS meeting Brookfield representatives explained the need to use the 939'as "operational full pond" to prevent flooding and needed extra absorption capacity beyond North Twin due to the larger size of the watershed. Almost all the upstream inflow and that of the extensive storage lakes and ponds is managed by the current operator. The technology and ability to manage flood control is available without starting a recreational season at 939'. Failure to use 941.6 as full lake in the Operations Model risks the accuracy of the model and potentially skews results in multiple ways, including creating an appearance of less energy being produced.

Target elevations of the Operations Model are unrealistic and are not aligned with historical levels as claimed. The Target Elevation for the Ripogenus Development of 928.8' on October 15th is simply an average of elevations on that date the past 10 years, which assumes the past 10 years have been typical operations management. They have not. The actual historical elevation on October 15$^{th}$ has been above 928.8 feet 17 out of the past 22 years.

## Aesthetics Study Comments

The Aesthetics study confirmed what we already knew: The project region is incredibly beautiful and project operations negatively impact the aesthetics of the Chesuncook, Caribou and Ripogenus Lakes. Unfortunately, participants were unable to assess some of the most valued KOP's on the lakes. Despite emails agreeing to use photos and videos submitted by focus group participants as KOP's, at the meetings we were told submitted images would only be included in the report, but not evaluated. As you will see from images below, there is a vast, substantial difference between images submitted by participants, and those given by GLHA.

Although the report states, "*Through a collaborative discussion, it was determined that due to the time of the year and logistics, it would not be safe or practicable to visit and evaluate the "from the water" perspective KOPs, the remote campsite KOPs, or the Caribou Lake Boat Launch."* A collaborative discussion between Focus Group members never took place. Focus Group members were simply told we would not be visiting remote KOP's or observe "on the water" perspectives. There was no collaborative discussion.

The report further claims, *"Instead, GLHA requested that focus group members provide additional photographs or videos of these KOPs to help supplement those gathered as part of the First Year Study."* GLHA representatives refused to allow the focus group to evaluate submitted pictures and videos, which were accurately representative of the "boater's perspective" and "remote campsites" KOP's, "*to identify visual values and develop a baseline rating of the aesthetic value of the views from each KOP."* Instead, we were told we needed to use the "Boater's Perspectives Images" taken by GLHA of the "Most Notable View/Representative View."

The images below, and included videos provide an accurate representation of the lakes from the water, or boater's perspective, as compared to the still images focus group members were required to use. It is easy to see participant images are much more representative of the lakes and capture the "Most Notable View/Representative View."

**Caribou Lake Boater's Perspective Image – be sure to view included videos, which also include views of Katahdin, the largest of the many mountains visible.**

East View

6/21/2022 2:25pm East View, Ripogenus Lake Boater's Perspective

9/13/2022 3:20pm East View, Ripogenus Lake Boater's Perspective

At the ISR meeting and in ISR comments the need to compare the impact of project operations on project aesthetics was discussed. As part of the focus group participants compared and rated images from spring to fall at specific KOPs. Although the comparison of images clearly demonstrated diminished aesthetic value as the lake levels dropped, the lake level at the time of comparison (approximately 936 feet) was unusually high due to a wet summer and a damaged turbine and does not represent typical fall levels. A level of 936 feet in October has not been seen since 2014.

The pictures below show comparisons from full lake to low water and demonstrate project operations impact on access within and between lakes, aesthetics, boater safety, recreational safety, user enjoyment and user experience. The aesthetic discrepancy is vast.

Videos from a boater's perspective on Chesuncook, Ripogenus and Caribou Lakes are included in this submission. These are the videos we wanted to use for "boater's perspective" KOPs but were not allowed to. They give the observer a complete image of the lakes.

**The south end of Chesuncook Lake at high and low water:**

**The thoroughfare between Ripogenus and Chesuncook lakes from the Chesuncook Dam Site High and Low Water**

**What someone recreating on the lakes experiences at low water:**

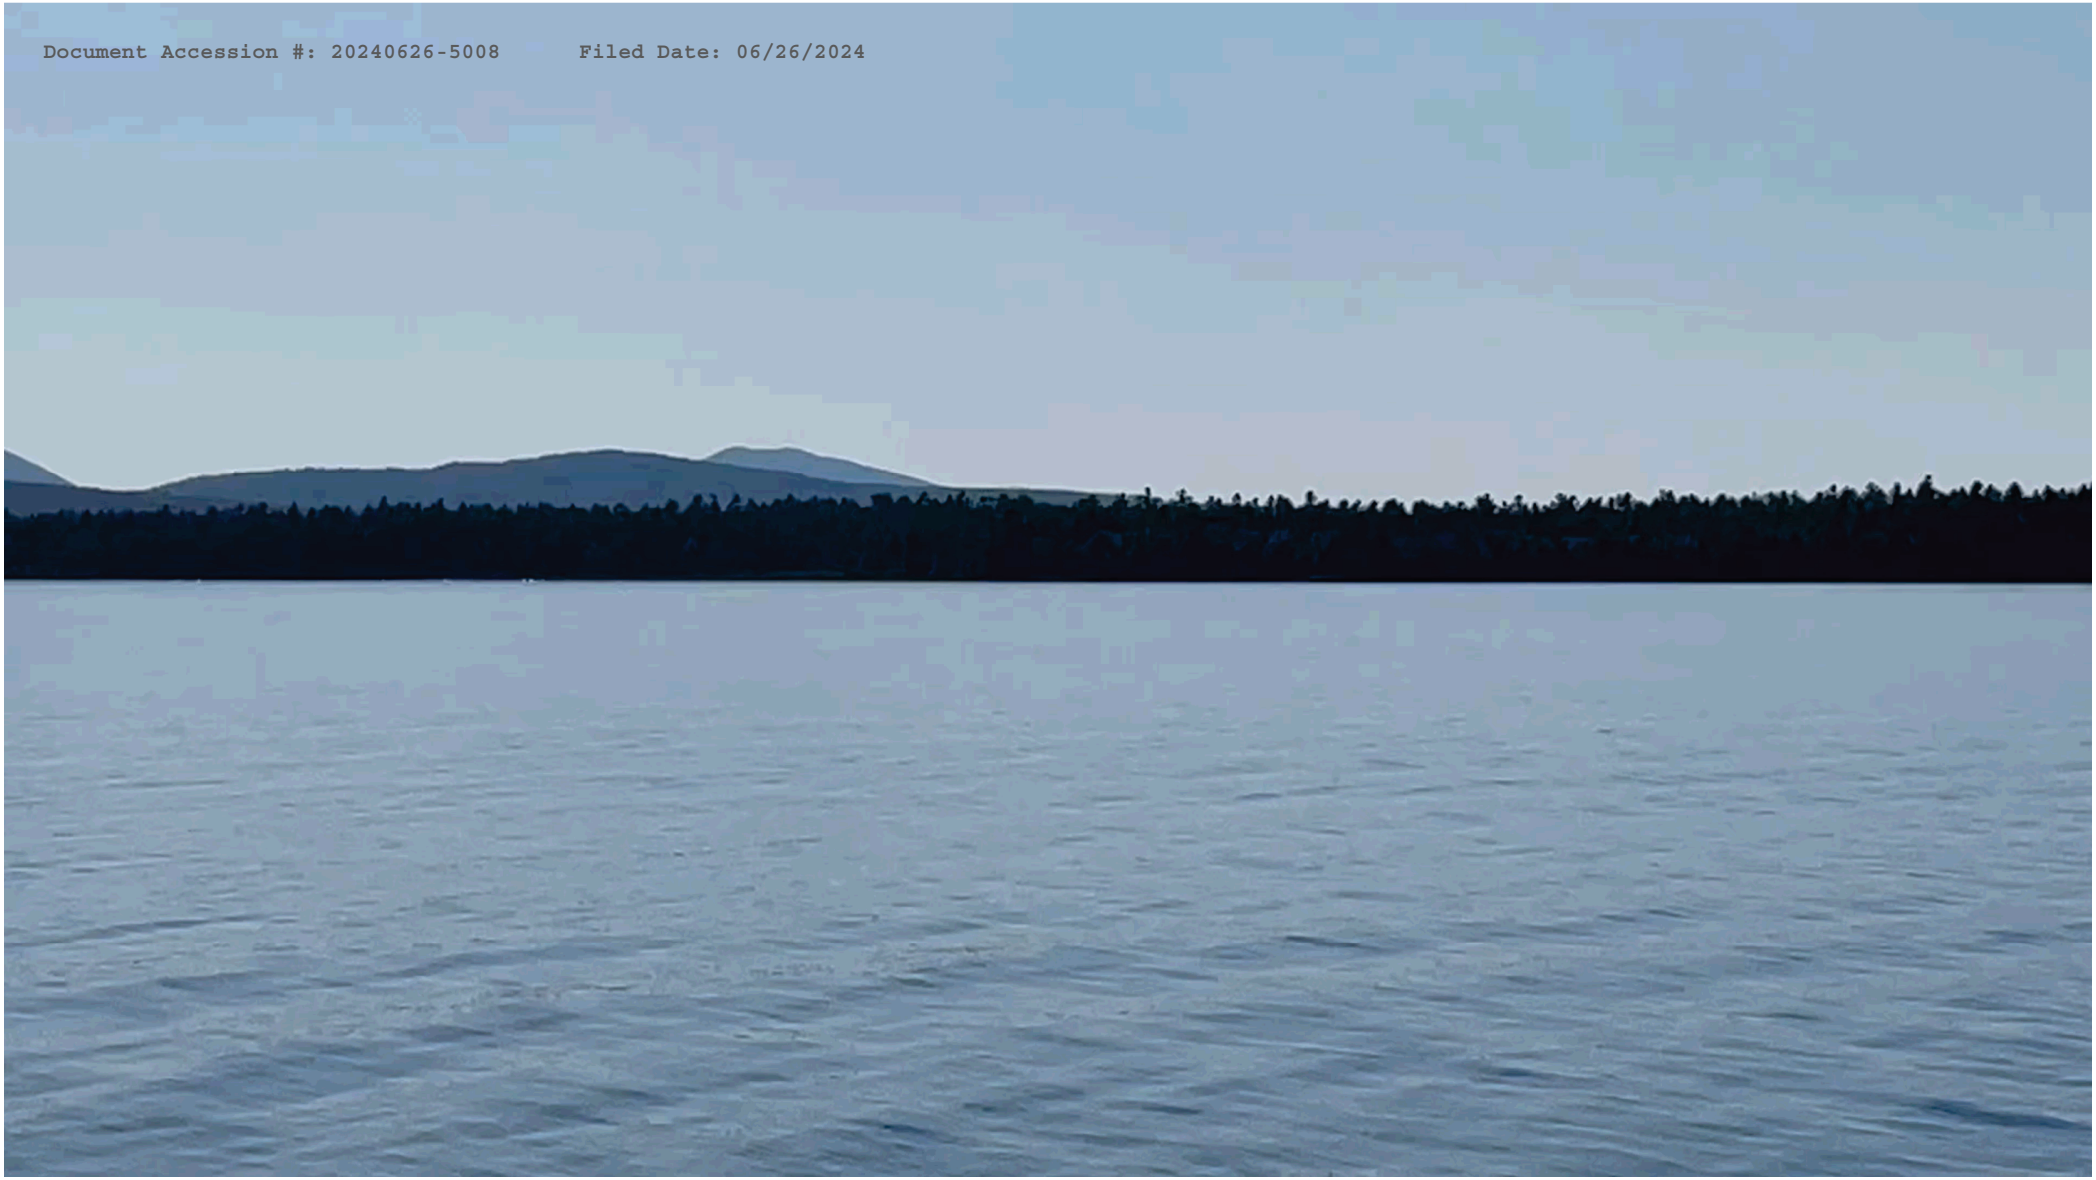
Clearly, Recreation and Aesthetics on Chesuncook, Caribou and Ripogenus lakes are significantly impacted by project operations, much more so than the study reports revealed. **Access** to and between lakes **becomes limited and sometimes dangerous,** campers at **public sites** face **unsafe conditions** including having to walk long distances over slippery rocks to access water for drinking, cooking, cleaning and extinguishing fires. These difficulties combined with an unpleasant aesthetic significantly diminish a user's experience.

Maine is nationally known for its beauty and recreational opportunities. Outdoor recreation is a major economic force in the region and promises to become even larger. All the lakes and river stretches in the project must also be managed to protect their aesthetic value and recreational assets. We seek to ensure a strong lake and river fishery, abundant recreational opportunities and secure wildlife habitat through an informed, balanced license. We support other agency and NGO requests that seek to thoroughly and accurately inform the process to create a beneficial license for all stakeholders, including fish and wildlife. We are confident that given an accurate picture of the project today, and an inspired vision for the future, this is possible.

Thank you for the opportunity to submit comments and share our unique stakeholder perspectives. We greatly appreciate the time taken by FERC to read and consider our thoughts.

Sincerely,

Bill Houston



Spokesperson, Caribou and Chesuncook Lake Associations

Document Accession #: 20240626-5008 Filed Date: 06/26/2024

Debbie-Anne A. Reese, Acting Secretary June 26, 2024
Federal Energy Regulatory Commission
888 First Street, N.E.
Washington, DC 20426

**Subject: Ripogenus Project, FERC No. 2572; Great Lakes Hydro America's June 21 Response to FERC's** May 24, 2024, Additional Information Request

Dear Secretary Reese Via Electronic Filing

This filing is intended to clarify goals set forth in my July 28, 2023 and February 2, 2024 filings that, in summary, sought to provide additional outage protection to West Branch of the Penobscot River fish and aquatic communities during the relicensing process. Nothing I wrote dealt with maintenance at McKay Station and the need to return McKay Station to operational status. Additionally, as has often been the case, Great Lakes Hydro America (the Licensee) is offering an opinion regarding fish and aquatic communities that is not based on facts. The survivability of salmonid (fish) and aquatic communities as they relate to "travel time" of water is ignored.

The Licensee responded to FERC's May 24, 2024 request on June 21, 2024. In this filing the Licensee's response included "*GLHA does not believe that staffing of the station would appreciably reduce fish mortalities during an outage."* This ignores the facts and simplicity of my request. I made no mention of staffing McKay Station. My suggestion was simply that a person (or persons if safely issues are involved) be sent to Ripogenus Dam possibly using the "Dam Tenders house" when Weather Radar suggest lighting strikes are a possibility. The 500 yard trip from the Dam Tender's house to the Ripogenus Dam gate house and starting the gas generator would have a deep gate open within 15 minutes. Lighting storms are relatively short, this preventive measure would be practical, cheap, and effective.

Furthermore, the Licensee would have the stakeholders, agencies and FERC staff believe that "time saving" is unimportant. The Licensee is ignoring its own data collected in the Stranding Study. While the sudden loss of river flow has major and disastrous impacts on aquatic macroinvertebrates and juvenile fish, impacts occur over time and distance. Fish and aquatic macroinvertebrates

can survive dewatering for several minutes; longer depending on temperature; even longer if the full impact of station outages has not reached downstream habitats. Time matters when emergency West Branch flows are considered.

The Licensee also discusses outage penalty *funds* citing agreements made with Maine Department of Inland Fisheries and Wildlife following the Moose River (P2615) outage. This discussion is largely irrelevant to discussions of short term protection, as any penalty phase would likely be a License article. First and foremost, the goal for McKay Station and the downstream West Branch should be maximizing fish and aquatic communities protection. The suggestion of a “Moose River renumeration model” should only be considered as a last resort. A penalty for each event should be 25 % of the capital cost of the most practical bypass option.

Thank you for the opportunity to clarify/restate my suggestion that would provide fish and aquatic communities additional protection during unplanned McKay Station outages during this relicensing process.

George Forgette, Schuylerville, NY.
Project: P-2572-133

It was 1965 when I was in grad school at Cornell University that I first fished the West Branch of the Penobscot. Our first visit of the West Branch and the fishing was awesome. Everything the fishing magazine article wrote about was true. The West Branch is the gem of rivers east of the Mississippi. You could consistently catch a 3 Â½ - 4-pound salmon on a dry fly, streamer or nymph in 3-4 days of fishing. What an opportunity for a parent to take a child (female or male) who could cast a fly line salmon fishing at only the cost of a license and pitching a tent.

Iâ€™m an 83-year-old retired math and science teacher (grades 7-12) and college with courses in physics, chemistry, biology, and earth science. I am past president of the Adirondack Chapter of Trout Unlimited.

Over the years, my wife and I would see mid to late June swarms of mayflies and/or caddis flies between the Little Eddy and Big Eddy at dusk. On occasion, an osprey would put on a show, diving into the river and get airborne with a 14-inch salmon. From time to time weâ€™d see a family of river otters.

Sadly, much of the latter has disappeared since the year 2003 when Brookfield took over management of the water flow. Brookfield treats the water source like a yo-yo, fluctuating as much as plus or minus 2,000 cfs, based on energy demand. Great Northern, consistently, ran the water from 2600 to 2800 cfs. If there was a problem at the power plant (McKay Station) the water flow was dropping, there was a maintenance staff flying up the road to fix the problem. I timed it one day, about 30 minutes from Millinocket. During station shutdown, all the time water was continually released from the bottom of the dam through Ripogenus Gorge to the Little Eddy and downstream, benefiting the salmon, trout and insect life all year long. Remember the characteristics of water during winter. The top of the lake ice was 0 degrees Celsius, the bottom of the lake 3-4 degrees Celsius warmer than the top. The water release will became more critical in years to come as climatic warming increases, and especially during the summer time.

I no longer see smelt in the river, which was the major source of food for the salmon along with some of the bird life that fed on smelt. A study needs to be done on Ripogenus impoundment as well as the smelt access to their spawning streams and subsequent passage of smelt downstream of McKay station.

I understand that a biologist, contractor to Brookfield, shocked the Big Eddy in May. Of course the contractor would do exactly what Brookfield asked them to do; no more or no less. However, the upstream movement of salmon varies from the first week to the fourth week of June (1991 FERC licensee application). Their report, probably, includes the length and weight of the fish and that they looked healthy. Whereas, if they took scale samples, Brookfield would have much more information about the salmonâ€™s age, growth rate, etc.

Scientific American has several articles in the past 2 y ears about information and disinformation. By not sampling other pools and not getting scale samples, it is bias sampling. I would anticipate Brookfield using the contracted biologistâ€™s report; everything is fine with the salmon and insect life. This is disinformation; the general public would not be aware how they are being misinformed. A good measure of the lack of salmon is a lack of fishermen. The Big Eddy campsite should be full in the third week of June. It is not. This lack of users affects the whole economy of the area, campgrounds, and businesses in Millinocket.

The only way to submit information or comments is by computer online. Itâ€™s a problem for some of us older folks. Please talk to or elicit information from fishermen that have 40 or more years on the river.

The West Branch is a gem of gems river, if properly managed, to be what it once was to everything, it could be to all in the future.

**Re: MDIFW Comments on the Updated Study Report for the Ripogenus Hydroelectric Project (FERC No. 2572) and Penobscot Mills Hydroelectric Project (FERC No. 2458)**

Dear Acting Secretary Reese:

The Maine Department of Inland Fisheries and Wildlife (MDIFW) has reviewed Great Lakes Hydro America, LLC's (GLHA, Licensee) Updated Study Report (USR) and associated study reports for the Ripogenus and Penobscot Mills Projects filed April 22, 2024. MDIFW staff also attended the USR Meeting held May 15 and 16, 2024. We provide the following limited comments on the USR below and will provide more thorough comments on the Draft License Application (DLA).

North Twin Impoundment Tributary Access Study Report

The report indicates the Tributary Access Study was conducted on November 6 and 7, 2023, at a water surface elevation level (WSEL) of 489.7 feet. Furthermore, the report states:

> "*Since 2012,[2] Article 408 of the Penobscot Mills Project license has required the North Twin impoundment elevation to be maintained at a relatively stable level from May 1 through August 22 annually and maintained at a minimum target elevation of 488.42 from August 22 through October 15 (i.e., no more than 3.5 feet below the full pond elevation). The license also requires a minimum flow of 3,000 cubic feet per second (cfs) from the North Twin Development from August 22 through October 15, so long as the impoundment elevation exceeds 488.42 feet.* ***From October 15 to the start of the spring freshet, the impoundment elevation is gradually reduced to a lower target elevation of 479.42 (12 feet from the normal full pond elevation) to provide storage for winter thaw and spring inflows.*** *From ice out to August 22, the impoundment is refilled and then maintained at a relatively stable target elevation*."
>
> ***"Daily average water surface elevation (WSEL) data from the North Twin impoundment between 2012 and 2022 show that during the Landlocked Salmon spawning period (October and November), the mean low WSEL was 487.86 feet (4.1 feet below normal full pond elevation), and the median low value was 487.96 feet (4.0 feet below normal full pond elevation)*** *(Table 1-1). The lowest impoundment elevation recorded in this time period*

PHONE: (207) 287-5254 FISH AND WILDLIFE ON THE WEB: www.maine.gov/ifw EMAIL ADDRESS: IFWEnvironmentalreview@maine.gov

> *occurred on November 30, 2019, at 485.37 feet (6.5 feet below normal full pond elevation).* ***The highest impoundment elevation in this period occurred on November 16, 2013, at 489.43 feet*** *(2.5 feet below normal full pond elevation) (Figure 1-1).”* (emphasis added)

*Nahmakanta Stream*

Again, the North Twin Impoundment Tributary Access Study was conducted at an impoundment level of 489.7 feet, or 2.1 feet above the mean low WSEL for the 10-year landlocked salmon spawning period of October and November 2012-2022, and 0.27 foot higher than the highest recorded impoundment elevation for the same period. Tributary access would not be expected to be impeded during these high flows. Table 1-1 (Appendix E, Pg.4) shows the lowest daily average elevation level of the North Twin impoundment between October and November 2012-2022 varied from 485.37 to 489.43, while Figure 5-5 (Appendix E, Pg.18) indicates a bottom elevation contour for the upper reach of the impoundment in Nahmakanta Stream to range from 484-488 feet. Further, Figure 5-6 (Appendix E, Pg.19), Nahmakanta Depth Contours, shows the stream depth in the upper reach to be 2 feet minimum at the WSEL 489.7 feet at the time of survey. Therefore, a WSEL of 489.7, minus 2 feet of water depth, equals 487.7 feet bottom elevation. The study report refers to an accepted zone of passage (ZOP), or minimum depth of water suitable for salmon passage, of 0.5 feet. Adding 0.5 feet to a streambed elevation of 487.7 feet yields a water surface elevation of 488.2 feet as the *minimum* necessary to permit landlocked salmon passage. Applying the lowest daily average WSEL of Table 1-1, the North Twin impoundment appears to have been below the upper stream reach bottom elevation contour ZOP nearly 73% of the years from 2012-2022 during the landlocked salmon spawning period. Low water-surface elevations in Nahmakanta Stream appear to not only block safe, timely, and effective passage of landlocked salmon to spawning habitat, but also expose and prevent the use of valuable spawning substrates.

*Original MDIFW proposed study request*

MDIFW’s originally submitted “*Comprehensive Impoundment Landlocked Salmon Habitat Use/Spawning Study*” in part requested the Licensee to radio tag and track a number of landlocked salmon to: assist in determining seasonal movements and behaviors of landlocked salmon (within and between the five connected lakes), observe any effects of annual Project drawdowns on the movement and behaviors of landlocked salmon in the impoundment, and help identify landlocked salmon spawning areas within the North Twin impoundment and project boundaries.

The telemetry portion of the request was denied and subsequently modified to become the “*North Twin Impoundment Tributary Access Survey*”. The Licensee’s study modification ignores seasonal salmonid movement into, out of, or within the 18,000-acre North Twin impoundment including windswept shoal and shoreline spawning habitats, particularly during fall spawning period. It is MDIFW’s position that the Tributary Access Study, without the recommended telemetry component, has failed to identify salmonid movement or habitat use within the lacustrine shoals and shoreline of the North Twin impoundment. Additionally, any salmon movement into the outlet during the fall spawning period has not been documented. Outlet flows of the North Twin impoundment are controlled by the Project’s North Twin Dam and could have

an effect on spawning timing and success. As was requested for the initial study, radio-tagged salmon could help identify potential salmon movement into the outlet and the efficacy of the North Twin Dam fishway to pass salmon back upstream into the impoundment after spawning.

There is virtually no information on what effects Project seasonal water level fluctuations may have, or may not have, on landlocked salmon life histories, most importantly spawning and rearing potential. Tracking landlocked salmon movements through the use of radio telemetry within the North Twin impoundment would document timing and spawning locations of naturally reared salmon, as well as identify any potential effects of Project operations on spawning behavior. Location of salmonid spawning habitat could potentially help inform fisheries managers whether minimum impoundment levels need to be established in a license renewal to help protect established redds and ensure adequate water levels for incubating eggs and emerging fry.

Terrestrial, Wildlife, and Botanical Resources Study/ Riparian and Littoral Habitat Assessment

Regarding the Cover Type Mapping, the report states that the Projects' boundaries include a total of approximately 71,097 acres, the majority of which (>83%, or approximately 59,011 acres) consists of open water associated with the Projects' impoundments.

*Riparian and Littoral Habitat Assessment Study*

Pertaining to the Riparian and Littoral Habitat Assessment Study, MDIFW wishes to reiterate our recommendations made during the Initial Study Report Meeting, held on May 2, 3, and 4, 2023, and restated during the USR meeting held on May 15 and 16, 2024. These recommendations were not fully captured in the Assessment Study, although some of the wetland concerns were addressed in the subsequent USR Meeting Minutes:

1. Compare the location, size and various wetland cover type delineations from when they were evaluated for the last license (i.e., late 1980's, early 1990's) versus what they look like today.
    a.) Provide a map showing the location of all wetlands within the Project boundary with the different wetland cover types delineated for each wetland, for both time periods.
    b.) Provide a summary table of the number of acres of all the wetlands and each cover type for both time periods.
    c.) Clearly explain the procedures used to determine these wetland comparisons for both time periods.

2. Provide an explanation of how (i.e., timing, procedures) the transmission corridors vegetation is managed. With a better understanding of these procedures, it may be possible to modify the timing and selection of certain tree or shrub species to benefit wildlife without greatly compromising the ability to keep vegetation from contacting the transmission lines. For example, there is a Deer Wintering Area located on the south side of the West Branch in T3R11 WELS. During winter, some deer travel out of this area to the south and across the transmission line to reach quality winter shelter on the other side. Currently, this area has

very short vegetation, like most of the transmission corridor. By allowing the vegetation to grow to a greater height along a section of this portion of the transmission line, it could help deer navigate this area as the snow gets deeper during the worst part of winter.

The routine operations of the Projects (water level drawdowns and fluctuating flow releases) impact the acreage of Open Water habitat as well as associated littoral zones, riparian wetlands, and downstream riparian aquatic habitats, including the varied wildlife species that depend on these habitats for their life history requirements, to varying degrees. These diverse wildlife groups include benthic invertebrates/macroinvertebrates, fishes, amphibians, reptiles, aquatic mammals (e.g. beavers, muskrat) and water-dependent birds (e.g., common loons, breeding and foraging marsh birds, breeding and foraging waterfowl). As indicated in our previous comments, many of the species impacted may include modeled and/or predicted Species of Greatest Conservation Need (SGCN) aquatic or aquatic-associated invertebrate species, as described in Maine's 2015 State Wildlife Action Plan.

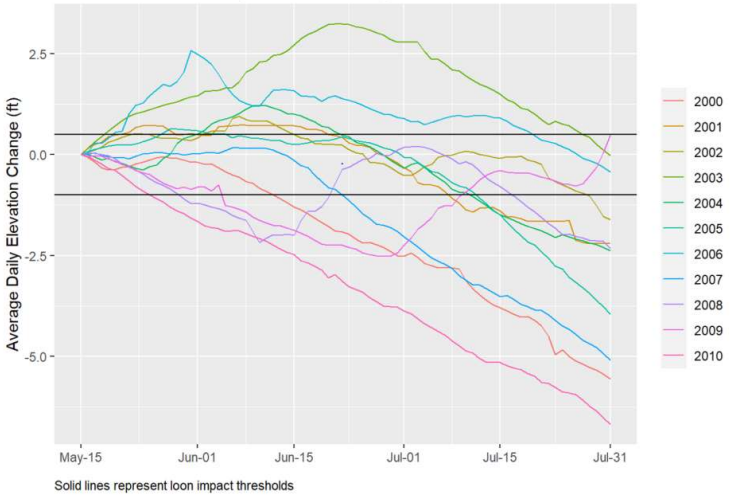
Without specific studies to document the presence/absence, abundance, and distribution of one or more of these SGCN species in the Project Areas, it remains unclear how, and to what extent, Project operations may be impacting these species, if present.

MDIFW will be exploring comprehensive Protection, Mitigation, and Enhancements (PME) measures in our review of the DLA.

Marsh Bird Study and Common Loon Assessment



*Marsh Bird Study*

The only target species detected in this assessment was the American bittern, which is designated as a Species of Greatest Conservation Need in Maine's State Wildlife Action Plan. American bitterns prefer hemi-marsh conditions (50:50 ratio of open water interspersed with vegetation), and research has shown that water level fluctuations that reduce the amount of open water cause extinction from a site over time. Likewise, this species prefers to have some deeper water present within the wetlands: they have longer legs than many other marsh birds which allows them to take advantage of deeper sites for feeding. Therefore, fluctuations that reduce water depths could have a negative effect on this species' use of the site. American Bitterns nest May through July, so minimizing drawdowns during this time would be beneficial to this species as well as a suite of other marsh birds, wading birds, and waterfowl species that nest on the ground or close to the water surface.

*Common Loon Assessment*

The Ripogenus Project operates as a store-and-release development with an annual seasonal drawdown that allows for management of water levels and flows downstream of the Ripogenus Project. The normal full pond elevation of the Ripogenus impoundment is 941.59 feet with a maximum drawdown of 44 feet (based on operational limitations of the Project); however, target seasonal drawdown in the spring prior to high inflows is typically not more than 28 feet (913.6). Figure 19 below depicts the water level elevations at the Ripogenus Impoundment between 2000-2010 during the loon breeding season, which is also relevant to resident marsh birds, wading birds, and waterfowl species.

**Figure 19**
**Average Change in Daily Water Surface Elevation by Year in the Ripogenus Impoundment During the Loon Nesting Period, 2000-2010**

MDIFW will be exploring comprehensive Protection, Mitigation, and Enhancements (PME) measures for water-dependent birds, including a more comprehensive Common Loon Management Plan, in our review of the DLA.

Furbearer Study

The goal of the study was to determine if Project operations, namely annual drawdowns, are impacting resident beavers and muskrats at the Ripogenus impoundment. Specifically, the goal of the study was to collect baseline data on muskrats and beavers using the Ripogenus impoundment area *to enable assessment of potential Project-related impacts* (emphasis added) and available habitat. To get at this, the objectives of the study were to:

1. Obtain baseline distributional and habitat presence/absence data and map occurrences of muskrats and beavers within the Ripogenus Project area; and
2. Describe the distribution and relative abundance of muskrat houses, muskrat push-ups, and beaver lodges in various habitat types within the Ripogenus Project area *in relation to changing water levels during the season* (emphasis added)

The Ripogenus Project operates as a store-and-release development with an annual seasonal drawdown that allows for management of water levels and flows downstream of the Ripogenus Project. Normal full pond elevation of the Ripogenus impoundment is 941.59 feet with a maximum drawdown of 44 feet (based on operational limitations of the Project), although the target seasonal drawdown in the spring prior to high inflows is typically not more than 28 feet (913.6).

It should be noted that the study report accurately states that GLHA consulted with MDIFW, and that GLHA also invited MDIFW staff to participate in study efforts, but that MDIFW was unable to participate in the study due to conflicting schedules and limited staff availability. For additional context, Maine experienced unusually high amounts of precipitation in 2023, delaying the study until weather conditions were suitable. By the time a suitable study weather window materialized in October 2023, the Licensee was unable to provide adequate notice to MDIFW for participation (at no fault to the Licensee.)

MDIFW truly appreciates the multi-day effort over sometimes challenging terrain that went into this study, which revealed that beavers and muskrat are utilizing the impoundment and associated wetland habitats, as anticipated. However, while the first objective of the study was achieved, MDIFW does not believe that the second objective, or a major goal of the study (assessment of potential Project-related impacts) was accomplished. This would have been challenging to accomplish given that the precipitation during 2023 resulted in the impoundment remaining at higher-than-normal lake levels during the study period.

The study references two earlier furbearer studies at other hydroelectric projects in the region (Brassua Project, FERC No. 2615 and the Flagstaff Project, FERC No. 2612) that indicated that beavers had adapted well to the winter drawdown at these impoundments based on observations of the utilization of multiple lodges and food caches and the ability to travel safely under the ice to reach both. Specific to muskrat, the Brassua study indicated that while muskrats were able to remain in their dens and utilize under-ice runways to forage, the presence of aquatic vegetation, a preferred food, may have been reduced by lack of suitable substrate and by winter drawdowns. The conclusion of the studies indicated no significant difference between the animals studied at the Brassua and Flagstaff impoundments compared to the natural/non-regulated control lakes.

While MDIFW agrees with the results of those earlier studies, it is unclear if the results can be directly applied to the Ripogenus Project due to differing bathymetry/depths, riparian wetlands, substrate type and composition, and any other variations between the projects, including operations. While the animals at the Flagstaff and Brassua Projects were impacted by respective project operations, it was demonstrated they were able to adapt to those conditions at those locations. Similarly, it stands to reason that beavers and muskrats are being impacted at the Ripogenus Project, but the study was unable to determine if the animals at Ripogenus are similarly able to adapt.

MDIFW will be exploring comprehensive Protection, Mitigation, and Enhancements (PME) measures for furbearers in our review of the DLA.

These are large-scale, remote, and inherently challenging issues to resolve, with oftentimes competing or conflicting interests from other agencies and groups, and MDIFW appreciates the Licensee's ongoing commitment to work through these issues. Please feel free to contact my office if you have any questions regarding this information, or if I can be of any further assistance.

Best regards,

John Perry

Debbie-Anne A. Reese, Acting Secretary
Federal Energy Regulatory Commission
888 First Street, NE
Washington, DC 20426

**Subject: Ripogenus Hydroelectric Project (FERC No. 2572-133)**
**Penobscot Mills Hydroelectric Project (FERC No. 2458-247)**
**Updated Study Report Supplement**

Dear Acting Secretary Reese:

Great Lakes Hydro America, LLC (GLHA), the Licensee of the Ripogenus Hydroelectric Project (FERC No. 2572) and the Penobscot Mills Hydroelectric Project (FERC No. 2458) (collectively referred to as the "Projects"), herein files with the Federal Energy Regulatory Commission (FERC) a supplement to the Updated Study Report (USR) for the relicensing of the Projects. The Projects are located on the West Branch Penobscot River and Millinocket Stream in Piscataquis and Penobscot counties, Maine.

On June 11, 2021, GLHA filed the Notices of Intent and a Pre-Application Document, which initiated the formal relicensing proceeding to obtain two separate new licenses for the continued operation of the Projects through FERC's Integrated Licensing Process (ILP). On April 22, 2024, GLHA filed with FERC the USR, which included study results available at that time.

Since the filing of the USR, additional study results for the Operations Model Study have become available and are provided herein, which consist of the model run results for the requested alternative operating scenarios evaluated by the model.

**GLHA will conduct a virtual meeting with interested stakeholders to explain the operations model run results provided herein. The virtual meeting will occur on Wednesday, July 10, 2024, from 9:00 AM to 2:00 PM. GLHA requests that agencies or stakeholders who plan on attending the virtual meeting RSVP by contacting Cate Russell at Cate.Russell@hdrinc.com or by phone at (207) 239-3792 on or before July 8, 2024.**

In response to stakeholder requests during the USR meeting, GLHA is providing the data in MS Excel format for all of the recreation user surveys that were collected for the Recreation Study in 2022-2024. The MS Excel spreadsheet includes two worksheets: Metadata and Data. The Metadata sheet provides the survey questions, the corresponding variable names in the Data sheet, a description for each variable, and the coding used for the responses. The Data sheet provides the data for all 330 surveys that were collected via the QR code and paper for Project recreation sites, non-Project recreation sites, and unknown recreation sites.

**GREAT LAKES HYDRO AMERICA, LLC**
1024 Central Street, Millinocket, ME 04462
T +1 207.723.4341 F +1 207.723.4597 brookfieldrenewableUS.com

Additional study activities associated with the Fish Assemblage Survey, the McKay Station Ramping Study, the Fish Stranding Mitigation Study, the Whitewater Boating Assessment Study, the Water Quality Study (macroinvertebrate sampling), and the Umbazooksus Lake Mitigation Study are ongoing. GLHA will file additional study data associated with the ongoing studies with FERC in another USR Supplement and/or with the Final License Application.

Concurrent with this filing, GLHA is providing a copy of this letter to all parties listed in the attached distribution list. Parties can download an electric copy of this filing from FERC's eLibrary system at https://www.ferc.gov/ferc-online/elibrary by conducting a search using the docket numbers P-2458 and/or P-2572.

If you have any questions regarding this letter, please contact me by phone at (315) 566-0197 or by email at michael.scarzello@brookfieldrenewable.com.

Sincerely,

Michael Scarzello
Manager, Licensing

**RE: Comment on Updated Study Report and Updated Study Report Meeting Summary, Ripogenus Project (FERC No. 2572) and Penobscot Mills Project (FERC No. 2458)**

Dear Acting Secretary Reese,

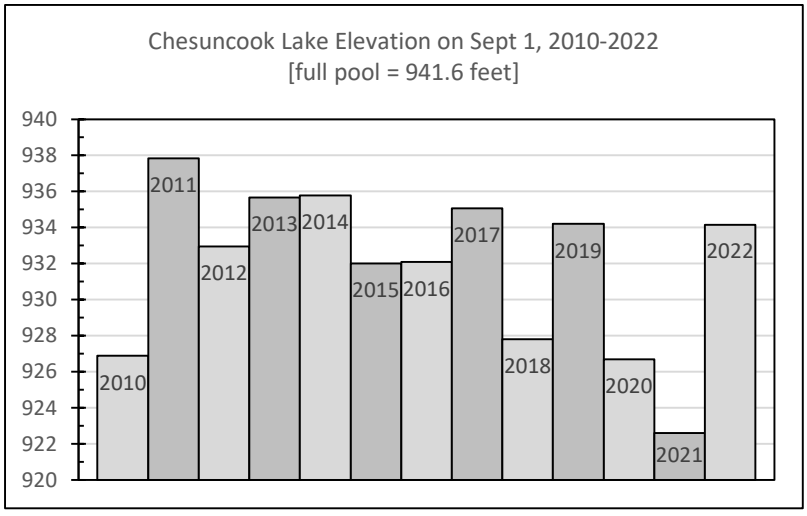
These comments are in response to the Updated Study Report (USR), submitted to FERC on April 21, 2024, and the Updated Study Report Meeting Summary, submitted to FERC on May 31, 2024, by Great Lake Hydro America, LLC (GLHA). The Bureau has been an active participant in the combined Integrated Relicensing Process (ILP) for these Projects, providing input to the development of the study plans for the Recreation and Aesthetics Studies. We also attended the in-person ISR meeting in Millinocket on May 4, 2023, when the Recreation and Aesthetics Studies were discussed, and participated in field visits and focus groups associated with those studies. Based on that participation and on our review of the Year 2 study results presented in the USR and USR Meeting Summary, we offer the following comments.

Recreation Study

The Bureau appreciates the 233 additional user surveys collected as part of the Year 2 study effort, which substantially strengthens the overall study data as a basis for evaluating recreation needs. ***The Bureau strongly believes that surveys collected from users of non-Project recreation sites should be included in the study analysis and results, as also requested by several other stakeholders.*** In particular, the surveys collected from users of the Chesuncook Lake remote campsites (including on Gero Island), and at Chesuncook Village/Graveyard Point, all of which are owned and/or managed by the Bureau, as well as from campowners on the lake, are vital to a complete and accurate analysis. In our prior comments in the ILP, we have highlighted the known and potential adverse effects of project operations on the use and enjoyment of Chesuncook Lake on these user groups. The severe summer drawdown that occurs some years substantially affects water access to these sites and the aesthetic quality of recreation on the shoreline and on the water.

In the USR meeting summary, GLHA states that it will file additional information related to the surveys completed for non-Project recreation sites at a later date. This information should not be limited to the raw survey data but should incorporate that additional survey information into the analysis of recreation and aesthetic issues.

Aesthetics Study



The Aesthetic Study's analysis of the effects of drawdown on the aesthetics at Chesuncook Lake is in part based on photographs taken in June 2022 (representing "high water") and September and October 2022 (representing "low water") during higher-than-normal elevation levels. In particular, the photos taken at remote shoreline campsites and at locations on the lake intended to capture a boater's perspective fail to adequately document conditions that campers and boaters are likely to encounter many years.

The photo dates and lake elevation on those dates were as follows:

| Date | Lake elevation |
|---|---|
| 6/21/22 | 940.3 ft. |
| 9/13/22 | 932.8 ft. |
| 10/28/22 | 934.3 ft. |

*(full pool=941.6 ft)*

The chart below makes use of lake elevation data provided by GLHA. The September 1 date represents the end of the summer season. During 7 of the 13 years in this period, the lake was already at or below 933-934 feet elevation (approx. elevation when the fall 2022 photos were taken) by September 1, and during several years was 5-10 feet below that elevation. This indicates that the September and October 2022 photos do not provide an adequate basis for comparison of the effects of the drawdown in years with greater than average drawdown (e.g., dry years).

The Caribou and Chesuncook Lake Associations submitted to FERC, with their 6/24/24 comments, a number of photographs that depict low water conditions on Chesuncook Lake as viewed from and near remote shoreline campsites and various other locations on the lake. The Bureau believes these photographs better represent the conditions campers and boaters are likely to encounter many years, particularly in late summer and fall, and should be included in the analysis. Dates the photos were taken are not provided so the lake elevation cannot be ascertained. However, the Lake Associations may be able to provide dates for the photos, which would allow the approximate lake elevation to be determined and strengthen the analysis.

Thank you for the opportunity to submit these comments. Please feel free to contact me at (207) 287-2163 or via email at Jim.Vogel@maine.gov if you have any questions.

Sincerely,

Jim Vogel

**Maine Professional River Outfitters**

June 30, 2024

Debbie-Anne A. Reese
Acting Secretary
Federal Energy Regulatory Commission
888 First Street, N.E.
Washington, D.C. 20426

**Re**: Ripogenus Project (P-2572) and Penobscot Mills Project (P-2458)
Comments on Updated Study Report

Dear Secretary Reese:

## Introduction

Maine Professional River Outfitters (MEPRO) is an organization of the commercial rafting outfitters that operate on a fourteen mile stretch of the Penobscot River, from below McKay Station to Nevers Corner. MEPRO members seek to ensure that this licensing process carefully considers the licensee's obligations to the commercial rafting industry and provides adequate mechanisms to ensure compliance with those requirements. Maine's rafting industry plays a vital role in bolstering the State's rural economy by attracting tourists and providing employment opportunities in remote areas. We appreciate the opportunity to provide comments on licensee's updated study report ("USR").

## Ensuring Adequate Flow During Recreation Hours

Under the existing FERC license, commercial rafters and the whitewater rafting industry have historically had recreation flows from May 1 - September 15 between the hours of 8:30am-5:00pm. MEPRO seeks to ensure that this arrangement is preserved and that a minor logistical adjustment is made to more fully satisfy that arrangement.

Under the existing license, the agreed-upon flows are set forth below:

| ***Whitewater*** | |
|---|---|
| May 1 – September 15<br>(8:30 AM – 5:00 PM) | Normal hydrologic year[3]:<br>• 2,300 cfs on Saturdays and Sundays<br>• 2,200 cfs on Mondays and Fridays<br>• 2,000 cfs on Tuesdays through Thursdays<br>Wet or dry hydrologic year[3]:<br>• 2,200 cfs on Saturdays and Sundays<br>• 2,000 cfs on Mondays and Fridays<br>• 1,800 cfs on Tuesdays through Thursdays |
| September 16 – October 1<br>(8:30 AM– 5:00 PM) | Normal hydrologic year[3]:<br>• 2,300 cfs on Saturdays and Sundays<br>Wet or dry hydrologic year[3]:<br>• 2,200 cfs on Saturdays and Sundays |
| June 8 – October 14<br>(5:00 PM – 8:30 AM) | 1,000 cfs |

Recreation flows are guaranteed from 8:30am-5:00pm, with a minimum of 1800 cfs being released during a wet/dry year on certain days of the week. The minimum flow required to run a safe and enjoyable whitewater rafting trip are the flows that are currently required in the license– including a minimum of 1800 cfs on a wet/dry year, and 2000 cfs on a normal year.

In order to ensure that recreational flows are available during the agreed upon hours, we request earlier releases that will enable recreation level flows to reach all commercial access points (McKay and Nesowadnehunk) by 8:30am as contemplated in the Operations Model Logic and Validation Report.[1]

Our members have experienced that, in a dry year when the turbines may be dropped to just 1 operating turbine overnight, an earlier release is needed to ensure that the recreation flow reaches McKay and Nesowadnehunk Falls by 8:30am. To illustrate, some of our members put their rafts in at 8:30am at McKay Station for a full river trip, which could mean taking out as late as 5:00pm at Nevers Corner. Other members begin their trips by putting-in at Nesowadnehunk Falls and run the McKay Station portion of the river after lunch. Outfitters are given specific launch times and locations by the Department of Inland Fisheries and Wildlife, and our members want to ensure that adequate flows reach the entire fourteen mile stretch on which we operate by 8:30am and are maintained until 5:00pm. Under the current permitting regime, when flows have dropped below 2000 cfs overnight, outfitters have experienced low water during the identified recreation hours of 8:30am to 5:00pm. This inhibits their ability to begin river trips on time, negatively impacting user experience and making scheduling less predictable.

Based on our experience working and recreating on the Penobscot River, we submit that an earlier release from McKay Station when flows are dropped below 2000 cfs overnight is necessary to ensure sufficient recreational flows make it to Nesowadnehunk Falls by 8:30am for our members who put in there. This earlier release would guarantee whitewater rafting operations could be

[1] *See* Section 5.2.3.5 Recreation Flows, *Appendix A: Operations Model Logic and Validation Report* (April 2024).

reliably scheduled and provide consistent recreation flows during the recreation hours throughout the fourteen-mile section we raft.

To be clear, MEPRO is not proposing any changes to the minimum flow requirements in the existing license, but rather a refinement to the process undertaken to increase the low flow up to the recreation flow by the start of designated recreation hours, due to slow fill in Nesowadnehunk Dead Water and Abol Dead Water. Commitment to an earlier release time under low flow scenarios will allow the whitewater industry and its customers to have confidence that recreation flows will reach launch points at a time and in a manner that enables predictable launch times, and a consistent flow throughout the river for running rapids. MEPRO wants to ensure that the license provides the whitewater rafting industry adequate flow for running the river beginning at 8:30am, whether putting in at McKay Station or Nesowadnehunk Falls.

Consistent and predictable flows are critical to the smooth and successful operation of the commercial rafting industry. MEPRO and its members want to ensure that the license creates a requirement to maintain these flows during the full breadth of designated recreation hours. The simple act of preserving our existing arrangement will provide significant benefits to support outdoor recreation and tourism, which, with the decline of other industry, has become the number one industry in the area and is increasingly important to Maine's rural economy.

**Gage Installation**

MEPRO and its members support installation of U.S. Geological Survey ("USGS") streamflow gage(s) as described in the USGS Gage Feasibility Study Report.[2] The Report indicates that streamflow gages would use satellite technology to transmit near real-time data about flows. Having access to contemporaneous data about flows would provide the whitewater rafting industry with actionable information to aid in monitoring water levels and scheduling rafting trips.

The Report concludes that an appropriate location for a USGS gage would be in the vicinity of the Big Eddy Campground. MEPRO recommends installation of USGS gages in two locations: (1) somewhere in the area between Telos Bridge and Big Eddy and (2) in the vicinity of Abol Bridge. Placing USGS-maintained gages at these locations would confirm whether adequate recreation flows (up to the agreed-upon historic flows) are reaching whitewater rafting put-ins at McKay Station and Nesowadnehunk Falls by the start of recreation hours.

**Repair and Maintenance of the McKay Station Put-In**

Finally, MEPRO and its members formally request that the license require timely and regular repair and maintenance of any licensee-controlled put-ins. MEPRO and its members are

[2] *Appendix B: U.S. Geological Survey Gage Feasibility Study.*

particularly concerned that the McKay Station put-in is still in need of repair work following the last damaging high-water event.

The license should require that all repair and maintenance of put-ins following spillover events at Ripogenus Dam is completed by May 1 each year. MEPRO and its members depend on the put-ins being in safe, working order to access the river and operate our businesses. A May 1 deadline to complete put-in repair and maintenance would ensure the river access points would be ready to accommodate whitewater rafting trips on the Penobscot River at the start of each season. We also request that the license requires reasonable efforts to repair put-ins in a timely manner following any mid-season spillover events.

**Conclusion**

MEPRO's goal is to protect and maintain the water levels the whitewater rafting industry has historically enjoyed and relies on for its continued operational success while also acknowledging the importance of other interests in and uses of the Penobscot River. We favor a water management system that supports a stable operating environment and look forward to the collaborative stewardship of this important natural resource among a diverse set of stakeholders. Thank you for the opportunity to provide these comments.

2.1.1 per article 401

100 cfs July/August is water that comes fromThe top of the lake and is too warm and unattractive to concerned fish species. 100cfs doesn't allow for any whitewater recreation.

This minimum should increase from Rip Dam to around 350cfs from a deep gate for the July-September requirement. This volume of water coming from the bottom of the lake would facilitate attractive water conditions for salmon and trout and increase their summer habitat substantially. while also creating a very high quality class III whitewater paddling environment, plus add major aesthetic value to those looking to enjoy a remote forested gorge.

Any requests during re-licensing, to fully study the whitewater recreation conditions between rip dam and McKay hydro station have been largely ignored by GLHA and FERC. The data that was presented during the study reports shows an incomplete picture, a picture that accommodates GLHA wishes to prevent whitewater recreation between Rip Dam and McKay station. GLHA has also resisted any effort to improve the informal trail leading down to the river in the upper gorge that would facilitate whitewater boating, fishing, and aesthetic views of the upper gorge.
The data presented and collected from river users and YouTube videos only accounts for about a median portion of total data of the range of flows that can come from rip dam. Only flows 1400cfs-7000cfs were used in any of the studies. There is absolutely NOTHING from 110cfs-1400cfs, and therefor the study is incomplete. I think a study modification request is appropriate to address the lack of data of the reach in a low water environment

Currently the only reason GLHA spills water down the Ripogenus Dam is to accommodate for spring freshet flows, flooding, and for emergency use to sustain minimum flow requirements. And thus the only whitewater recreation that has been available to users, at a very short notice, has been in a high volume environment, 1400cfs and above, certainly a class IV-V run. There is no data showing the whitewater conditions from 110cfs to 1400cfs, to not include information from 110cfs to 1400cfs will paint an incomplete picture of the whitewater possibilities between rip dam and McKay station, and without a complete picture, FERC can't possibly make a fair decision based on the data. I have personally paddled it at these lower level ranges and found amazing and very manageable class II-III whitewater circa 2017, it's definitely not the high adrenaline, high risk class IV-V run that users see at higher flows. These lower flows will accommodate a much larger user group and present a much safer overall environment for whitewater paddlers, while also creating better fish habitat. In my eyes increasing the summer flow release from 100cfs to 350cfs is a win win for whitewater boaters, the fishermen, and the fish and bugs of the Penobscot.

Concerning the Ambajejus Boat Launch Area. The data presented about the Ambajejus Boat Launch shows the lowest ratings for parking availability at the boat launch. Brookfield in the winter of 23-24 put up concrete barriers to block an adjacent parking area that has been utilized by local businesses for decades along the access road to the Millinocket Lake Pump house. Since this happened the parking situation for all parties involved has greatly deteriorated. During several meetings I mentioned this and Randy Dorman responded it was a nuisance issue outside the project boundaries. This area I'm I referring is along the road to the Millinocket Lake Pump House which is certainly in the project boundary of this re-licensing. In early meetings with Brookfield on this issue concerned parties brought up different ideas of placing signs informing people they are parking at their own risk or finding a way to place a public easement on the area so it could be continued to be used by the public and local businesses. However Brookfield said they discussed it internally and won't pursue any other course of action to restore this parking area. Meanwhile Fred Michaud with the DOT took a dirt parking area capable of fitting 40 vehicles, and turned the lot into a

rest area with only 15 parking spaces. Fred has now banned all employees, guests, and company vehicles from utilizing this area. This does not only force all North Country Rivers employees to park at the Ambajejus Boat Launch parking, but also all of the Big Moose Inn employees, the Northern Outdoors employees, and all of golden road crossing employees, this is a considerable new parking strain in this vital tourist area and all these employees and guests are forced to use the already strained Ambajejus Boat Launch Parking. This is not a “nuisance” issue for four businesses and the most heavily used boat launch in the region. This is all because GLHA simply refuses to work with affiliated parties to come up with a solution at the Millinocket Lake Pumphouse parking area. It is my belief that the newly blocked off area, is in the project boundary and that FERC needs to require GLHA to work with the local businesses to come up with a solution. Or alternatively GLHA must be required to greatly expand not only the parking at Ambajejus Boat Launch but also add bathrooms to accommodate the needs of this high use tourist area.
When it comes to the issue of a whitewater boating study taking place below stone dam. I have fundamental problems with the methodology and utilization of resources to properly study this section of river. First I’d like to point out that there seems to be a massive discrepancy about how GLHA can release water from Stone Dam. During the meetings in early June GLHA representatives when asked, kept referring that only Mike Osbourne could speak to these specific issues. GLHA several times stated he was the only one that could speak to these specifics, however he wasn’t available for the meeting. It just seemed all too convenient that he couldn’t make this meeting to discuss one of the biggest discrepancies. GLHA ability to control water releases from stone dam. The absence of Mike Osbourne from the meeting so THE SPECIFICS could not be discussed allows GLHA to avoid answering some very important questions. Whilst playing into their stalling strategy, his absence just seemed all too convenient for GLHA to be a coincidence. That issue aside, GLHA said they are going to conduct a whitewater boating survey from shore and only at leakage flows. This is completely inadequate, and inconsistent with the Whittaker studies methodology. Seeing a river from shore and running a river are completely different experiences. For example a friend and I wanted to determine the lowest level we could kayak Orbitin Stream at over in Phillips, Maine. spring 2023. We hiked along the banks to the put in and visually concluded that there wasn’t enough water. However we wanted to be sure. So we put in the river anyway and to our surprise found that the water channeled up enough that we could kayak it without constantly hitting rocks. There we were on shore already forming a conclusion which after actually getting in and paddling found our prior conclusion, to be greatly wrong. To me it’s insulting to the river reach to conduct this study from shore and only with minimal flows to “fully”study the opportunities below stone dam. This is a once and a 30 year shot to do this. If you’re going to do anything you might as well do it right…. And not half assed. Which half assed is the perfect adjective to describe the methodology proposed for the level 2 Whittaker study below stone dam.

After a third successful Millinocket X-Stream Canoe Race, and several youth programs that took place around that time. it is completely and 100% clear that scheduled releases on Millinocket Stream can provide diverse recreational options for many different user groups. The value of this local resource to Millinocket cannot be overstated. I personally co-lead two trips down Millinocket Stream with local high school students from Millinocket and Houlton high schools. The happiness, excitement, and positive emotions coming from the students during these outings cannot adequately be described in words. During the release for the race weekend, over 150 whitewater paddlers were able to enjoy the Stream from all points New England. It is of my opinion that this years provided flow of 650cfs is the perfect flow to accommodate the widest range of whitewater paddlers on this stretch. It is also my belief that the GLHA should no longer pump 240cfs from Millinocket Lake into Ambajejus Lake for profits and this water should instead be allowed to freely flow its natural course down Millinocket Stream creating better fishing and boating opportunities on this tremendous resource for more days per year. The whitewater quality is so high on this section that if there was scheduled releases on Millinocket Stream local organizations and

rafting outfitters would be able to expand their offerings to include the class II-III Millinocket Stream for rafting and kayak trips. Currently the only whitewater offered by outfitters is on the class IV/V Penobscot River. For an outfitter or organization to diversify their options to include Millinocket Stream would mean they are unlocking a whole new and different customer base helping the businesses hire more employees and create more revenue. Scheduled releases on Millinocket Stream is a 150% win for the town, residents, and outfitters in the Millinocket Area.

The evidence is clear that if you schedule releases or provide flows adequate for whitewater boating, people will come and utilize the whitewater. Millinocket Stream is the perfect example. FERC needs to require more releases on all the river reaches from GLHA because at the end of the day the water DOES NOT BELONG TO BROOKFIELD, and they should not be entitled to maximized profits. Great Northern Paper built all this infrastructure for the purpose of paper making and providing timber to the economy. With the paper and timber industry being a fraction of what it was, Millinocket continues to struggle with economic issues from the fall out of Great Northern, but Millinocket has a strong foothold and is rebirthing its self as an outdoor recreation hub. It is the duty of this federal organization FERC to help this community, by ordering GLHA to do everything they can to provide water flows from rip dam to McKay, below McKay, and through the back channel below stone dam, and below Millinocket Lake Dam. There are several large scale whitewater hubs in the US, the largest being in White Salmon, Washington and in Fayetteville, West Virginia. These hubs have gained notoriety and popularity because of their diverse options for whitewater, causing a large community of paddlers to form in these areas. While Millinocket may never be able to compare to these communities because of our remote location and economic situation. With the help of FERC and GLHA, Millinocket could offer a similar level of diverse paddling opportunities as seen in the large scale whitewater paddling communities.

July 1, 2024

Ms. Debbie-Anne A. Reese

Washington, D.C. 20426

**Via online submission to: http://www/ferc.gov**

Subject: **Comments of Maine Council of Trout Unlimited on the Updated Study Report for the Ripogenus Project (P-2572) and the Penobscot Mills Project (P-2458)**

Dear Acting Secretary Reese:

On behalf of its six chapters and over 2,000 members, Maine Council of Trout Unlimited ("TU") submits these comments on the Updated Study Report ("USR") for the Ripogenus Project (P-2572) and the Penobscot Mills Project (P-2458) filed by licensee Great Lakes Hydro America, LLC a subsidiary of Brookfield Renewable ("Brookfield" or "Applicant").[1] This filing also responds to the Report of the USR Meeting held May 15 and May 16, 2023 in Bangor, Maine,[2] and Brookfield's proposed and unresolved Ramping Study circulated by email, and subsequently filed to the FERC docket by TU.[3]

**General Comments**

Taken together, the Ripogenus and Penobscot Mills relicensings reflect over 105.4 MW of generation capacity making this the largest relicensing effort in the state of Maine in terms of electricity production by a large margin. The waters and surrounding habitat affected by these relicensings are of similar scale and significance with a combined Project area containing an affected drainage area of 3,533 square miles, hundreds of miles of river and tributaries, and multiple large lakes. The land-locked salmon fishery below Ripogenus Dam is sustained by naturally spawned fish and nationally known for its high-quality fisheries habitat. With Maine's highest mountain nearby, Ripogenus Gorge below the dam is Maine's most spectacular gorge. The waters of the Penobscot Mills Project are also important in their own right and should play a part in the restoration of currently dewatered sections of the West Branch of the Penobscot River to provide traditional waterways and sustenance fisheries to the Penobscot Indian Nation (PIN) that have been so long promised but not delivered.

**Studies conducted to date have not provided the information required to make informed decisions on the terms and conditions of a new license, and those currently approved will not correct this.** Changes in project ownership have resulted in changes to the way the projects are operated, starting at and most affecting the Ripogenus Project and extending downstream to Penobscot Mills Project. In a number of cases, studies conducted have not provided the information and data they were intended to provide, or have served to underline the need for additional studies. Additional information is needed to limit the drawdowns to the Ripogenus-Chesuncook Reservoir and to peaking operations being conducted at McKay Station. From McKay Station to Stone Dam, the watershed has been extensively modified, and how to optimize project operations

[1] Great Lakes Hydro America, LLC, Initial Study Report for the Ripogenus (FERC No. P-2572-133) and Penobscot Mills (FERC No. P-2458-247) Hydroelectric Projects dated April 22, 2024.
[2] Ripogenus Hydroelectric Project (FERC No. P-2572-133), Penobscot Mills Hydroelectric Project (FERC No. P-2458-247), Updated Study Report Meeting Summary dated May 31, 2024.
[3] TU letter dated June 5, 2024, Subj: Status of Consultation for Studies for the Ripogenus Project (P-2572) and the Penobscot Mills Project (P-2458).

so as to provide the best balance of between electrical power generation and the other uses including fishing, recreation (especially whitewater), aesthetics, and habitat must be found.

Brookfield entered into the relicensing process stating that "PM&E measures comprehensively address resource interests specific to the Project areas"[4] despite the obvious radical changes that had occurred since the last relicensing. The non-government stakeholders (NGOs) took exception to this and stated so on the record:

> "These assertions could not be more wrong and started the relicensing off on the wrong foot. A glaring example: The Ripogenus-Chesuncook impoundment has not been fully watered in two years, and the boat launch provided as PM&E has been so far from the waterline for most of the summers so as to be practically unusable, as many photos have clearly shown. The public interest has vastly changed since the last relicensing. Agencies bent over backward to ensure the profitability of the mills in East Millinocket, the major employer in the area, that were supplied by power the projects provided. If that were not the case, the Use Attainability Analysis (UAA) and the provisions of 38 M.R.S.A. § 464(9-A) would not have allowed so much leeway for project operations, e.g., no minimum drawdown for the Ripogenus-Chesuncook impoundment other than the lowest levels the physical characteristics of Ripogenus Dam allow. Other examples included the dewatered Ripogenus Gorge on the main stem of the West Branch below Ripogenus Dam and 4.5 miles of the main stem below Stone Dam. It is highly unlikely that these examples would have been permitted under the last relicensings were it not for economic considerations that simply no longer exist. With the mills closed and the electricity produced by the projects going to the grid and not dramatically affecting the economy of the region, the situation has changed greatly, and that change needs to be acknowledged for the relicensing process to proceed effectively under the ILP."[5]

The NGO filing went on to state that Brookfield was attempting to "delay and confuse the process."[6] Brookfield's actions appear to have continued in the same vein. Rather than conduct studies that inform the relicensing by comparing the effects of flows on different facets of the project, Brookfield has provided little data that provides a rational or informed basis for comparison. Consultation with NGO stakeholders has been minimal. On the present course, there will be inadequate comparison data upon which to base key relicensings decisions like minimum flows below Ripogenus Dam or Stone Dam. The likely result will be delay and litigation – neither of these are in the public interest, and both are outcomes that TU seeks to avoid. To meet the requirements for a Maine Water Quality Certification, the new license will certainly contain provisions to water the reaches of the main stem of the West Branch of the Penobscot River in Ripogenus Gorge and below Stone Dam and establish a set of rules for managing water levels in Ripogenus – Chesuncook Lake. Delay will benefit Brookfield since it will not be able to generate electricity at current levels under a new license with new minimum flow requirements. Comments by both FERC staff and Brookfield at the USR Meeting also both confirmed some delay in issuing the Ready for Environmental Analysis (REA) and thus to relicensing, largely due to the July 8, 2023 failure of two of the three generators at McKay Station due to maintenance errors complicating flow management and making conducting flow-related studies problematic. Taken as a whole, the conclusion that Brookfield neither wants a comprehensible and defensible environmental review or to have this matter resolved in a timely manner is inescapable. As this behavior is expected to continue, TU objects.

Specific comments follow that support this conclusion and request corrective action.

**Specific Studies**

Appendix A: Operations Model Study Report

**Brookfield is limiting model runs to further own agenda: Maintenance of the current minimum flow regime**.

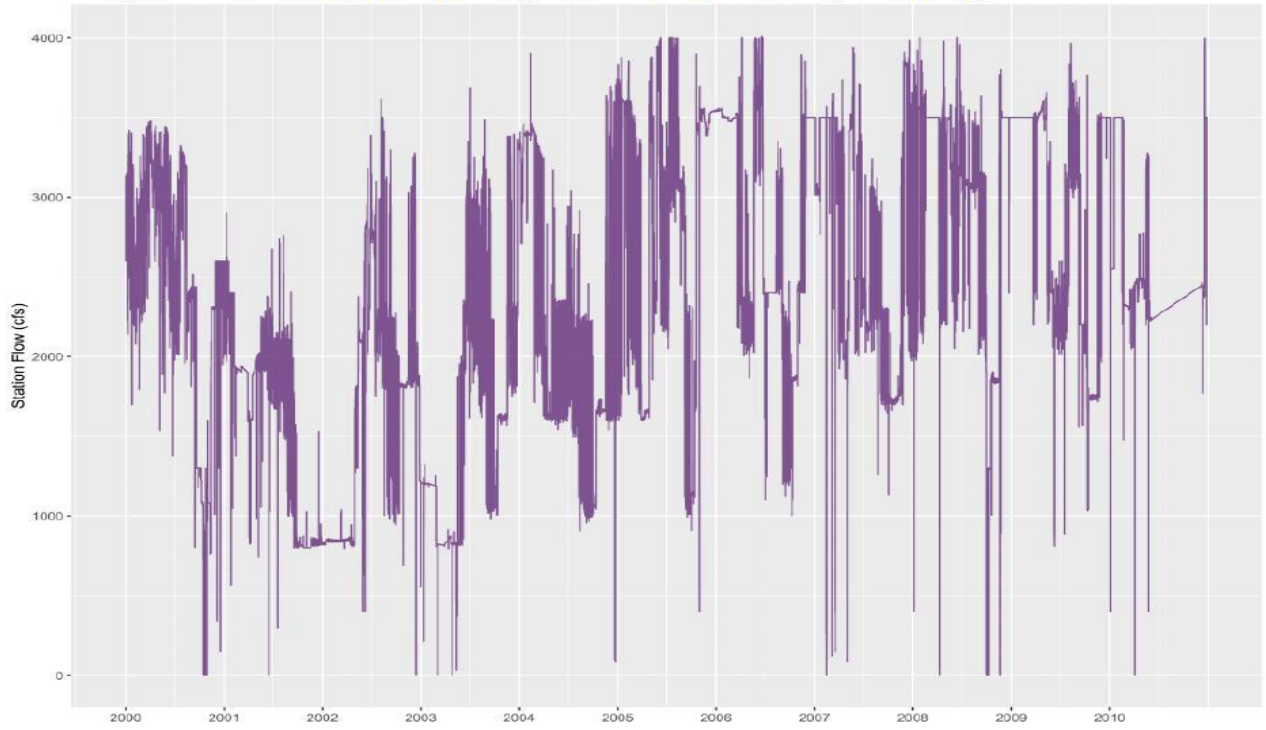
Even though Randy Dorman said at the USR Meeting that Brookfield had filled Ripogenus-Chesuncook Lake to over 939 asl this spring, Brookfield refuses to conduct Ops Model runs above that elevation. Brookfield's own data shows that it has filled the lake to above that level often in the past: Operations data from 2010-2022 shows lake elevation on May 15th at 940 asl or above every year except 2012, 2013, 2015, 2016 and 2021.[7] Given these data, the upper limit should be 941.6 asl, the physical, but safe limits created by Ripogenus Dam. By failing to run the Ops Model at a more realistic and historically accurate fill regime, **Brookfield is misleading the available fill volumes, making less profitable flow scenarios seem less feasible than they truly are. Stated another way, if Brookfield raised the lake fill level, it could offset or at least mitigate the economic impacts of increased minimum flows required for other purposes.** This 2.6 feet of elevation equates to billions of cubic feet of water with enormous potential use, not just for power generation but to provide flows to maintain lake levels allowing access to boat ramps in Ripogenus-Chesuncook Lake and flow into Ripogenus Gorge to create both whitewater and recreational fishing opportunities as well as improve the aquatic habitat. It is well established that Brookfield uses even smaller amounts of water level variance elsewhere in Maine in its many run-of river projects to conduct peaking operations, varying flows to maximize the profitability of its electricity, but degrading both the aquatic habitat and recreational fishing opportunities in the process. Efficient management of lake fill levels can mitigate this degradation.

Brookfield refused to run a full range of flow scenarios in Upper Ripogenus Gorge or Stone Dam or the set of runs agreed on and requested by NGOs.[8] Comments provided under the Angler Flow Eval Study Report elaborate on Stone Dam scenarios and provide additional details.

Brookfield filed an Updated Study Report Supplement on June 28, 2024[9] that reported the results of the Ops Model runs. In general, rather than examine a range of scenarios to define potential future project operations, Brookfield only ran the scenarios that suited its agenda. Our preliminary comments on it are: (1) It does not look at maximum lake capacity of 941.6 making less profitable flow scenarios seem less feasible than they truly are. (2) It did not run the set of parameters jointly requested by NGO stakeholders representing fisheries interests, camp owners, whitewater and hiking interests. (3) Brookfield did not test a constant minimum 200 cfs flow below Stone Dam. Brookfield has apparently already made the determination that only a seasonal put-and-take fishery would be supported below Stone Dam and that there is minimal impact in a seasonal operating mode. Brookfield should have tested the effects of the 365-day scenario as requested. The runs did not answer the question if there is potential (with minimal impact to generation) if we have 365-day flows. With refugia available downstream at Shad Pond year-round trout and landlocked salmon is survival possible. There are no studies that show a causal relationship between actual flow changes and fish biomass and the predicted fish biomass that IFIM says would be there. When IFIM predicts increases or decreases in fish based on the IFIM Models, the resulting fish populations never agree with what the model predicted. (5) Brookfield's statement that "Higher Ripogenus Impoundment elevations in the fall result in increases in spill occurrences " implies that this would be a negative outcome. TU views this as providing additional benefit to scenic users, not a negative project outcome. (6) The study shows a need for an alternative value/benefit assessment instead of the percentage change in generation at each production station. The real issues are the effect on total generation and the actual dollar cost. This feeds into the need for an overall cost benefit analysis that

[7] Hourly Operations Data (2000-2022) filed electronically in MS Excel format) (Supplement to the Historic Operations Data Assessment Study Report filed as Appendix A of the April 22, 2023 Initial Study Report.

[8] NGO letter dated March 5, 2024, Subj: NGO Requests for Ops Model Runs for the Ripogenus Project (P-2572) and the Penobscot Mills Project (P-2458).



[9] Brookfield letter dated June 28, 2024, Subject: Ripogenus Hydroelectric Project (FERC No. 2572-133), Penobscot Mills Hydroelectric Project (FERC No. 2458-247), Updated Study Report Supplement.

looks at stakeholder value metrics with dollar values assigned as opposed to just changes in generation. Pure flow numbers are only part of the analysis. The larger issues include: What is the value of a roaring fall in the gorge to Millinocket economics. How many people would be coming up to raft, fish or just visit if alternative flow were implemented? What are the incremental added benefits to regional economics-consumer surplus? This analysis is needed to leverage model results. **TU requests an economic cost-benefit analysis of the impacts of the various proposed flow changes as described in Loomis 2000.**[10]

**The validity of the Ops Model itself is questionable.**

The version of the Ops Model contained some adjustments to the version that was presented at the Ops Model Workshop. **The Ops Model version in the USR contained a change to the most important feature of the model: predicting levels of Ripogenus- Chesuncook Lake based on flows from Ripogenus Dam/McKay Station.** TU's first observation when the Ops Model was referenced in the Initial Study Report (ISR) Meeting was that the figure below showing the relationship between flows from McKay Station and flow was impossible, stating: "The figures showing hourly McKay Station flows based on generation data show flows of 4000 cfs, especially Figure 12 below. These exceed the 3500 cfs hydraulic capacity of McKay Station [Pre-application Document dated June 11, 2021, page 4-14.]

**Figure 12. Estimated hourly flows from McKay Station, 2000-2010**

These exceed the 3500 cfs hydraulic capacity of McKay Station [Pre- application Document dated June 11, 2021, page 4-14.] When queried at the ISR Meeting, the Brookfield response was the flows were not completely accurate and a range of variability was not available. This continues to cast doubt on the results of the analysis."[11] It should also be noted that this graph is even worse than it seems as the values above 4000 CFS are truncated, making this data even less reliable. It is apparent that there are still problems with

[10] Loomis, John B., 2000 Environmental Valuation Techniques in Water Resource Decision Making. J. Wtr Res. Planning and Mgt. 126(6):339.

[11] Maine TU Council ISR Comments dated July 5, 2023, Appendix A.

modeling this most basic and important factor in flow and lake level management that fundamentally affects both the Ripogenus and Penobscot Mills Projects.

It was stated at the USR Meeting that a third version of the model will be forthcoming, but that was not included with the USR Meeting Report. After using words like "calibration" and "validation" at the Ops Model Workshop back in May, such an important change to the Ops Model was surprising, and TU expects that further changes will be forthcoming to the Ops Model.

Per the NGOs' earlier comments,[12] "…many assumptions were made to generate the model, e.g., flashboard installation, proration of Seboeis flows, rules on how the project is operated, correlation between generation data and actual flows, etc. Variability was not quantified but some variability must be expected." The absence of a flow gauge in the West Branch below McKay Station causes the model to be based on assumptions and circular logic rather than empirical data. This is further reflected in the comments on USGS Gage Feasibility below.

**For these reasons, the credibility of the Ops Model is strained at best. Brookfield is using proprietary CHEOPS software to generate the model making it impossible for stakeholders to duplicate or validate. Accordingly, TU requests that an independent, peer-reviewed study be ordered by FERC to determine the validity of the model for making relicensing decisions related to flows and lake levels.**

Appendix B: USGS Gage Feasibility Study Report

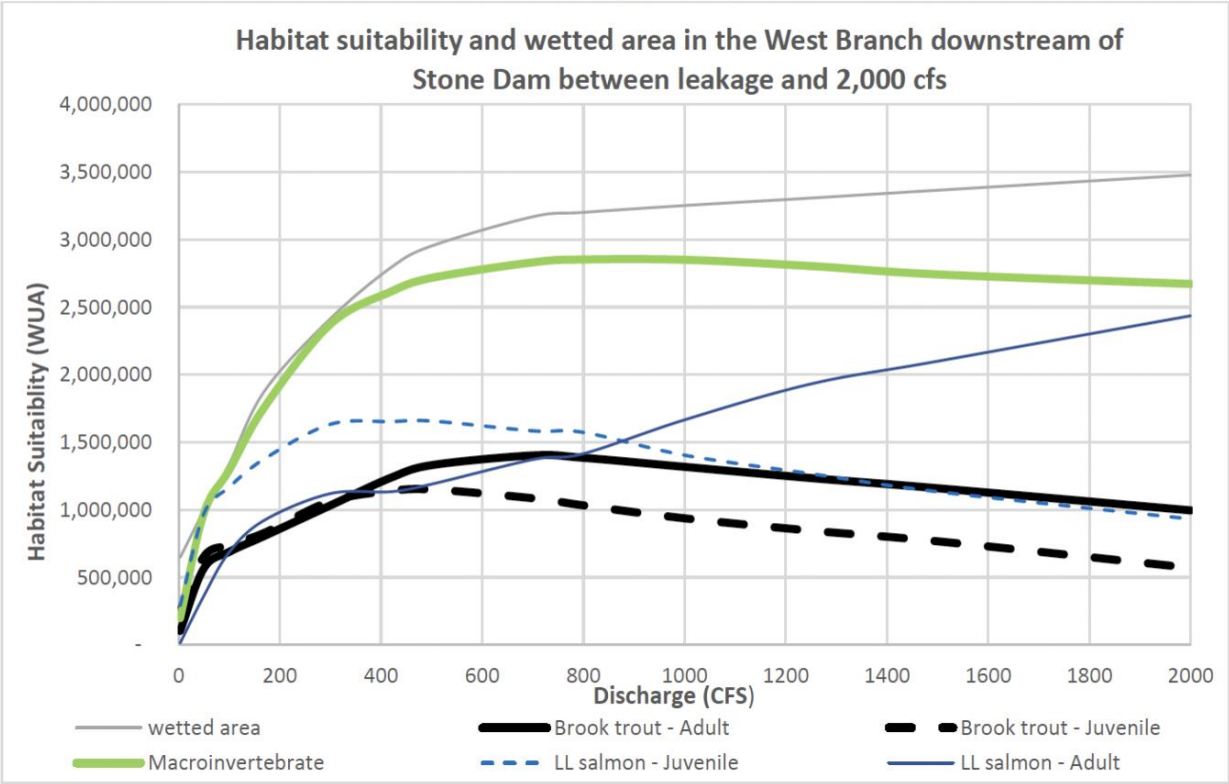
TU strongly agrees that a USGS gage between Ripogenus Gorge and the Big Eddy Pool is needed. Both FERC staff and Brookfield acknowledged that a delay in relicensing is likely; TU believes that other delays will be forthcoming. **Accordingly, TU asks that Brookfield implement a temporary means to gage flows other than by inference from power generation between the present and when the new license is issued.** This is the most direct method available to improve the validity of the Ops Model. This would also serve to inform the ongoing FERC Compliance investigation and search for an interim solution to the significant fishkill that occurred on July 7, 2023.

TU also requests that Ripogenus-Chesuncook Lake levels be made available on the Brookfield SafeWaters website between now and when the new license is issued so that boaters have a means to determine if the boat launches on the lake are accessible.

Appendix C: 2023 Water Quality Study Report

"Based on the feedback received from the MDEP during the meeting, GLHA plans to re-sample for macroinvertebrates at six locations in 2024 with a focus on more representative habitats in the West Branch that are suitable for macroinvertebrate colonization. The 2024 sampling locations will include representative riverine habitat downstream of McKay Station, Little Ambejackmockamus Falls, North Twin, the Millinocket Development, Millinocket Lake Storage Dam, and Dolby Dam."

TU does not see how the reach below Stone Dam could be represented as meeting Maine Water Quality Standards because the reach is dewatered for most of the year and based on Maine environmental statutes, TU believes that Maine Department of Environmental Protection will reach the same conclusion. It simply does not have the minimum flows, or at times any flow, to sustain an aquatic environment or aquatic species. This is clear error.



[12] NGO letter dated March 5, 2024, Subj: NGO Requests for Ops Model Runs for the Ripogenus Project (P-2572) and the Penobscot Mills Project (P-2458).

TU notes that the results of water quality studies of Ripogenus – Chesuncook Lake would have been very different if conducted during dry years 2020 or 2021 when the littoral zone was dewatered. It is this selective data collection and study, only occurring at times when there is water in the reach, that degrades the conclusions reached with regard to water quality and completely ignores the effects of dewatering.

Appendix D: Angler Flow Eval Study Report

**The study had no legitimate scientific basis and was fundamentally flawed with a design that drove results toward a predetermined result.** No pre-study consultation regarding study parameters was conducted with TU who had requested the study and provided volunteers for data collection. This included the key elements of flow and observation locations. Three flows of less than 400 cfs, less than half of what the Fisheries Habitat Study was needed to support adult landlocked salmon (thin blue line) and maximize macro-invertebrate habitat (thicker light green line) were shown by Brookfield's own study[13] depicted in the figure that follows:

**Figure 2. Habitat suitability and wetted area in the West Branch downstream of Stone Dam between leakage and 2,000 cfs.**

Flows were so low that anglers could walk across what is the main stem of the West Branch of the Penobscot River. The mean annual flow in this location is approximately 4,000 CFS[14] if flows were not diverted to Millinocket Station, and did not rejoin the mainstem river until Shad Pond. As TU said in its comments on the proposed study, "the validity of the study will be proportional to the range of flows provided." Brookfield

[13] ISR, Appendix f-11.

[14] USGS StreamStats accessed at https://streamstats.usgs.gov/ss/ for location (Latitude, Longitude): 45.63379, -68.67245 returns 4060CFS.

documentation filed with LIHI indicates that the bladder system installed on Stone Dams can be used to control flows.[15]

It is unremarkable that the study demonstrated that the lower flows are more wadable. Leakage flows and a dry riverbed are even more so. It should be self-evident that wading is easier when there is no water in the channel, and this type of rationale and conclusion reveals Brookfield's intent to maintain low or nonexistent flows despite the negative impacts. Alternatively, higher flows would have provided more habitat and better fishing opportunity. Aquatic Base Flows per longstanding USFWS guidance are ~2,000 CFS based on the drainage area.[16]

Further, no sites were sampled on lower part of "bypass" where best fishing opportunities are located. This is also closer to Shad Pond where you would expect salmonids to find thermal refugia during the summer months before returning on the fall and spring typical of Maine's tailwater fisheries.

The study assumed no access from the east bank. Google Earth clearly shows two roads: one road parallel to the river about 1500 from the water on the east side of the river, the other within 500ft of that section of river. Access should be sought as part of the relicensing effort both for whitewater and fishing recreational access and use.

Study assumed 30 ft fly casting distance. This is an unrealistically shortened distance and reduced the useable/castable area by 50%. Spin fishing would also be possible there with even longer casting distances. The reaches at the flows sampled provided a fishing opportunity more appropriate to a smaller tributary, not the main stem of the West Branch of the Penobscot River where the bulk of recreational fishing is known to occur.

Whitewater recreational use also involves higher flows as well with the whitewater community likely to ask to see flows of up to 2,000 CFS. TU hopes that the in-water portion of that study will be conducted, and wishes to be informed when it will occur so that it can put its own observers in the field.

<u>Appendix E: North Twin Impoundment Tributary Access Survey Study Report</u>

Study did not collect observations at different lake levels. While some redds were observed, little knowledge was gained about where the landlocked salmon in the lake actually go to spawn as the study did not employ radio tracking technology per the MDIFW request. TU strongly concurs with MDIFW Comments that included: "There is virtually no information on what effects Project seasonal water level fluctuations may have, or may not have, on landlocked salmon life histories, most importantly spawning and rearing potential."[17] This is

[15] "Whenever abnormal conditions occur such that a flow cannot be passed through the generators at the Millinocket Powerhouse to achieve the 2,000 cfs minimum flow, the inflatable rubber flashboard system shall be deflated to release flows in an expeditious effort to minimize downriver effects on water quality and aquatic habitat. Except for the initial 2-minute siren warning and a safety flow of 200 cfs for 15 minutes, such flows will not be ramped. The protection of downriver water quality and aquatic habitat is a higher priority than prevention of channel scouring and destruction of vegetation in the Back Channel. During periods of high seasonal flows, the initial 2-minute siren warning and safety flow of 200 cfs for 15 minutes will also be used. Following this 15-minute release, increases of 400 cfs per hour will be made until either the required flow is met, the elevation at Stone Dam is less than 459.45 feet, or the inflatable rubber flashboard system is fully deflated, if necessary. *The ramping up of seasonal flows in the Back Channel will be done only after the hydraulic capacity of those units available has been attained."* Brookfield letter dated June 3, 2019, Subject: Low Impact Hydropower Institute Application for the Penobscot Mills Project -Dolby & Millinocket Developments. Accessed at https://lowimpacthydro.org/wp-content/uploads/2020/07/20190603-Initial-LIHI-Application-Millinocket-Dolby.pdf - page 29, italics supplied.

[16] USGS StreamStats accessed at https://streamstats.usgs.gov/ss/ for location (Latitude, Longitude): 45.63379, -68.67245 drainage area is 2077 square miles. Aquatic baseflow is computed as that value in CFS.

[17] MDIFW Letter dated June 27, 2024, RE: MDIFW Comments on the Updated Study Report for the Ripogenus Hydroelectric Project (FERC No. 2572) and Penobscot Mills Hydroelectric Project (FERC No. 2458), page 3.

another example of a missed opportunity to acquire additional, timely and accurate information upon which to base relicensing decisions.

Appendix F: 2023 Upstream American Eel Study Report

TU concurs with the results.

The study demonstrated that eels are in the system with levels of abundance and that provisions for eel passage, including deep gate passage, should be included with the new license.

Appendix G: Terrestrial, Wildlife, and Botanical Resources Study Report

No comments.

Appendix H: Riparian and Littoral Habitat Assessment Study Report

Results would have been very different if conducted during dry years 2020 or 2021 when the littoral zone was dewatered and reflects an intention to mislead FERC into believing that sustainable minimum flows are constant and have been historically present when they are not.

Appendix I: Marsh Bird Study Report

TU notes that very few birds were observed given the amount of habitat studied.

Appendix J: Furbearer Survey Study Report given the available habitat

No comments.

Appendix K: Wood Turtle Study Report

No comments.

Appendix L: Second Year Recreation Study Report

Completed recreational surveys were not included by Brookfield for lake campsites or the Big Eddy Campground due to incomplete data. TU notes that there were repeated requests to put surveyors in the field by the stakeholders that would have prevented this from happening. **TU requests that the forms be included in the report, and that given the delay already assumed by FERC and Brookfield, that surveyors be put into the field to collect data throughout the study area during a third year of studies. The fact that Brookfield's efforts to collect recreational use data by less reliable means has continued to fail makes this a logical next step. The Big Eddy Campground is one of the most well-known and heavily used areas on the river the failure to obtain reliable data from this area severely undermines any recreational conclusions that might be drawn.**

Recreational data continues to be lacking in coverage of the Chesuncook Lake part of the Northern Forest Canoe Trail, which includes many BPL remote campsites, and sites in the Penobscot River Corridor that are affected by project operations.

The recreational study does not acknowledge or address extensive use by groups such as - private kids camps, universities, guided canoe trips, etc.

Lack of parking was a persistent theme at boat launches, some of which need work on the ramps. While this was included in the report, other aspects of TU inputs to the Recreational Focus Group were largely ignored. TU has included them as Attachment A. Of particular note to TU are the pull-offs from the Golden Road that provide parking and access to fishing sites on the mainstem of the West Branch. Having recently traveled there, **the Golden Road continues to degrade from pavement to gravel, and recent grading efforts make the pull-offs even less well defined. Over the 40-year span of the license, they will become indistinguishable making parking to access fishing sites problematic and dangerous due to passing logging trucks on this road. TU requests that Brookfield propose a way to maintain pull-off parking or conduct a study to identify how to achieve that.**

TU comments regarding problems with parking at Millinocket Lake Boat Launch, Ambajejus Lake Boat Launch and South Twin Lake Boat Launch were acknowledged,[18] and TU has since heard reports that loss of parking at the Ambajejus Lake Boat Launch has created a major parking problem during high-use periods this summer: holidays and weekends. Brookfield's USR response was: "The comment regarding the need for expanded parking is acknowledged, and the meeting notes for these sites have been updated to reflect this concern. The discussion regarding jersey barriers was not specific to any of the FERC approved Project recreation sites. Rather, this was a concern regarding the potential restriction of parking on the private access road to the Pump House on Millinocket Lake. Jersey barriers do not restrict parking at any of the FERC approved Project recreation sites." The areas involved appears to be in the project area and access to the lake should be a significant concern. The PM&E measures that Brookfield described in the PAD as completely adequate have been eroded, and action needs to be taken to restore access to the resource to accommodate local, tourist and business needs. Comments by whitewater operator Chris Howe stated: "This is all because GLHA simply refuses to work with affiliated parties to come up with a solution at the Millinocket Lake Pumphouse parking area."[19] **TU requests that Brookfield propose a way to restore adequate parking in the area of the Ambajejus Lake and Millinocket Lake launches or conduct a study to identify how to achieve that.**

Appendix M: Whitewater Boating Assessment Study Report

**Brookfield has only scheduled the first phase of Level-2 study methodology established by Whittaker and Shelby. This will likely drive further delays to the relicensing, delays that are avoidable. TU requests that the in-waters portion of Level-2 be conducted this summer.**

Current access to whitewater opportunities below Stone Dam is only available by making a long paddle across Quakish Lake. Access on river left downstream of Stone Dam should be provided where there are existing roads; river right has only logging tote roads and trails. This access would also provide recreational fishing opportunities is the lower reach closest to Shad Pond where fish seek refuge from high water temperatures during the hottest summer months.

Appendix N: Aesthetics Study Report

Purpose of the study was to evaluate the impact of project operations on aesthetics. This was not accomplished because the comparison pictures are at lake levels of 936 asl - a level not seen since 2014. Even with poor comparisons there was a documented decrease in aesthetic quality from full lake to 936 asl. Remote campsites used by a large number of people were not included in the study. Videos and images were not

[18] USR, Second Year Recreation Study Report, Attachment 11-12.
[19] Chris Howe letter filed July 1, 2024.

accepted for evaluation by the focus group, despite emails saying they would be. The study claims that the focus group made decisions when there is no evidence any such decisions were made. The group was told what the studies would consist of, not consulted for input on substantive decisions. **Again, Brookfield did not consult with stakeholders and produced a study that fails to inform relicensing decisions. For the most part, the study merely confirms the obvious: that people in the Maine woods like woods, water and stone. This oversimplification determines nothing and is based on little or no actual data. This is particularly applicable to Ripogenus Gorge where only one flow level was used for the observations. In the absence of comparison data, it should be assumed that higher flows are more useful for recreational and aesthetic purposes.**

The camp owners USR Comments[20] demonstrate dramatically what comparison data looks like by showing aesthetic lake views at differing water levels. Volunteers produced data much more useful that that provided in the Brookfield report.

Appendix O: Environmental Justice Study

FERC policy on Environmental Justice is narrowly defined and the studies conducted by Brookfield exceeded FERC's requirements without identifying environmental justice issues.

**Other Study Matters**

Fish Assemblage Study

Further data collection by the Midwest Biological Diversity Institute was observed by TU members and scale samples were apparently not being taken. This is another example where an easy opportunity to inform the relicensing was missed, in this case, to compare fish growth rate data with the data from the last relicensing to confirm or deny the perception that the world-class fishery described in the last license application is being maintained or is otherwise impacted by Brookfield's operations.

Ramping Study

TU concerns were stated in email to Brookfield contractor Jesse Wechsler provided as Attachment B.[21] The dates proposed for the study were the worst possible dates for the fisheries resources. TU participation on data collection teams was assumed without even asking TU. The study would look at changing between one, two and three generator operations without examining low flows contained in the current license that are based on opinion and past practice rather than empirical data: 1,422 CFS, 1,300 CFS and 1,000 CFS. FERC cannot set minimum flows for the new license without data justifying those flows.

Proposed sampling in the Big Eddy Pool is not indicated. There is no reason to sample an area where stranding is unlikely to occur.

TU has since determined that the basis for the study was not as stated in the Jesse Wechsler email but from a TU Study Request that we have included as Attachment C.[22] We again note that the methodology for ramping studies has been well established by Smokorowski and that Brookfield is well aware of this because it paid for

[20] Caribou and Chesuncook Lake Associations letter dated June 24, 2024, Subject: Ripogenus Hydroelectric Project (FERC No. 2572-133) Updated Study Report Comments.
[21] Email thread filed to the FERC docket by letter dated June 5, 2024, Subject: Status of Consultation for Studies for the Ripogenus Project (P-2572) and the Penobscot Mills Project (P-2458)
[22] Ed Spear letter dated May 1, 2024, Subject: Ripogenus Project (P-2572) Comments and Study Suggestions on the Proposed Ramping Study Plan Issued Via Email on April 24, 2024.

the studies that it subsequently did not follow. This was noted by retired fisheries biologist Ed Spear as well.[23] The proposed Ramping Study is a ramping study in name only.

**TU's request for the status of consultation remains unanswered, and TU has not been consulted on the Ramping Study as the date of this filing.** On June 26, 2024, Jesse Wechsler sent an email announcing the dates of the study as occurring in mid-to-late July.[24] An announcement is dictation, not consultation. It will be difficult to find volunteer observers during the height of vacation season on short notice. TU continues to request that the study should be conducted sometime between August and mid-October of this year, with the later dates having the least potential impacts on the fishery.

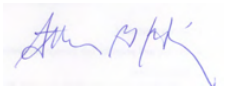
**Updated Study Report Meeting**

The report of the meeting Brookfield provided omitted important questions. TU asked where the information supporting the flows of 1,422 cfs, 1,300 cfs and 1,000cfs was located, and the Brookfield representative's reply was that it is in the record, but neither this question nor the Brookfield response were included in the meeting report. This is remarkable given that Ed Spear had already filed specific comments noting the request.[25]

**Conclusion**

Information provided in these comments demonstrates that Brookfield continues to work against the intent of the ILP by conducting studies that fail to reasonably inform relicensing decisions. This is reflected in our comments regarding the Ops Model Study, the Angler Flow Eval Study, North Twin Impoundment Tributary Access Survey Study, the Second Year Recreation Study, the Whitewater Boating Assessment Study, the Aesthetics Study, the Fish Assemblage Study and the Ramping Study.

TU appreciates the direction FERC staff provided in its June 14, 2024 letter[26] especially with regard to determining the origin of McKay Station flows, and consultation regarding the Fish Stranding Study. The information requirements involved are the most important of the relicensing in determining the appropriate flow regime for the new license. While the staff comments did not address the Ops Model runs, the model and input lake elevations will greatly influence future flow regimes. Therefore, it is important that model inputs include lake levels of 941.6 asl, the maximum water surface elevation of Ripogenus - Chesuncook Lake. To do otherwise, Brookfield is dictating future operations, not studying the options. If the full range of options for future project operations are not examined, further relicensing delays and litigation will inevitably ensue.



TU also appreciates the staff comments on the Terrestrial, Wildlife and Biological Resources Study, but more so the comments on the Whitewater Boating Assessment Study. If Level-2 is accomplished in stages as Brookfield proposes, not as prescribed by Whittaker et al., it will most likely result in further delays in issuance of the REA. TU also hope to do its own further evaluation of wadability/fishability of the reach below Stone Dam during the whitewater flows that TU expects will include flows of at least 1,000 cfs rather than the less than 400 cfs flows that Brookfield provided for its study.

TU would also like to note that the Year-2 Recreational Study is deficient and that surveyors should be put into the field for a third year of study.

Subject: **Comments on the Recreational Focus Group Summary**

Dear Uriah:

I am submitting these comments on the Meeting/Call Summary Recreation Focus Group Meeting for the Ripogenus and Penobscot Mills Hydroelectric Projects (FERC Nos. 2572 and 2458) held January 22, 2024 that I did attend. Their primary purpose is to clarify, expand and provide emphasis where needed on the group comments captured at the meeting using a white board. I have over 25 years of experience fishing the West Branch and am well acquainted with others who recreate in other ways in the area.

**General Comments.**

Overall approach. The group was presented with selected recreational site that has been inventoried. Future studies are needed to assess current and future needs for fishing, boating, hiking and whitewater activities.

Boat launch parking. Multiple comments addressed the adequacy of parking and the need for improvements at a number of launch facilities. In general, improvement improve larger parking areas to accommodate maximum loading, provisions for vehicles with trailers, and space to turn around. While these are not generally seen as safety hazards in terms of personnel injury, they are a hazard for equipment, especially as relates to vehicles towing trailers and their need to back them.

Boat ramps. The Ambajejus Lake Boat Launch ramp was felt to be best of class and should be used as a model for upgrades.

**Specific Comments.**

Caribou Lake Put-in and Chesuncook Dam Point Boat Launch. These facilities are only usable about 50% of the boating season. Lake levels need to be more stable and the facilities modified to be functional throughout the boating season (June through September) down to historic low lake levels.

Upper Gorge Trail. Please expand the second bullet with the bolded words to read: Anglers also use this site to access the Upper Gorge, and higher flows in the Upper Gorge **coming from the deep gates** would increase the presence of valuable fish (salmon/trout) targeted by anglers. The trail needs to include informal trails that provide access down to the water for anglers and paddlers – hikers as well.

McKay Station Rafting Station. Current situation is marginally safe at best. Additional rock needs to be added or other measures need to be taken to make water access safer for paddlers, rafters and anglers and less damaging to equipment; a longer-term solution also needs to be found. This comment included as a matter of special emphasis.

Big Amberjackmockamus Launch. Although recently improved, the site is generally poorly maintained despite high use by the whitewater community. The access road is in poor condition and needs maintenance: grading and gravel. Additional parking and turn around space is needed.

Millinocket Lake Boat Launch, Ambajejus Lake Boat Launch and South Twin Lake Boat Launch. All need expanded parking; Brookfield's use of Jersey barriers further restricts parking.

Dead Man's Curve Boat Launch. This launch is unusually steep and needs to be redesigned to be more usable. More parking and an area to turn around are also needed.

Stone Dam Access. Brookfield has stated this will be will all be examined as part of a Level 2 Whitewater Access and Reconnaissance planned for the spring/summer of 2024. This comment is included for emphasis. It is expected that the new license will put water into the main channel of the West Branch below Stone dam. This will provide both fishing and whitewater opportunities. Access must be provided better than the long lake paddle currently available.

**Additional Sites.** The following were not presented to the focus group. The future of the parking provided is unclear. TU requests that they be added to the report. Site location is provided by attached Map 1. Orange pins indicate parking for fishing access.

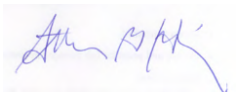
Telos Bridge Parking Area. Parking provides fisheries access to the pools fishable from the north bank above Telos Bridge. Maintained by MDACF/BPL. Parking considered adequate, future maintenance is a possible issue.

Golden Road Pull-offs. Additional sites providing access to fishable pools from the south side of the Golden Road both upstream and downstream of Telos Road. These are of special concern because Katahdin Forest Management is letting the Golden Road return to gravel as the McAdam surface deteriorates. These pull-offs are not well defined and could be lost in the process unless provision for them is provided.

Holbrook Pull-off. Pull-off space for a couple of vehicles providing access to south shore and to Holbrook Pool. This pull-off is a special concern because it is relatively narrow and logging truck come at relatively high speed down the hill above from the west.

Meadows Pull-off. Pull-off space for a couple of vehicles providing access to south shore and to the Meadows Pool.

Steep Bank Pull-off. Pull-off space for a couple of vehicles providing access to the south shore and to the Steep Bank Pool.



Little Amberjackmockamus Pull-off. Pull-off space for a couple of vehicles providing access to south shore and to the pool below Little A Falls.

Abol Falls Pull-off. Pull-off provides parking for a couple of vehicles off Water Way below the Abol Falls Boat Launch to access the run of water below Abol Falls. Status is unclear. Location is shown on Map 2.

Little Amberjackmockamus Launch Site/Take Out. Boat takeout/put in maintained by MDACF/BPL. Needs additional parking, improvement to side-channel crossing, and gravel added to the access route.

I appreciate this opportunity to provide input on the recreational aspects of the Ripogenus and Penobscot Mills Projects.

Respectfully,

Stephen G. Heinz

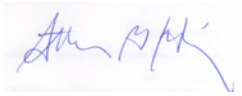
Ms. Debbie-Anne Reese
Acting Secretary Federal Energy Regulatory Commission
888 First Street, N.E.
Washington, D.C. 20426

**Via online submission to: http://www/ferc.gov**

Subject: **Status of Consultation for Studies for the Ripogenus Project (P-2572) and the Penobscot Mills Project (P-2458)**



Dear Acting Secretary Reese:

On behalf of its six chapters and over 2,000 members, Maine Council of Trout Unlimited (TU) submits the attached email thread regarding studies for the Ripogenus Project (P-2572) and the Penobscot Mills Project (P-2458) filed for Great Lakes Hydro America, LLC by Brookfield Renewable ("Brookfield" or "Applicant") so that it is part of the record.

TU had asked Brookfield through its contractor Jesse Wechsler for a response to his email regarding consultation and the Ramping Study by May 31, 2024 and that has not been not forthcoming. We reiterate this request.

TU asked at the Updated Study Report Meeting that Brookfield provide the bases for Ripogenus Project flows of 1422 cfs, 1300 cfs and 1000 cfs that are in the current license. Rather than respond to the request, Brookfield stated that it was in the record without reference to where it was located. TU reiterates that request which was included in the attached email.

Respectfully,

Stephen G. Heinz
Maine TU Council FERC Coordinator

---

Jesse,

Thank you for the clarification.

TU expected be able to conduct substantive discussions of the Ramping Study combined with year two of the Stranding Study at the USR Meeting based on the content of Brookfield's Filing of May 3 that stated: “GLHA looks forward to discussing the study at the USR Meeting." Despite TU noting this at the very beginning of the meeting, no substantive discussion occurred beyond Brookfield stating that the study would likely be delayed until September and that consultation with stakeholders was ongoing. TU had proposed September of early October, the same timeframe that the year 1 Stranding study was conducted. TU supports this later date because milder weather conditions would be less likely to cause mortality of salmon parr and macro-invertebrates, and would not be during the fishing season, but we will not object to conducting it in late July or August. Consultation between Brookfield and TU was minimal for the Stranding Study, but did result in moving some of the study area from areas where strandings were not expected to areas where they were. For the Wadability/Fishability Study, consultation was virtually non-existent: participants were not given key details of the study until they arrived to participate such as specific locations or flows. One of the Brookfield contractors stated at the USR Meeting that none of the volunteers objected to the study methods when it was conducted. It is unrealistic to think that volunteers showing up in the field to participate in a study could do the analysis required in the field on the fly.

The Ramping Study that TU received with your April 26 email assumed TU volunteer participation. TU was not asked if it wished to participate in data collection for the study. TU may want to sample other areas when the study is conducted as we did with the Stranding Study. Conducting relicensing studies is the responsibility of the applicant. TU currently has no paid employees in Maine and any support which we supply is on our members' own time and at their own expense. Few live within easy driving distance of the Ripogenus Project, and most have to find lodging at their own expense to participate in West Branch studies. They are under no obligation to participate and should not be counted on to collect data and certainly without asking if we wished to be used in that manner. We may put independent observers in the field as we did for the Stranding Study where we covered different areas than the formal study did and would appreciate advance notice of its timing and details.

Our participation in the Wadability/Fishability Study was driven by our conclusion that contractor observers would be unqualified to make determinations of either wadeability or fishability over any range of flow. We were not consulted on the details of the study and were disappointed that the range of flows was limited to under 400 cfs. TU’s general comments on the study were that ‘the validity would be dependent on the range of flows provided.’ We anticipated that the three flows that would be provided would cover a larger range. Although bladder systems are not generally used to control flows from dams, Brookfield does use it to control flows within the system to control Millinocket Development ramping rates:

> "Whenever abnormal conditions occur such that a flow cannot be passed through the generators at the Millinocket Powerhouse to achieve the 2,000 cfs minimum flow, the inflatable rubber flashboard system shall be deflated to release flows in an expeditious effort to minimize downriver effects on water quality and aquatic habitat. Except for the initial 2-minute siren warning and a safety flow of 200 cfs for 15 minutes, such flows will not be ramped. The protection of downriver water quality and aquatic habitat is a higher priority than prevention of channel scouring and destruction of vegetation in the Back Channel. During periods of high seasonal flows, the initial 2-minute siren warning and safety flow of 200 cfs for 15 minutes will also be used. Following this 15-minute release, increases of 400 cfs per hour will be made until either the required flow is met, the elevation at Stone Dam is less than 459.45 feet, or the inflatable rubber flashboard system is fully deflated, if necessary. *The ramping up of seasonal flows in the Back Channel will be done only after the hydraulic capacity of those units available has been attained.*” [Source: https://lowimpacthydro.org/wp-content/uploads/2020/07/20190603-Initial-LIHI-Application-Millinocket-Dolby.pdf -page 29, italics supplied].

Less than half the flow that maximized macro invertebrate habitat or adult landlocked salmon habitat that Brookfield Aquatic Habit Study indicated was provided for the Wadability/Fishability Study.

I was surprised that Ed Spear was not included on your April 26 email. Ed has spent more time and done more study of the West Branch fishery than anyone, and his knowledge and experience are invaluable. TU agrees with the comments in his FERC filing of May 1 that supported our requests that the study be conducted in late September or early October. They also reflect TU’s analysis that there is no value in sampling the Big Eddy Pool and alternative sites should be included:

> 'As designed, the RSP includes only about 10 percent of critical salmonid spawning areas (Vol IX 1991 Ripogenus Project Application Table 16) and perhaps a third of salmonid nursey and aquatic insect habitat. This oversight can easily be corrected by including the two flow sensitive areas (either the gravel bar above Line Pool or the relatively long gravel area beginning at the end of Line Pool ) immediately above Nesowadenhunk Deadwater“ and removing the “below Big Eddy Site”. This minor change will include the “Horserace”, prime nursery habitat, and the major spawning areas, Little A Deadwater and the two combined “head of Nesowadenhunk Deadwater” sites. The third major spawning area is the pool immediately below Abol Bridge and is downstream of the reaches of apparent study interest although it is thought to be critical to the North Twin Impoundment salmon population.'

Ed’s comments go on to request inclusion of sampling of macro-invertebrate drift, a key feature of the studies conducted by Smokorowski and others. Incorporating this represents an opportunity to further inform the relicensing, and better determine of the full effects of peaking below McKay station. He goes no to say:

> "Aquatic insects provide critical forage for juvenile salmon and as maintenance food items to adult salmon during summer periods. The RSP addresses aquatic communities only in terms of mortalities. They then continue by quoting Smokorowski et al (2011) implying that they are familiar with work done by Smokorowki, Marty and others on the Magpie and Batchawana Rivers. Impressive work, sponsored by the Licensee.
>
> The Licensee correctly identified Smokorowski and other’s work but failed to include their reports of increased aquatic communities “drift” and population shifts resulting from unramped peaking. The literature is replete with publications concerning aquatic insect drift (or movement) caused by peaking as well as emergency outages. This phenomenon should be addressed in

the RSP. My filing of February 14, 2022 (accession No. 20220214-5027) provided details of impacts resulting from unramped peaking and regulated flows and an accompanying list of peer reviewed references. I see no need to repeat well-known science.

I suggest the RSP be modified and include aquatic community drift before, during, and after flow changes. For all sample sites, duplicate metered, drift nets should be set in a fixed position for two hour periods just prior to flow increases; emptied and set again immediately as flow rises; removed before a flow change, and then reset for a two hour period after flows are increased. As mentioned above, to avoid bias caused by the sometimes crepuscular/diel aquatic insect behavior, sampling should be mid-day."

TU would like to build on Ed's comments. The Ramping Study as written is not a ramping study but an exercise to verify that normal switching between 1, 2 and 3 generator operations does not strand fish. If it shows that stranding does not occur when this happens, then it does not make sense to look at smaller increments of flow change - except at lower flows. As TU stated in its April 30 email:

"TU is still unaware of data supporting the flows that comprise the terms and conditions of the current license. The 400 cfs trip event flows allowed under the current license have been demonstrated to cause extensive mortality to fish and macro-invertebrates. If data exists to justify 1000 cfs as a minimum flow in terms of strandings, then please direct us to the study data that shows that. Similarly, if data exists to justify spawning and incubation flow of 1422 to 1300 cfs, then please direct us to that as well. To our knowledge, the 1422 cfs only reflects the general guidance for minimum flow developed by USFWS for New England waters: the catchment area in square miles. More specific data is needed to condition the new license."

In any case, the scope of the study needs to be expanded to include examination of the range of flows from 1422 cfs down to the 500 cfs that the Stranding Study has conclusively shown to cause extensive mortality, especially to landlocked salmon parr. If this is not incorporated into the Ramping Study, then additional delays to those already caused by the failure go two McKay Station generators on July 8, 2023 will be incurred when it is recognized that the current minimum, spawning and incubation flows are not based on data.

I spoke with Allan Creamer at the USR Meeting on May 16, and he said he had looked and the only flow study he could locate was an IFIM study for Ripogenus Gorge. This is completely the opposite of what Brookfield asserted in response to my multiple requests that Brookfield identify the studies supporting current license flows. We are well into the relicensing process and still lack data justifying the flows in the current license that we expect Brookfield will apply to have continued in the new license.

TU proposed both the Stranding Study and the Ramping Study. We appreciate the opportunity to provide input to the consultation. Please reply by May 31, 2024.

Thanks again,

Steve Heinz

>
> We are surprised that you would choose the weeks of highest aquatic biological activity to conduct the study. The weeks that you propose are during the largest hatches of caddis flies and greatest period of stonefly emergence. The study would perturbate the lifecycle of the insects and the fish that feed on them. Besides that, landlocked salmon fry would be very young then and vulnerable to changes in flow conditions. In mid-June, water temperatures and air temperatures will likely be fairly high so any strandings that might occur would be more likely to result in mortality than if the study were conducted either earlier or later in the year.
>
> These are also the weeks that most Maine trout fishermen want to be on the water, so it is doubtful that TU would be able to recruit enough volunteers to assist with data collection if we supported these dates. Local guide and campground businesses would also likely suffer.
>

Hi Steve –

Confirming for you that no additional communication has gone out on this topic and providing you with the latest update.

Per MDIFW's recommendations on May 2, we are now looking to perform the study in back-to-back weeks in the 2nd ½ of July or in August. We anticipate two days of field work (1 day in each week). We are currently discussing the timing with GLHA to make sure that this will work operationally and to identify specific dates for the field work. We also need to make sure that the new timeframe will work for the rafting outfitters.

Per the study plan, we are planning to form teams of three (1 staffer from TU, MDIFW, and GLHA/KA) for each of the three study sites.

This timing should also allow us to include the results of the study in the Final License Application, which is due to FERC by 9/30.

Due to planned outages and MDIFW permit restrictions, we are not able to perform the study in October.

I plan to develop a detailed schedule soon and send it back out to the group.

Thank you!
Jesse

All,

At the USR Meeting in Bangor last week, I understood that Jesse Wechsler or Brookfield would get back to us regarding "ongoing consultations" involving the upcoming Ramping Study, and combining it with the rest of the Stranding Study. TU was the organization that proposed both studies.

When I spoke with Dave Scarzello this morning at the FERC DEIS Hearing on the

Shawmut Project in Augusta, he said that something had been sent out earlier this week.

I have looked back through my emails and checked the FERC docket and cannot find any new emails or new FERC filing to the docket related to the Ramping Study.

If an email was sent, please forward it to me at your earliest convenience. TU has inputs.

Thanks,

Steve Heinz

On Apr 26, 2024, at 4:44 PM, Jesse Wechsler <Jesse.Wechsler@KleinschmidtGroup.com> wrote:

Good afternoon all,

On behalf of GLHA, I am writing to provide an update and to start coordinating with you on the upcoming ramping study at the Ripogenus Project. As you might recall and as described in documents filed with FERC in 2023 as part of the current relicensing effort, GLHA is planning to study the effects of the following two operational scenarios at the Ripogenus Project on downstream fish and aquatic resources:

- Changing from 3-unit operation (~3,500 cfs) to 2-unit operation (~2,300 cfs) to 1 unit operation (~1,100 cfs) (holding at 2-unit operation for 1 hour before going to 1-unit operation).
- Changing from 3-unit operation (~3,500 cfs) to 1-unit operation (~1,100 cfs) by simultaneously shutting down the other two units.

The study plan, which has been approved by FERC, is attached as reference.

GLHA originally planned to complete the study in the fall of 2023 but was unable to do so because of excess precipitation and scheduled maintenance activities at the McKay Station, which resulted in one or more turbine units being unavailable for the study.

On April 10 of this year, GLHA consulted with members of the rafting

community (i.e., the New England Outdoor Center and other members) at the annual Whitewater Outfitters Meeting to identify dates for the ramping study that would not affect planned recreational and rafting activities in the West Branch. Based on requests from the rafting community and the need to avoid planned maintenance outages this fall, GLHA is targeting this study to occur on two days over back-to-back weeks in June. Specifically, the planned dates are Wednesday June 12 and Wednesday June 19. A target study schedule is attached, showing the planned timeline for operational changes, river flows, and field monitoring activities.

As described in the study plan, the intent is to develop three small field teams that include one representative from TU, GLHA, and MDIFW for each of the 3 sites. We envision this year's study will rely on small teams working together to evaluate the effects of these flow changes on fish and aquatic resources.

As we continue planning the field study, could you please confirm whether your organization will take part, and if so, provide contact information for specific individuals so that we can coordinate directly with team members?

Please feel free to contact me with any questions.

Thank you!

# Attachment C

**Ramping Study**

A Ramping Study would inform the project participants by determining minimum flow changes protective of fish and aquatic communities. The Licensee presently ramps flows below the Caucomgomoc and Brassua Lake Dams. Ramping is commonly requirement in FERC Licensed projects.

**Additional Study Request**

In accordance with 18 CFR 5.15(e), the following is submitted to justify the request.

(1) *Any material changes in the law or regulations applicable to the information request*: there have been no material changes in the law or regulations applicable to this request.

(2) *Why the goals and objectives of any approved study could not be met with the approved study methodology*: No approved study addressed the minimum flows that would preclude or minimize strandings or the rates of achieving those flows that preclude or minimize mortality. TU supported a Ramping Study in its Proposed Study Plan Comments. Information on adequate flows or alternative means of project operations such as ramping to prevent this mortality was not contained in any of the studies included in the ISR.

(3) *Why the request was not made earlier.* Such a study was proposed as a Pre-application Document Comment [Ed Spear letter dated February 12, 2022, Subject: A study Request; Ramping and the Need to Determine the Appropriate Rate of Flow Change Below McKay Station on the West Branch of the Penobscot River] but was not included in the studies FERC approved in its Study Plan Determination (SPD)[ FERC Study Plan Determination for the Ripogenus Hydroelectric Project and the Penobscot Mills Hydroelectric Project dated May 13, 2022, page A-1].

(4) *Significant changes in the project proposal or that significant new information material to the study objectives has become available:*.. The Licensee stated there have been no change in Project operations. This is incorrect. Project operations have changed from relatively base flow for papermaking to a market driven peaking regime. Stranding Study decisively demonstrated that permitted project operations allow abrupt changes in flow that result in significant strandings of fish and macroinvertebrates with significant mortality noted, especially to landlocked salmon parr. This conclusively demonstrated the need for a Ramping Study to determine environmentally safe flows changes and the ramping rates needed to achieve them.

(5) *Why the new study request satisfies the study criteria in § 5.9(b):* The following resubmits the ramping study request in accordance with § 5.9(b).

*1. Describe the goals and objectives of each study proposal and the information to be obtained.*

The goal of the study is to determine safe ramping rates as well as minimum safe flows and the ramping rates needed to achieve them.

2*. If applicable, explain the relevant resource management goals of the agencies or Indian tribes with jurisdiction over the resource to be studied.*

Ramping rate studies are a recognized way to determine ramping rates that reduce or eliminate resultant mortality. Brookfield is well aware of such studies from a multi-year study on ramping effects for the Magpie River Project in Wawa, Ontario since the project is operated by a Brookfield subsidiary. The study is described by Karen E. Smokorowski, Robert A. Metcalfe, Nicholas E. Jones, Jerome Marty, Shilei Niu, and Richard S. Pyrce. Studying Ramp Rate Restrictions, Hydro Review, July 2009.

*3. If the requester is not a resource agency, explain any relevant public interest considerations in regard to the proposed study*.

TU members fish the West Branch of the Penobscot regularly. For many of our members, this is one of our most favored fishing destinations, one that we endeavor to revisit every year. TU has a strong and continuing interest in the terms of the relicensing of the West Branch projects. TU's fisheries interests parallel the general public interest.

4*. Describe existing information concerning the subject of the study proposal, and the need for additional information*.

The Stranding Study demonstrated that an abrupt change from flows of about 2000 cfs to trip event flows of 500 cfs caused significant strandings and mortality, primarily to landlocked salmon parr. The Stranding Study identified areas where dewatering, stranding and mortality occurred. This information can be used to position observers for the ramping study. As stated in the SPD: "As discussed in our recommendations regarding Study 5, the Fish Stranding Study, rapid changes in flow and decreases in water surface elevations can increase the risk of fish and invertebrate stranding that can be stressful and/or lethal for aquatic organisms. As indicated by GLHA, the proposed Historical Operations Data Assessment, would provide information on how the Ripogenus Project is operated, including flows provided by McKay Station. However, it is unclear how this study would determine whether the current rate of downstream flow changes adversely affects aquatic resources or how it would determine the rate at which flows from McKay Station can be ramped up or down to minimize the effects of project operations on aquatic resources." There is no empirical data in the record that documents safe flow change for the Ripogenus Project or the ramping rates needed to achieve them.

*5. Explain any nexus between project operations and effects (direct, indirect, and/or cumulative) on the resource to be studied, and how the study results would inform the development of license requirements*.

Changes in the manner in which flow changes are implemented and the limits on them are needed to improve protection of fish and aquatic communities. Results of the study would directly inform development of terms and conditions of a new license to prevent flow changes at rates that would cause dewatering, stranding and mortality.

6. *Explain how any proposed study methodology (including any preferred data collection and analysis techniques, or objectively quantified information, and a schedule including appropriate filed season(s) and the duration) is consistent with generally accepted practice in the scientific community or, as appropriate, considers relevant tribal values and knowledge.*

Methodology for ramping studies is well documented in Magpie River Ramping Rate Study, Experiment Design, Fisheries and Oceans Canada (DFO), Great Lakes Laboratory for Fisheries and Aquatic Sciences, Sault Ste. Marie. Ontario Ministry of Natural Resources (OMNR) Great Lakes Power Ltd. (GLPL) July 11, 2002.

The study should be conducted in early October before the effective date of spawning flow restrictions: October 15.

Nominal whitewater flows of 2000 to 2400 cfs should be in effect for a week prior to the study event(s).

Suggested range of flows: 3600 cfs (hydraulic limit) to 500 cfs (trip event flow).

If strandings occurs at the initial rate chosen for the study, result in strandings, the ramping would be repeated on subsequent days at lesser ramping rates until a safe ramping rate was found.

The proposed study methodology is consistent with current practice and consistent with the values of the Penobscot Indian Nation.

7. *Describe considerations of level of effort and cost, as applicable, and why proposed alternative studies would not be sufficient to meet the stated information needs*.

Estimated cost is $25,000, consistent with a project of this size and importance. The stranding Study conducted by Brookfield did not meet information ramping goals and are inadequate to inform improved terms and conditions.

> You don't often get email from dan.mccaw@penobscotnation.org. Learn why this is important

Good morning, Dustin,

I am writing about the May 24th letter written by Stephen Bowler to Chief Kirk Francis, here at Penobscot Nation.

If GLHA would like to contact me, my phone number is below. I am unsure as to what number they have been calling, but I have received no calls or messages from the licensee.

The licensee certainly knows my email, but I have received no messages to date about the referenced study. The Nation is preparing comments on the Study to be submitted before June 3oth.

Sincerely,

Dan

**Subject: Ripogenus Hydroelectric Project (FERC No. 2572-133)**
**Penobscot Mills Hydroelectric Project (FERC No. 2458-247)**
**Comments on the Licensee's June 28, 2024 Updated Study Report Supplement, Filing**

Dear Secretary Reese Via eFile

The implied purpose of the Operation Model (Ops Model) was to determine if environmental, aesthetic, and recreational goals could be implemented while having a degree of compatibility with energy production. The Great Lakes Hydro America's (the Licensee) June 28, 2024 Ops Model as well as earlier filings use a baseline that is based on power production. These data were based on the Millinocket and East Millinocket operation (1999-2002), the East Millinocket operation (2003-2014), and the period in 2015 with 2 closed mills that included a prolonged drought. This variable data set ignored the Rule Curve developed by (then) Great Northern Paper which was the foundation of the 1996 License. While the baseline data set includes minor environmental flow requirements (100 cfs Upper Goal flow July 1-September 30) and boating flow requirements (2000-2300 from 8 AM to 5PM) that vary with the "water year", neither produce any major impact on Ripogenus Project Storage. As long as an energy driven baseline is used, reasonable stakeholder and agency requests that deal with flow or storage will be defeated by the need for market driven energy production

As presented, using power generation as a default, this filing is a continuation of the Licensee's on-going attempt to manipulate data and present results favorable to their market driven energy production. As with the Tributary (salmon) Access and Fish Assemblage Studies, despite highly professional field efforts, subsequent reports, and zoom meetings, parameters set by the Licensee resulted in seriously flawed work products. This filing attempts to outline erroneous assumptions and misuse of data that produced results damaging to Stakeholder and Agency goals.

The Ripogenus and Penobscot Mills Projects and their accompanying Licenses represent two vastly different sets of environmental, aesthetic and recreational arenas. The Ripogenus Project is relatively remote with NO full-time residents (with the possible exception of Chesuncook Village) and other than McKay Station, no industrial development. The Ripogenus Project was once famous for its "world class" West Branch salmon fishery (there is no current quantitative information on its status), white water boating activities, and camping. The Penobscot Mills Project set in the towns of Millinocket and East Millinocket is the exact opposite.

The former Great Northen Paper Mills are now shuttered. Subsequently, the need for constant Hydro power and any linkage between the two Projects no longer exists. Linkage of the two projects creates an artificial burden on the Ripogenus Project and its 30 BCF of storage ability to meet environmental, aesthetic, and recreational goals. These are two separate projects, and two separate licenses. Any (operations) model runs should be made without the bias caused by linking the two projects

In what appears to have been a tactical maneuver, the Licensee filed an Application and accompanying material on the combined Ripogenus and Penobscot Mills Projects . The Licensee needs to explain why they continue to link the Ripogenus and Penobscot Mills Projects. The use of Ripogenus Storage to meet Penobscot Mills power generation should not be included when considering Ripogenus Impoundment elevation and downstream West Branch flow goals. The burden of meeting Penobscot Mills' power production and/or environmental goals lies with North Twin Impoundment and Millinocket Lake storage.

In what appeared to be another tactical maneuver, the Licensee continues to use 939 ft as a Ripogenus Impoundment full pond elevation. As this impoundment routinely reaches 941.6, the licensed elevation, during/after spring runoff, the use of 939 ft is the continuing effort to "hide" three billion cubic feet of storage. Once licensed, the Licensee can fill the impoundment as it wishes, but Ops Model runs should be conducted using a full pond elevation of 941.6 feet

In reading though the Updated Study Report Supplement it appears that elevation and flow values of the R3 models were determined using the synthetic hydrographs of six years (2015-2020) of records (the current operation regime, attachment B) and then model runs were calculated using the synthetic values of the 23-year (1999-2021) period of record. Additionally, as R3 values were the result of one or more calculations, some error statement is needed. It would be helpful if the Licensee could clarify their graphic representations.

As noted above, the Licensee uses the term historic flows (baseline) when analyzing modeling requests. Modeling runs included historic McKay Station flows and these outflows include peaking, low flow events e.g.,1000cfs, and outage events. Inclusion of baseline data and its variability confounds any request for gradual impoundment drawdown and moderate West Branch flows. My request was forward looking, and the Licensee's past operating modes (baseline) have nothing to do with post License operation. My request simply inquired about the possibility of a slower drawdown and moderate flow e.g., 2400 cfs, needed to protect the Holbrook Bypass Channel juvenile salmon production.

The Licensee continues to use estimated inflow derived from distant waters rather than the USGS Gaging Station on the North Branch of the Penobscot River (North Branch) that provides actual inflow into Project impoundments. In-system data must be superior to data derived from distance sources. The Licensee's dismissal of the North Branch is based on two De minimis dams on Dole Brook that provide "regulated" or unnatural flow. However, the Licensee has no problem in classifying Nahmakanta Stream as unregulated (Appendix E-7, 4.0 Methodolgy,) despite the dam on the outlet of Rainbow Lake. The Licensee should clarify when a dam is not a dam.

Current model run outputs are based on change in generation and power production rather than the need to meet resource goals. Despite the fact that McKay spillage provides no danger to the uninhabited West Branch downstream of Ripogenus Dam, the avoidance of spill events remains a major parameter. McKay Station was brought on-line in 1953. Flooding of the West Branch below McKay Station has never been an issue to life or property. On

rare occasions traffic has been inconvenienced. Regarding the Ripogesnus Project, any issue concerning spillage/flooding, is largely irrelevant.

Regarding item one of the above reference filing "HolbrookQByp200Elev8.5", this iteration should not be attributed to me. I made no request to include the Penobscot Mills Project in the analysis . ("*This request severs/delinks any storage need from the Penobscot Mills Project". Filed 02/09/2024).*

The 40 Billion Cubic Feet (BCF) of combined storage along with inflow is adequate to meet flow demands that would water the frequently dewatered Holbrook Bypass Chanel (Article 406). At issue is the impact on Ripogenus Impoundment elevation. One would assume that using a reiterate method, a slightly lower McKay Station annual flow, reduced peaking, would meet Impoundment elevation goals requested by other stakeholders and the agencies

The 1996 Environmental Impact Statement (EIS) stated that agency and stakeholder flow and lake level requests could be generally met, the exception being the historic West Branch Channel (the Back Channel) flow of 350 cfs on dry years. The Licensee needs to explain errors made in the FERC EIS lake elvation and flow conclusions.

Even absent confidence limits around estimates of lost generation, results provided in Updated Study Report Supplement are encouraging. For example , a disciplined peaking operation that reduces McKay Station average outflow by 100 cfs (annually) lessens the demand on Ripogenus Storage by over 3 BCF or three feet in Impoundment elevation. Other methods of meeting environmental concerns exist; including (capital) improvements to the Holbrook Bypass Channel gates that could eliminate the historical flow violation of Article 406.

The Ops Model as presented was devopled by the Licensee and contains many obvious "glitches". Examples include the continued use of flawed inflow data devloped from distant streams, the use of 939 ft as a Ripogenus full pond elevation, the lack of error statements, and the continued linkage of the Ripogenus and Penobscot Mills Projects.

The stakeholders have commented and made directed requests concerning the above "glitches" as well as other lake level, flow and a litany of recreational issues. The Licensee has been consistent in its refusal to modify

the Ops Model. In earlier filings I urged FERC to request a peer-reviewed water management plan or model, one which addresses the needs of all user needs equally. In this filing, I again request an independent model of the project's storage and outflow capabilites. This information will allow FERC to give equal consideration to all the users of the collective resources,

Thank you for opportunity to comment.

Taft Sibley, Chattanooga, TN.
To whom it may concern,

Each year, a group of approximately 40 whitewater kayakers gather to host a world championship competition. In 2021 this group, chose a river feature the Penobscot River which was believed to be world class. Unfortunately, due to irregular flows, the river feature was ideal and the championships had to be moved 1.5 hours down the road to another section of whitewater.

This year, we've chosen to host our event on the Penobscot again and are experiencing the same problem of inconsistent flows. Unfortunately, several of the competitors have chosen to forego the event.

Consistent flows and predictable releases would certainly bring positive impact on the local economy.

- **Subject: Ripogenus Hydroelectric Project (FERC No. 2572-133) Submittal of West Branch of the Penobscot River 2023 Landlocked Salmon Age-Growth Data**

Dear Secretary Reese, Via Electronic filing

This filing is a revised document to the one that was first filed on September 27, 2023. These revisions largley involved addition of the 2023 landlocked salmon age-growth data.

The age and growth data presented below, represents the 2023 information as well as the previously presented 2022 data. Landlocked salmon (salmon) age and growth distribution of West Branch of the Penobscot River (West Branch) in the river reaches Downstream of McKay Station are shown in the tables below. These data were collected from pools just above Nesowadenhunk Deadwater, the major overwintering area. This reach was popular with anglers in the 1980s and 1990s. Sampling location and methods (angling) are comparable to 1980's West Branch catch data filed in the 1991 FERC Apllication shown in the tables below.

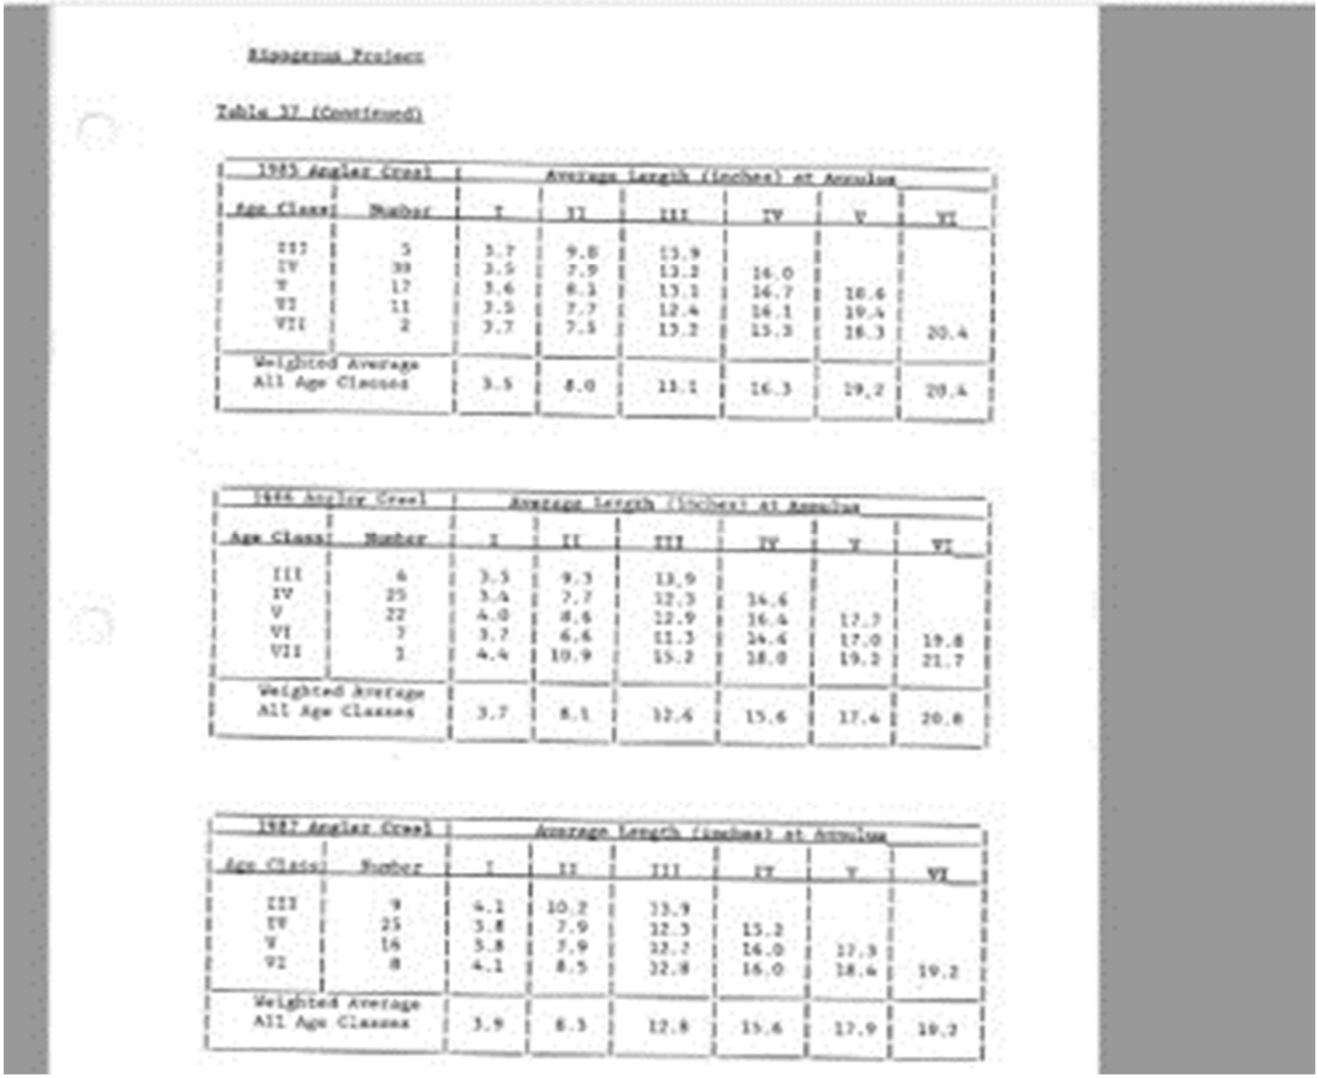
Salmon were collected over a four week period representing seven May sampling events (fishing trips) that typically lasted five hours. As in 2022, the decline in Mayfly hatches eliminated stimulus that might have improved salmon "catchability" and increased the adult salmon sample size. Salmon were caught by fly, landed using a rubber net, measured, and scales removed from the peducle area near the lateral line. When obvious, spawning history (part of the scale margin being absorbed) was noted.

Scale samples were read using a scale projector that produced a magnified image. Age was determined by counting and then measuring annular rings that are formed as the fish begins its yearly growth i.e., normally in May. A number of 2023 fish sample had not yet begun (significant) growth and a new annulus. These fish were assigned the assumed age i.e., treated as if there was an annulus.

Included in the 2022 and 2023 samples were a number of salmons less than 14" (the historic legal size limit). These 2022 fish were not included in the tables of "legal size" salmon shown below. However, based on back-calculated lengths, 2023 sub legal fish are included in a seperate Table below. Juvenile salmon, Ages I and II (Brood years 2019, 2020, 2021) continued to grow at expected rates.

Landlocked Salmon Less Than 14 inches, Angled from the Nesowadenhunk Deadwater Area May, 2023. Lengths are in inches at the time of annulus formation.

| Age | Number | Length At Capture | annulus 1 | annulus 2 | annulus 3 | annulus 4 |
|---|---|---|---|---|---|---|
| 2 | 3 | 11.5 | 4.3 | 10.1 | | |
| 3 | 6 | 12.2 | 3.4 | 9.2 | 12.2 | |
| 4 | 4 | 12.6 | 3.5 | 10.0 | 12.2 | 13.7 |



| | Landlocked Salmon Greater Than 14 Inches Angled from the Nesowadenhunk Deadwater Area May, 2023. Lengths are in inches at the time of annulus formation. | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| AGE | Ave Length at Capture | Number | AGE ! | AGE II | AGE III | AGE IV | AGE V | AGE VI | AGE VII | |
| IV | | none | | | | | | | | |
| V | 15.6” | 4 | 4.4 | 9.8 | 12.3 | 14.3 | 15.5 | | | |
| VI | 16.2” | 3 | 4.3 | 7.8 | 11.8 | 13.3 | 14.7 | 16.1 | | |
| VII | | none | | | | | | | | |
| | | | | | | | | | | |
| | Average N weighted | | 4.4 | 8.9 | 12.1 | 13.9 | 14.7 | 16.1 | | |
| | | | | | | | | | | |

Landlocked Salmon Greater Than 14 Inches Angled from the Nesowadenhunk Deadwater Area Spring 2022. Lengths are in inches at the time of annulus formation.

| | Number | AGE ! | AGE II | AGE III | AGE IV | AGE V | AGE VI | AGE VII |
|---|---|---|---|---|---|---|---|---|
| IV | 5 | 3.5 | 8.1 | 11.4 | 14.0 | | | |
| V | 3 | 3.6 | 7.0 | 10.6 | 12.6 | 14.1 | | |
| VI | 6 | 3.2 | 6.4 | 10.7 | 13.5 | 15.0 | 16.4 | |
| VII | 1 | 2.7 | 7.5 | 10.0 | 11.5 | 13.2 | 15.6 | 16.9 |
| Average N weighted | | 3.3 | 6.7 | 10.6 | 13.2 | 14.5 | 16.3 | 16.9 |

When compared to 1980’s salmon growth data (see tables shown below), the 2023 West Branch adult salmon population continous to be in a percipitous decline. While Juvenile salmon (ages I and II) grow well, adult fish collected in 2022 and 2023 were typically a year or more behind in growth (rate), one to three inches (depending on spawning

history) when compared to the historic (1985-1987, Rip Application Vol. IX) tablar data shown below. This slow adult salmon growth is most obvious as fish reach their third or fourth growing season and when the absence of suitable food sources e.g., rainbow smelt (smelt), becomes appearent. Salmon that had spawned the prior fall, had not resumed normal (scale) growth pattens. “Spent” adult salmon are, and were historically, the life stage most vulnerable to the absence of suitable food source(s).

Blagdenus Project

| VI | 7 | 3.7 | 6.6 | 11.3 | 14.6 | 17.0 | 19.8 |
| VII | 1 | 4.4 | 10.9 | 15.2 | 18.0 | 19.3 | 21.7 |
| Weighted Average All Age Classes | | 3.7 | 8.1 | 12.6 | 15.6 | 17.4 | 20.8 |

| 1987 Angler Creel | | Average Length (inches) at Annulus | | | | | |
|---|---|---|---|---|---|---|---|
| Age Class | Number | I | II | III | IV | V | VI |
| III | 9 | 4.1 | 10.2 | 13.9 | | | |
| IV | 25 | 3.8 | 7.9 | 12.3 | 15.2 | | |
| V | 16 | 3.8 | 7.9 | 12.7 | 16.0 | 17.3 | |
| VI | 8 | 4.1 | 8.5 | 12.8 | 16.0 | 18.4 | 19.2 |
| Weighted Average All Age Classes | | 3.9 | 8.3 | 12.8 | 15.6 | 17.9 | 19.2 |

Intellectual integrity requires I note that salmon in  upstream reaches e.g., the Little Eddy, closer to McKay Station in the June to Sptember period are typically slightly larger than Nesowadenhunk Fish as they are closer to any tailwater effects. However these “upriver” fish would only have been a small component of historical data sets. The Licensee has, or should have, archival fisheries data sheets.

The comparison between 2022- 2023 and 1985-1987 data demonstrates the diasterous reduction in salmon growth rates brought on by the change in project operations. Juvenile smelt, the primary food source of adult salmon, abundance has declined if not disappeared in recent years. The West Branch is no longer the world class fishery FERC described in the Enviromental Impact Statement of 1996.

The Stakeholders have argued for more stable littoral areas to be provided by slower impoundment drawdowns during the growing season, May1 -October 15. The 2023-2024 water year conditions were notably better than aquatic communities' condition during the spring 2021-spring 2023 period. During the last 13 months the Ripogenus Impoundment stayed fuller and for a longer period. Because of this factor, it is likely that these conditions will be manifested in improved salmon growth when 2024 West Branch and Ripogenus Impoundment data are analyzed.

The Licensee has constantly repeated the theme that nothing has changed regarding the shift to peaking operations and earlier drawdowns. The Licensee has fought all study requests that would provide current fish and aquatic communities data that could be compared to information in the 1991 FERC Application. Information presented in this filing demonstrates the fallacy of this pipe dream/negoiating position. Clearly the Ripogenus Project is not meeting MeDIFW fisheries managemnt goals or MeDEP water quality standards.

The Licensee's June 2021 PAD referenced "data gaps", actually voids. These issues remain unchallanged and unchanged. I continue to urge FERC staff to require the Licensee to collect information on Ripogenus smelt (e.g.), plankton, smelt spawning success, food requirements, habitat availablity (littoral areas), as well as downstream smelt drift. This information would provide a course of action that could require modification of future project operations. The West Branch salmon population needs juvenile smelt as a forage base.

Thank you for the opportunity to present these data.

**Subject:** **Ripogenus Hydroelectric Project (FERC No. 2572-133)**
**Penobscot Mills Hydroelectric Project (FERC No. 2458-247)**
**Operations Model Run Results – Supplemental Information**

Dear Acting Secretary Reese:

Great Lakes Hydro America, LLC (GLHA), the Licensee of the Ripogenus Hydroelectric Project (FERC No. 2572) and the Penobscot Mills Hydroelectric Project (FERC No. 2458) (collectively referred to as the "Projects"), herein files with the Federal Energy Regulatory Commission (FERC) supplemental information associated with the Operations Model Study for the relicensing of the Projects. The Projects are located on the West Branch Penobscot River and Millinocket Stream in Piscataquis and Penobscot counties, Maine.

On June 11, 2021, GLHA filed the Notices of Intent and a Pre-Application Document, which initiated the formal relicensing proceeding to obtain two separate new licenses for the continued operation of the Projects through FERC's Integrated Licensing Process (ILP). Per the Operations Model Study, GLHA developed an Operations Model to evaluate alternative operating scenarios for the Projects.

On June 28, 2024, GLHA filed with FERC the model run results for the stakeholder-requested alternative operating scenarios evaluated by the model. On July 10, 2024, GLHA conducted a virtual meeting with interested stakeholders to explain the operations model run results that were filed with FERC on June 28, 2024. Per stakeholder request during the July 10, 2024 meeting, GLHA herein files a copy of the information presented during the July 10, 2024 meeting.

Concurrent with this filing, GLHA is providing a copy of this letter to all parties listed in the attached distribution list. Parties can download an electric copy of this filing from FERC's eLibrary system at https://www.ferc.gov/ferc-online/elibrary by conducting a search using the docket numbers P-2458 and/or P-2572.

**Subject: Ripogenus Hydroelectric Project (FERC No. 2572-133) Draft License Application Comments.**

Dear Acting Secretary Reese,

The following comments on the Draft License Application (DLA) for Ripogenus Project (P-2572-133) are submitted on behalf of members of the Caribou Chesuncook Lake Camp Associations. These comments are in addition to and supplement the comments we have submitted jointly with other stakeholders. These associations represent individuals with a significant investment in time, treasure and commitment to Chesuncook, Caribou and Ripogenus Lakes. Many multigenerational families are part of this stakeholder group. We have extensive experience with and knowledge of the Lakes. Our stakeholder group also includes members of the Maine Wilderness Guides Association, fishing guides, commercial guiding businesses, and other recreational users of the lakes. I have been involved in the ILP since the initial PAD was presented and I, or my wife, have attended every possible stakeholder meeting.

The DLA was a profound disappointment. In the fast-changing world of technology and energy generation it was disappointing to see one of the biggest participants in the energy field not design a more inspiring license. Nothing new and creative was presented. At the USR meeting we learned that incomplete DLA's are often submitted due to the progress of different studies and were promised a more visionary License Application in the future. I hope this is true.

As in previous filings, the applicant did not acknowledge project impacts and instead painted a rose-colored picture of the project and its operations, despite having been proven inaccurate multiple times. One of the most egregious claims is that lake levels are "*gradually drawn down over the summer,*" on Chesuncook, Ripogenus and Caribou Lakes. The mean drawdown from 2000 - 2022, during the recreational season (May–September) excluding the four wettest and four driest summers, is **11.91 feet**. This significant drawdown of nearly **3 feet per month** is close to the previous licensee's drawdowns of **3.45 feet the entire summer** as stated in their license application, "*an average drawdown of the Ripogenus Impoundment during the recreation season from 1972 to 1985 was **3.45 feet**."* This is a gradual drawdown. Nearly 12 feet—at 3 feet per month—is not.

In 2020, a dry year, the lake dropped over 5 feet a month from June 30 (936.07) to July 31 (931.5). In 2017, a wet year, the drop from July 31 (939.12) to August 31 (935.1) was 4 feet in one month. These precipitous drops are not anomalies. They occur too often. A drop of more than 1-1.5 feet per month is too much.

Other glaring concerns in the application include, but are not limited to:

1. The applicant makes great assumptions to support their purpose when addressing "Reasonable Cost and Availability of Alternative Sources of Power," stating *"The replacement of energy and capacity provided by the Projects would be met through other sources, likely to be fossil-fired generating units, whose fuel and other variable costs would be significantly higher than those of the Projects over the life of the new licenses."* Claiming fuel replacement is "*likely to be fossil-fired generating*" is an implication designed to create concern. The ISO New England Overview and Regional Update presented to the Maine Legislature in January 2023 predicts coal and oil will not be contributors to the energy mix by 2040 and contributed less than 1% in 2021. The applicant must know this, yet used the threat of fossil fuels as a scare tactic. This insincerity is concerning.

2. There are contradictions between claimed flood control capability and the Operations Models. In section 2.13.1 "Existing and Planned Operation of the Projects During Flood Conditions," the applicant is confident of their ability to manage flooding, stating "*Gate operations are started when the Ripogenus impoundment water level approaches, and would be expected to exceed, the normal full pond elevation of 941.59 feet. If the impoundment elevation continues to rise, one or more of the fourteen quick-release stoplog bays would be opened, although this has never been necessary at the Ripogenus Project."* Despite this confidence and clear ability to manage high flows, the applicant insists on using 939 feet as full pond in the Operations Model to protect from flooding downstream, giving up five billion cubic feet of storage capacity.

3. The applicant does not acknowledge littoral zone and shoreline environment changes when stating, *"Ripogenus.. is exposed to wind and waves that are typical of large Maine lakes and, therefore, not conducive to the growth of aquatic vegetation."* This image from July 2024 (936') shows, aquatic and shoreline vegetation is abundant, unlike the rocks that were once there.

4. Claimed environmental mitigation measures are not occuring. In section 5.1 "Existing Environmental Measures" the applicant promises to "*Deploy artificial loon nesting platforms on the Ripogenus impoundment.*" As was shown earlier in the process, the platforms may be deployed but do not appear to be maintained or monitored as these images, taken on July 22, 2024 when the lake is approximately 6.5 feet down (935.7 feet elevation) clearly show.

Sites 5 and 7 from the 2022 Loon Nest Site Map provided in the Loon Study

5. There are severe adverse impacts on water quantity from lake level drawdown despite the applicants claim of *"no unavoidable adverse impacts to water quantity or water quality that occur under the existing and proposed operation of the Ripogenus and Penobscot Mills Projects"* Our previous PAD, Historical Ops Study, ISR and USR comments clearly demonstrate the adverse impacts that are indeed avoidable. Operations make a difference. For example, 2013 was a dry/average year (per FERC) with an inflow of 2,502 units and the project was able to produce 238,835 megawatts (mw) while keeping the lakes up to 935 feet through September 30. In contrast, 2014 was an average hydrological year with an inflow of 2,690 units, yet produced only 224,936 mw of energy (13,899 mw less energy) and left the lake two feet lower in September. Operations do have impacts.

The recent Operations Models also show other operational strategies that could help avoid adverse impacts. The applicant has shown the operational ability, when required by a license, to maintain lake levels within 1.5 feet of spill crest during the summer months (see graphs in the Operations Model Study for North Twin Lake).

6. The applicant continues to claim "*Ripogenus Impoundment is managed for downstream requirements."* Ripogenus Dam is managed for power production. The licensee directly decides how much water is released downstream and hence the impacts. The licensee released between 3,200 to 3,500 cubic feet per second (cfs) from North Twin from June 18-28, twenty-four hours a day, and again July 18-19. This week, 2,200 cfs is scheduled—the license requires 2000 cfs. This extra water is coming from Chesuncook, Caribou and Ripogenus Lakes, which are already nearly 7 feet down, less than halfway through the recreational season. This is lower than GLHA's July 1 Target Elevation of 939 feet. The Caribou boat landing is unusable, according to the applicants Recreation Study results, and the Chesuncook Dam launch is difficult to use. Downstream requirements are dictated by upstream decisions. As has been shown in the Operations Model and other submissions, it IS possible to manage Ripogenus in a manner that maintains relatively stable lake levels and produces energy without dramatically negatively impacting project lakes.

7. The applicant fails to acknowledge the Cumulative Effects (6.1) of significant drawdowns on the lakes above Ripogenus Dam, which are profound and have been documented in numerous submissions, including our most recent USR comments. For the applicant to deny this reality is disturbing. Fortunately, the Operations Model clearly shows that the pre-2012 historical operations, with more stable water levels, remains a sustainable solution for all parties.

8. Boat launch status and use of data are misleading. The DLA claims, *"On average, recreation users indicated they were satisfied with the sites, that the overall condition of the sites was between neutral and good, and that they would return to the site…."* The numerous comments about the impact of low water are ignored. One needs only to glance at the user comments from the recreational user surveys to know low water negatively impacted user experience.

9. The application misrepresents historical data. The DLA claims "*hourly impoundment elevation data from May 1 to November 30 of 2010 to 2022"* indicates "*the Chesuncook Dam Point Boat Launch (is usable) approximately 70 percent of the time"and "the Caribou Lake Boat Launch, approximately 35 percent of the time."*

The above claim grossly extends the recreational season to the end of November and blurs the reality of the data. When assessing boat launch usability, **the date boat landings become unusable** is what matters. If one trusts that the boat landing usability in the Recreation Study is accurate, and using data provided by Brookfield from 2010 - 2022, the Chesuncook Dam boat landing has been **unusable:**

- 77% of the time on October 15 (10 out of 13 years )
- 31% of the time on August 31 (4 out of 13 years)
- 23% of the time on July 30 (3 out of 13 years)

Using data from 5 recent years (2018-2022), the results are more alarming:

- 100% of the time on October 15
- 40% of the time on August 31 (2 out of 5 years)
- 40% of the time on July 30 (2 out of 5 years)

The Caribou boat launch was **unusable 75% of the time on August 1st.**

These numbers are unacceptable. The people of Maine have the right to access their waters 100% of the recreational season.

10. The applicant justifies limiting access to Chesuncook, Caribou and Ripogenus Lakes for a large demographic of users, stating,*"When the impoundment elevation is below the usable levels…both boat launches remain usable for small, trailered boats and hand carry boat access."* It is unsafe, unreasonable and unwelcoming to expect a recreationist accessing a State of Maine lake to drag a boat 150 feet or more over a slippery, rock-strewn shoreline to access the third largest lake in Maine. A boat that needs to be trailered is not meant to be carried. Many users are not able to hand carry boats to the water and many users on the lakes are people fishing from motorboats, which cannot be carried. The size of the trailers in these images from July 2024 prove these boats could not be carried to the water:

Goal 4 of Maine's 2012-2035 Statewide Fisheries and Hatcheries Management Plan seeks to provide safe, reliable access in stating, *"Encourage, and where possible provide, fair, equitable, safe, and permanent access to Maine's public waters for fishing and boating."* The applicant has a responsibility to provide access to project waters throughout the entire recreational season. Furthermore, **if water at the boat launches is too low for launching, the water is also too low to safely navigate between lakes,** as is shown in previous submissions.

11. The applicant inaccurately claims if operations were kept the same, "*there would be no effect on views from the KOPs or the aesthetics in and around the Project."* Again, this statement has been proven false in multiple submissions and was negated in the applicants own Aesthetics Study, which documented a decrease in the VMI Rating at lower water.

12. The applicant improperly and inaccurately takes responsibility for the aesthetic beauty of the area and the public's ability to view it.

*a.* The applicant states, "*the Projects provide public access from their multiple recreation sites for the public to access and view the scenery in and around Projects."* This is true – to a point. The applicant is required to provide public access; a requirement that has not been met numerous times in the past years. The public has had great difficulty accessing the project waters, and there has been little to no maintenance completed. Access is often unnavigable, unsightly and unsafe.

*b.* The applicant goes on to say, *"the Project impoundments are well known as recreation areas and for their aesthetic character, offering outstanding views of nearby mountain ranges including the tallest mountain in Maine Mount Katahdin."* This is true, but has nothing to do with the project's operations and cannot be credited to the applicant.

*c.* When discussing KOP's, the applicant says, "*A major contributor to the high aesthetic ratings at all KOPs were Project waters. These high ratings throughout the Projects suggest that the impoundments themselves and existing flows into riverine reaches help create and influence the high aesthetic character of the area."* The water is beautiful, but this does not make the applicant responsible for the aesthetics at the KOP's. These waters were here well before the project. All the lakes (except Dolby) within project boundaries existed as natural lakes since the last glaciers receded and have been used by people since that time. Without the project, the lakes would be both accessible and not have the significantly negative impact of drawdowns. The project is not responsible for the aesthetics of the area or the use of these waterways. The Wabanaki people have used these waters for thousands of years!

*d.* On Page 583 the applicant boasts, *"Based on the high aesthetic ratings from the KOPs around the Ripogenus impoundment, Project operations positively affect aesthetics."* This nebulous statement does not explain how such an assumption is justified. In fact, as has been proven in our previously submitted comments and the applicant's own studies, project operations **do** negatively impact aesthetics. To ignore this fact in a license application is deeply irresponsible and disturbing.

12. The applicant distorts data to present information. For example, they claim, *"Historically during the recreation season median monthly elevations range between 3 and 10 ft below normal full pond elevation."* As is explained in greater depth in our Historical operations comments, the impact of drawdowns needs to be evaluated by the date upon which impacts occur. Please see our Historical Ops comments for specific facts on this.

As a leader in hydropower production, it is concerning that the licensee has no visionary plans other than maintaining the status quo. Operating the projects under the old license is simply looking backward. The time has come to look forward to new technologies, new operational strategies and a new vision for the project. A new license needs to be developed with creative solutions and collaborative problem solving.

To help create this new license and provide *"(1) angling and recreational access/opportunities on the project impoundments (including Caribou, Chesuncook, and Ripogenus Lakes) and the West Branch; (2) public safety of recreational users of the lakes; (3) water supply to properties around Ripogenus Impoundment;"* as suggested in the DLA, we suggest and respectfully ask:

1. The lakes above Ripogenus Dam will be refilled to full pool elevation of 941.6' (944' GNP datum) +/-1 foot by May 15, then drawdown at a rate no more than 1 foot every 28 days until October 15. This meets loon nesting requirements, protects aquatic and shoreline communities, mirrors current plans for other project lakes and will ensure water is available throughout the summer months for fishing, generation and recreation needs. This request also potentially meets or restores ME DEP water quality standards and mirrors the GLHA Water Use Plan in the current license.

2. A maximum 1 foot drawdown per month until October 15 achieves a minimum lake level of 935.6' (938' GNP datum) on October 15. This is close to the level the applicant used for the KOP comparison in 2023. This level was accomplished in 2013, a dry/average year, while still generating 238,835 mw. This level also keeps lakes relatively full during the recreational season with all of its accompanying benefits, provides safe access to project waters and preserves the aesthetic beauty of the area. Maintaining this level will provide habitat conditions at the confluence of Umbazookus Stream suitable for Lake Whitefish spawning activities: staging, spawning, and post spawning out migration. Nearby Allagash Stream offers adult Lake Whitefish as a donor source. Therefore, a small undetected relic population may exist, and this elevation provides an opportunity for natural recolonization. Most importantly, it is supported by the Ops Model.

3. Impoundment elevations for all sites (including storage ponds) are reported on Safe Waters. Lake boaters need to know this information to plan for safe navigation within and between lakes and be able to anticipate the condition of the boat landings. Camp owners and users of public campsites need this information to plan for packing and gear organization. This is public information currently available for North Twin and Millinocket Lakes, and needs to be available for all project lakes.

4. A mechanism be put in place to assess and report to FERC and the public, mid-winter snowpack, long and short term weather forecasts and lake elevations to determine if operations need to be modified (i.e., reduced outflow) to secure enough water for spring refill to 941.6 feet (944' GNP datum). Winter drawdown below elevation 925.1 feet will only be allowed in "wet years" based on a mid-winter notification process.

5. Develop a "Rule Curve" that allows for a low water year plan that protects all stakeholders and sets minimum lake levels for all project lakes. Impacts of low water years must be absorbed by all stakeholders.

Given the significant changes in the project from the last license, the applicant is essentially seeking a new license. The license should be viewed with a new set of eyes that consider the future of energy, recreation within the project area, the history and culture of the area and the aquatic and shoreland communities that make their home here. Guardrails are needed in the license to assure available water to all project lakes and rivers and to protect all users. We again submit it is possible to define a balanced license that recognizes and includes all stakeholders. We hope the applicant's Final License Application will reflect this.

Thank you for the opportunity to submit and for your continued diligence in seeking an understanding of the larger picture and impacts of project operations so a balanced license can be created.

Respectfully,

Bill Houston

**Subject:** **Ripogenus Hydroelectric Project (FERC No. 2572-133)**
**Penobscot Mills Hydroelectric Project (FERC No. 2458-247)**
**Response to Comments on the Updated Study Report and Requests for New or Amended Studies**

Dear Acting Secretary Reese:

Great Lakes Hydro America, LLC (GLHA), the Licensee of the Ripogenus Hydroelectric Project (No. 2572) and the Penobscot Mills Hydroelectric Project (No. 2458) (collectively referred to as the "Projects"), herein files with the Federal Energy Regulatory Commission (FERC) responses to comments on the Updated Study Report (USR) and requests for new or amended studies for the Projects. The Projects are located on the West Branch of the Penobscot River and Millinocket Stream in Piscataquis and Penobscot counties, Maine.

On June 11, 2021, GLHA filed the Notices of Intent and a Pre-Application Document (PAD), which initiated the formal relicensing proceeding to obtain two separate new licenses for the continued operation of the Projects through FERC's Integrated Licensing Process (ILP). On March 23, 2022, GLHA filed a Revised Study Plan (RSP) for the Projects, and the Commission issued the Study Plan Determination (SPD) on May 13, 2022. GLHA performed study activities in 2022 with available results provided in the Initial Study Report (ISR) filed with FERC on April 24, 2023. Subsequent to the filing of the ISR, stakeholders filed comments on the ISR and new study requests, and on September 19, 2023, FERC issued the second SPD. GLHA performed continued study activities in 2023 for which available results were provided in the USR filed with FERC on April 22, 2024. Additional studies are ongoing in 2024.

GLHA has reviewed the stakeholder comments on the USR and requests for new or amended studies as filed with FERC and herein provides responses to these comments and requests.

Concurrent with this filing, GLHA is providing a copy of this letter to all parties listed in the attached distribution list. Parties can download an electronic copy of this filing from FERC's eLibrary system at https://www.ferc.gov/ferc-online/elibrary by conducting a search using the docket numbers P-2458 and/or P-2572.

OFFICE OF ENERGY PROJECTS

Project Nos. 2572-133 & 2458-247 –
Maine
Ripogenus Hydroelectric Project
Penobscot Mills Hydroelectric Project
Great Lakes Hydro America, LLC

**VIA FERC Service**

Mr. Michael Scarzello, Licensing Manager
Great Lakes Hydro American, LLC
c/o Brookfield Renewable U.S.
399 Big Bay Road
Queensbury, New York 12804

**Reference: Staff Comments on Draft License Application**

Dear Mr. Scarzello:

On May 3, 2024, you filed a draft license application (DLA) with the Federal Energy Regulatory Commission for the relicensing of the Ripogenus and Penobscot Mills Hydroelectric Projects. We have reviewed the DLA, and provide our comments in the enclosed Schedule A.

Please contact Allan Creamer at (202) 502-8365, or at allan.creamer@ferc.gov, if you have any questions.

Sincerely,

Stephen Bowler, Chief
South Branch
Division of Hydropower Licensing

Enclosure: Attachment A – Staff's Draft License Application Comments

## Attachment A – Staff's Draft License Application Comments

### Protection, Mitigation, and Enhancement (PM&E) Measures

1. Section 5.18(b)(5)(ii)(C) of the Commission's regulations requires that all of an applicant's proposed environmental measures must be provided in the final license application (FLA).[1] Section 5.2, *Proposed Environmental Measures*, of Exhibit E of the draft license application (DLA) states that Great Lakes Hydro American (GLHA) proposes to continue to operate and maintain the Ripogenus and Penobscot Mills Hydroelectric Projects (collectively, the Projects), and to implement environmental PM&E measures as described in the DLA for the term of the Projects' new licenses. However, the DLA contains no PM&Es. GLHA's FLA must include all of the proposed PM&E measures for review by Commission staff and stakeholders, with sufficient information to inform an economic and environmental analysis of each proposed PM&E. Therefore, please include in the FLA, all proposed measures, including drafts of all proposed plans or a description of the conceptual elements of the plans, as well as cost estimates for the measures and/or plans. The consultation record filed with the FLA should demonstrate that GLHA considered stakeholder recommendations and comments, as well as explain, in detail, why stakeholder's recommendations are or are not adopted as part of the proposed action for the Projects.

### Exhibit B – Project Operation

2. In order for Commission staff to complete its economic analysis of each relicensing alternative (*i.e.,* no action, applicant's proposal, staff alternative, and staff alternative with mandatory conditions), please provide, in the FLA, the median monthly flow duration at the Projects' dams (in graphic and tabular form) for an average flow year.

3. Appendix B of the DLA provides the annual and monthly flow duration curves for the West Branch at the Ripogenus Project and the North Twin development of the Penobscot Mills Project. Please provide the tabular data for these graphs in the FLA.

[1] *See* Guidance on Environmental Measures in License Application; available at https://www.ferc.gov/sites/default/files/2020-04/GuidanceonEnvironmentalMeasuresinLicenseApplications.pdf.

**Exhibit E – Environmental Resources**

*General Comments*

*4.* The DLA includes maps of the project areas showing various geographic information system (GIS) data collected during the prefiling studies conducted by GLHA and its consultants. To facilitate review of the data collected on environmental resources at the Projects, please file the GIS shapefiles associated with the studies with the FLA.

*Aquatic Resources*

*5.* Section 5.1, *Existing Environmental Measures*, of Exhibit E of the DLA describes the existing flows released from McKay Station downstream into the West Branch. These flows are released to enhance landlocked salmon habitat and the fishery, as well as support recreational boating on the river. During the May 15 and 16, 2024 Updated Study Report Meeting, and in a letter subsequently filed with the Commission,[2] the Maine Council of Trout Unlimited (Maine TU) asked GLHA for information on the basis for the biological flows (i.e., 1,422, 1,300, and 1,000 cubic feet per second [cfs]) released from McKay Station under the existing license. The DLA does not include this information. Rather, it describes the results of the 2022 Riverine Aquatic Habitat Study,[3] which was designed to address whether the existing flows meet Maine's water quality standards. Specifically, for the West Branch downstream from McKay Station (i.e., river reach extending 1,000 feet downstream from McKay Station), the study, which was done using drone imagery to document habitat conditions, only provides information on water depth, zone-of-passage, and wetted width at 1,000 cfs. This information, while useful for determining compliance with the state's water quality standards, does not adequately describe the biological basis for the existing McKay Station flow releases. Therefore, in order for Commission staff to analyze the environmental effects associated with existing and any proposed flow releases from McKay Station, the FLA should describe the requisite biological information that supports the existing, as well as any proposed and recommended flows. The FLA should include the information necessary for us to understand the relationship between flow and aquatic habitat in the West Branch downstream from McKay Station.

[2] *See* Maine TU's June 5, 2024 Filing.

[3] DLA at E-124 and E-125.

*Terrestrial Resources*

6. Exhibit A of the DLA for the Ripogenus Project[4] and the Penobscot Mills Project[5] includes a brief, general description of project transformers, transmission lines, and substations. Section 6.7.2.2, *Wildlife Resources*, of Exhibit E of the DLA does not include information regarding the effects of operating and maintaining the transmission facilities on terrestrial resources, including birds and other wildlife. To facilitate Commission staff's review of the design, configuration, and maintenance of the Projects' transmission facilities as they relate to avian protection, please provide the following information in the FLA:

(a) a discussion of whether the Projects' transmission line poles and other equipment currently installed are consistent with the Avian Power Line Interaction Committee (APLIC) and U.S. Fish and Wildlife Service (FWS) guidelines to minimize adverse avian interactions (i.e., potential avian electrocutions and collisions) (APLIC, 2006 and 2012;[6] and APLIC and FWS, 2005[7]);
(b) detailed descriptions, figures, and diagrams of the Projects' transmission facilities and any existing avian protection devices currently installed;
(c) the specifications and locations of any proposed avian protection measures that would be consistent with APLIC guidelines, if applicable;
(d) a copy of any Avian Protection Plan for the Projects, or a general description of any avian protection measures implemented by GLHA at the Projects; and
(e) any data regarding observed or documented avian interactions with the Projects' transmission facilities, such as nest building, perching, electrocutions, collisions, and any outages related to such interactions.

7. Exhibit E of the DLA does not include a description of GLHA's vegetation management activities within the project boundaries, beyond its forestry management practices for the wildlife management area at the Penobscot Mills Project. To facilitate Commission staff's review of the effects of the Projects' operation and maintenance

[4] DLA, Exhibit A – Section 4.0, *Transmission Line and Equipment Specifications*.

[5] DLA, Exhibit A – Sections 1.4, 2.4, 3.4, 4.4, and 5.4, *Transmission Line and Equipment Specifications*.

[6] APLIC (2006) is available at: https://www.aplic.org/uploads/files/2643/SuggestedPractices2006(LR-2).pdf; and APLIC (2012) is available at: https://www.aplic.org/uploads/files/15518/Reducing_Avian_Collisions_2012watermarkLR.pdf.

[7] APLIC and FWS (2005) is available at: https://www.aplic.org/uploads/files/2634/APPguidelines_final-draft_Aprl2005.pdf.

activities on terrestrial resources, including regular vegetation management, please provide the following information in the FLA:

(a) the types of existing and proposed vegetation management activities used at the Projects (e.g., tree trimming and removal, mowing, and herbicide applications);
(b) the locations where each vegetation management technique occurs within the project boundaries (e.g., transmission facilities; access roads; parking areas; and recreation areas);
(c) the procedures, including any time of year restrictions, for managing vegetation in sensitive habitats such as wetlands, riparian areas, and suitable locations for rare, threatened, or endangered species; and
(d) a schedule for conducting regular vegetation management (i.e., activities performed annually, seasonally, as-needed, etc.). If herbicides are used to control vegetation, please include the method/location of application (e.g., foliar, stump, stem, and/or vine).

*Threatened and Endangered Species*

8. Section 6.9., *Rare, Threatened, and Endangered Species*, of Exhibit E of the DLA discusses species protected under the Endangered Species Act, including the endangered northern long-eared bat (NLEB) and Atlantic salmon; the threatened Canada lynx; and the monarch butterfly, a candidate for federal listing, among the species that may occur within the project boundary. However, the DLA does not include the tricolored bat, which FWS proposed for listing as endangered on September 14, 2022.[8] Moreover, the DLA does not provide enough detail for Commission staff to assess potential project-related effects on federally listed, proposed, and candidate species. Therefore, in the FLA, please ensure that the *Rare, Threatened, and Endangered Species* section:

a. provides detailed, species-specific discussions of the potential project-related effects (i.e., operation; maintenance, including seasonal vegetation management and use of pesticides; and project-related recreation activities) on federally listed, proposed, and candidate species, and their habitats, that may occur at the Projects, or otherwise be affected by the Projects' operations. These species include the Atlantic salmon, NLEB, tricolored bat, Canada lynx, and monarch butterfly;
b. describes any existing or proposed tree removal activities, which includes cutting down, harvesting, destroying, trimming, or manipulating of trees, saplings, snags, or any other form of woody vegetation likely to be used by NLEBs or tricolored

[8] 87 Fed. Reg. 56,381-56,393 (September 14, 2022). Please note that the range of tricolored bats includes all of Maine, and there may be a delay for this species to appear on species lists generated on FWS's Information for Planning and Consultation (IPaC) system.

bats within the project boundaries. (Please note that suitable NLEB roosts include live or dead trees that are typically greater than, or equal to, 3 inches in diameter at breast height and have cavities, peeling bark, crevices, or hollows. Tricolored bats primarily roost among live and dead leaf clusters of live or recently dead deciduous hardwood trees, but they have also been observed roosting in lichens with pendant growth forms, as well as among pine and eastern red cedar needles); and

c. a description of any known hibernacula or maternity roost trees within or adjacent to the project boundaries.

*Cultural Resources*

9. Section 6.12.3, *Cultural Resources – Proposed Environmental Measures*, of Exhibit E of the DLA states that GLHA proposes to develop an updated Historic Properties Management Plan (HPMP) for the Projects. Please include the draft HPMP with the FLA.

**Exhibit G – Project Boundary Maps**

10. The Exhibit G maps, included with the DLA, show the existing project boundary, but do not depict the proposed project boundary. The FLA should include Exhibit G maps that show the existing project boundary for the Projects, as well as a proposed project boundary for the Projects, if changes to the project boundary(ies) are proposed. In addition, please submit with the FLA, the relevant GIS data layers for the existing and/or proposed project boundaries, as applicable.

Washington, D.C. 20426

**RE: Comment on Draft License Application, Ripogenus Project (FERC No. 2572) and Penobscot Mills Project (FERC No. 2458)**

Dear Acting Secretary Reese,

These comments are in response to the Draft License Application (DLA) submitted to FERC on May 3, 2024, by Great Lake Hydro America, LLC (GLHA, or licensee). The Bureau has been an active participant in the combined Integrated Relicensing Process (ILP) for these Projects, providing input to the development of the study plans for the Recreation and Aesthetics Studies. We attended the in-person ISR meeting in Millinocket on May 4, 2023, when the Recreation and Aesthetics Studies were discussed, participated in subsequent field visits and focus groups associated with those studies, and reviewed the Year 2 study results presented in the Updated Study Report submitted to FERC by the licensee on April 22, 2024.

As mentioned in the Recreation and Aesthetics Study Reports, provided in Exhibit E of the DLA, no recreation or aesthetics protection, mitigation, or enhancement (PM&E) measures are proposed in the DLA, in part due to ongoing study work (e.g., Year 2 Whitewater Study on the West Branch downstream of Stone Dam). Thus, based on the participation outline above, we offer the following comments on the DLA in anticipation of the forthcoming Final License Application and the PM&E measures we recommend that it include.

Recommendations for Recreation and Aesthetic Measures at the Ripogenus Project

***Ripogenus Impoundment Water Levels*** - As demonstrated by the Recreation and the Aesthetics Study data, maximized impoundment levels will help reduce the adverse effects of operations on boat launching and navigation, access to shoreline campsites, and aesthetics, which have been severe at certain times. Numerous survey respondents reported dissatisfaction with low water levels and difficulties when launching during periods of low water.

Certain scenarios included in the Operations Model Run Results submitted to FERC on June 28, 2024, appear to have beneficial effects on summer and fall Chesuncook Lake water levels. However, it is also clear that operations between the two Projects are complex and all scenarios involve tradeoffs, such as reduced flows below Ripogenus Dam and a lower North Twin impoundment pool at certain times. Therefore, at this point the Bureau does not request specific maximum and minimum Chesuncook Lake pool elevations or annual drawdown schedule, with the expectation that input from other agencies and stakeholders and the results of the ongoing Operations Model Study will inform potential future operations criteria under the new license.

However, the Bureau strongly advocates that the FLA include environmental measures that maximize Chesuncook Lake water levels during the summer and fall seasons (May-Oct), to the extent feasible considering the final results of the Operations Model Study and the existing and potential new downstream flow requirements that are anticipated to be included in the new license. The Bureau also advocates that Chesuncook Lake be refilled to the full pool target elevation each spring, if feasible, given available water and downstream flow requirements.

***Chesuncook Dam Point Boat Launch*** – The Recreation Study results indicate that this boat launch, the primary public boat access on Chesuncook Lake, was not usable about 30% of summer and fall days (May-Nov) during the 13-year period of analysis. Operations data provided by the licensee indicates that the facility may be unusable for most of the summer and fall seasons of years when drawdown is most severe. Therefore, the Bureau requests that the FLA include measures to ensure this facility is functional at all impoundment levels that are likely to occur in the May-Oct period, including during dry years. As recommended by participants in the Recreation Study, this may include the removal of large boulders and improvement of the substrate within the launching zone in use during times of substantial drawdown.

***Provision of Real-Time Ripogenus Impoundment Level Data*** – Given the substantial effects of drawdown on Chesuncook Lake boat launching facilities, navigation, and access to shoreline campsites, the availability of real-time or recent impoundment level data is of great benefit to recreation visitors. Therefore, the Bureau requests that the FLA include a measure to provide this data to the public online (e.g., GLHA's SafeWaters website, or similar).

***Maintenance of the Upper Gorge Trail*** – The Upper Gorge Trail is a FERC-approved facility but use appears to be discouraged by a lack of maintenance and obstruction of views of the gorge by vegetation growth. The Bureau requests that the FLA include a measure that ensures the trail will be regularly maintained (e.g., overgrowth controlled, blowdowns removed) and views into the gorge maintained at select locations by trimming trees and other vegetation as needed.

<u>Recommendations for Recreation Measures at the Penobscot Mills Project</u>

***Expansion of Parking at the Ambajejus Boat Launch*** – The Recreation Study documented the lack of adequate parking at this facility, exacerbated by the recent loss of informal parking nearby on licensee-owned property after that area was blocked off. The Bureau requests that FLA include a measure to explore means to provide additional parking in the vicinity.

***Increased Flows on West Branch Below Stone Dam –*** The Angler Flow Evaluation Study conducted on the West Branch in 2023 indicated the potential for improved angling

opportunities on the stream with increased flows, in the range that the Instream Flow and Habitat Assessment of West Branch Downstream of Stone Dam Study indicated will support an enhanced fishery. The pending Year 2 Whitewater Study will address the feasibility and potential quality of boating opportunities in the reach, among other goals. The Operations Modeling Study also includes two scenarios focused on increased flows below Stone Dam. The Bureau requests that the FLA, based on the results of these studies, include a schedule for increased flows below Stone Dam to benefit fisheries, angling and, potentially, whitewater recreation.

***Improved Road Access and Parking along the West Branch Downstream of Stone Dam*** – The Bureau's observations during the field component of the Angler Flow Evaluation Study indicated the roads to the river within the GLHA-owned Wildlife Management Area are in generally good condition, but that portions of the road system along the river are less usable and vehicle crossings of tributary streams are absent. In concurrence with results of the Angler Flow Evaluation Study and the Year 2 Whitewater Study, the Bureau requests that the FLA include measures to ensure existing roads are maintained in a condition suitable for anglers and boaters to access the river and that roads and bridges along the river be improved as needed to provide access, along with designation and improvement of parking areas.

<u>Recommendation to Address Recreation Facility Maintenance and Enhancement Needs at Project Sites in the Recreation Management Plan</u>

The Recreation Study documented certain maintenance needs at Project recreation facilities and users' desires for aesthetic and functional enhancements. In the DLA, GLHA proposes developing a Recreation Management Plan (RMP) and including a draft in the FLA. The Bureau recommends that the draft RMP include specific plans and details for near-term and longer-term Project recreation facility maintenance and enhancements. Examples of potential actions based on needs documented in the Year 1 and Year 2 Recreation Study Reports include repair of erosion and ice damage at the Caribou Lake boat launch, repair of the Ambajejus boat launch, and repair of the access road to Deadman's Curve boat launch. The Recreation Study data also indicate that expanded or reconfigured parking at several boat access sites at both Projects may be needed.

Thank you for the opportunity to submit these comments. Please contact me at (207) 287-2163 or via email at Jim.Vogel@maine.gov if you have any questions.

Sincerely,

James Vogel

**Subject:** **Ripogenus Hydroelectric Project (FERC No. 2572-133)**
**Penobscot Mills Hydroelectric Project (FERC No. 2458-247)**
**Sixth Study Progress Report**

Dear Acting Secretary Reese:

Great Lakes Hydro America, LLC (GLHA), Licensee of the Ripogenus Hydroelectric Project (FERC No. 2572) and the Penobscot Mills Hydroelectric Project (FERC No. 2458) (collectively referred to as the "Projects"), herein files with the Federal Energy Regulatory Commission ("FERC" or "Commission") the Sixth Study Progress Report for the relicensing of the Projects. The Projects are located on the West Branch of the Penobscot River and Millinocket Stream in Piscataquis and Penobscot counties, Maine.

The current licenses for the Projects were issued on October 22, 1996 and expire on September 30, 2026. On June 11, 2021, GLHA filed the Notices of Intent and Pre-Application Document, which initiated the formal relicensing proceeding to obtain two separate new licenses for the continued operation of the Projects through the Commission's Integrated Licensing Process (ILP). On March 23, 2022, GLHA filed a Revised Study Plan (RSP) for the Projects, and the Commission issued the Study Plan Determination (SPD) on May 13, 2022. GLHA performed study activities in 2022 with available results provided in the Initial Study Report (ISR) filed with FERC on April 24, 2023. Subsequent to the filing of the ISR, stakeholders filed comments on the ISR and new study requests, and on September 19, 2023, FERC issued the second SPD. GLHA performed continued study activities in 2023 for which available results were provided in the Updated Study Report (USR) filed with FERC by April 22, 2024. Additional studies are ongoing in 2024.

GLHA herein submits the Sixth Study Progress Report for the period from May 1, 2024 through July 31, 2024 for the Projects. The enclosed table (report) provides a list of the required studies and associated status of progress, as well as any modifications to the approved methodologies.

Concurrent with this filing, GLHA is providing a copy of this letter to all parties listed in the attached distribution list. A copy of the Sixth Study Progress Report can be downloaded from FERC's eLibrary system at https://www.ferc.gov/docs-filing/elibrary.asp by conducting a search using the docket numbers p-2458 and/or p-2572.

SIXTH STUDY PROGRESS REPORT

| Ripogenus Hydroelectric Project (FERC No. 2572)<br>Penobscot Mills Hydroelectric Project (FERC No. 2458)<br>Sixth Study Progress Report<br>(May 1, 2024 through July 31, 2024) | | | |
|---|---|---|---|
| **No.** | **Study** | **Status** | **Modifications to Methodology** |
| 1a | Water Quality Study – Impoundment Lake Trophic Assessment | Study completed as required in 2022 with study results provided in the ISR. | None. |
| 1b | Water Quality Study – Downstream DO/Water Temperature Assessment | • First season study activities were completed as required in 2022 with study results provided in the ISR.<br>• Based on comments during the ISR Meeting and pursuant to FERC's SPD issued September 19, 2023, additional water temperature data was collected at three monitoring sites in the West Branch downstream of Stone Dam in June and July 2023 with results provided in the USR. | None. |
| 1c | Water Quality – Benthic Macroinvertebrate Assessment | • First season study activities were completed as required in 2022 with study results provided in the ISR.<br>• Additional macroinvertebrate data was collected in 2023 at two locations in the West Branch downstream of Stone Dam with results provided in the USR. | None. |
| 1d | Water Quality – Impoundment Aquatic Habitat Assessment | Study completed as required in 2022 with study results provided in the ISR. | None. |
| 1e | Water Quality – Riverine Aquatic Habitat Assessment | Study completed as required in 2022 with study results provided in the ISR. | None. |
| 2 | Instream Flow and Habitat Assessment of West Branch below Stone Dam | Study completed as required in 2022 with study results provided in the ISR. | None. |

| No. | Study | Status | Modifications to Methodology |
|---|---|---|---|
| 3 | Fish Assemblage Survey Study | • First season study activities completed in 2022 with study results provided in the ISR.<br>• Pursuant to FERC's SPD issued September 19, 2023, GLHA performed a fish assemblage survey at the Ripogenus Project in the spring of 2024.<br>• Data collected during the spring of 2024 will be provided in a USR supplement or the Final License Application. | None. |
| 4 | Fish Stranding Study | • Study completed as required in 2022 with study results provided in the ISR.<br>• Additional information specific to the Fish Stranding Mitigation Study and the McKay Station Ramping Study is provided below. | None. |
| 5 | North Twin Impoundment Tributary Access Survey | • Study completed as required in 2022-2023 with study results provided in the ISR and USR. | None. |
| 6 | Upstream American Eel Passage Assessment Study | • Study completed as required in 2022-2023 with study results provided in the ISR and USR. | • Heavy precipitation coupled with planned unit outages for maintenance during the summer of 2023 resulted in high flows in the rivers and spill conditions at the dams limiting the ability to perform nighttime eel observations and electrofishing surveys. Although there were fewer surveys than anticipated, the monitoring completed in 2023 allowed GLHA to gain a good understanding of juvenile American eel presence and behavior at the Penobscot Mills Project. |

**Re: MDIFW Comments on the Draft License Application for the Ripogenus Hydroelectric Project (FERC No. 2572) and Penobscot Mills Hydroelectric Project (FERC No. 2458)**

Dear Acting Secretary Reese:

The Maine Department of Inland Fisheries and Wildlife (MDIFW) has reviewed Great Lakes Hydro America, LLC's (GLHA, Licensee) Draft License Application (DLA) for the Ripogenus and Penobscot Mills Projects filed April 22, 2024.

## Ripogenus Project

According to Section 5.1 Existing Environmental Measures of the DLA, GLHA proposes to operate the Ripogenus Project with several environmental PM&E measures. MDIFW offers comments and recommendations on several of these measures below.

### Fisheries Recommendations

*Impoundment Elevations*

MDIFW has received the results of the Operations Model Run exercise and we are currently reviewing it. We anticipate further discussions with the Licensee and other stakeholders regarding water management between the two Projects. Therefore, final comments and recommendations will be made at a later date. MDIFW had requested the modeling exercise to include a model run to evaluate downstream flows while maintaining the lake elevations that allow recreational access to the Ripogenus impoundment. That said, MDIFW is supportive of the concept of reducing drawdowns in the Ripogenus impoundment during the summer recreational season. This would also be less impactful to the waterbird breeding season and overall aquatic benthic and associated wetland communities, to the extent feasible considering the final results of the Operations Model Study, including any existing and potential new downstream flow requirements that are anticipated to be included in the new licenses.

We understand a revised Water Management Plan will require changes to downstream flows and result in impacts to other impoundments in the system. We will reserve final recommendations until after the model analysis is complete.

PHONE: (207) 287-5254 FISH AND WILDLIFE ON THE WEB: www.maine.gov/ifw EMAIL ADDRESS: MDIFWEnvironmentalreview@maine.gov

*Attraction Flow to the Gorge*

As a condition of their current FERC license, the Licensee is required to provide a flow of 100 cfs through Ripogenus Dam to provide a summer attraction flow into the Gorge to create angling opportunities. It was assumed that this flow would be provided through the dam's deep gates and therefore would be cool water from below the thermocline. Due to mechanical limitations, flow has been provided from a surface gate. This negates the intent to provide a cool attraction flow for landlocked salmon and consequently does not provide additional angling opportunities sought as mitigation in the current license. MDIFW requests that the Final License Application (FLA) specify that the 100 cfs attraction flow originate from a deep gate, or from water below the thermocline, for the pending license.

*Ramping Flows*

To minimize impacts resulting from rapidly changing water levels on fish and aquatic macroinvertebrates, including multiple modeled and/or predicted Species of Greatest Conservation Need, as described in Maine's 2015 State Wildlife Action Plan, MDIFW recommends changes in hourly rates of flow in the West Branch of the Penobscot River downstream of the Ripogenus Project to be limited to no more than 25%. MDIFW believes this should help to reduce stranding and minimize impacts on the aquatic community.

*Smelt Drift*

Smelt are critical forage for landlocked salmon growth. The resident population of salmon in the West Branch of the Penobscot River below Ripogenus Dam rely on year-round smelt drift from the Ripogenus Impoundment through both Ripogenus Dam and McKay Station to sustain their growth, and past studies have documented the annual drift to be substantial. MDIFW requests no changes to trash racks or other modifications that may reduce smelt drift that could negatively impact one of Maine's premier landlocked salmon fisheries.

*Holbrook Side Channel*

MDIFW recommends that flows into the Holbrook Side Channel continue to be managed for enhanced salmonid spawning and nursery habitat, as per the current license.

*USGS Gage*

MDIFW requests the Licensee fund the installation and maintenance of a USGS gage on the West Branch of the Penobscot River below McKay Station, at a suitable location as determined by the USGS. There is often confusion over the flow readings for this heavily regulated system that originate from the output at McKay Station, and MDIFW believes a USGS gage would alleviate these concerns for all stakeholders, particularly during outages. We also request the Ripogenus Lake elevation be provided on the USGS gage and on the Licensee's SafeWaters website.

*Winter Access*

Access to surface waters of the State and their fishery resources is an important State and Department goal. As land ownership changes across the State, public access opportunities to water resources are challenged, while the demand for water based, outdoor activities climb. Providing winter angling is an important management strategy for MDIFW on the Ripogenus Impoundment. Winter angler harvest of salmon is critical to maintaining the forage base and good salmon growth rates. Angler access is limited in the winter to two sites: the boat launch at the old Chesuncook Dam site and a small pull-off site on Caribou Lake. The Caribou Lake access site is essentially a wide area plowed on the side of the Golden Road that can accommodate 4-5 vehicles at best. The main public access site is the boat launch area at the old Chesuncook Dam site. This area is congested on the weekends and limits angling participation on the lake. MDIFW requests the Licensee provide additional funding annually to help the camp owners association maintain wintertime access for the benefit of all wintertime users.

*Improved Angler Access*

Public access has been restricted at several locations in the Project area, including around McKay Station, among other areas. While MDIFW understands the need for Project security, efforts should be made to allow the public access to these resources. We recommend access be restored in areas where fencing has been installed by the Licensee for angling and other recreational opportunities.

*Fisheries Funding*

Much of the data used to evaluate the fisheries in the rivers and impoundments impacted by hydroelectric development originate from ongoing routine monitoring by MDIFW. These monitoring efforts are necessary to provide long-term trend analyses on fisheries and fish populations. One-time studies conducted by Licensees every 20 to 30+ years at the time of relicensing efforts may not accurately reflect long-term trends. Moreover, these brief studies are often impacted by short-term climatic and other conditions. Continual and periodic monitoring of lakes and rivers utilizing creel surveys, use and harvest estimates, and other sampling techniques are necessary to ensure a full understanding of the fish populations and any changes that could occur as a result of ongoing hydroelectric operations. Therefore, MDIFW requests the Licensee's cooperation in funding studies, to be conducted by MDIFW, in the Project area over the term of the next License.

Wildlife Recommendations

*Maintenance of the Umbazooksus Lake Mitigation Area*

The wetland mitigation activities performed at Umbazooksus Lake satisfied the wetland mitigation requirements for both the Ripogenus Project and the Penobscot Mills Project in the current license. Pursuant to the FERC-approved plan, GLHA discontinued storage and release operation in the spring of 1998 at Umbazooksus Lake by maintaining the outlet gate in a

permanently opened position, resulting in a run-of-river regime to lower water levels and enhance wetlands at Umbazooksus Lake (Umbazooksus Lake Mitigation Area, ULMA).

However, additional needed information was raised by MDIFW regarding the Riparian and Littoral Habitat Assessment Study to better understand the full potential of the ULMA to offset the whole suite of impacts, not only to wetlands. Furthermore, the Cover Type Mapping report states that the Projects' boundaries include a total of approximately 71,097 acres, the majority of which (>83%, or approximately 59,011 acres) consists of open water associated with the Projects' impoundments, with impacts to the benthic habitat and macroinvertebrate community because of seasonal drawdowns. Therefore, while the ULMA *may* continue to satisfy impoundment-associated wetland impacts (pending MDIFW's review of earlier additional data requests), they may not satisfy lacustrine impacts resulting from drawdowns at the two Projects, or riparian wetland and riverine aquatic habitat impacts along the West Branch of the Penobscot River. Moreover, the ULMA does not mitigate for impacts to the diverse wildlife groups which encompasses benthic invertebrates/macroinvertebrates, including multiple modeled and/or predicted aquatic or aquatic-associated invertebrate Species of Greatest Conservation Need (as described in Maine's 2015 State Wildlife Action Plan), fishes, amphibians, reptiles, aquatic mammals (e.g., beavers, muskrat[1]) and water-dependent birds (e.g., common loons, breeding and foraging marsh birds, and breeding and foraging waterfowl). At present, MDIFW is unable to accept solely the proposed ULMA until fully analyzing the requested study results. MDIFW requests the Licensee work with MDIFW to better minimize these impacts by exploring changes to Project operations, as indicated above. Ultimately, MDIFW believes that even with some Project operational changes, impacts to wetlands and wildlife species will continue for the new License, and that any PM&E measures to offset both wetland and wildlife impacts will likely require mitigation in addition to the ULMA. Specific to aquatic lacustrine and riverine macroinvertebrate impacts, MDIFW requests GHLA consider other holdings with intact riparian corridors as potential mitigation sites.

*Common Loon Management Plan*

As stated in our earlier comments, the common loon is identified as a Priority 2 Species of Greatest Conservation Need by MDIFW's Comprehensive Wildlife Conservation Strategy, also known as Maine's State Wildlife Action Plan (MDIFW 2015). Project operations at the Ripogenus Project have impacted the reproductive success of this species, and as a result the Licensee has implemented a Common Loon Management Plan. However, it remains unclear to MDIFW how thoroughly the current Plan has been adhered to. Attached are images[2] of abandoned loon platforms, located at Sites 5 and 7, from July 22, 2024. The water level on Chesuncook was estimated by the photographer to be approximately 6.6 feet down (el. 935 feet). Stable water levels or active loon management via rafts between May 15 through July 31 are typically prescribed to protect nesting loons and wildlife habitat; in these instances, the evidence suggests loons were not successful at these locations in 2024.

[1] While not requested to be assessed as part of Furbearer Survey Study, the timing and extent of drawdowns at North Twin (approximately 12-foot drawdown between October 1st and the spring freshet) are also expected to impact resident aquatic furbearers
[2] Photographs courtesy of Kathy Houston

To be effective at mitigating water level drawdowns on nesting, active management of loon platforms involves relocating floating nests as lake levels are drawn down for the entirety of the nesting season. Judging from the lack of water and resulting growth of vegetation, it appears these rafts were not actively managed throughout the nesting season in 2024. If this continues, an ecological trap could result (DeSorbo et al. 2007).

The Licensee proposes to file an updated Loon Nest Management Plan with the FLA. MDIFW recommends a more robust plan that, at a minimum, includes:

- For the first five years of the new license, weekly monitoring performed by qualified biologists with expertise in loon biology and management throughout the loon nesting season (e.g., May, June, and July).

- For the first five years of the new license, confirm the locations of all territories, including any newly established and/or abandoned territories, and assess the possible cause(s) of territory abandonment.
- For the first five years of the new license, monitor and document all nesting sites to determine nesting attempts, clutch sizes, hatching success, and to document any nest failures. An assessment of use at each platform compared with an assessment of natural breeding should also be included.
- For the first five years of the new license, compare nesting/hatching rates and success with those of previous years.
- Annually for the life of the new license, identify, attribute, and quantify probable causes of nest failure including water-level fluctuation or failure/stranding of nest platforms.
- Annually for the life of the new license, conduct weekly active relocation of loon platforms during seasonal drawdowns for territories prone to dewatering.
- Annually for the life of the new license, submit a report to MDIFW and USFWS, summarizing the active loon management efforts at the Ripogenus Project. In addition to the above, the annual report should include the dates of installation, dates of removal, and a description and dates of necessary maintenance repairs for each platform.

Note that MDIFW requests the Licensee work with MDIFW by exploring changes to Project operations, as indicated above, which could lessen impacts to breeding loons and possibly result in a less intensive management regime.

## Penobscot Mills Project

According to Section 5.1 Existing Environmental Measures of the DLA, GLHA proposes to operate the Penobscot Mills Project with several environmental PM&E measures. MDIFW offers comments and recommendations on several of these measures below.

### Fisheries Recommendations

*North Twin Impoundment*

The North Twin impoundment is home to some of the best salmonid fisheries in the Millinocket area. Principal coldwater fisheries include lake trout, brook trout, and landlocked salmon. A self-sustaining lake whitefish population is also present in the impoundment and has historically provided a fishery in the winter. MDIFW currently stocks brook trout each fall in the impoundment, and additionally stocks lake trout on an alternate year basis. The landlocked salmon fishery, while previously supported by hatchery stocked fish, has become exclusively dependent on natural reproduction since 2018. The 1996 FERC license included lake trout water level management (Article 408) requiring GLHA to carefully control water levels in the North Twin impoundment to protect lake trout spawning shoals. The attempt to establish a self-sustaining lake trout population in the North Twin impoundment was unsuccessful and Article 408 was amended in 2012 to loosen water level requirements.

Landlocked Salmon

MDIFW submitted an initial study request in response to the Pre-Application Document (PAD), a Comprehensive Impoundment Landlocked Salmon Habitat Use/Spawning Study, which included several goals and objectives. Among the information MDIFW had hoped to gain through tracking radio-tagged landlocked salmon included: track seasonal movements and behaviors of landlocked salmon (within and between the five connected lakes) via radio telemetry; determine the effects of annual Project drawdowns on the movement and behaviors of landlocked salmon within the North Twin impoundment; and identify landlocked salmon spawning areas within the North Twin impoundment.

The initial study request was denied, and instead the Licensee proposed and conducted the North Twin Impoundment Tributary Access Study, with the following goals and objectives: identify tributaries to the North Twin impoundment that are used by landlocked salmon for spawning or that have habitat suitable for spawning; survey the identified tributary streams and identify potential natural and Project-related fish passage barriers near their confluence with the North Twin impoundment; and evaluate the effects of the typical seasonal impoundment fluctuation on tributary access by landlocked salmon during critical life stages. Findings of the Tributary Access Study concluded that "*The lowest daily average elevation of the North Twin impoundment during the landlocked salmon spawning season over the past 11 years was 485.4 feet. Based on bathymetry data and the channel form documented in the confluence area, this elevation would be expected to provide spawning salmon with zone of passage (0.5 foot) within the channel and into Nahmakanta Stream"*.

Lake Whitefish

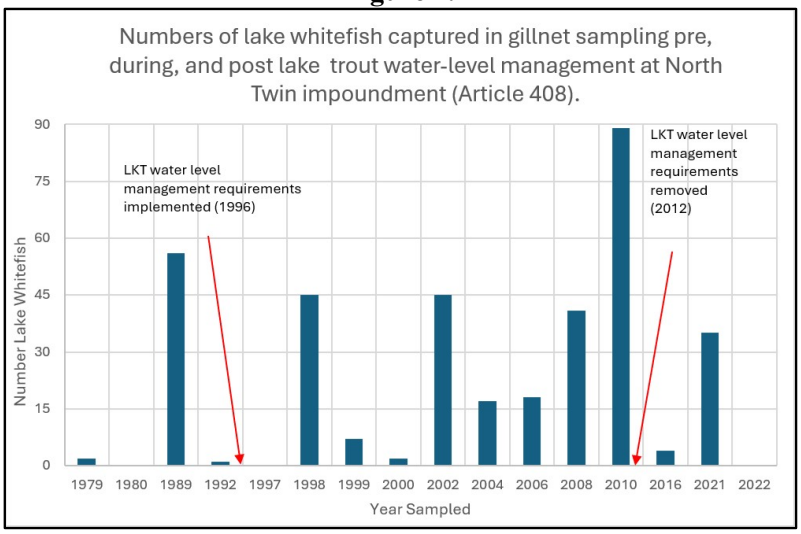
Throughout most of the year the lake whitefish population in the North Twin impoundment is predominantly concentrated in the north basin in proximity to cold, deep, well-oxygenated water. Occasionally anglers will encounter lake whitefish near the southern basins. Whitefish populations in Maine have significantly declined since the early 1900's and are today believed to occur in just 50 or fewer waterbodies in the State (Whitaker and Wood 2019). The Maine Wildlife Action Plan recognizes lake whitefish as a Species of Greatest Conservation Need in the State and has identified recruitment failure at early life stages as a potential cause of population declines (MDIFW 2015).

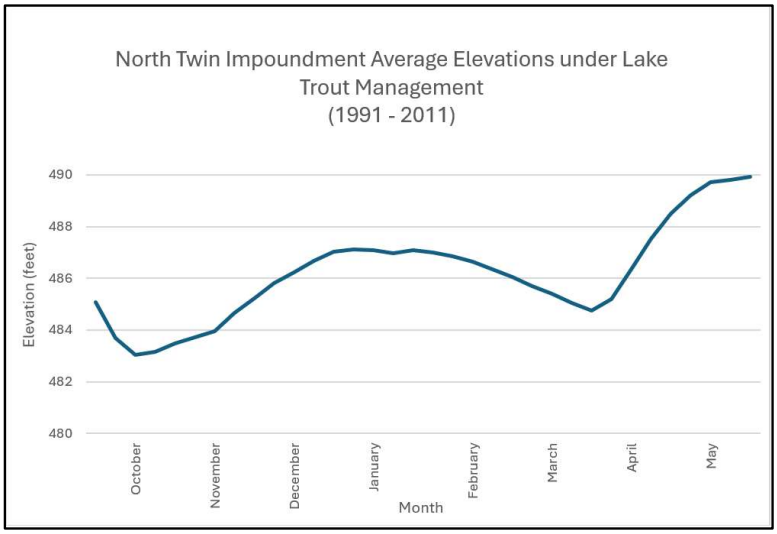
Radio telemetry data from northern Maine indicates lake whitefish spawn during early November during the time water temperatures fall to $6^{O}$C and below. Preferential spawning habit for both wind-swept shoals and tributaries consists of clean, well-layered cobble. Additionally, areas of moderately sloped shorelines with a water depth reaching four to five feet within 100 feet of land and facing prevailing northwest winds creating sufficient wave action are also favored (Whitaker and Wood). As such, water level fluctuations during spawning and egg incubation can contribute to a decline in lake whitefish recruitment.

Based on past MDIFW sampling events the lake whitefish population in the North Twin impoundment seems highly variable, though appearing at its most robust and stable levels during the 1996-2012 time period when the aforementioned lake trout water level management plan was

in effect (Figure 1.). Lake whitefish and lake trout have similar life histories and spawning habitat requirements, and indications are the lake whitefish population benefited and thrived under the original (1996) Article 408 water level requirements of stable impoundment levels with a minimum set level between October and April (Figure 2.).

**Figure 1.**





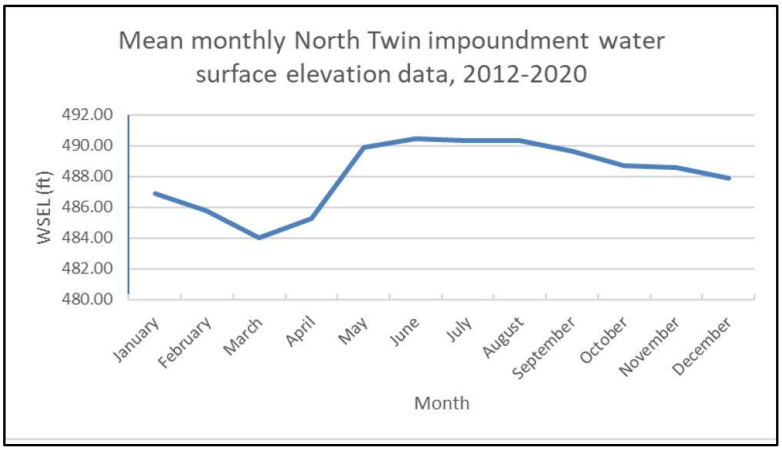


**Figure 2.**

Current water level management operations begin drawing the impoundment down in October during the start of landlocked salmon, lake trout and lake whitefish spawning seasons and continuing into March when the impoundment has begun to refill. This water level regime

dewaters shoreline and shoals after lake whitefish have spawned, potentially exposing redds and eggs, negatively affecting larval recruitment (Figure 3.).

**Figure 3. (adapted from "North Twin Impoundment Tributary Access Study Report, Figure 1-1, Appendix E-4)**

*North Twin Impoundment Recommendations*

Anticipating further discussions with the Licensee and other stakeholders regarding water management between the two Projects, MDIFW's preliminary recommendation is to maintain a fall minimum impoundment elevation similar to that of the previous Article 408, and that the impoundment elevation remain at or above 485 feet, based on findings of the North Twin Tributary Access Study, from October 1 through March 31.

***West Branch Downstream of Stone Dam***

*Habitat Suitability*

MDIFW's October 8, 2021, response to GLHA's PAD and Study Requests included a Minimum Flow Analysis be conducted for the West Branch Penobscot River below Stone Dam. The goal of this study was to inform the decision process for determining the best timing and extent of minimum flow releases required to maximize fishery resources in terms of both aquatic habitat and fishable opportunities in the river reach below Stone Dam (mainstem West Branch of the Penobscot River). The objectives of this study request included: generate a comparative analysis of the various scenarios for minimum flow levels that best addresses and/or maximizes the needs of inland fisheries resources within the river reach; evaluate how various minimum flows influence the fishable aquatic habitat in the various lotic and lentic areas of the river reach; and identify a minimum flow that will enhance aquatic habitat and recreational opportunities below the dam.

The study was requested to ensure that any agreed upon minimum flow releases occur at levels that meet inland fisheries needs. The amounts of minimum flow releases are required to maximize aquatic freshwater fisheries habitat and fishable habitat, as well as maximize benefits to the aquatic macroinvertebrate community. Due to changing MDIFW fisheries goals and growing angler pressures in the region, MDIFW is trying to establish a put-and-take fishery in this resource to provide more spring and fall angler opportunities.

In consultation with MDIFW, GLHA ran a desktop PHABSIM hydraulic model using data from an earlier Instream Flow Incremental Methodology (IFIM) Study for the West Branch downstream of Stone Dam (NAI 1989) but updating it with habitat suitability criteria that reflect contemporary resource management objectives.

Hydraulic modeling results show a flow range between 300 cfs and 500 cfs below Stone Dam will provide 92-100%, 74-95%, 99-100%, and 46-49% of maximum potential habitat suitability for juvenile brook trout, adult brook trout, juvenile landlocked salmon, and adult landlocked salmon respectively. Percent potential macroinvertebrate habitat suitability ranges from 83-95% at the same flows.

*Angler Flow Evaluation*

As part of the relicensing process and in conjunction with the flow analysis study, MDIFW requested GLHA conduct an Angler Flow Evaluation in the river reach below Stone Dam to help develop safe angler wading flows while maximizing suitable habitat for salmonids and macroinvertebrates.

Three different river flows (low, 93 cfs (or "leakage"); mid, 236 cfs; and high, 392 cfs) were angled by volunteers to determine, in part, 'ability to walk shoreline/bank', 'velocity of water for casting', and 'wadability'. Opinions varied somewhat based on level of angler experience, but 'ability to walk shoreline/bank' was ranked (from low flow to high) as good, good, and fair; 'velocity of water for casting' was ranked good, excellent, and excellent; 'wadability' was ranked as fair, good, and good.

Taken together, results of the habitat suitability study and angler flow evaluation suggest river flows in the 300-500 cfs range below Stone Dam will greatly benefit aquatic resources while providing good to excellent angler conditions in the river reach.

*West Branch Downstream of Stone Dam Recommendations*

Being conscious of other competing resources for water demand including power production and new recreational paddling and whitewater opportunities, while attempting to establish a seasonal (spring and fall) salmonid fishery and anticipating further discussions with the Licensee and other stakeholders regarding water management between the two Projects, MDIFW's preliminary recommendation is for a minimum flow from Stone Dam be set at 300 cfs between September 15 and June 30.

As stated earlier, access to surface waters of the State and their fishery resources are an important State and Department goal. As land ownership changes across the State, public access opportunities to water resources are challenged, while the demand for water based, outdoor activities climb. In Maine, MDIFW stocks coldwater species at many bypass and tailrace areas associated with hydropower projects when public access and minimum flows are suitable to support stocking programs. These stockings are typically very popular and can provide seasonal or year-round angling for coldwater or resident warmwater fish species.

MDIFW requests formal access improvements including improved vehicle access, signage, and parking provisions to the West Branch bypass area below Stone Dam. We request the Licensee work with MDIFW to ensure any access improvements made by the Licensee are suitable.

*Millinocket Stream*

As a condition of its 1996 FERC license, GLHA is required to stock brook trout annually in Millinocket Stream to help provide a regional fishery opportunity. Currently, 60 cfs is the minimum flow requirement for Millinocket Stream and is adequate for the fishery resources present. Anticipating further discussions with the Licensee and other stakeholders regarding water management between the two Projects, MDIFW's preliminary recommendation is maintaining the present 60 cfs minimum flow for Millinocket Stream.

Wildlife Recommendations

*Maintenance of the Umbazooksus Lake Mitigation Area*

As stated above, the wetland mitigation activities performed at Umbazooksus Lake satisfied the wetland mitigation requirements for both the Ripogenus Project and the Penobscot Mills Project in the current license. Pursuant to the FERC-approved plan, GLHA discontinued storage and release operation in spring 1998 at Umbazooksus Lake by maintaining the outlet gate in a

permanently opened position, resulting in a run-of-river regime to lower water levels and enhance wetlands at Umbazooksus Lake.

As previously stated above for the Ripogenus Project, currently MDIFW is unable to accept solely the proposed Umbazooksus Lake Mitigation Area until fully analyzing the requested study results. MDIFW requests the Licensee work with MDIFW to better minimize these impacts by exploring changes to Project operations, as well as additional mitigation opportunities, as indicated above.

Rare Freshwater Mussels

As stated in our comments for the PAD, the Penobscot Mills Project Area supports both yellow lampmussel and tidewater mucket, and likely supports the brook floater. All three mussel species are designated as State Threatened and are afforded protection under Maine's Endangered Species Act (MESA, 12 M.R.S §12801 et. seq.)

We appreciate the Licensee notifying MDIFW regarding maintenance and other unexpected activities that have the potential to impact these species. While all inwater maintenance activities have the potential to impact listed mussels, drawing the impoundments down to more than annual maintenance events, especially drawdowns of extended durations, and/or abrupt changes in flow reductions beyond what is typically experienced, can significantly increase the risk of "Take" (kill or cause death) and/or "harassment" (create injury or significantly disrupt normal behavior patterns) of these species. MDIFW requests that the Licensee work with MDIFW to develop a strategy to minimize against Take of listed mussels, particularly during these more extreme draw downs and/or flow reduction maintenance events.

**Recreation Recommendations**

MDIFW supports the DLA recommendations of the Bureau of Parks and Lands regarding recreation and expanding recreational access and opportunities.

MDIFW looks forward to working with the Licensee's to resolve outstanding issues in anticipation of the Final License Application. Please feel free to contact my office if you have any questions regarding this information, or if I can be of any further assistance.

Best regards,

John Perry

**Subject: Maine DMR comments on the Draft License Application for the Ripogenus (P-2572) and Penobscot Mills (P-2458) Hydroelectric Projects**

Dear Acting Secretary Reese:

On May 3, 2024, Great Lakes Hydro America, LLC (GLHA; Licensee) submitted their Draft License Application (DLA) for the Ripogenus (P-2572) and Penobscot Mills (P-2458) Hydroelectric Projects (Projects) on the West Branch of the Penobscot River in Maine. Enclosed are the Maine Department of Marine Resources (MDMR; Department) comments on the DLA for the Projects.

## EXECUTIVE SUMMARY

GLHA documented American eels downstream of all the Penobscot Mills projects and demonstrated a high probability of blade-strike and turbine mortality for adult American eels migrating downstream through the projects. The DLA asserts that the small number of eels observed at the projects indicates that mortality would not have population-wide effects and that protective measures are not needed at the project. MDMR disagrees with these assertions and notes that the American eel population within the project area is likely much higher than GLHA has observed, and the severity of predicted turbine mortality warrants protective measures at the projects in addition to appropriate measures for upstream passage. If the high level of impacts during downstream migration on the population of eels in the West Branch Penobscot are allowed to continue during the subsequent license term, the West Branch Penobscot will continue to have a detrimental impact on the population otherwise known as an ecological trap which is known to have population level impacts on American eels[1,2]. As a catadromous species, American eels migrate downstream when mature to spawn at which time they vulnerable to passage mortality at hydroelectric generating stations[3,4].

[1] McLaughlin et al. (2013). Unintended consequences and trade-offs of fish passage. Fish and Fisheries, 14, 580–604.
[2] Haxton, T. (2022). Cumulative downstream turbine-induced mortality and thresholds for facilitating upstream passage of American eel. *River Research and Applications*, *38*(3), 513-521.
[3] Heisey et al. (2019). Passage survival of European and American eels at Francis and propeller turbines. Journal of Fish Biology, 95, 1172–1183.
[4] Trancart et al. (2020). When “safe” dams kill: Analyzing combination of impacts of overflow dams on the migration of silver eels. Ecological Engineering, 145, 105741.

Reducing mortality on the silver lifestage of American eels is critically important, as was highlighted in the Addendum VII to the Fishery Management Plan for American Eel[5]. "The 2023 Benchmark Stock Assessment and Peer Review indicates the American eel stock remains depleted at or near historically low levels due to a combination of historical overfishing, habitat loss, food web alterations, predation, turbine mortality, environmental changes, toxins and contaminants, and disease (ASMFC 2023), consistent with the results of the 2012 and 2017 stock assessments." In the 2023 Benchmark American Eel Stock Assessment[6], ASMFC made recommendations for improving upstream and downstream passage for American eels. Specifically, "Blockages and obstructions that limit upstream migration of American eels have reduced habitat availability and limited the range of the species. Dams may also limit or delay downstream movements of spawning adults. Additionally, downstream mortality may be caused by hydroelectric facilities by impingement or turbine passage." We reiterate, the level of mortality and injury imposed on adult eels by the Project dams, during their downstream migration, is unacceptable and changes in Project structures and operations are necessary to protect fish immediately.

GLHA also asserts that upstream passage for anadromous species should not be required at the projects due to the limited amount of historic habitat upstream and the current existence of passage barriers downstream (Mattaceunk and Medway). However, the Licensee is incorrect in their assertion that the amount of habitat is a determinant on their responsibility to address avoidable impacts at the Projects. Indigenous aquatic species native to the section of the Penobscot River occupied by the Project, both above and below the Project dams, include diadromous fish. While the Licensee failed to do so in the DLA, the Licensee must demonstrate in the FLA that the waters of the West Branch Penobscot River, including where these waters flow through and over the Project dams, provide for the safe, timely, and effective passage of diadromous fish, ensuring that the river is of sufficient quality to support all indigenous aquatic species and that the discharge of the river water from the dam does not cause an adverse impact to indigenous diadromous fish. Furthermore, fish passage is already planned at the Mattaceunk project (see our comments on the DLA below), and MDMR intends to recommend passage at Medway as well in close consultation with the Maine Department of Inland Fisheries and Wildlife (MDIFW) to achieve both the improvement of fish passage for indigenous species and prevention of the spread of aquatic invasive species.

The Department of Marine Resources looks forward to further collaboration with the Licensee on addressing impacts to diadromous fish at the Ripogenus and Penobscot Mills projects. Please contact Casey Clark (casey.clark@maine.gov; 207-350-9791) or Lars Hammer (lars.hammer@maine.gov; 207-557-1564) if you have any questions.

Sincerely,

Patrick C. Keliher, Commissioner

MDMR DLA Comments

Exhibit E

PDF page 232: "American eel have been documented in Ripogenus impoundment historically, but during consultation with MDIFW prior to the 2022 assemblage sampling, agency staff noted that American eel had not been observed in over 7,000 hours of gill net and trap net sampling upstream of Chesuncook Lake (Ripogenus impoundment) (personal communication, Tim Obrey, MDIFW, Regional Fisheries Supervisor, with Kevin Bernier, Senior Compliance Specialist, GLHA, April 27, 2022), suggesting a very low density for this species."
MDMR Comment: Although MDIFW spent considerable time sampling the impoundment, their methods were not intended to document American eel. Gill nets, in particular, are biased towards fishes with fusiform body shapes and are not effective at capturing American eels, and thus gill net sampling would not provide reliable information to describe the eel population in the impoundment.

PDF Page 264: "However, under the Strategic Plan, upstream fish passage for anadromous species is not planned in the near term in the West Branch (MDMR and MDIFW 2008)…"
MDMR Comment: The 2008 Strategic Plan states, "American eel, American shad, and Atlantic salmon historically utilized portions of the West Branch Penobscot, but the 10 hydropower and water storage dams on the West Branch Penobscot do not pass diadromous fish and no passage is planned in the near term."[7] While the historic habitat for these species and alewife was identified in the plan, no passage was planned or supported by the licensee for the Projects in 2008. The absence of upstream passage facilities at the Projects prevents upstream passage for most diadromous species, including sea-lamprey not explicitly mentioned in the plan, and inhibits the passage of American eels. Therefore, there was no path at the time of writing of the 2008 Strategic Plan for restoration of diadromous species to the historic habitat in the West Branch Penobscot. These impacts are in direct conflict with MDMR's goal for the Penobscot River in the 2008 Strategic Plan, which is an accepted comprehensive plan. "The Department's goal for the Penobscot River is to restore, protect, enhance and manage self-sustaining[8] populations of native diadromous alewife, American shad, American eel, Atlantic salmon, Atlantic sturgeon, Atlantic tomcod, blueback herring, rainbow smelt, sea lamprey, shortnose sturgeon, and striped bass within their historical habitat in the Penobscot River basin for broad-based public use and benefit." Since the 2008 Strategic Plan was approved, two mainstem dams in the lower Penobscot River have been removed, a third has been decommissioned with the installation of a nature-like fishway, and a fourth has received a new fishway and other measures for fish passage. In addition, MDMR and our partners have made significant investments in passage or removal at non-hydro dams, replacement of culverts and other infrastructure to address barriers to diadromous fish, and reintroducing diadromous fish to historic habitat in all parts of the Penobscot watershed except the West Branch. Now is the appropriate time to include upstream and downstream passage infrastructure at a subset of the West Branch dams to pass anadromous species upstream into historic habitat. If upstream and downstream passage infrastructure is not included in the subsequent licenses for these projects the Department's goals and the benefits to the people of the State of Maine will not be realized for at least another 40 years.

[7] Maine DMR (Dept. Marine Resources) and IFW (Dept. Inland Fish and Wildlife). 2008. Strategic Plan for the Restoration of Diadromous Fishes to the Penobscot River.
[8] "Self-sustaining populations spawn in the wild, and migrate to and from the ocean with a minimum of human interference."

PDF Page 265: “Only 1.7 percent of American shad and blueback herring historical habitat is in the West Branch (MDMR and MDIFW 2008).”
MDMR Comment: While the Licensee’s information is correct in this case, 1.7% equates to almost 26,000 American shad and approximately 112,000 blueback herring (i.e., not an insignificant number of fish). In addition, the licensee does not consider the potential benefits of passage in the West Branch to Atlantic salmon and sea lamprey.

PDF Page 265: “As FERC described in its SPD, Atlantic salmon, alosines, and sea lamprey do not reach the Penobscot Mills Project given that there is no fish passage at the Medway Project, and a new upstream fishway is not planned for the Mattaceunk Project until 2037.”
MDMR Comment: This comment is irrelevant as the Medway project is currently undergoing relicensing as well, and Maine DMR will recommend fish passage measures at the Medway project in close consultation with MDIFW to achieve both the improvement of fish passage for indigenous species and prevention of the spread of aquatic invasive species as agreed to in a 2024 MOU between the two agencies. An upstream fishway is planned to be operational at the Mattaceunk project in year 16 of the license issued in 2021, so upstream anadromous measures should be included at a subset of the West Branch dams in the Final License Application along a similar timeline to avoid additional years of impacts on diadromous populations in the Penobscot River. MDMR also requests that the Licensee and FERC clarify that year 16 of the Mattaceunk license is indeed 2036, and not 2037 as stated on Page 265. The FERC Order issuing a new license for the Mattaceunk project was issued on February 26, 2021.[9] See the below table for tabulation.

| First year | Year 2 | Year 3 | Year 4 | Year 5 | Year 6 | Year 7 | Year 8 | Year 9 | Year 10 | Year 11 | Year 12 | Year 13 | Year 14 | Year 15 | Year 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| 2021 | 2022 | 2023 | 2024 | 2025 | 2026 | 2027 | 2028 | 2029 | 2030 | 2031 | 2032 | 2033 | 2034 | 2035 | 2036 |

PDF Page 269: “While major American shad restoration efforts are occurring in the lower Penobscot River drainage, American shad are not targeted for restoration in the West Branch (MDMR and MDIFW 2008).”

PDF Page 269: “However, there is limited historical spawning and rearing habitat available in the West Branch, and river herring are not targeted for restoration in the West Branch (MDMR and MDIFW 2008).”
MDMR Comment: See previous comments. The West Branch could provide habitat for approximately 26,000 American shad and 112,000 blueback herring. The 2008 Strategic Plan did not identify restoration in the West Branch because “…10 hydropower and water storage dams on the West Branch Penobscot do not pass diadromous fish and no passage is planned in the near term.”[10]. However, in the 16 years since the adoption of the 2008 Strategic plan there has been a focus on improving passage at projects in the lower river and now is the appropriate time to see passage in the West Branch to allow restoration of diadromous species to those historic habitats.

PDF Page 269: “The current and historical distribution of sea lamprey throughout the Penobscot watershed is relatively unknown (Saunders et al. 2006).”

[9] Accession No. 20210226-3016
[10] Maine DMR (Dept. Marine Resources) and IFW (Dept. Inland Fish and Wildlife). 2008. Strategic Plan for the Restoration of Diadromous Fishes to the Penobscot River.

MDMR Comment: MDMR assumes that the distribution of sea lamprey throughout the Penobscot watershed is comparable to that of Atlantic salmon due to their similar habitat requirements.

PDF Page 273: "Given that Stone Dam is a low head dam with a good amount of leakage from the flashboards, it is likely that small juvenile eels can ascend the river right side of the dam."
MDMR Comment: Although current conditions at Stone Dam may allow some eel passage over or through existing features, there is no evidence that this passage is safe, timely, or effective for eels. Observations of potentially favorable passage conditions do not preclude the need for siting studies or installation of upstream passage infrastructure.

PDF Page 274: "Given that Millinocket Lake Storage Dam has a low head, a curved profile, and a good amount of flow through existing notches, American eels are likely able to migrate over or through existing features at the site."
MDMR Comment: Although current conditions at Millinocket Lake Storage Dam may allow some eel passage over or through existing features, there is no evidence that this passage is safe, timely, or effective for eels. Observations of potentially favorable passage conditions do not preclude the need for siting studies or installation of upstream passage infrastructure.

PDF Page 279: "A cumulative survival estimate for male sized eels was not calculated as results from larger female sized eels were considered to be a worst-case scenario."
MDMR Comment: The licensee's cumulative survival estimate clearly demonstrated significant impacts to American eels throughout the West Branch, with some projects exhibiting 100% blade-strike probability for adult eels (of either sex) passing through the turbines. Table 37 in the ISR[11] indicates that only 6.4% of eels would survive passage of Ripogenus and all of the Penobscot Mills projects. While this estimate is already staggeringly low, downstream migrating eels are further impacted by at least four additional downstream dams before they reach the ocean. Under current conditions, the impacts from the West Branch projects are likely an ecological trap as described in our summary comments. A watershed wide estimate of cumulative mortality is important and is under development by MDMR and USFWS. This watershed wide estimate will be filed on the record as soon as we have completed agency review.

PDF Page 306: "As such, operation of the Ripogenus Project impoundment as proposed, is not expected to affect American eels"
MDMR Comment: While operation of the impoundment is unlikely to directly kill or injure American eels in the headpond, large drawdowns that occur at the project are likely to reduce the forage base in Ripogenus Lake that is available for American eels, which would impact growth and survival in the same way that it impacts resident species.

PDF Page 311: "No eels were observed during the 2022 Fish Stranding Study downstream of McKay Station. As such, proposed operations of the Ripogenus Project are not expected to affect American eels in the West Branch downstream of the Ripogenus Project or in the impoundment.
MDMR Comment: An American eel was observed during the 2024 Ramping Study that the Licensee conducted on July 17, 2024[12]. It is also reasonable to assume that the eel population in the habitat downstream of McKay station are depressed from historical levels due to the lack of passage at the Penobscot Mills and other dams downstream. Once upstream passage is provided at the downstream

[11] Accession No. 20230424-5265
[12] This documentation was emailed to Alicia.Jackson@ferc.gov on July 30, 2024.

dams, we expect eel populations in the habitat in the West Branch Penobscot to increase and larger populations of eels could be impacted at a higher rate by proposed operations of the Ripogenus project downstream of the project from a stranding perspective. In addition, it is completely inappropriate to say that operation of the project will not impact American eels in the impoundment. In fact, the Licensee's own analysis indicates that 11% of eels 15" in length and 0% of eels 28" in length would survive passage downstream of the project.

PDF Page 315: "Management of anadromous fish species (e.g., Atlantic salmon, river herring, sea lamprey, and American shad) in the West Branch is not envisioned under current, published management plans for the Penobscot River (MDMR and MDIFW 2008)."
MDMR Comment: This comment is incorrect and misinterprets the 2008 Strategic Plan. See our above comment on this subject.

PDF Page 315: "Based on 2022 and 2023 study results, juvenile eels are finding upstream passage routes at all of the Penobscot Mills Project dams. The greatest number of eels were observed at Dolby Dam, Millinocket Lake Storage Dam, and East Millinocket Dam, respectfully. The number of eels observed at Stone Dam and North Twin Dam were an order of magnitude lower than at all other locations; all eels at the North Twin Dam were seen in the existing fish ladder designed to pass landlocked salmon. As such, GLHA's proposed operations would be expected to maintain opportunities for American eels to move upstream at the Penobscot Mills Project."
MDMR Comment: While some eels are finding upstream passage routes, there is no information to determine that these existing routes provide safe, timely, and effective passage for American eels. Installation of specific eel passage infrastructure would provide a dedicated route of passage for American eels at the projects. Proper monitoring and if necessary, improvements, would ensure safe, timely, and effective passage.

PDF Page 316: "Under GLHA's proposed operation of the Penobscot Mills Project, there would be no change to these potential survival rates for downstream migrating adult silver eels. However, given the relatively small numbers of eels reaching the Penobscot Mills Project impoundment waters and, therefore, needing to pass back downstream past the various dams/powerhouses, it is not clear that the existing mortality rates would have any significant effect at the population level."

PDF Page 318: "Unavoidable adverse impacts resulting from continued operations of the Ripogenus Project and Penobscot Mills Project may include entrainment or impingement of downstream migrating adult silver eels. However, because relatively few eels reach the West Branch (as compared to lower in the Penobscot River watershed), it is unlikely that proposed operations would have a significant effect on American eels at the population level."
MDMR Comment: While there are certainly adverse impacts to downstream migrating adult silver eels resulting from current operations of the Ripogenus and Penobscot Mills projects, these impacts are not "unavoidable" as the Licensee suggests. The best scientific information available suggests that entrainment and impingement can be limited or avoided entirely with the installation of ¾" angled trashracks and appropriate downstream bypasses[13].

GLHA's conclusions that there are relatively small numbers of eels reaching the Ripogenus and Penobscot Mills impoundments are based on very limited information. For example, the licensee

[13] USFWS (U.S. Fish and Wildlife Service). 2019. Fish Passage Engineering Design Criteria. USFWS, Northeast Region R5, Hadley, Massachusetts.

observed 2,045 eels below Dolby dam across only 7 nights of observation, which in and of itself is a significant number of eels. If we assume that GLHA's observations encompassed the entire upstream passage season for American eels (i.e., the entire season was 7/27-9/5), and that the number of eels observed was representative of upstream passage each night, then it is possible that GLHA would have observed over 13,000 eels if they had monitored every day during that time period. While this is an extremely simple example, we do know that GLHA's observations did not cover the entire upstream passage season (typically June-August), 230 eels were still observed during the last survey in early September, more surveys would have resulted in more eels, and no surveys at Dolby were conducted during rain events, which may have increased the number of eels observed. Thus, it is likely that the number of eels interacting with these projects is much larger than the numbers GLHA has observed, and downstream mortality and poor upstream passage would have significant effects at the population level.

**Maine Professional River Outfitters**

August 1, 2024

Debbie-Anne A. Reese
Acting Secretary
Federal Energy Regulatory Commission
888 First Street, N.E.
Washington, D.C. 20426

**Re**: Ripogenus Project (P-2572) and Penobscot Mills Project (P-2458)
Comments on Draft License Application

Dear Secretary Reese:

Maine Professional River Outfitters ("MEPRO") is an unincorporated organization of commercial rafting outfitters that operate on a fourteen mile stretch of the Penobscot River, from below McKay Station to Nevers Corner. Maine's rafting industry plays a vital role in bolstering the State's rural economy by attracting tourists and providing employment opportunities in remote areas. We appreciate the opportunity to provide comments on licensee's draft license application ("DLA") submitted on May 3, 2024.

## Introduction

As an initial matter, MEPRO reiterates and incorporates its July 6, 2023 comments on licensee's Initial Study Plan and its June 30, 2024 comments on the Updated Study Report. MEPRO's primary objectives are (1) to maintain and protect the historic flows the industry has come to rely on, (2) to ensure that the licensing process carefully considers the licensee's obligations to the commercial rafting industry, and (3) to ensure the license provides sufficient mechanisms to support the continued success of the commercial rafting industry in Maine.

## Ensuring Adequate Flow During Recreation Hours

As explained in our comments on July 6, 2023, MEPRO is a party to a 1993 settlement agreement with Great Northern Paper, Inc. that resolved issues related to the commercial rafting industry raised during the previous relicensing process (the "1993 Settlement").

Maintaining the flows provided for in the 1993 Settlement is absolutely critical to the continued success and viability of the commercial rafting industry in Northern Maine. Under the existing FERC license, commercial rafters and the whitewater rafting industry have historically had recreation flows from May 1 - September 15 between the hours of 8:30am-5:00pm. MEPRO seeks to ensure these recreation flows are preserved and it respectfully submits that a refinement of the water release protocol is necessary to fully satisfy that arrangement.

Specifically, in order to ensure that recreational flows are available during the agreed upon hours, we request earlier releases that will enable recreation level flows to reach all commercial access points (McKay and Nesowadnehunk) by 8:30am as contemplated in the Operations Model Logic and Validation Report.[1]

Under the existing license, the agreed-upon flows are set forth below:

| ***Whitewater*** | |
|---|---|
| May 1 – September 15<br>(8:30 AM – 5:00 PM) | Normal hydrologic year[3]:<br>• 2,300 cfs on Saturdays and Sundays<br>• 2,200 cfs on Mondays and Fridays<br>• 2,000 cfs on Tuesdays through Thursdays<br>Wet or dry hydrologic year[3]:<br>• 2,200 cfs on Saturdays and Sundays<br>• 2,000 cfs on Mondays and Fridays<br>• 1,800 cfs on Tuesdays through Thursdays |
| September 16 – October 1<br>(8:30 AM– 5:00 PM) | Normal hydrologic year[3]:<br>• 2,300 cfs on Saturdays and Sundays<br>Wet or dry hydrologic year[3]:<br>• 2,200 cfs on Saturdays and Sundays |
| June 8 – October 14<br>(5:00 PM – 8:30 AM) | 1,000 cfs |

Recreation flows are guaranteed from 8:30am-5:00pm, with a minimum of 1800 cfs being released during a wet/dry year on certain days of the week. The minimum flow required to run a safe and enjoyable whitewater rafting trip are the flows that are currently required in the license–including a minimum of 1800 cfs on a wet/dry year, and 2000 cfs on a normal year.

Our members have experienced that, in a dry year, when the turbines may be dropped to just one operating turbine overnight, an earlier release is needed to ensure the recreation flow reaches McKay and Nesowadnehunk Falls by 8:30am. To illustrate, some of our members put their rafts in at 8:30am at McKay Station for a full river trip, which could mean taking out as late as 5:00pm at Nevers Corner. Other members begin their trips by putting-in at Nesowadnehunk Falls and run the McKay Station portion of the river after lunch. Outfitters are given specific launch times and locations by the Department of Inland Fisheries and Wildlife, and our members want to ensure adequate flows reach the entire fourteen mile stretch on which we operate by 8:30am and are

[1] *See* Section 5.2.3.5 Recreation Flows, *Appendix A: Operations Model Logic and Validation Report* (April 2024).

maintained until 5:00pm. Under the current permitting regime, when flows have dropped below 2000 cfs overnight, outfitters have experienced low water during the identified recreation hours of 8:30am to 5:00pm. This inhibits their ability to begin river trips on time, negatively impacting user experience and making scheduling less predictable.

Based on our experience working and recreating on the Penobscot River, we submit an earlier release from McKay Station when flows are dropped below 2000 cfs overnight is necessary to ensure sufficient recreational flows make it to Nesowadnehunk Falls by 8:30am for our members who put in there. Commitment to an earlier release time under low flow scenarios will allow the whitewater industry and its customers to have confidence that recreation flows will reach launch points at a time and in a manner that enables predictable launch times, and a consistent flow throughout the river for running rapids. MEPRO wants to ensure that the license provides the whitewater rafting industry with adequate flow for running the river throughout the fourteen-mile section we raft, beginning at 8:30am, whether putting in at McKay Station or Nesowadnehunk Falls.

To be clear, MEPRO is not proposing any changes to the minimum flow requirements in the existing license, but rather an enhancement to the process undertaken to increase the low flow up to the recreation flow by the start of designated recreation hours, due to slow fill in Nesowadnehunk Dead Water and Abol Dead Water.

Consistent and predictable flows are critical to the smooth and successful operation of the commercial rafting industry. MEPRO and its members want to ensure the license creates a requirement to maintain these flows during the full breadth of the designated recreation hours. The simple act of preserving our existing arrangement will provide significant benefits to support outdoor recreation and tourism, which, with the decline of other industry, has become the number one industry in the area and is increasingly important to Maine's rural economy.

**Gage Installation**

MEPRO members support installation of U.S. Geological Survey ("USGS") streamflow gage(s) as described in the USGS Gage Feasibility Study Report.[2] The Report indicates that streamflow gages would use satellite technology to transmit near real-time data about flows. Having access to contemporaneous data about flows would provide the whitewater rafting industry with actionable information to aid in monitoring water levels and scheduling rafting trips.

[2] *Appendix B: U.S. Geological Survey Gage Feasibility Study.*

The Report concludes that an appropriate location for a USGS gage would be in the vicinity of the Big Eddy Campground. As the licensee notes, "if a USGS gage is installed in the vicinity of Big Eddy, stakeholders will be able to understand flows from previous hours, which will inform whether boating flows are available at the downstream Abol Bridge."[3] As stated in its June 30, 2024 comments, MEPRO continues to recommend installation of USGS gages in two locations: (1) somewhere in the area between Telos Bridge and Big Eddy and (2) in the vicinity of Abol Bridge. Placing USGS-maintained gages at these locations would confirm whether adequate recreation flows (up to the agreed-upon historic flows) are reaching whitewater rafting put-ins at McKay Station and Nesowadnehunk Falls by the start of recreation hours.

**Repair and Maintenance of the McKay Station Put-In**

MEPRO and its members reiterate our request that the license require timely and regular repair and maintenance of any licensee-controlled put-ins. MEPRO and its members are particularly concerned that the McKay Station put-in is still in need of repair work following the last damaging high-water event.

The license should require all repair and maintenance of put-ins following spillover events at Ripogenus Dam to be completed by May 1 each year. MEPRO and its members depend on the put-ins being in safe, working order to access the river and operate our businesses. A May 1 deadline to complete put-in repair and maintenance would ensure the river access points would be ready to accommodate commercial rafting trips on the Penobscot River at the start of each season. We also request the license requires reasonable efforts to repair put-ins in a timely manner following any mid-season spillover events.

**Additional Access Point in the Vicinity of Abol Bridge**

MEPRO members, along with other stakeholders, support the construction of additional access and egress points along the section of the Penobscot River on which we operate. MEPRO formally requests an additional access point at Abol Bridge, specifically a hand-carry access put-in for commercial use on river right just below the bridge or at another appropriate site in the vicinity with suitable parking.

MEPRO members have seen an increased demand for less challenging river trips. These types of less adventurous river trips are not currently available on the West Branch of the Penobscot River. A suitable access/egress point in the vicinity of Abol Bridge would help satisfy this demand by accommodating those clients who seek a less strenuous river trip.

[3] GLHA Response to Comments on the Update Study Report and Requests for New or Modified Studies at page 33 (Jul. 30, 2024).

Additionally, an access/egress point in the vicinity of Abol Bridge would be particularly beneficial during flood stage water levels when it is nearly impossible to safely run the river from either Ripogenus Gorge or Nesowadnehunk Falls. An Abol Bridge access/egress point would allow the industry to access the River when flood stage water levels make it too dangerous to run the upper rapids.

**Improved Access to Debsconeag Falls**

Finally, MEPRO members agree with other stakeholders that the license should require road improvements to the Debsconeag Falls access road. Debsconeag Falls is a class 4/5 rapid located just over two miles below the existing Nevers Corner commercial rafting take out. However, the Debsconeag Falls rapid is rarely utilized (either by private boaters or the commercial rafting industry) due to the poor quality of the access road leading to it.

Improvements to the Debsconeag Falls access road would provide an additional class 4/5 whitewater boating opportunity without any changes in required flows or other system management changes. MEPRO and its members formally request the license require improvements to and maintenance of the Debsconeag Falls access road which will improve access the river and increase the quantity and variety of commercial rafting trips the industry can offer.

**Conclusion**

MEPRO's primary goal is to protect and maintain the water levels the whitewater rafting industry has historically enjoyed and relies on for its continued operational success. Our other comments make reasonable requests of the licensee that will improve the commercial rafting industry's access to the River and ability to offer a diverse array of safe and enjoyable whitewater trips. Thank you for the opportunity to provide these comments.

Application for New License

Ripogenus Hydroelectric Project
FERC No. 2572

Penobscot Mills Hydroelectric Project
FERC No. 2458

# JOINT NGO STAKEHOLDER COMMENTS ON DRAFT LICENSE APPLICATION FOR THE RIPOGENUS HYDROELECTRIC PROJECT (P-2572) AND PENOBSCOT MILLS HYDROELECTRIC PROJECT (P-2458)

American Whitewater ("AW"); Appalachian Mountain Club ("AMC"); Maine Council of Trout Unlimited ("TU"); American Rivers ("AR"); Maine Rivers; Atlantic Salmon Federation ("ASF"); Caribou, Chesuncook Lake Camp Associations; Chesuncook Dam Camp Owners Association; the Allagash Gateway Campground; and Andre Emerson Cushing Corporation (collectively, "NGOs" or "Signatories") submit the following Comments in response to the filing of the Draft License Application for the Ripogenus Hydroelectric Project and Penobscot Mills Hydroelectric Project (FERC Project Nos. P-2572, P-2458) by Great Lakes Hydro America, LLC ("GLHA") Collectively, these projects are located on the West Branch of the Penobscot River and Millinocket Stream and are comprised of the Ripogenus Hydroelectric Project and the Millinocket Lake Storage, North Twin, Millinocket, Dolby, and East Millinocket developments as part of the Penobscot Mills Hydroelectric Project. While GLHA holds separate licenses for the Ripogenus and Penobscot Mills projects, the licensee has appropriately jointly filed a Draft License Application because GLHA is the licensee for both projects, they have the same license expiration date, and the operations of both projects are inextricably linked. Throughout the Integrated Licensing Process utilized for this relicensing, GLHA has held joint Initial Study Report and Updated Study Report meetings as well as joint meetings concerning ongoing studies applicable to both projects including recreation, aesthetics, and project operations. Inasmuch as these projects have cumulative impacts on both developmental and non-developmental resources, we are jointly filing these comments on the Draft License Application for both projects as a single document under each FERC docket to support a coordinated approach to the relicensing of these projects and to advocate for the preparation of a single NEPA document addressing the cumulative impact of all six developments.

American Whitewater is a national non-profit 501(c)(3) river conservation and recreation organization founded in 1954. With approximately 6,000 members and 85 affiliate clubs, representing tens of thousands of whitewater paddlers across the nation, American Whitewater's mission is to protect and restore our nation's whitewater resources and to enhance opportunities to enjoy them safely. Our members are primarily conservation-oriented kayakers and canoeists, many of whom live and/or engage in recreational boating in the New England region within easy proximity of the Penobscot River. American Whitewater has long been involved with the FERC licensed hydropower projects in the Maine, including hydropower projects located on the Penobscot, Kennebec, Rapid, and Magalloway rivers, and are party to settlement agreements that provide for whitewater boating opportunities that

partially mitigate for project impacts.

Since 1876, the Appalachian Mountain Club has promoted the protection, enjoyment, and understanding of the mountains, forests, waters, and trails of the Appalachian region. AMC is the largest conservation and recreation organization in the Northeast with more than 90,000 members, supporters, and advocates, many of whom visit the lands and waters upstream and downstream of the projects for recreation.

Maine Council of Trout Unlimited represents six local chapters with over 2,000 fisher-conservationists in Maine. The mission of the organization is to bring together diverse interests to care for and recover rivers and streams so our children can experience the joy of wild and native trout and salmon. The entire watershed of the West Branch of the Penobscot is especially important to a great many of our members who enjoy its fishing resources, including the area from McKay Station to Nesowadnehunk Falls, Ripogenus-Chesuncook-Caribou Lake, and the waters below to its confluence with the main stem of the Penobscot River that are greatly affected by the Ripogenus and Penobscot Mills projects.

American Rivers is a national non-profit organization whose mission is to protect wild rivers, restore damaged rivers, and conserve clean water for people and nature.

The Caribou and Chesuncook Lake Camp Associations represent the interests of those with property on the shores of these lakes who have been greatly affected by the severe dewatering of the Ripogenus-Chesuncook impoundment in recent years. Their interest also extends to other recreational users of the lakes including the many canoe campers, recreational boaters, fishermen and women, those who use the public campsites on the lakes as well as the aquatic and shoreline communities who make their homes there.

Maine Rivers, begun in 1998 as a project of the Natural Resources Council of Maine, became an independent organization in 2003. The Maine Rivers mission is to protect, restore and enhance the health and vitality of Maine's rivers. Since the Clean Water Act was passed in 1972, the health of Maine's Rivers has improved dramatically, but there are still serious threats to our rivers – from the toxins that wash in with every rain storm, to the pollution discharged by paper mills, to water withdrawals by farmers and ski resorts. Maine Rivers recognizes that the destructive impacts that colonization and industry have on our rivers also degrade and destroy human life, and seek to find better ways to safeguard Maine's countless miles of remarkable rivers.

Atlantic Salmon Federation is an international non-governmental organization dedicated to the conservation and restoration of wild Atlantic salmon and their ecosystems. ASF represents more than 25,000 members and volunteers across North America. ASF conducts research on wild salmon throughout the North Atlantic, performs complex river restoration project, promotes conservation of critical salmon habitats, and advocates for legislation and policies that will help to protect wild Atlantic salmon. ASF's U.S. office is located in Brunswick, Maine.

Allagash Gateway is a four-season sporting camp located on Ripogenus Lake near the Chesuncook Dam Point Boat Launch. It offers a private boat launch, canoeing, campsites, lodging, guide services, and a small store. During the summer months, Allagash Gateway's clientele is primarily interested in boating and fishing the lakes that make up the Ripogenus impoundment. Operations of the campground have

been profoundly impacted over the last few years by the water levels of Ripogenus Lake and Chesuncook Lake.

Andre Emerson Cushing Corporation is the majority landowner in T3 R12 WELS. Approximately 80% of Ripogenus Lake and 20% of Chesuncook Lake are within the boundaries of T3 R12 WELS. William Cushing, a director of Andre Emerson Cushing Corporation, is a year-round resident of T3 R12 WELS, and his home is on Ripogenus Lake.

These organizations are working together to represent the interests of all stakeholders, including fish and wildlife, to the Commission in the most consistent and coherent way possible. Individual organizations may submit additional DLA Comments to supplement and support this filing.

**General Comments**

The West Branch of the Penobscot River is one of the nation's premier natural, scenic, and recreational wonders. Water flowing over many millennia has sculpted the bedrock, river channel and landscape from the Ripogenus Gorge to Millinocket into a series of remarkable geological and scenic features that make this river a unique recreational and natural resource. Ripogenus Dam causes the merging of Ripogenus Lake, Chesuncook Lake and Caribou Lake in to Maine's third largest lake that provides unique recreational and scenic opportunities. The operation of large hydroelectric power plants, dams and other associated structures degrades the public's use and enjoyment of this unique and spectacular public resource.

Since the last license was issued, Project Operations have changed significantly. Great Northern Paper (GNP) operated the projects to keep a steady flow of water going downstream to power the operation of its East Millinocket Mills. Since splitting off its hydro operations to Great Lakes Hydro America, LLC, the project has been operated using peaking flows to increase profits from the electricity generated that is now sold on the grid, and use of this practice has increased under Brookfield Renewable's ownership. The current license prescribes minimum flows that partially address recreational and environmental concerns. Additional terms and conditions are needed to improve water management and balance project harms and benefits given the changes to project operations. It is clear from the record of the last relicensing that agencies and officials bent over backwards to license the projects under terms and conditions favorable to GNP's economic interests. Those interests are not longer relevant to the proceeding as the paper mills that once dominated the region are long gone. The terms and conditions of the current license, however, are not compliant with current Maine environmental statutes or federal hydropower regulations. Example: FERC does not issue storage project licenses without specifying target fill date and level or minimum drawdown levels. Under the terms of the current license, Ripogenus-Chesuncook-Caribou Lake may be drawn down to the physical limits of Ripogenus Dam.

Since the filing of the Pre-Application Document on June 11, 2021, stakeholders in this relicensing including American Whitewater, Appalachian Mountain Club, Trout Unlimited, Penobscot Indian Nation, whitewater outfitters, lake owners, state and federal resource agencies, individual recreationists, and others have filed scores of comments on the FERC docket, requested

relicensing studies, participated in study implementation, attended study report meetings, and meaningfully and substantially participated in the relicensing process. Notwithstanding the importance of the issues and concerns raised by stakeholders throughout the relicensing process, GLHA and filed a Draft License Application that ignores the result of every study and ignores the written and oral comments provided by every relicensing stakeholder. Instead, GLHA has filed a Draft License Application that proposes no changes whatsoever in is current operations with no analysis, seemingly treating the relicensing process as a waste of time and money and little more than a check-the-box exercise, expecting FERC to simply issue a new license under the same terms and conditions. The DLA states: "GLHA proposes to continue operating the Projects as described above during mean/normal, high, and adverse/low water years." [Exhibit B, page B-11] This is despite the fact that Brookfield has yet to identify the data supporting those same flows in the license nothwithstand FERC Staff's specific request for this information. The relicensing process demands more. So does NEPA, the Federal Power Act, and the Clean Water Act.

**Description of Project Facilities and Operations**

From the top of the Ripogenus impoundment to the East Millinocket tailrace, these storage projects and hydropower dams impact more than 40 river miles of the West Branch of the Penobscot River and more than 12 river miles of Millinocket Stream. The uppermost development, Ripogenus Hydroelectric Project, obstructs more than 20 miles of the West Branch of the Penobscot River by diverting flows at the Ripogenus Dam into a 3,850-foot-long penstock leading to the McKay Station powerhouse. The drainage area of the project is 1422 sq. mi.

Ripogenus-Chesuncook-Caribou Lake has a surface area of 26,200 acres and is Maine's third largest lake. The current license allows lake levels to vary restrained only by the physical structure of Ripogenus Dam. The lake was not filled during the years 2020 and 2021 and was finally filled during the winter of 2022 by dropping outflows to 1000 cfs and subsequently 800 cfs, well below licensed spawning flows and undoubtedly having significant negative impact on the redds of salmonids downstream.

Chesuncook is unique. It is of highest value, developed mainly on the north and south shores with future development limited, and yet is still accessible. Further demonstrating the lake's status as a valued fishing, boating and canoeing destination, Maine statute prohibits jet skis from Chesuncook, Caribou and Ripogenus lakes. These lakes are remote, wilderness gems.

Chesuncook Lake's remoteness and undeveloped nature is what makes it so important to the state of Maine. So valued that the State of Maine employs a full-time Lake Ranger, May through October to monitor and maintain the public campsites on Chesuncook Lake, including Umbazookus and Gero Island. This ranger assists the numerous public, private and commercial canoe campers, recreational boaters and fishermen and women who use the lake including Bowdoin College, Colby College, Outward Bound, the Sierra Club, the LL Bean Discovery Program, and numerous private fishing and canoe camps and outfitters.

The lake is steeped in history. The Wabanaki–Thoreau Canoe Trail, a 200-mile network of paddling and hiking routes once used by Henry David Thoreau and members of the Wabanaki Nations, passes through Chesuncook Lake. The lake also hosts the Northern Forest Canoe Trail. This 700-mile trail is

the longest water trail in the nation spanning New York to Maine on traditional routes used by Indigenous peoples, settlers and guides.

The pristine beauty of Chesuncook Lake attracts recreational users today to the remote campsites and the developments at the north and south end. At the north end of the lake lies Chesuncook Village. A bustling community with an active church and museum, and a large, quintessential, iconic lodging facility. Just across from the village, is Gero Island, a state Ecological Preserve within public reserved lands, one of only 17 in the state within the Maine Natural Resources Program, hosting 5 of the State of Maine's public campsites.

On the southern end of the lake sits the Chesuncook Dam Village which holds the Chesuncook Lake Boom House Museum honoring the logging history of the area, and hosting over 600 visitors yearly, a commercial fishing and hunting business, many private cottages and is the take-out point for the famous West Branch canoe trip as well as the launching point for lake adventures. Multiple private camps dot the shoreline between the north and south shores.

Numerous private camps line the west shore of Caribou Lake and join a large neighborhood of private camps on the east shore. On a summer day one will see recreationists canoeing, kayaking, motor boating and fishing. Winter brings adventurers snowmobiling, ice fishing and Nordic skiing. The lakes are always alive with those savoring the beauty and recreational opportunities the lakes offer.

The previous licensee understood the recreational value and use of the lakes north of Ripogenus Dam and managed the lakes in a balanced manner with an average drawdown "during the recreation season from 1972 to 1985 was 3.45 ft. The maximum drawdown of the impoundment during the recreation season for the period of record was 15.25 ft in 1980, an extreme low water year when the impoundment began the season 11.4 ft below the normal high-water elevation."

There is also immense economic value to the lakes. A recent study by the University of Maine reveals Maine lake's economic value at a staggering 14 billion. The Bureau of Economic Analysis found Maine is the third most heavily involved state in the recreation industry. The report credits Maine's world-class outdoor recreational assets and predicts Maine's outdoor companies who are innovative and sustainable have "great potential for future growth." A study of outdoor recreation in rural Maine found a potential for doubling the industry in the next ten years, from $2.3 billion in 2017 to $5.6 billion in 2030. Outdoor research also shows that access to the outdoors is a major element in recruiting talent." Outdoor recreation encompassed 4% of the state gross domestic product in 2022. As explained by Jenny Kordick, the executive director of Maine Outdoor Brands, "Outdoor recreation isn't just a pastime; it's the heartbeat of our state's economy." The Piscataquis County Economic Development Council believes in the potential of the region as well and identifies Chesuncook Lake as "one of Maine's recreational highlights."

The recreational value of Chesuncook, Caribou and Ripogenus lakes cannot be overstated. The Maine Department of Agriculture, Conservation and Forestry, in a 2004 policy on FERC hydropower project licensing, directed the Bureau of Parks and Lands "engagement to be focused on 1) public recreational facilities and access, 2) adequacy of flow releases for boating, and 3) the effect of the project on public lands. The primary concern of the Bureau is to avoid or reduce the adverse impacts of continued, increased or fluctuating impoundment levels and downstream flows on public access, wildlife habitat,

forest resources, aesthetic resources, recreational facilities, and public trust rights on these lands." These lakes matter to the people of the state of Maine. As one of the user survey respondents stated, "I love any recreational experience I have on Chesuncook Lake. It is an invaluable natural resource to the state of Maine because of its remoteness and beauty. I have been coming to Chesuncook Lake many times a year for the past twenty years, and it's a lake I plan to return to for the rest of my life. It's one of my favorite places in Maine to motorboat, kayak, canoe, paddleboard, and swim in the summer."

The images that follow demonstrate the impact of project operations on recreationists, boaters, fishermen and those using remote camping sites cared for by the Maine Bureau of Parks and Lands that were not captured in the study reports. Additional images were included with Caribou, Chesuncook Lake Camp Associations/Chesuncook Dam Camp Owners Association USR Comments.

The access between Chesuncook and Caribou Lakes at near full lake and at low water. Look closely at the second picture where you will see a canoe trying to navigate the narrow channel. The canoeists eventually had to walk their boat. Motorboats could not pass.

Mouser Island, one of the most heavily used BPL sites on the lake, at high water and at low water. The rocky shoreline makes walking extremely dangerous and limits access.

Below the lake, the flow diversion at Ripogenus Dam regularly diverts nearly all flows from the West Branch of the Penobscot River, virtually dewatering the Ripogenus Dryway or Upper Gorge of the natural river channel other than an unnatural steady state minimum flow of 100 cfs from July 1 to September 30. At other times, GLHA leaves the Upper Gorge dewatered except for leakage of 12 cfs.

The minimum flow in the bypassed reach is 0.07 cubic feet per second per square mile (cfsm) of the drainage area during the summer months and 0.008 cfsm during the rest of the year, far below the United State Fish and Wildlife Service recommended base flow of 0.5 cfsm necessary to support healthy aquatic habitat. The flow diversion and dewatering of the natural river channel below the Ripogenus Dam impacts aquatic habitat, obstructs river connectivity, reduces sediment transport, degrades water quality, reduces recreation opportunity, and degrades the aesthetic quality of the Ripogenus Dryway.

From the top of the Ripogenus impoundment to the McKay Station tailrace, the dewatered natural river reach drops about 84 feet over the .75-mile natural river channel. While the licensee does not include a description of the geologic features in the bypassed reach, imagery of and accounts by whitewater paddlers of this reach shows that this river reach contains a continuous series of ledges and features that provide high-quality whitewater boating opportunity when sufficient flows are provided. Additionally, the licensee acknowledged in its prior license application that the Upper Gorge is an aesthetic feature in the project boundary that draws visitors to the project to hike and view the falls in its present dewatered condition. There are no scheduled whitewater boating releases in the Dryway, and the licensee does not provide information on the frequency with which flows are spilled into the natural river reach when the pond is full, and inflows exceed the 3500 cfs combined capacity of the three turbines at McKay Station. McKay Station is a 38.6 MW powerhouse that operates in hydropeaking mode by fluctuating the upstream impoundment. Given the allowable impoundment drawdown of 44 feet at Ripogenus and the licensee’s interest in avoiding spillage, we assume that spillage into the Upper Gorge is infrequent outside of the spring freshet.

Due to the flow diversion at Ripogenus Dam, flows into the Upper Gorge section above McKay Station dramatically alter the natural flow regime by fluctuating flows from a near non-existant from of 12 cfs to 100 cfs for most of the year, and then periodically spill high flows in excess of 10,000 cfsin the spring. Compare flows into the Upper Gorge to the outflows from McKay Station where flows from inflows and storage typically range from 1,000 cfs to 3,500 cfs unless the project is spilling flows into the bypassed reach. These flow fluctuations into the Upper Gorge eliminates valuable recreational boating and fishing opportunities, damages aquatic habitat, and degrades aesthetic views. While a hiking trail between Ripogenus Dam and McKay Station provides some recreation opportunity, access into the water in the Upper Gorge is difficult due to the lack of a defined portage route around the dam down to the water. The lack of adequate flows, access, and real-time flow information in the Upper Gorge limits recreational boating, fishing, and aesthetic viewing opportunities. Additionally, generator trip events that drop flows to 400 cfs for an average duration of four hours have been occurring on an average of once per year that two independent stranding studies have shown cause to cause extensive downstream mortality to fish, especially landlocked salmon fry and parr.

Under its current license, GLHA is required to release flows from McKay Station from pond storage ranging from 1,800 to 2,300 cfs daily between 8:30 a.m. and 5:00 p.m. from May 1 to October 15.

Flows fluctuate based on the day of the week, time of year, and water year type. GLHA flows may exceed these minimums based on station generation needs or spill. GLHA's required daytime generation flows during the recreation season has provided significant whitewater boating opportunities that support the outdoor recreation economy in the region.

Whitewater flows have proven to be fish-friendly flows and this combined with GNP's need for steady flows resulted in a world-class landlocked salmon fishery below McKay Station that was recognized as such in the EIS published in 1996. Over the years, peaking operations and Brookfield's removal of Ripogenus dam keeper have increased the time needed to restore flows after a generator trip event affecting both salmonids directly and the macro-invertebrate community upon which they feed. Poor water management and lake drawdowns has impacted the smelt population in the lake and decreased the resultant drift downstream hurting size quality. The overall result is a diminished fishery.

Below McKay Station, project outflows cascade over the 15-mile premier whitewater boating reach between McKay and Debsconeag before flowing into Ambajejus Lake in the North Twin Development impoundment and diversion dam located 21 miles below McKay Station. Like McKay, North Twin is a peaking operation relying on storage from the four lakes that comprise its impoundment. North Twin impoundment lake levels fluctuate throughout the year from 1.5 feet after spring refill to 3.5 feet during the late summer to 12 feet or more during the winter months. Flows into the North Twin Impoundment come from releases from Ripogenus and tributary inflow as well as water pumped from the Millinocket Lake Storage Development.

Flows into North Twin are augmented by the Millinocket Lake Storage Development pumping water into Ambejejus Lake in support of hydropeaking operations at North Twin. Impoundment levels at Millinocket Lake Storage Development fluctuate 10 feet because of its pumping for North Twin Station as well as the release of an unnatural steady state minimum flow of 60 cfs from Millinocket Lake Dam into the 9.4-mile reach of Millinocket Stream between Millinocket Lake and Shad Pond below the Millinocket Development. The pumping at Millinocket Lake diverts flows that would otherwise be available for downstream flows on Millinocket Stream, eliminates natural flow variability beneficial to aquatic habitat and recreation, degrades water quality, and increases the hydropeaking on the West Branch of the Penobscot in the Penobscot Mills project area.

The North Twin Dam, located 33 miles below the Ripogenus Dam, is a 7 MW hydropower development with three turbines with a combined hydraulic capacity of 4500 cfs. The powerhouse, located adjacent to the North Twin Dam, operates in hydropeaking mode fluctuating flows from a minimum flow of 2000/3000 cfs up to the 4500 cfs hydraulic capacity of the project. Project outflows are released into a riverine reach leading to Quakish Lake, the impoundment for the Millinocket Development located 2.6 miles below the North Twin Dam.

Inasmuch as Quakish Lake has negligible storage capacity, the licensee's characterization of its operations at Millinocket and the lower developments as run-of-river is misleading in several respects. The Penobscot Mills Hydroelectric Project is a hydropeaking project from North Twin to East Millinocket because each hydropower development is successively passing peaking flows from the upstream development. None of these developments can be characterized as run-of river because they generate power based on the flow regime at North Twin and rely on the operational flexibility provided by the North Twin and Millinocket Lake storage reservoirs. Characterizing the Millinocket

Development as run-of-river obscures the substantial impact of project operations by implying that it passes natural flows and protects the natural flow regime.

More significantly, the 37 MW Millinocket Development dams and diverts the West Branch of the Penobscot River at Stone Dam where the current license requirements fail to mandate any minimum or naturally variable flow into the 4.5-mile natural river channel of the Penobscot River leading to Shad Pond, a section of the Penobscot River that the licensee incongruously calls the "Back Channel", a characterization objectionable to the Penobscot Indian Nation and numerous stakeholders. While the Licensee is required to release a minimum flow of 3,000 cfs from North Twin Development from August 22 through October 15 and 2,000 cfs from Shad Pond at other times, no minimum or naturally variable flows are passed at Stone Dam, leaving the natural river channel nearly dewatered at most times. The only flow in the natural river is from tributary inflow in the lower reach when available and at times when upstream flows exceed the 4,305 cfs hydraulic capacity of the Millinocket powerhouse, primarily during the spring runoff.

Flows from Millinocket Development, Millinocket Lake Storage Development, and leakage or spill from Stone Dam converge on Shad Pond downstream from Millinocket Development with a required minimum flow of 2,000 cfs leading to the Dolby impoundment. Like Millinocket, the licensee mischaracterizes the Dolby Development as run-of-river. In reality, the Millinocket, Dolby, and East Millinocket Developments, like Ripogenus and North Twin, are utilize hydropeaking flows from the upstream projects that successively pass altered flows rather than passing unaltered flow or reregulating discharges to more closely mimic the natural flow regime.

The Dolby Development, located approximately 8 miles below the Millinocket Development and approximately two miles above East Millinocket Development, has a 16.5 MW powerhouse with a hydraulic capacity of 4,350 cfs. Both Dolby and East Millinocket have negligible usable storage. Flows from the Dolby tailrace flow into the West Branch of the Penobscot River to the East Millinocket Development located 1.9 miles downriver. The Drainage area at East Millinocket is 2,111 sq. mi.. East Millinocket powerhouse has a combined hydraulic capacity of 4,200 cfs. The Penobscot Mills project flows into the Medway project, also owned by GLHA, before reaching the mainstem of the Penobscot River.

## Impact of Project Facilities & Operations on Resources

### Aquatic Habitat & Fish Passage

For more than a century, the dams on the mainstem and tributaries of the Penobscot River have decimated native species of sea-run fish including Atlantic Salmon and Shad. While efforts over the past two decades have resulted in the removal of the Veazie and Great Works dams, improvements to fish passage, and opening of hundreds of miles of habitat, the continued presence of hydropower dams continue to have deleterious effects on numerous fish species and recreation opportunity. The harm caused by the hydropower dams on the Penobscot is evident in the licensee's dams at East Millinocket, Dolby, Millinocket, North Twin, and Ripogenus. Once home to Atlantic Salmon, river herring, and other native fish species, what remains today is a managed fishery with landlocked Salmon, smelt, and warm water fish species.

Restoration of the Penobscot River will require an assessment of each dam along the mainstem and tributaries to provide meaningful improvements for fish passage through the relicensing process.

Fish passage at the Penobscot Mills and Ripogenus hydroelectric projects is virtually nonexistent except for North Twin where passage is provided for landlocked Salmon between the Millinocket and North Twin impoundments. The dewatering of bypassed reaches below the Ripogenus and Millinocket dams has eliminated habitat that would be otherwise suitable for various species. The East Millinocket and Dolby projects lack any fish passage for river herring and there are no Shad in Shad Pond. Restoration of the river reach from the Ripogenus impoundment to the East Millinocket tailrace will require the restoration of flows to dewatered river reaches, installation of appropriate fish passage at each development, and the restoration of a Shad fishery in Shad Pond. Restoration of flows on the West Branch below Stone Dam would provide 4.5 miles of suitable habitat that is presently dewatered by the licensee.

The reach below from McKay Station to below Nesowadnehunk Falls is known for its wild landlocked salmon fishery. While Atlantic salmon are known to have proceeded upstream past Ripogenus Falls top Penobscot Stream, this reach is not designated Atlantic salmon critical habitat. Emphasis should be on optimizing the anadromous fish passage in the Penobscot Mills Project and optimizing the habitat for landlocked salmon in the Ripogenus Project. Anadromous fish passage in the Penobscot Mills Project will improve the overall health of the watershed and benefit Atlantic salmon restoration efforts in the mainstem of the Penobscot. The Penobscot Nation holds treaty-reserved sustenance fishing rights in the Penobscot River that would be served. Tribe has advocated for the installation of full depth angled trash racks with a dedicated downstream bypass to protect downstream migrants (primarily eels and brook trout). It is well established that Atlantic salmon cannot be successfully restored without restoring their co-evolved species, on the West Branch, American eels, American shad and river herring.

**Whitewater Boating**

The West Branch of the Penobscot River is known internationally as among the most important rivers for whitewater boating in the Northeast and draws tens of thousands of whitewater boaters annually seeking to enjoy the scenic beauty of the West Branch of the Penobscot River and its dramatic rapids. Paddlers traveling to the Maine Woods region have a positive economic impact on the region and support the outdoor recreation economy, impacts that far exceeds the value of power generated by these hydroelectric projects.

The West Branch of the Penobscot River, where the projects are located, is treasured by local residents and visitors to the area who enjoy boating, angling, swimming and hiking throughout the recreation season. Eco-tourism and outdoor recreation form the foundation of the local economy, relying heavily on the resources impacted by these projects. Unfortunately, project facilities and operations diminish recreation opportunities on the West Branch of the Penobscot River, and diminish the natural beauty of the area, obstructing natural river flow, dewatering dramatic waterfalls, rapids and other sections of the natural river essential to the enjoyment of designated and existing uses of these rivers. American Whitewater and Appalachian Mountain Club have identified four sections of the West Branch of the Penobscot River located in the project boundaries for the Ripogenus and Penobscot Mills projects as providing high quality whitewater boating opportunities. These sections are as follows:

- **Ripogenus Dryway:**

The section of the West Branch from Ripogenus Dam to McKay Station, known as the Upper Gorge or Ripogenus Dryway, is a .75-mile reach with sufficient gradient structure to provide a highly valuable whitewater boating opportunity with sufficient flow. This section of the West Branch cascades over a series of ledges and other geologic features through a remote, narrow gorge setting before paddlers enter the lower gorge below McKay Station. This section has been periodically run by paddlers during spillage from the Ripogenus Dam, demonstrating that this section should be considered a whitewater boating resource. Unfortunately, opportunities to boat this section are infrequent as they only occur when flows are above station capacity, or when the project is offline. The aesthetic quality of this reach also attracts hikers along the Upper Gorge Trail. While precise flow ranges for this section of the river are unknown, anectodical information from those who have previously boated this reach shows that the Ripogenus Dryway is boatable at flows at 400-2200+ cfs and provides flows in the Class III/IV range of difficulty. These flows within the normal operating range of the project and would require that the licensee forego generation and restore natural river flows in Upper Ripogenus Gorge.

The reach is watered by100 cfs flows from July 1 to September 30. These flows come from a sluiceway which provides the warmest water from Ripogenus-Chesuncook-Caribou Lake, and do not function as fishing flows as intended. The warmwater attracts fallfish, not salmonids. An IFIM fisheries habitat study conducted during the last relicensing shows that flows in the Upper Gorge would provide a fishery there.

Here is what the applicable Maine statutes say:

> MRSA §467¶7C(1)c: From Ripogenus Dam through Ripogenus Gorge to the McKay powerhouse - Class B.
> MRSA §465¶3A: “3. A. Class B waters must be of such quality that they are suitable for the designated uses of drinking water supply after treatment; fishing; agriculture; recreation in and on the water; industrial process and cooling water supply; hydroelectric power generation, except as prohibited under Title 12, section 403; navigation; and as habitat for fish and other aquatic life. The habitat must be characterized as unimpaired. [PL 2003, c. 227, §3 (AMD); PL 2003, c. 227, §9 (AFF); PL 2005, c. 561, §10 (AFF).]”
> MRSA §466(11): ‘"Unimpaired" means without a diminished capacity to support aquatic life.’

Dewatering the gorge for nine months out of the year is contrary to Maine environmental law, the habitat cannot be considered unimpaired. Minimum flows to the dryway must be provided year-round to provide aquatic habitat as required by Maine statutes.

*Ripogenus Dryway at high flow*

*Ripogenus Dryway at base flow conditions*

*Ripogenus Dryway from the crest of Ripogenus Dam*

*Ripogenus Dryway during a high flow event showing whitewater paddling features*

- **McKay Station:**

The West Branch of the Penobscot River below McKay Station is the arguably the most renowned whitewater river in the northeast, its closest comparable river reach being the Gauley River in West Virginia. The upper section below McKay features a series of Class III – V rapids through the Penobscot Gorge and Cribworks sections to Big Eddy. This section of the West Branch is known for its powerful hydraulics, waterfall drops, stunning views of Mount Katahdin and frequent wildlife sightings. The 15-mile reach down to Debsconeag provides both rafters and private boaters with an unequaled boating opportunity in the region.

Under its current FERC license, the licensee is required to release daytime flows ranging from 1800-2300 between May 1 – October 1 with flows varying within this range depending on the day of week and hydrologic conditions. While this flow range is well utilized by both private boaters and commercial outfitters, the licensee has not conducted a controlled-flow whitewater boating study on this river reach using the widely accepted *Whittaker* protocols developed in 2005 to identify minimum acceptable and optimal flow ranges.

*Penobscot Gorge downstream of McKay Station*

*Cribworks Rapid on the West Branch of the Penobscot River near Telos Road*

*Rapids on the West Branch of the Penobscot River*

- **Stone Dam:**

The Penobscot Mills Dryway or Stone Dam Dryway between Stone Dam and Shad Pond on the West Branch of the Penobscot River, is a 4.5-mile river reach that the licensee refers to as the "Back Channel", which has the potential to provide a highly valuable whitewater boating opportunity to paddlers with a wide range of abilities if sufficient flows were provided. Under current FERC license conditions, the licensee is not required to release any minimum flow into this lengthy river reach as all flows are diverted into the Millinocket powerhouse rather than flowing naturally into the river.

The flow diversion at Stone Dam and the dewatering of the 4.5-mile reach of the West Branch of the Penobscot River destroys aquatic habitat, obstructs sediment transport, reduces water quality, and eliminates valuable recreational boating and angling opportunities that would otherwise be available if sufficient flow were provided. This section of the river contains ample gradient and geologic features that would provide high quality aquatic habitat as well as whitewater boating and angling opportunities under appropriate flow conditions. The reach also contains Grand Falls, a significant geologic feature located 2.7 miles below Stone Dam. Rarely, flows are spilled over Stone Dam when upstream flows from North Twin exceed 4305 cfs and the impoundment is at capacity. Dewatered throughout the year except during high flows that are beyond the capacity of the project to store or generate power, the dewatered Grand Falls is a natural and recreational treasure along this reach significantly impacted by the projects.

Higher flows into the West Branch at Stone Dam can be released from an inflatable rubber flashboard system and is currently operated at times by deflating the pneumatic rubber flashboard system to provide flows of 200 cfs and then ramping up at an interval of 400 cfs an hour until downstream flow targets are met or until Stone Dam falls to 459.45 FTMSL.

This section of the West Branch has been run by numerous whitewater boaters when flows on the West Branch exceed the hydraulic capacity of the Millinocket Development. While this river reach is clearly boatable, minimum acceptable and optimal flow ranges are unknown, and the licensee has not previously performed a controlled-flow whitewater boating study using the widely accepted *Whittaker* protocols developed in 2005. Boaters previously paddling this reach have determined that this reach contains Class III/IV rapids that provide a high-quality whitewater boating experience under suitable flow conditions. as shown on the image that follows.

*West Branch of the Penobscot River Below Stone Dam Showing Spillage*

*West Branch of the Penobscot River Below Stone Dam at Grand Falls Showing Spillage (Occasional)*

*West Branch of the Penobscot River Below Stone Dam at Grand Falls Dewatered (Typical)*

*Grand Falls on the West Branch of the Penobscot River below Stone Dam on the Penobscot Mills Dryway (Unknown flow)*

Current operations affecting operation of Stone Dam are contrary to Maine Statutes.

MRSA §467¶7C(1)f: From the outlet of Ferguson and Quakish Lakes to its confluence with Millinocket Stream - Class C.

MSR Title 38 §465(4). "4. Class C waters. Class C shall be the 4th highest classification.

A. Class C waters must be of such quality that they are suitable for the designated uses of drinking water supply after treatment; fishing; agriculture; recreation in and on the water; industrial process and cooling water supply; hydroelectric power generation, except as prohibited under Title 12, section 403; navigation; and as a habitat for fish and other aquatic life.

B. Class C waters must be of sufficient quality to support all species of fish indigenous to those waters and to maintain the structure and function of the resident biological community…"

C. Discharges to Class C waters may cause some changes to aquatic life, except that the receiving waters must be of sufficient quality to support all species of fish indigenous to the receiving waters and maintain the structure and function of the resident biological community."

Watering the reach is needed to meet Maine statutory requirements for designated uses other than hydroelectric production: fishing, recreation and habitat.

Watering the reach would be compliant with the EPA's April 2024 ruling regarding access to resources in ceded Native American lands. "The U.S. Environmental Protection Agency (EPA) is finalizing revisions to the Clean Water Act (CWA) water quality standards (WQS) regulation to add requirements for states establishing WQS in waters where Tribes hold and assert rights to CWA-protected aquatic and aquatic-dependent resources reserved through treaties, statutes, or Executive orders." [A Rule by the Environmental Protection Agency on 05/02/2024. Citation: 89 FR 35717]

Improvements to whitewater, recreation and aesthetics must be accompanied by minimum flows to support aquatic habitat.

- **Millinocket Stream:**

Millinocket Stream between Millinocket Lake and Shad Pond has the potential to provide whitewater boating opportunity if sufficient flows are provided. While there is no river gage and the licensee does not publicly release flow information on spill from the Millinocket Lake Dam, whitewater boating is an existing use on this 9.4-mile river reach during spill conditions.

In its prior relicensing of the Penobscot Mills Hydroelectric Project, the licensee acknowledged the whitewater boating potential of this reach in response to FERC's AIR, stating that the reach between Millinocket Lake and Shad Pond is a recreational resource when flows greater than 250 cfs are released from the Millinocket Lake Dam including the Class III Locomotive Rips (or Choo-Choo Falls). While the information was solely based on a conversation with several boaters who previously paddled the reach, a more in-depth study is required to evaluate the recreational value of the resource more thoroughly.

Since the last relicensing, boaters have paddled Millinocket Stream below the dam when flows are available, and for the past 3 years, local boaters have hosted the Millinocket X-treme Canoe Race demonstrating substantial interest in this reach as discussed below.

**Relicensing Studies**

In response to stakeholder study requests, FERC issued a Study Plan Determination on May 13, 2022, as modified by the Study Modification Determination on July 23, 2023, requiring that GLHA conduct a number of studies that impact recreational use, habitat restoration, aesthetics, and other non-power values. Stakeholders previously filed comments in response to the Initial Study Report and Updated Study Report and incorporate those comments by reference and summarize them below. Inasmuch as GLHA has not completed all required studies or responded to all additional information requests by FERC and stakeholders, we reserve the right to file additional comments, and if necessary additional study modification requests, once those studies are complete and additional information has been provided. Studies conducted to date have failed to inform the full range of options for future project operations that will best balance project harms and benefits in this complex and highly modified river segment.

- **Historic Operations Data Assessment Study**

As more fully explained in AW/AMC Initial Study Report Comments, the Ripogenus and Penobscot Mills hydroelectric projects were last licensed in 1996. At the time of the last relicensing, the project provided power to the Millinocket and East Millinocket paper mills. Those paper mills closed in 2008 and 2013, respectively, and the projects were converted to provide power to the electric grid in 2014. Although the project purpose changed in 2014 following the closure of the paper mills, the Water Management Plan, including the required minimum flows to the West Branch Penobscot bypassed reaches and Millinocket Stream, is based on the project purpose of supplying power to the paper mills at the time of the last relicensing. The study does not address historical changes in the timing of generation since the closure of the paper mills and the repurposing of the project.

The Ripogenus Dam impounds the West Branch creating a 710,000-acre-foot impoundment that fluctuates by 44 feet and causing negative impacts to Ripogenus Lake, Caribou Lake, Chesuncook Lake, Moose Pond, Brandy Pond, and Black Pond. Project operations at Ripogenus divert flows into a penstock bypassing the natural river channel, leaving .75 miles of the West Branch dewatered except for an unnatural minimum flow of 12-100 cfs when flows are less than the 3500 cfs hydraulic capacity of McKay Station. Under its current license, the licensee is required to release minimum flows at McKay Station ranging from 1000-2300 cfs at different times of day and at different times of year that support power generation, aquatic habitat below McKay Station, and whitewater boating and other recreation.

Project operations at McKay alter flows by impounding and gradually releasing flows on the West Branch. Project operations at McKay adversely affect water quality by raising water temperature and lowering dissolved oxygen in the impounded lakes, reducing sediment transport, harming the littoral zone, and limiting stream access upstream from the dam. Downstream from the dam, the natural river channel between Ripogenus Dam and McKay Station is adversely

affected by the inadequate minimum flow and by the loss of naturally variable flows that have an adverse effect on aquatic habitat and whitewater boating use in the Upper Gorge. An examination of historical flow data demonstrates the infrequency of spill below Ripogenus Dam when the impoundment is full and inflows exceed the 3,500 cfs McKay Station hydraulic capacity.

Spill below Ripogenus Dam is infrequent even during even the highest water years and is generally limited to the high flows that typically occur at tail end of the spring freshet when the impoundment fills after the annual winter drawdown. The licensee manages the project to maximize generation by lowering the reservoir elevation during the winter to avoid spill — what the study report euphemistically and offensively calls “waste flow”, but which are actually the restored natural flows to the West Branch of the Penobscot River. This artificial lowering of the impoundment reduces the number of boatable days in the Upper Gorge and beneficial effects of high flows on aquatic habitat.

Millinocket Lake Storage serves as one of several impoundments for the Millinocket Development with a fluctuating impoundment affecting upstream and downstream aquatic habitat. Flows on Millinocket Stream are diverted by Millinocket Lake Dam and then pumped to Ambajejus Lake joining inflows from the Ripogenus Project into North Twin. The pumping station was constructed in 1950 to provide additional water for generation of power for the paper mills. With the demise of the paper mills, the flow diversion and partial dewatering of Millinocket Stream provides power to the grid and profit to the licensee. Lake Millinocket and Millinocket Station essentially function similar to Ripogenus in that flows are diverted by Millinocket Lake Dam through a series of impoundments before flowing into the Millinocket Station tailrace and back into Millinocket Stream.

The effect of this diversion is the partial dewatering of Millinocket Stream leaving only a minimum flow of 60 cfs or less to support aquatic habitat. The flow diversion at Millinocket Dam disrupts river connectivity due to the lack of fish passage, obstructs sediment transport and water quality, and reduces flow variability. The licensee operates two pumps with a combined hydraulic capacity of 244 cfs to pump water from Millinocket Lake to Ambajejus Lake. The pumps typically operate from 16-63 percent of the time throughout the year, with near continuous pumping typically occurring throughout much of the warmer summer months in all water year types, often reducing outflows from 300 cfs down to a meager 60 cfs for much of the year. Since there is no gage on Millinocket Stream, the flow data is based on a calculated flow, so the accuracy of this data cannot be verified.

The Millinocket Development also functions as a typical hydropower project with Stone Dam impounding the West Branch of the Penobscot River, a bypassed reach on the West Branch of the Penobscot River below Stone Dam, and a powerhouse at Millinocket Station discharging diverted flows into Shad Pond before rejoining the West Branch. Under the current FERC license, the bypassed reach of the West Branch has been completely dewatered by the Stone Dam other than minimal leakage or infrequent spillage over the flashboards.

The 1996 FERC license disregarded the environmental consequences of the complete dewatering of the West Branch below Stone Dam based on the economic impact to the paper mills owned by

the then licensee, Great Northern Paper. The dewatering of the West Branch below Stone Dam can no longer be justified by the economic impact on Great Northern Paper whose paper mills no longer operate, their crumbling structures marring what would otherwise be a pristine landscape. The dewatering below Stone Dam has disrupted river connectivity, destroyed aquatic habitat, eliminated recreation opportunities, and degraded cultural resources.

- **Operations Model**

FERC's Study Plan Determination required that GLHA complete an Operations Model Study to evaluate alternative modes of operation against a baseline scenario to evaluate the impact of alternatives on water availability, power generation, aquatic resources, recreation, and other values. At the request of AW/AMC, GLHA invited stakeholders to submit various scenarios, and GLHA agreed to some but not all of the requested model runs. The model runs requested by AW/AMC were intended to simulate the following scenarios:

- Minimum flow in Upper Gorge
- Whitewater boating releases in Upper Gorge
- Minimum flow below Stone Dam
- Whitewater boating releases below Stone Dam
- Elimination of pumping at Millinocket Lake Storage
- Whitewater boating releases in Millinocket Stream

GLHA agreed to all of the model runs requested by AW/AMC with the exception of the 400 cfs minimum flow in the bypassed reach below Ripogenus Dam. Inasmuch as GLHA agreed to the 200 cfs model run requested by USFWS and the results are relatively linear, the effect of the 400 cfs minimum bypassed reach flow in the Upper Gorge can be easily extrapolated from the model run results. Below are the results of those model runs:

| No. | Scenario Name | Requestor(s) | Project Area | Summary of Alternative Scenario Evaluated by the Model** | Summary of Modeling Results Compared to BaselineR3 | Effect of Scenario on Average Annual Generation Compared to BaselineR3 | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | RIP | NTWIN | MILL | DOLBY | EMILL |
| 9 | 1000RecUpperGorge | AW/AMC | Ripogenus Bypass Flow (Upper Gorge) | • 5/1-10/1, provide 1,000 for 4 hours on 1 weekend day each week from 10:00-14:00. | • Requested scenario has minimal effects on Ripogenus impoundment elevations, timing of flows, and generation at McKay Station based on the approximately 330-acre-feet of water per release event. | 0% | 0% | 0% | 0% | 0% |
| 10 | 200UpperGorge | USFWS | | • 24/7/365, provide 200 cfs in the Ripogenus bypass reach | • Requested scenario results in slightly lower Ripogenus Impoundment elevations, as model strives to efficiently utilize McKay Station to pass downstream flows while maintaining 200 cfs in bypassed reach.<br>• Increased outflows from Ripogenus at times results in a slight increase in spill occurring at downstream developments. | -6.9% | 1.0% | 0.4% | -0.2% | -0.1% |
| 11 | 200StoneDam | USFWS MDEP MDIFW | Millinocket Bypass Flow (below Stone Dam) | • 24/7/365, provide 200 cfs from Stone Dam. | • Requested scenario results in an increase in the number days of spill at Dolby dam as compared to BaselineR3 due to the difference in timing and magnitude of releases from the Millinocket powerhouse and dam. | 0% | 0% | -4.9% | 0% | 0% |
| 12 | 400StoneDam | AW/AMC | | • 24/7/365, provide 400 cfs from Stone Dam. | • Requested scenario results in a small decrease in Millinocket Impoundment elevations as compared to BaselineR3 due to the difference in timing and magnitude of releases from Millinocket powerhouse and dam.<br>• Requested scenario results in an increase in the number days of spill at Dolby and East Millinocket dams as compared to BaselineR3 due to the difference in timing and magnitude of releases from the Millinocket powerhouse and dam. | 0% | 0% | -10.0% | -0.1% | 0% |
| 13 | 2300RecStoneDam | AW/AMC | | • 5/1 – 10/1, provide 2300 cfs from Stone Dam for 4 hours on 1 weekend day each week from 10:00-14:00. | • Requested scenario results in an increase in the number days of spill at Dolby and East Millinocket dams as compared to BaselineR3 due to the difference in timing and magnitude of releases from Millinocket powerhouse and dam. | 0% | 0% | -0.6% | 0% | -0.1% |
| 14 | NoMillLakePumping | AW/AMC | Millinocket Stream Flow | • No Pumping from Millinocket Lake Storage to North Twin. | • Requested scenario results in slightly lower North Twin Impoundment elevations and flows.<br>• Requested scenario results in slightly higher Millinocket Lake Impoundment elevations.<br>• Requested scenario results in very small differences in impoundment elevations and flows downstream of North Twin as compared to BaselineR3 due to the difference in timing and magnitude of releases from Millinocket Lake. | 0.1% | -1.6% | -1.2% | -0.1% | -0.1% |
| 15 | 600RecMillStream | AW/AMC | | • 6/1 – 10/1, provide 600 cfs from dam for 4 hrs on 1 weekend day each week for WW boating from 10:00-14:00 | • Requested scenario results in very small differences in impoundment elevations and flows as compared to BaselineR3. | 0% | 0% | 0% | 0% | 0% |

**The information in the table represents the conditions that were evaluated by the model, which may slightly differ from what was requested as indicated in the May 3, 2024 filing with FERC included as Attachment A of this report.

The results of all model runs requested by AW/AMC (including the 200 cfs bypassed reach model run requested by USFWS) demonstrate the viability of each of the AW/AMC requested scenarios. Specifically, the model runs demonstrate the following:

- Providing 1000 cfs whitewater releases from Ripogenus Dam into the Upper Gorge one weekend day each week for four hours from May 1 to October 1 will have no effect on annual generation.
- Providing 200 cfs bypassed reach flow in the Upper Gorge, rather than the current 12/100 bypassed reach flow, will result in a 2.6% reduction in total generation reduction at Ripogenus and Penobscot Mills.
- Providing 400 cfs bypassed reach flow below Stone Dam, rather than the current no bypassed reach flow (leakage 12/121 cfs), will result in a 3% reduction in total generation reduction at Ripogenus and Penobscot Mills. Unclear whether this accounts for leakage flows.
- Providing 2300 cfs whitewater releases from Stone Dam into the West Branch bypassed reach one weekend day each week for four hours from May 1 to October 1 will have a 0.2% effect on annual generation. This effect would be reduced in the likely event that a minimum flow from Stone Dam into the West Branch is required under a new project license.
- Eliminating pumping from Millinocket Lake Storage into North Twin impoundment will result in a 0.5% reduction in total generation reduction at Ripogenus and Penobscot Mills.
- Providing 600 cfs whitewater releases from Millinocket Lake Storage Dam into Millinocket Stream one weekend day each week for four hours from May 1 to October 1 will have no effect on annual generation.

Overall, these operations model runs demonstrate that providing scheduled whitewater boating releases in the Upper Gorge and Millinocket Stream will have no effect on generation at the projects, and that providing scheduled whitewater boating releases below Stone Dam will have a negligible effect on generation. The Level 1 whitewater boating study on these three reaches and comments by numerous stakeholders demonstrates that the Upper Gorge, Stone Dam, and Millinocket Stream river reaches are highly desirable by a wide range of recreational users and would provide more natural river functions when paired with appropriate minimum and variable flows. Additionally, eliminating pumping operations from Millinocket Lake and ending the flow diversion into North Twin will have minimal effect on generation and would restore flows and natural river function to Millinocket Stream.

In addition, AW; AMC; TU; Caribou, Chesuncook Lake Camp Associations; Chesuncook Dam Camp Owners Association; the Allagash Gateway Campground; and Andre Emerson Cushing Corporation submitted a joint request for ops model runs that would accommodate additional requirements. Brookfield rejected this request. These organizations will next focus on agreeing on sets of ops model runs that will be submitted in the near term. This will include scenarios outside the limits that Brookfield has dictated for the model runs.

A key issue regarding the Ops Model remains the fill elevation for the lake. Even though a Brookfield representative stated at the USR Meeting that Brookfield had filled Ripogenus-Chesuncook Lake to over 939 asl this spring, Brookfield refuses to conduct Ops Model runs above that elevation. Brookfield's own data shows that it has filled the lake to above that level often in the past: Operations data from 2010-2022 shows lake elevation on May 15th at 940 asl or above every year except 2012, 2013, 2015, 2016 and 2021. Given these data, the upper limit should be 941.6 asl, the physical, but safe limits created by Ripogenus Dam. By failing to run the Ops Model at a more realistic and historically accurate fill regime, Brookfield is misleading the available fill volumes, making less profitable flow scenarios seem less feasible than they truly

are. Stated another way, if Brookfield raised the lake fill level, it could offset or at least mitigate the economic impacts of increased minimum flows required for other purposes. This 2.6 feet of elevation equates to billions of cubic feet of water with enormous potential use, not just for power generation but to provide flows to maintain lake levels allowing access to boat ramps in Ripogenus-Chesuncook Lake and flow into Ripogenus Gorge to create both whitewater and recreational fishing opportunities as well as improve the aquatic habitat. It is well established that Brookfield uses even smaller amounts of water level variance elsewhere in Maine in its many run-of river projects to conduct peaking operations, varying flows to maximize the profitability of its electricity, but degrading both the aquatic habitat and recreational fishing opportunities in the process. Efficient management of lake fill levels can mitigate this degradation.

- **Recreation**

As more fully explained in the AW/AMC Initial Study Report and Updated Study Report Comments, GLHA conducted a recreation study as required by FERC's Study Plan Determination and Study Modification Determination evaluating both formal and informal recreation sites. While the study report collected useful data on formal and informal recreation sites, the report's conclusions that all recreation sites are in good condition and its failure to make recommendations for improvement is unsupported by the study results. The deficiencies in the study report are particularly egregious at the whitewater boating access sites where the need for improvements is apparent. In the Upper Gorge, for example, there is no marked or improved trail leading down to the river that would enable whitewater boaters, as well as anglers and hikers, to easily descend the steep embankment to boat this river reach when sufficient flows are present, enable access tranquil fishing spots, or enjoy aesthetic views of the Upper Gorge.

At McKay Station, the rafting put-in needs improvement to provide safe river access. Additionally, there is no sanitation at the lower access area where rafters are dropped off as the only portable sanitation unit is locked. There is no signage directing rafters to summit the steep access road to locate the toilets at the upper parking area. The access road to the lower drop off location is available only to commercial outfitters but not to other boaters.

At Stone Dam, there is no clearly marked parking area across Quakish Lake, there is no easy egress at Stone Dam, and no land access to Stone Dam is provided by GLHA. These areas are all used during spill events when flows are restored to these river reaches; however, the difficult access and lack of real-time flow information inhibit recreational use. To assess project effects on this recreation opportunity, the licensee needs to expand the geographic scope of the study to include informal recreation access areas identified by stakeholders.

In performing its NEPA analysis of project effects, we encourage FERC to carefully examine the study data in the recreation and whitewater boating study reports and stakeholder comments rather than GLHA's unsupported conclusions about the adequacy of formal and informal recreation sites. Given that GLHA has declined to prepare a Recreation Management Plan, we request that FERC develop appropriate PM&E measures that address project effects on recreational resources including adequate parking and river access. We also recommend that this study be read in conjunction with the operations model study, angler flow study, whitewater boating study, and the USGS gage study as these studies and potentially others are intended to

address project effects on recreational resources. These measures should include flow and impoundment level notification, safety signage, parking, sanitation, recreation flow releases, and improvements to access in impoundments, bypassed reaches in the Upper Gorge, Stone Dam, and Millinocket Stream, and riverine reaches affected by project operations.

- **Whitewater Boating**

At the request of AW/AMC and following FERC's Study Plan Determination, GLHA conducted a whitewater boating study to assess project effects on whitewater boating opportunities on four river reaches in the project boundary: 1) Upper Gorge between Ripogenus Dam and McKay Station; 2) Below McKay Station to Debsconeag; 3) Millinocket Stream below Millinocket Lake Dam; and, 4) West Branch between Stone Dam and Shad Pond. The intent of the study is to assess potential whitewater boating opportunities and to identify the acceptable and optimal flow ranges for whitewater boating by individuals currently or potentially utilizing these river reaches under current or alternative modes of operation, evaluate the adequacy of put-in and take-out locations and the need for access improvements, and identify flow information needs that would support whitewater boating use. FERC-approved whitewater boating studies routinely follow the standard methodology as described in Whittaker et al., in "*Flows and Recreation: A guide to studies for river professionals"* (2005). This methodology is designed to assess the presence, quality, and preferred flow ranges for river-based boating resources in a stepwise manner. The process steps are generally 1) desktop analyses, 2) on-land feasibility assessment, and/or on-water single flow assessment, 3) on-water multiple flow assessment.

While AW/AMC requested that GLHA follow the full study methodology with appropriate off ramps before proceeding to the next stage, GLHA initially conducted only a Level 1 desktop analysis on each of the four river reaches identified by American Whitewater. The Level 1 component of the study was sufficient for the McKay Station and Millinocket Stream in that it confirmed that these two-river reaches provide valuable whitewater boating opportunities when sufficient flows are present.

The reach below McKay Station has long been considered the premier whitewater boating run in New England containing scenic gorges and powerful hydraulics that provide thrilling rafting and kayaking opportunities throughout the summer. While this region in Maine was once known for its paper mills that were the mainstay of the local economy, today the region is known for its outdoor recreation that drives the local economy. Rafting the West Branch below McKay Station draws tourists from throughout the country and beyond to experience the scenic views and rapids below the powerhouse. Whitewater boating flows from McKay Station are required under GLHA's current license and range from 1800 to 2300 cfs depending on the water year type and day of the week throughout the boating season. Whitewater boating below McKay Station results in no loss of generation.

In addition to the reach below McKay Station, Millinocket Stream below Millinocket Lake Dam has the potential to offer whitewater boating opportunities of a very different character. Over the past three years, the annual Millinocket X-Stream Canoe Race has been held on this section of the river. The race is a 7.3-mile whitewater race for canoes, kayaks, and paddle boards on the Millinocket Stream in Maine. This section is appropriate for both novice and intermediate

boaters. The annual event has drawn up to 100 participants and demonstrated considerable paddler and spectator interest. Opportunities to boat on Millinocket Stream are extremely limited due the GLHA's current operations that divert flows into Millinocket Lake into North Twin impoundment through pumping operations that leave Millinocket Stream without sufficient flows for boating throughout most of the year. The primary obstacles to recreational boating at Millinocket Stream are the lack of boatable minimum flows, pumping operations, the lack of real-time flow information, and the lack of scheduled boating releases required under the current license.

While the Level 1 analysis at McKay Station and Millinocket Stream was sufficient to identify minimum acceptable and optimal flow ranges and no further study was necessary on these two river reaches, insufficient information was obtained on the potential whitewater boating opportunities in the Upper Gorge and on the West Branch below Stone Dam and further study following the Whittaker methodology is warranted. While the Level 1 study was insufficient, it did provide limited information demonstrating the whitewater boating potential of the Upper Gorge and Stone dam sections.

Flows below Ripogenus Dam into the Upper Gorge dryway are infrequent due to GLHA's flow diversion at Ripogenus into the penstock for power generation. Local paddlers have boated this reach infrequently when inflows exceed the hydraulic capacity of McKay Station and impoundment storage is at maximum capacity. While there is no flow gage in the bypassed reach and GLHA does not report bypassed reach flows on the Safe Waters website, local boaters have reported that this reach contains highly valuable whitewater boating opportunities at a variety of flow levels.

At lower flows, perhaps 600 cfs by some reports, this reach provides intermediate boating above McKay Station. At higher flows, perhaps 1000 cfs and above, rapids become more challenging as hydraulics become more powerful. At a range of flow levels, paddlers have reported that paddling the Upper Gorge is important because it considerably lengthens the whitewater boating run through the Ripogenus Gorge below McKay Station by adding as many as six additional rapids to the run providing more appealing recreation opportunities for advanced and expert paddlers. Current minimum flows of 12 to 100 cfs are insufficient to provide whitewater boating opportunities in the Upper Gorge dryway. The primary obstacles to use of this river reach are the flow diversion, lack of boatable minimum flows, lack of scheduled releases, and the inadequacy of access from the Ripogenus hiking trail down to the river.

As with the Upper Gorge, the section of the West Branch below Stone Dam is a hidden whitewater boating resource that is largely dewatered by the Penobscot Mills project. With no required minimum flow below Stone Dam under the current license, the only flows present in this dewatered river reach come from leakage from flashboards, spill when inflows into Quakish Lake exceed the hydraulic capacity of the Millinocket Development, or backflow from Shad Pond. There is no real-time flow gage on the West Branch below Stone Dam and this information is not reported on the Safe Waters website. Access is also a major impediment to use as GLHA does not allow public access though its easement and accessing Stone Dam via Quakish Lake involves a 2-mile flat water paddle. Access may also be available to lands on the river right over lands controlled by Katahdin Forest Management.

Over the years, this section of the West Branch has been paddled by whitewater boaters at various flows, but not enough is known about minimum and optimal boating levels. At very high flows, this run provides a continuous series of Class III/IV rapids as the river approaches Grand Falls, a Class IV rapid with challenging hydraulics suitable for intermediate and advanced paddlers. At lower flow levels, the run is suitable for intermediate paddlers. At the request of American Whitewater, FERC required GLHA to proceed with the Level 2 study phase including an on-water flow evaluation. As described in more detail in our Updated Study Report comments, GLHA has the capacity to release variable flows from its inflatable gate structure including flows of 2000 cfs to meet minimum downstream flow requirements when the Millinocket powerhouse trips offline. Through the Level 2 study phase, we intend to evaluated the boating potential of this river reach at this flow level and reserve the right to supplement our comments when the final study report is completed.

- **Aesthetics**

GLHA was required to perform an aesthetics study to evaluate project effects on aesthetic view opportunities at both projects. Regrettably, this study was conducted in a way that poorly informs FERC NEPA analysis. Rather than evaluate the aesthetic effect of impoundment fluctuations, flow diversions, and peaking operations, GLHA randomly photographed lakes and omitted views that highlight degraded aesthetic view and then evaluated those views using its own paid consultant, and later, asked stakeholders to review those same photographs. In a subsequent phase, it allowed a study group to view these locations in person at additional locations, but the result was more of an anecdotal opinion survey rather than a systematic assessment of aesthetic impact of project operations. Missing from this study is an evaluation of shoreline aesthetics at minimum and maximum impoundment levels, as well as views of the Upper Gorge at various levels from both Ripogenus Dam and the lower Ripogenus Gorge. Comments filed by numerous stakeholder and comments at the scoping and study report meetings attest to the negative impact of project operations at impoundments and dewatered river reaches at the projects.

## Compliance Issues

July 7, 2023 McKay Station Trip Event. FERC Compliance has not resolved the complaint regarding the event. No interim solution has been identified. Video obtained during the Ramping Study on July 14 and 24, 2024 shows that additional mortality can occur even when flows are reduced to 1000 cfs in the vicinity of the McKay Station hydro discharge.

Millinocket Stream Stocking. Recent stockings have violated the Penobscot Mill Project License, Article 413 that requires brook trout, three to a pound, be stocked in May. Additionally, larger brook trout are stocked in mid-October after local fishing interest has diminished. If this can't be corrected, other more effective mitigation should be discussed."

Holbrook Bypass flows. Flows provided during generator trip events violate Article 406 of the current license. The bypass was designed to provide flows when main river flows are in the 2400

cfs range. The bypass was designed to support the landlocked salmon population by providing needed juvenile recruits. When flows decrease, the bypass is no longer suitable landlocked salmon rearing habitat. The habitat has largely been taken over by brook trout juveniles. "We simply request that the Licensee continue to operate and maintain the Holbrook Side Channel as outlined in the current license, Order approving recommendations of habitat improvement plan under Article 406." [MDIFW PAD Comments October 8, 2021, page 12]. The bypass was a mitigation measure included in the current license, higher base flows restore this mitigation measure.

**FERC Process**

The Signatories request that an Environmental Impact Statement (EIS) be required for these relicensings in lieu of an Environmental Analysis (EA). This is necessary because of the size and complexity of the projects, and has the potential to highlight deficiencies in project studies.

**Preliminary NGO Request for New License Terms and Conditions**

The Signatories submit their list of desired features for incorporation into the new license as Attachment A.

**Conclusion**

The signatories appreciate the opportunity to submit these comments on the Draft License Application for the Ripogenus – Penobscot Mills relicensing.

# Preliminary Stakeholders Requests for Inclusion in the Ripogenus and Penobscot Mills Licenses

**Ripogenus-Chesuncook Lake**

1. Fill the lake to 940.6 (1 foot below full pond) by May 15th, drawdown no more than 1 foot every 28 days until July 31.

Justification:

a. Meets loon habitat and nesting requirements
b. Provides for smelt spawning and incubation
c. Promotes shorebird nesting
d. Potential protection of wood turtle reproductive sites
e. Maintains and stabilizes the littoral zone (plankton and juvenile smelt)
f. Provides water for summer recreation needs
g. Parallels MEDEP and MDIFW Operations Model requests
h. Provides water for summer recreation, fisheries and generation needs
i. Mirrors current plan for other project lakes
j. Meets or restores ME DEP water quality standards
k. Supported by GLHA Water Use Plan in current license

2. Maximum 1 foot lake drawdown per month from July 31-October 15, maintaining a minimum lake level of 935.6 on October 15

Justification:

a. Supported as possible (within 1 foot) by Ops Model run with minimal downstream impact
b. This was accomplished in 2013, a dry/average hydrologic year, while still generating 238,835 mw
c. Boat landings remain usable
d. Provides for the gradual drawdown cited in DLA and other GLHA submissions
e. Maintains aesthetic value of lakes
f. Provides safe lake access
g. Ensures remote campsites are safely accessible and aesthetically pleasing
h. Provides salmonid access to tributary streams
i. Provides improved angler access to the Upper West Branch (September)
j. This will provide habitat conditions at the confluence of Umbazookus Stream suitable for Lake Whitefish spawning activities: staging, spawning, and post spawning out migration. Allagash Stream offers nearby adult Lake White fish as a donor source therefore, a small undetected relic population may exist, and this elevation provides an opportunity for natural recolonization.

k. Reduces navigation hazards
l. Meets or restores ME DEP water quality standards
m. Supported by GLHA Water Use Plan in current license

3. Set the operating (when power is being generated) minimum at McKay Station flow at 2400 cfs during the biological growing season (May1 -October 15) and at 2200 cfs from October 16-april 30th

Justification:

a. Similar to how operated under Great Northern Paper and supported by the 1996 Flow Management Plan
b. The water is available if McKay Station operations are modified.
c. Meets Maine Department Water Quality Standards
d. Stabilize aquatic macroinvertebrate populations
e. Stabilize habitats for various fish populations
f. Restore fishing opportunity to its historic levels (1978-1991)

4. Provide river flows capable of meeting required Holbrook Bypass channel (article 406) flows or reengineer the Bypass gate system to meet the required flow during low flow events.

Justification:

a. The Bypass was designed to provide flows when main river flows are in the 2400 cfs range.
b. Support the Landlocked salmon population by providing needed juvenile recruits
c. When flows decrease, the Bypass is no longer suitable landlocked salmon rearing habitat. The habitat has largely been taken over by brook trout juveniles.
d. "We simply request that the Licensee continue to operate and maintain the Holbrook Side Channel as outlined in the current license, Order approving recommendations of habitat improvement plan under Article 406." [MDIFW PAD Comments October 8, 2021, page 12]
e. The bypass was a mitigation measure included in the current license, higher base flow restores this mitigation.

5. Water Upper Ripogenus Gorge year-round at higher than leakage flows with minimum flows of 350 cfs. From June 15 to September 15, this must be from a deep gate, not the sluiceway. These flows would be subtractive from summer whitewater flow requirements. Example: 2400 cfs would be supplied by 2050 cfs from McKay Station, 350 cfs from a deep gate release.

Justification:

a. Higher, year-round flows support fishing and aesthetics
b. Provides new whitewater paddling and buffers generator trip events
c. Water over the sluiceway currently provided is the warmest in the lake and does not provide the fishing flows the release was designed to provide. An IFIM from last relicensings shows the fisheries value. [Need quote, cite] 350 cfs has been requested by the whitewater community.

d. Current sluiceway 100 cfs sluiceway flows from July 1 to September 30 are attractive to fallfish, not the salmonids that are sought after recreationally. The 100 cfs does not achieve its design purpose.

e. Current dewatering practices (9 months out of the year) are contrary to Maine environmental law, the habitat cannot be considered unimpaired.

1. MRSA §467¶7C(1)c: From Ripogenus Dam through Ripogenus Gorge to the McKay powerhouse - Class B.
2. MRSA §465¶3A: "3. A. Class B waters must be of such quality that they are suitable for the designated uses of drinking water supply after treatment; fishing; agriculture; recreation in and on the water; industrial process and cooling water supply; hydroelectric power generation, except as prohibited under Title 12, section 403; navigation; and as habitat for fish and other aquatic life. The habitat must be characterized as unimpaired. [PL 2003, c. 227, §3 (AMD); PL 2003, c. 227, §9 (AFF); PL 2005, c. 561, §10 (AFF).]"
3. MRSA §466(11): "Unimpaired" means without a diminished capacity to support aquatic life."

f. 350 cfs minimum flows in Ripogenus Gorge would satisfy Maine statutory requirements for designated uses other than hydroelectric production: fishing, recreation and habitat.

6. Whitewater releases for Rip Gorge from 5/1-10/1, flows 1000 cfs, 1 weekend day weekly, 4 hours

Justification:

a. Ripogenus Gorge contains sufficient gradient and structure resulting in a continuous series of rapids between Ripogenus Dam and McKay Station suitable for intermediate to advances whitewater boaters

b. This reach is suitable at a range of flow levels with flows between 600 cfs to 1000+ having been identified as optimal.

c. Substantially extends the length of whitewater boating reach that would otherwise begin at McKay Station.

d. Operations Model indicates this is possible with little to no impact on project generation.

e. Whitewater boating study and comments by public indicate that there is substantial demand for boating in the Ripogenus Gorge dryway.

7. Require mid-winter assessment and reporting of snowpack, long and short-term weather forecasts, and impoundment levels to determine if operations modifications (e.g. reduced outflow) are necessary to secure water for spring refill.

Justification:

a. With greater energy demands predicted for the winter months (ISONE Report to Maine Legislature, Jan, 2023) this needs to be done to support spring refill.

8. USGS gauge installed to record and report levels and flows - located between Little and Big Eddy Pool. Include a temperature gage as is usually installed at a USGS flow gage site.

Justification:

a. The updated Study Report (USR) contains information in Appendix B.
b. Exact location would be determined by further study.
c. Implementation would be relatively easy to accomplish.
d. This is the new license provision with the highest likelihood of adoption.

9. Lake level elevations for all sites (including storage ponds) reported on Safe Waters.

Justification:

a. Lake boaters need to know this information for safe navigation and to be able to anticipate the condition of the boat landings, and other access.
b. Relatively easy to accomplish
c. This is public information that is currently available for North Twin and Millinocket Lakes

10. Set minimum flows for trip events and other conditions based on empirical data.

Justification:

a. There is no study data to support minimum flows in the current license and minimum safe flows are unknown> 1422 cfs is the aquatic base flow based on a rough guideline, 1300 cfs is unsupported by data, 1000 cfs is a round number, 400 or 500 cfs has been demonstrated to strand and kill fish and macro-invertebrates.
b. TU repeatedly requested flows below 1000 cfs during the Ramping Study that Brookfield refused to provide
c. Reports from ramping Study volunteer observers were that even at flows of nominal 1000 cfs in the reach below Little Ambejackmockamus Falls known to be a major spawning area, some gravels were exposed and others were covered only by 2 to 3 inches of water.
d. Ramping Study volunteers reported stranded, dewatered caddis larvae with minimum mobility that were exposed during nominal 1000 cfs flows
e. Without further study, biologically appropriate minimum flows must be assumed to be aquatic base flows of 1422 cfs per longstanding USFWS guidance for the Northeastern United States [USFWS Interim Regional Policy for New England Stream Flow Recommendations, dated May 11, 1999].

11. Adopt conditions that restrict peaking TDB maintain 1800 to 2400 cfs flows during the growing period, May 1 to October 15.

Justification:

a. MDIWF request: [MDIFW PAD Comments October 8, 2021, page 12] “As the literature is replete with examples of the detrimental impacts on the riverine fisheries and aquatic communities from rapid changes in flow, and that the literature indicates that flow changes of less than 25% per hour (ramping rate) can mitigate impacts from peaking power, we request flow records to evaluate the frequency of flow changes that exceed 25%.”

b. Reduce caddis mortality, especially Hydropsyche and Rhyacophila.

c. Reduce strandings shown to occur when switching between one, two or three generator operations.

d. Improved flow stability benefiting overall health of the system.

12. Decrease the number and severity of “flow excursions” through automated flow restoration at Rip/McKay and/or restore dam keeper

Justification:

a. Generator trip events that were demonstrated to strand and kill fish and macro-invertebrates. happen on the average of once a year and last for over 4 hours according to Brookfield’s own data. This is unacceptable.

b. Automated Rip deep gates or reinstalling a dam keeper would result in reducing down time and provided for Brookfield’s stated concerns for safety in Ripogenus Gorge.

c. Brookfield’s stated concerns for safety in the Ripogenus Gorge are unsupported by logic or study data. They are only designed to keep from having to water Ripogenus Gorge.

13. Develop an operational Ripogenus project “Rule Curve” based on 1972 to -present mass inflow data and a full pond elevation of 941.6 feet. This will provide lake level guidance and should include a drought or "low water" year plan.

Justification:

a. Currently, Chesuncook, Caribou and Ripogenus lakes water is the “go to” source of water during drought years, causing profound drawdowns and associated negative impacts

b. Low water modifications need to be spread across all user groups

c. As with above requests, items 1-3, this will protect fisheries, aquatic communities, commercial, private and public recreational users and public recreational sites.

d. Rule curve will help secure year-round water storage

e. Used successfully by Great Northern Paper from 1972-2002 and accepted by FERC in the 1996 Environment Impact Statement.

14. Restore whitefish to Ripogenus - Chesuncook Lake

Justification:

a. Whitefish present in last relicensing.

b. Whitefish not sampled in latest assemblage studies.

c. Project operations a major factor in extirpation. Varying lake levels are the most likely cause.

**Penobscot Mills**

1.Reduce minimum flows from North Twin from 2000 cfs to 1500 cfs

Justification:

a. Maintain upstream lake levels and all associated benefits.
b. Only lowers North Twin .7 feet during the recreational season according to the Ops Model.
c. Adequate for downstream requirements.
d. Provides additional flexibility for releases upstream.
e. Need for downstream dilution no longer exists.

2. Water the West Branch below Quakish Lake / Stone Dam year-round with more than leakage flows of 700 to 1000 cfs minimum flow.

Justification:

a. This would maintain macroinvertebrates and landlocked salmon fishery of all life stages, not just brook trout and juveniles.
b. This could provide a new year-round fishery
c. Brookfield's aquatic habitat study shows that higher flows would support adult salmon and brook trout fisheries
d. This would provide new paddling and whitewater opportunities
e. Current operations are contrary to Maine Statutes

MRSA §467¶7C(1)f: From the outlet of Ferguson and Quakish Lakes to its confluence with Millinocket Stream - Class C.

MSR Title 38 §465(4). "4. Class C waters. Class C shall be the 4th highest classification.

A. Class C waters must be of such quality that they are suitable for the designated uses of drinking water supply after treatment; fishing; agriculture; recreation in and on the water; industrial process and cooling water supply; hydroelectric power generation, except as prohibited under Title 12, section 403; navigation; and as a habitat for fish and other aquatic life.

B. Class C waters must be of sufficient quality to support all species of fish indigenous to those waters and to maintain the structure and function of the resident biological community…"

C. Discharges to Class C waters may cause some changes to aquatic life, except that the receiving waters must be of sufficient quality to support all species of fish indigenous to the receiving waters and maintain the structure and function of the resident biological community."

f. This would need Maine statutory requirements for designated uses other than hydroelectric production: fishing, recreation and habitat
g. Watering the reach would be compliant with the EPA's April 2024 ruling regarding access to resources in ceded Native American lands. "The U.S. Environmental Protection Agency (EPA) is finalizing revisions to the Clean Water Act (CWA) water quality standards (WQS) regulation to add requirements for states establishing WQS in waters where Tribes hold and assert rights to CWA-protected aquatic and aquatic-dependent resources reserved through treaties, statutes, or Executive orders." [A Rule by the Environmental Protection Agency on 05/02/2024. Citation: 89 FR 35717]

h. Watering the main channel instead of diverting the water to the Millinocket Project would not affect downstream minimum flow requirements.

i. The only objection to higher flows is that the water would no longer be used for generation, and Brookfield's profits would suffer.

3. Establish fish passage for indigenous anadromous species over their former range, upstream extent: Shad Pond and Millinocket Stream and eel passage in Penobscot Mills System. River herring include alewives and blueback herring.

Justification:

a. These waters are within the historical range of anadromous fish.

b. The Penobscot Indian Nation was promised a sustenance fishery in the Penobscot that has yet to be delivered. This would be a step in restoring the fishery.

c. Restoration of anadromous species would improve the overall health of the watershed.

d. Restoration would aid Atlantic salmon restoration in the greater watershed, especially in the critical Atlantic salmon habitat that is downstream.

e. NGOs should support MDMR requests

f. "Put shad back in Shad Pond."

g. MDIFW has expressed concerns that this would introduce invasive species. A sorting facility could prevent this problem.

h. Denying fish passage to indigenous species is contrary to Maine statute as interpreted by the courts;

S.D. Warren Company v. Board of Environmental Protection, 2005 ME 27, 868 A.2d 210 (2005) ("S.D. Warren I"); S.D. Warren Company v. Board of Environmental Protection, 547 US 370 (2006) ("S.D. Warren II"). In S.D. Warren I at 442, the Court concluded that the narrative criteria at 38 M.R.S.A. § 465, which requires waters "of sufficient quality to support all indigenous fish species," was intended to be an integral part of the water quality standards for the BEP to consider. The Court also concluded, based upon the specificity of the designated uses at 38 M.R.S.A. § 465, that the Legislature's purpose for the language "suitable for the designated uses" was "that the designated uses actually be present." The court also stated that when those uses are not presently being achieved, the Legislature intended the quality of the water be enhanced so that the uses are achieved (internal citations omitted).

4. Provide whitewater releases into the West Branch below Stone Dam 1 weekend day weekly at 2300 cfs for 4 hours from 5/1-10/1.

Justification:

a. The West Branch between Stone Dam and Shad Pond contains sufficient gradient and structure to provide high quality whitewater boating opportunities with sufficient flows.

b. Continuous Class II/III rapids at suitable flows.

c. Grand Falls is a significant Class III/IV whitewater boating feature.

d. Aesthetic views of the West Branch below Stone Dam from the water are exceptional.

e. Whitewater boating opportunities are available at a range of flows above 1000 cfs with optimal flows being estimated as above 2000 cfs. Boating study is ongoing.

f. GLHA has the ability to release at least 2000 cfs through its inflatable gate structure that provides pond level control according to its LIHI application.
g. Operations Model indicates this is possible with little impact on generation.

5. Provide whitewater releases into Millinocket Stream on 1 weekend day weekly at 600 cfs for 4 hours from 5/1-10/1.

Justification:

a. Scenic Class II river reach below Millinocket Lake and Millinocket
b. Current 60 cfs minimum flow inadequate for boating
c. Annual Millinocket X-Treme Canoe Race demonstrates strong recreation demand
d. 600 cfs provides optimal flow for novice boaters
e. Water from Millinocket Lake pumped to North Twin for generation, reducing flows available for recreation on Millinocket Lake.
f. No effect on generation based on Operations Model.

6. Ceasing pumping at Millinocket Lake 5/1 - 10/1

Justification:

a. No pumping from Millinocket Lake into North Twin during summer boating season.
b. Pumping would still occur during higher flow period (e.g., spring freshet).
c. Pumping allowed when the project would otherwise spill utilizing excess water.
d. Little effect on generation.
e. Reserve water in Millinocket Lake for recreational use in Millinocket Stream during the recreational boating season.

**General Project Requests to Enhance Recreation**

1. Add lands to project boundary

Justification:

a. Recreation sites and recreation access related to project effects and operations should be included in the project boundary, which may include, but not limited to:
b. Vehicle access, including parking, to the Penobscot River at Stone Dam
c. Vehicle access, including parking, to the Millinocket Lake outlet
d. The public should be allowed to visit and enjoy these areas and to access the Penobscot River below Stone Dam and Millinocket Stream below Millinocket Lake for whitewater paddling, fishing, and other purposes.
e. Since flows are controlled by the licensee into these river reaches, the licensee should be required to provide public access.

2. Protect/maintain parking for fishing access sites along the Golden Road and below Telos Bridge

Justification:

a. The Golden Road is being allowed to change to gravel from paved road.
b. Plowing is obscuring pull offs for parking to access popular fishing spots.
c. Photos taken July 25, 2024 graphically illustrate the problem
d. There is a growing safety hazard from logging trucks.
e. A mechanism needs to be in place to protect parking over the 40-year span of the new license.

3. Improve Gorge Trail improvements to include new signage of parking areas, a kiosk, map of the trail showing scenic overlooks, length and slope, as well as showing trail access to the river. The trail needs more regular maintenance to clear back overgrowth, remove blowdowns, and fix drainage issues. Side trails need to be developed and added to connect to water level creating a trail network for public use.

Justification:

a. Assess will be needed to access improved fishing and paddling opportunities that minimum flows in Ripogenus Gorge will provide.
b. Aesthetics study does not provide photos showing contrasting flow levels in Upper Ripogenus Gorge.
c. NGOs working with local groups and individuals to obtain photos of the gorge at various flow levels.

4. Develop a comprehensive Recreation Management Plan that includes a robust maintenance schedule for all recreation sites, in collaboration with stakeholders, including but not limited to:

- Significant increases in the size of parking lots at launch sites at the project lakes. Almost every survey and focus group identifying parking as far too limited at boat ramps and launch sites.
- Rebuild boat launches that are too steep and not meeting user expectations such as Dead Man's Curve, and McKay Station which is both an extremely long walk for private boaters and on very uneven terrain.
- Correct deficiencies with boat launch docks noted by some users.
- Consistent kiosks, signage and maps at all recreation sites that shows all natural and recreational features that a user map encounter, as well as public safety information.
- A winter recreation specific map, focused on snowmobile, cross-country skiing and other winter activities that frequently use project boat launches for access to frozen lakes. Develop and coordinate with the greater Millinocket winter trail network to establish a comprehensive winter recreation plan.
- Providing real-time data of lake elevation levels for motorized and non-motorized users.
- Add new public access as a FERC approved recreation site to the Stone Dam site, perhaps along the existing GHLA road at the toe of Stone Dam from the east or through the Wildlife Management Area.
- Add new public access as a FERC approved recreation site at the outlet of Millinocket Lake to Millinocket Stream, perhaps along the existing road from the west used by GHLA to access the outlet.

- Add additional public access sites to the Wildlife Management area providing for more clear information and access for public use of these 2,300 acres for hunting, fishing, hiking, camping, dispersed recreation, and environmental education of the wildlife management activities taking place. A specific property management plan for this site, in concert with wildlife managers, should be developed to allow for increased and robust public uses for recreation while maintaining habitat values.

Justification:

a. The trails, recreation sites, and boat launches need to be monitored and maintained to ensure best access and experience, and maintenance plans should be developed and included in a comprehensive recreation management plan.

b. Trails, recreation sites, and boat launches are lacking basic amenities that the public demands, such as sufficient parking, docks, kiosks with recreation maps and other information, clearly marked signage of parking areas and directional signage to recreation sites, trailblazes, and seasonally appropriate information such as winter snowmobiling route finding and points of interest in the winter that may differ from the warm seasons.

c. New public access points are needed below Stone Dam, at the Millinocket Lake outlet, and the Wildlife Management Area.

d. The Wildlife Management Area represents a very large land area in the project boundary that can be better utilized for public use and enjoyment. The access road off of Route 11 has no signage, information about recreation opportunities or wildlife management activities, and is not integrated in the growing outdoor recreation amenities offered in the greated Millinocket area. Even community generated content on sites like AllTrails and Strava shows that the public is not visiting this area. A comprehensive site management plan should be developed in concert with stakeholder to fully realize the potential of these lands and the access that they provide to the Penobscot River below Stone Dam.

e. Users consistently reported in surveys and focus groups that parking at almost all boat launch sites was inadequate and that parking lots were frequently at capacity.

f. Access at Stone Dam and at the Millinocket Lake outlet are needed for project related recreation.

g. Expand winter recreation opportunities and coordinate them with surrounding landowners.

h. Some commenters found boat launches to be too steep and hard to use.

5. Remove fencing by around project facilities, McKay Station.

Justification:

a. MDIFW requested stream access to project sites are presently blocked by fencing.

b. Fencing needs to be removed at McKay Station, North Twin and Mill One.

c. Access needs to be provided at Stone Dam and the Dolby tailrace to support fishing and paddling recreational uses.

6. Improve access to the Debsconeag Falls area to support fishing and boating.

Justification:

a. Debsconeag Falls is a solid class 4/5 rapid located just over 2 miles below the existing Nevers Corner take out for commercial rafting. It would offer an excellent addition to the whitewater currently offered in the area but is almost never used by either private boaters or the commercial industry due to the poor quality of the access road leading to it.
b. It also offers an additional strong fishing opportunity that suffers the same lack of use.
c. Improvement of the road would provide additional class 4/5 boating opportunity and increased fishing opportunity with no change in flows from the baseline.
d. Adds opportunity without system management changes.

7. Establish boating/rafting/fishing access near Abol Bridge, on river right just below the bridge, or at another suitable site in the area with suitable parking.

Justification:

a. Demand for softer adventure on the river has grown at a time when the Rafting industry as a whole has contracted.
b. Providing a suitable access or egress point at Abol Bridge would allow for better service and accommodation for the growing user group that seeks softer adventure than is currently available on the West Branch of the Penobscot

8. Provide boat (launching) access to the base of Pockwockamus Falls, an historical May-early June fishing (boat) fishing area

Justification:

a. Needed to access the resource.
b. This access is frequently used by fishermen and women and boaters seeking to avoid the more difficult whitewater above.

9. Provide access by road to the east bank of the West Branch below Stone Dam.

Justification:

a. Providing minimum flows below Stone Dam at any reasonable level will provide fishing, paddling and perhaps whitewater opportunities.
b. Currently, the west shore is accessible using logging trails.
c. There is no good access from the east shore.
d. Paddlers assess the reach by a long paddle across Quakish Lake. This will be unacceptable once the reach is watered.
e. Owner Katahdin Forest Management may be amenable to the proposal.

**Recreations facilities improvements at specific sites -** Parking, ramp, amenities at launches

1. Chesuncook Dam Boat Launch - maintain site of, and primitive nature of launch with the following improvements: remove large boulders and improve substrate of launch to the 935.1 water

level, build a wind break on the northwest side of ramp, pay for and expand winter plowing, annual maintenance of ramp to repair erosion and ice damage.

Justification:

a. Provides safe, reliable access to project waters including public campsites
b. Enhances the safety of boats and trailers being launched. Currently there is repeated damage to these.
c. Supports commercial businesses
d. Ensures safe navigation between and within project lakes
e. Protects aesthetics of lakes and campsites
f. Ops Model Study demonstrates this as possible with minimum impact

2. Caribou Lake Boat Launch - increase parking both summer and winter, annual maintenance of ramp to repair erosion and ice damage. Maintain a usable water level of 936.7 or higher, as indicated in the Recreation Study from May 15th to the end of Labor Day weekend

Justification:

a. This is the level the boat launch is usable according to the Recreational Study
b. Provides safe, reliable access to lakes
c. Ensures safe navigation of project lakes
d. Supports commercial businesses
e. Protects aesthetics of lakes and campsites

3. Ambajejus Boat Launch/Millinocket Lake Boat Launch - Provide Adequate parking

Justification:

a. Current parking is inadequate during times of peak use: weekend and holidays.
b. Restricts access to both Ambejejus and Millinocket Lakes.
c. Appears to be within the project boundary.
d. Photos will be provided documenting the problem

Christopher G Howe, KINGFIELD, ME.
DLA Comments:

First off I'd like to thank the Staff at FERC for doing what you do. Without you and this platform,
ordinary citizens like myself would be left without a voice in this highly consequential process. Without FERC, and this process, I'd greatly fear the sacrifices companies like Brookfield/GLHA would make only to enrich their shareholders value.

Secondly I'd like to voice my support of the joint submission by American Whitewater, Trout Unlimited, Appalachian
Mountain Club, and American Rivers. Also I'd also like to express my support for the comments submitted by MPRO, the consolidated voice
of the commercial rafting industry on the Penobscot, which is so very important to the community, culture, and heritage to the Katahdin Region and this project boundary. While not individually a member of MPRO, I am a member of the community they represent. I have been guiding rafts on the Penobscot River for 16 seasons and have lived on the banks of the river for 10. I have guided thousands of people from all parts of the world and walks of life down this beautiful river, and the enrichment, fulfilment, and joy our participants receive while paddling the Penobscot cannot be overstated. From families enjoying quality time without cell phones, to business team building outings, to recovering drug addicts, to groups of hardworking men seeking escape from their daily grinds to support their families, to the solo traveler who wishes to experience everything a place has to offer. Whitewater Rafting on the Penobscot is a very special experience that cannot be duplicated anywhere in the world.

In my view, The DLA presented by GLHA is just straight up disrespectful to these proceedings and to all the stakeholders, agencies, and non profit organizations who have spent valuable time, and significant resources to contribute to this re-licensing. After years of studies, bureaucratic process, and ungodly amounts of money spent, GLHA could not even so much as come up with simple side notes that reflect any of the new data or stakeholder concerns that have arisen since the start of this process. GLHA continues to play school yard games with our beautiful watershed and this process by manipulating data, and delaying meetings and studies. GLHA chooses to play these tiresome games instead of putting their nose to the grindstone, and addressing the problems of the 1996 license, and getting this thing done. At the end of the day it appears that GLHA would rather endure years of legal mitigation instead of just working with stakeholders, NGOs, and agencies to come up with a fair and balanced license that would bring justice back to Maines largest watershed. This sentiment is further exacerbated by GLHA comments to stakeholders in the USR, where they continued to ultimately deflect, minimize, and ignore stakeholders concerns.

I've had 2 experiences recently that have really struck home the magnitude and the importance of these proceedings, and that we ALL must WORK HARDER, at WORKING

TOGETHER, to come up with a fair an balanced license that benefits firstly the river, its fish, and its bugs, and secondly benefiting the diverse groups of users who frequent the project boundary.

First being involved with both of the Ramping Studies that took place in July of this summer. I personally witnessed thousands of bugs and bug larva squirm, writhe, die, and panic as the water levels receded leaving them exposed to brutally hot 90 degree heat and direct sun. The scale of this devastation was very emotional as I paddled through the Ripogenus Gorge, where merely every rock along the river was covered with these squirming and struggling bugs and larva. To add to the personal devastation at witnessing such suffering, I also witnessed 30-50 salmon and brook trout panic swimming aggressively around a small stranding pool, desperately seeking escape when no escape was not possible. All because GLHA wants to play a min/max game to squeeze every $ out of the water that is not even theirs to begin with. To think of all the fish and bugs that have suffered or have been killed because of these studies just makes me sick.

The second experience was journeying to the West Branch of the Penobscot River below Stone Dam. With completely dry feet I was able to stand directly in the main river bed below Stone Dam as maybe 5 CFS trickled through the shallow and hot disjointed pools. As I stood gazing at the empty riverbed I considered all the life that used to exist in this river reach and how such life has been denied existence because of the 1996 license. To realize that GLHA is happy and okay with this denial of life is upsetting to me on the deepest level. For GLHA/Brookfield to produce a Draft License Agreement with virtually no input of new data and stakeholder concerns, shows how uncooperative GLHA is to coming up with healthy solutions to the problems this watershed has faced since the projects inception. And to realize the motive for all this denial of life and uncooperative behavior by GLHA is greed, control, and power is at times to much to bare.

As depressing as these 2 experiences were it gave me great hope that a much better future is with in our grasp and is possible because of FERC and this process. Although, personally, I have worries about the level of corruption that has infiltrated many of our greatest federal institutions, I'm still a patriotic American who believes in our country, our process, and our agencies designed to regulate and beat back the evils of the world. My personal experiences with the FERC staff working on this issue keep that patriotic bell tolling in my heart that we can do this, and that GLHA/Brookfield, FERC, Agencies, NGO's, and Private Stakeholders CAN work together to come up with fair and balanced license that brings JUSTICE to Maines largest watershed.

Thank you for taking the time to read my comments on the DLA,

Sincerely,

A fiercely dedicated friend of the Penobscot

Chris Howe

FERC No. 2458

# JOINT NGO STAKEHOLDER COMMENTS ON DRAFT LICENSE APPLICATION FOR THE RIPOGENUS HYDROELECTRIC PROJECT (P-2572) AND PENOBSCOT MILLS HYDROELECTRIC PROJECT (P-2458)

American Whitewater ("AW"); Appalachian Mountain Club ("AMC"); Maine Council of Trout Unlimited ("TU"); American Rivers ("AR"); Maine Rivers; Atlantic Salmon Federation ("ASF); Caribou, Chesuncook Lake Camp Associations; Chesuncook Dam Camp Owners Association; the Allagash Gateway Campground; and Andre Emerson Cushing Corporation (collectively, "NGOs" or "Signatories") submit the following Comments in response to the filing of the Draft License Application for the Ripogenus Hydroelectric Project and Penobscot Mills Hydroelectric Project (FERC Project Nos. P-2572, P-2458) by Great Lakes Hydro America, LLC ("GLHA") Collectively, these projects are located on the West Branch of the Penobscot River and Millinocket Stream and are comprised of the Ripogenus Hydroelectric Project and the Millinocket Lake Storage, North Twin, Millinocket, Dolby, and East Millinocket developments as part of the Penobscot Mills Hydroelectric Project. While GLHA holds separate licenses for the Ripogenus and Penobscot Mills projects, the licensee has appropriately jointly filed a Draft License Application because GLHA is the licensee for both projects, they have the same license expiration date, and the operations of both projects are inextricably linked. Throughout the Integrated Licensing Process utilized for this relicensing, GLHA has held joint Initial Study Report and Updated Study Report meetings as well as joint meetings concerning ongoing studies applicable to both projects including recreation, aesthetics, and project operations. Inasmuch as these projects have cumulative impacts on both developmental and non-developmental resources, we are jointly filing these comments on the Draft License Application for both projects as a single document under each FERC docket to support a coordinated approach to the relicensing of these projects and to advocate for the preparation of a single NEPA document addressing the cumulative impact of all six developments.

American Whitewater is a national non-profit 501(c)(3) river conservation and recreation organization founded in 1954. With approximately 6,000 members and 85 affiliate clubs, representing tens of thousands of whitewater paddlers across the nation, American Whitewater's mission is to protect and restore our nation's whitewater resources and to enhance opportunities to enjoy them safely. Our members are primarily conservation-oriented kayakers and canoeists, many of whom live and/or engage in recreational boating in the New England region within easy proximity of the Penobscot River. American Whitewater has long been involved with the FERC licensed hydropower projects in the Maine, including hydropower projects located on the Penobscot, Kennebec, Rapid, and Magalloway rivers, and are party to settlement agreements that provide for whitewater boating opportunities that

partially mitigate for project impacts.

Since 1876, the Appalachian Mountain Club has promoted the protection, enjoyment, and understanding of the mountains, forests, waters, and trails of the Appalachian region. AMC is the largest conservation and recreation organization in the Northeast with more than 90,000 members, supporters, and advocates, many of whom visit the lands and waters upstream and downstream of the projects for recreation.

Maine Council of Trout Unlimited represents six local chapters with over 2,000 fisher-conservationists in Maine. The mission of the organization is to bring together diverse interests to care for and recover rivers and streams so our children can experience the joy of wild and native trout and salmon. The entire watershed of the West Branch of the Penobscot is especially important to a great many of our members who enjoy its fishing resources, including the area from McKay Station to Nesowadnehunk Falls, Ripogenus-Chesuncook-Caribou Lake, and the waters below to its confluence with the main stem of the Penobscot River that are greatly affected by the Ripogenus and Penobscot Mills projects.

American Rivers is a national non-profit organization whose mission is to protect wild rivers, restore damaged rivers, and conserve clean water for people and nature.

The Caribou and Chesuncook Lake Camp Associations represent the interests of those with property on the shores of these lakes who have been greatly affected by the severe dewatering of the Ripogenus-Chesuncook impoundment in recent years. Their interest also extends to other recreational users of the lakes including the many canoe campers, recreational boaters, fishermen and women, those who use the public campsites on the lakes as well as the aquatic and shoreline communities who make their homes there.

Maine Rivers Maine Rivers, begun in 1998 as a project of the Natural Resources Council of Maine, became an independent organization in 2003. The Maine Rivers mission is to protect, restore and enhance the health and vitality of Maine's rivers. Since the Clean Water Act was passed in 1972, the health of Maine's Rivers has improved dramatically, but there are still serious threats to our rivers – from the toxins that wash in with every rain storm, to the pollution discharged by paper mills, to water withdrawals by farmers and ski resorts. Maine Rivers recognizes that the destructive impacts that colonization and industry have on our rivers also degrade and destroy human life, and seek to find better ways to safeguard Maine's countless miles of remarkable rivers.

Atlantic Salmon Federation is an international non-governmental organization dedicated to the conservation and restoration of wild Atlantic salmon and their ecosystems. ASF represents more than 25,000 members and volunteers across North America. ASF conducts research on wild salmon throughout the North Atlantic, performs complex river restoration project, promotes conservation of critical salmon habitats, and advocates for legislation and policies that will help to protect wild Atlantic salmon. ASF's U.S. office is located in Brunswick, Maine.

Allagash Gateway is a four-season sporting camp located on Ripogenus Lake near the Chesuncook Dam Point Boat Launch. It offers a private boat launch, canoeing, campsites, lodging, guide services, and a small store. During the summer months, Allagash Gateway's clientele is primarily interested in boating and fishing the lakes that make up the Ripogenus impoundment. Operations of the campground have

been profoundly impacted over the last few years by the water levels of Ripogenus Lake and Chesuncook Lake.

Andre Emerson Cushing Corporation is the majority landowner in T3 R12 WELS. Approximately 80% of Ripogenus Lake and 20% of Chesuncook Lake are within the boundaries of T3 R12 WELS. William Cushing, a director of Andre Emerson Cushing Corporation, is a year-round resident of T3 R12 WELS, and his home is on Ripogenus Lake.

These organizations are working together to represent the interests of all stakeholders, including fish and wildlife, to the Commission in the most consistent and coherent way possible. Individual organizations may submit additional DLA Comments to supplement and support this filing.

**General Comments**

The West Branch of the Penobscot River is one of the nation's premier natural, scenic, and recreational wonders. Water flowing over many millennia has sculpted the bedrock, river channel and landscape from the Ripogenus Gorge to Millinocket into a series of remarkable geological and scenic features that make this river a unique recreational and natural resource. Ripogenus Dam causes the merging of Ripogenus Lake, Chesuncook Lake and Caribou Lake in to Maine's third largest lake that provides unique recreational and scenic opportunities. The operation of large hydroelectric power plants, dams and other associated structures degrades the public's use and enjoyment of this unique and spectacular public resource.

Since the last license was issued, Project Operations have changed significantly. Great Northern Paper (GNP) operated the projects to keep a steady flow of water going downstream to power the operation of its East Millinocket Mills. Since splitting off its hydro operations to Great Lakes Hydro America, LLC, the project has been operated using peaking flows to increase profits from the electricity generated that is now sold on the grid, and use of this practice has increased under Brookfield Renewable's ownership. The current license prescribes minimum flows that were adequate in the past to protect recreational and environmental concerns. Additional terms and conditions are needed to improve water management and balance project harms and benefits given the changes to project operations. It is clear from the record of the last relicensing that agencies and officials bent over backwards to license the projects under terms and conditions favorable to GNP. These terms and conditions are not compliant with current Maine environmental statutes or federal hydropower regulations. Example: FERC does not issue storage project licenses without specifying target fill date and level or minimum drawdown levels. Under the terms of the current license, Ripogenus-Chesuncook-Caribou Lake may be drawn down to the physical limits of Ripogenus Dam.

Since the filing of the Pre-Application Document on June 11, 2021, stakeholders in this relicensing including American Whitewater, Appalachian Mountain Club, Trout Unlimited, Penobscot Indian Nation, whitewater outfitters, lake owners, state and federal resource agencies, individual recreationists, and others have filed scores of comments on the FERC docket, requested relicensing studies, participated in study implementation, attended study report meetings, and

meaningfully and substantially participated in the relicensing process. Notwithstanding the importance of the issues and concerns raised by stakeholders throughout the relicensing process, GLHA and filed a Draft License Application that ignores the result of every study and ignores the written and oral comments provided by every relicensing stakeholder. Instead, GLHA has filed a Draft License Application that proposes no changes whatsoever in is current operations with no analysis, seemingly treating the relicensing process as a waste of time and money and little more than a check-the-box exercise and expecting FERC to simply issue a new license under the same terms and conditions. The DLA states: "GLHA proposes to continue operating the Projects as described above during mean/normal, high, and adverse/low water years." [Exhibit B, page B-11] This is despite the fact that Brookfield has yet to identify the data supporting those same flows in the license despite FERC Staff's specific request. The relicensing process demands more. So does NEPA, the Federal Power Act. And the Clean Water Act.

**Description of Project Facilities and Operations**

From the top of the Ripogenus impoundment to the East Millinocket tailrace, these storage projects and hydropower dams impact more than 40 river miles of the West Branch of the Penobscot River and more than 12 river miles of Millinocket Stream. The uppermost development, Ripogenus Hydroelectric Project, obstructs more than 20 miles of the West Branch of the Penobscot River by diverting flows at the Ripogenus Dam into a 3,850-foot-long penstock leading to the McKay Station powerhouse. The drainage area of the project is 1422 sq. mi.

Ripogenus-Chesuncook-Caribou Lake has a surface area of 26,200 acres and is Maine's third largest lake. The current license allows lake levels to vary restrained only by the physical structure of Ripogenus Dam. The lake was not filled during the years 2020 and 2021 and was finally filled during the winter of 2022 by dropping outflows to 1000 cfs and subsequently 800 cfs, well below licensed spawning flows and undoubtedly having significant negative impact on the redds of salmonids downstream.

Chesuncook is unique. It is of highest value, developed mainly on the north and south shores with future development limited, and yet is still accessible. Further demonstrating the lake's status as a valued fishing, boating and canoeing destination, Maine statute prohibits jet skis from Chesuncook, Caribou and Ripogenus lakes. These lakes are remote, wilderness gems.

Chesuncook Lake's remoteness and undeveloped nature is what makes it so important to the state of Maine. So valued that the State of Maine employs a full-time Lake Ranger, May through October to monitor and maintain the public campsites on Chesuncook Lake, including Umbazookus and Gero Island. This ranger assists the numerous public, private and commercial canoe campers, recreational boaters and fishermen and women who use the lake including Bowdoin College, Colby College, Outward Bound, the Sierra Club, the LL Bean Discovery Program, and numerous private fishing and canoe camps and outfitters.

The lake is steeped in history. The Wabanaki–Thoreau Canoe Trail, a 200-mile network of paddling and hiking routes once used by Henry David Thoreau and members of the Wabanaki Nations, passes through Chesuncook Lake. The lake also hosts the Northern Forest Canoe Trail. This 700-mile trail is

the longest water trail in the nation spanning New York to Maine on traditional routes used by Indigenous peoples, settlers and guides.

The pristine beauty of Chesuncook Lake attracts recreational users today to the remote campsites and the developments at the north and south end. At the north end of the lake lies Chesuncook Village. A bustling community with an active church and museum, and a large, quintessential, iconic lodging facility. Just across from the village, is Gero Island, a state Ecological Preserve within public reserved lands, one of only 17 in the state within the Maine Natural Resources Program, hosting 5 of the State of Maine's public campsites.

On the southern end of the lake sits the Chesuncook Dam Village which holds the Chesuncook Lake Boom House Museum honoring the logging history of the area, and hosting over 600 visitors yearly, a commercial fishing and hunting business, many private cottages and is the take-out point for the famous West Branch canoe trip as well as the launching point for lake adventures. Multiple private camps dot the shoreline between the north and south shores.

Numerous private camps line the west shore of Caribou Lake and join a large neighborhood of private camps on the east shore. On a summer day one will see recreationists canoeing, kayaking, motor boating and fishing. Winter brings adventurers snowmobiling, ice fishing and Nordic skiing. The lakes are always alive with those savoring the beauty and recreational opportunities the lakes offer.

The previous licensee understood the recreational value and use of the lakes north of Ripogenus Dam and managed the lakes in a balanced manner with an average drawdown "during the recreation season from 1972 to 1985 was 3.45 ft. The maximum drawdown of the impoundment during the recreation season for the period of record was 15.25 ft in 1980, an extreme low water year when the impoundment began the season 11.4 ft below the normal high-water elevation."

There is also immense economic value to the lakes. A recent study by the University of Maine reveals Maine lake's economic value at a staggering 14 billion. The Bureau of Economic Analysis found Maine is the third most heavily involved state in the recreation industry. The report credits Maine's world-class outdoor recreational assets and predicts Maine's outdoor companies who are innovative and sustainable have "great potential for future growth." A study of outdoor recreation in rural Maine found a potential for doubling the industry in the next ten years, from $2.3 billion in 2017 to $5.6 billion in 2030. Outdoor research also shows that access to the outdoors is a major element in recruiting talent." Outdoor recreation encompassed 4% of the state gross domestic product in 2022. As explained by Jenny Kordick, the executive director of Maine Outdoor Brands, "Outdoor recreation isn't just a pastime; it's the heartbeat of our state's economy." The Piscataquis County Economic Development Council believes in the potential of the region as well and identifies Chesuncook Lake as "one of Maine's recreational highlights."

The recreational value of Chesuncook, Caribou and Ripogenus lakes cannot be overstated. The Maine Department of Agriculture, Conservation and Forestry, in a 2004 policy on FERC hydropower project licensing, directed the Bureau of Parks and Lands "engagement to be focused on 1) public recreational facilities and access, 2) adequacy of flow releases for boating, and 3) the effect of the project on public lands. The primary concern of the Bureau is to avoid or reduce the adverse impacts of continued, increased or fluctuating impoundment levels and downstream flows on public access, wildlife habitat,

forest resources, aesthetic resources, recreational facilities, and public trust rights on these lands." These lakes matter to the people of the state of Maine. As one of the user survey respondents stated, "I love any recreational experience I have on Chesuncook Lake. It is an invaluable natural resource to the state of Maine because of its remoteness and beauty. I have been coming to Chesuncook Lake many times a year for the past twenty years, and it's a lake I plan to return to for the rest of my life. It's one of my favorite places in Maine to motorboat, kayak, canoe, paddleboard, and swim in the summer."

The images that follow demonstrate the impact of project operations on recreationists, boaters, fishermen and those using remote camping sites cared for by the Maine Bureau of Parks and Lands that were not captured in the study reports. Additional images were included with Caribou, Chesuncook Lake Camp Associations/Chesuncook Dam Camp Owners Association USR Comments.

The access between Chesuncook and Caribou Lakes at near full lake and at low water. Look closely at the second picture where you will see a canoe trying to navigate the narrow channel. The canoeists eventually had to walk their boat. Motorboats could not pass.

Mouser Island, one of the most heavily used BPL sites on the lake, at high water and at low water. The rocky shoreline makes walking extremely dangerous and limits access.

Below the lake, the flow diversion at Ripogenus Dam regularly diverts nearly all flows from the West Branch of the Penobscot River, virtually dewatering the Ripogenus Dryway or Upper Gorge of the natural river channel other than an unnatural steady state minimum flow of 100 cfs from July 1 to September 30. At other times, GLHA leaves the Upper Gorge dewatered except for leakage of 12 cfs.

The minimum flow in the bypassed reach is 0.07 cubic feet per second per square mile (cfsm) of the drainage area during the summer months and 0.008 cfsm during the rest of the year, far below the United State Fish and Wildlife Service recommended base flow of 0.5 cfsm necessary to support healthy aquatic habitat. The flow diversion and dewatering of the natural river channel below the Ripogenus Dam impacts aquatic habitat, obstructs river connectivity, reduces sediment transport, degrades water quality, reduces recreation opportunity, and degrades the aesthetic quality of the Ripogenus Dryway.

From the top of the Ripogenus impoundment to the McKay Station tailrace, the dewatered natural river reach drops about 84 feet over the .75-mile natural river channel. While the licensee does not include a description of the geologic features in the bypassed reach, imagery of and accounts by whitewater paddlers of this reach shows that this river reach contains a continuous series of ledges and features that provide high-quality whitewater boating opportunity when sufficient flows are provided. Additionally, the licensee acknowledged in its prior license application that the Upper Gorge is an aesthetic feature in the project boundary that draws visitors to the project to hike and view the falls in its present dewatered condition. There are no scheduled whitewater boating releases in the Dryway, and the licensee does not provide information on the frequency with which flows are spilled into the natural river reach when the pond is full, and inflows exceed the 3500 cfs combined capacity of the three turbines at McKay Station. McKay Station is a 38.6 MW powerhouse that operates in hydropeaking mode by fluctuating the upstream impoundment. Given the allowable impoundment drawdown of 44 feet at Ripogenus and the licensee's interest in avoiding spillage, we assume that spillage into the Upper Gorge is infrequent outside of the spring freshet.

Due to the flow diversion at Ripogenus Dam, flows into the Upper Gorge section above McKay Station dramatically alter the natural flow regime by fluctuating flows from a near non-existant from of 12 cfs to 100 cfs during part of the summer, to nearly 15,000 cfs in the spring. Compare flows into the Upper Gorge to the outflows from McKay Station where flows from inflows and storage typically range from 1,000 cfs to 3,500 cfs unless the project is spilling flows into the bypassed reach. These flow fluctuations into the Upper Gorge eliminates valuable recreational boating and fishing opportunities, damages aquatic habitat, and degrades aesthetic views. While a hiking trail between Ripogenus Dam and McKay Station provides some recreation opportunity, access into the water in the Upper Gorge is difficult due to the lack of a defined portage route around the dam down to the water. The lack of adequate flows, access, and real-time flow information in the Upper Gorge limits recreational boating, fishing, and aesthetic viewing opportunities. Additionally, generator trip events that drop flows to 400 cfs for an average duration of four hours have been occurring on an average of once per year that two independent stranding studies have shown cause to cause extensive downstream mortality to fish, especially landlocked salmon fry and parr.

Under its current license, GLHA is required to release flows from McKay Station from pond storage ranging from 1,800 to 2,300 cfs daily between 8:30 a.m. and 5:00 p.m. from May 1 to October 15. Flows fluctuate based on the day of the week and water year type. GLHA flows may exceed these

minimums based on station generation needs or spill. GLHA's required daytime generation flows during the recreation season has provided significant whitewater boating opportunities that support the outdoor recreation economy in the region.

Whitewater flows have proven to be fish-friendly flows and this combined with GNP's need for steady flows resulted in a world-class landlocked salmon fishery below McKay Station that was recognized as such in the EIS published in 1996. Over the years, peaking operations and Brookfield's removal of Ripogenus dam keeper have increased the time needed to restore flows after a generator trip event affecting both salmonids directly and the macro-invertebrate community upon which they feed. Poor water management and lake drawdowns has impacted the smelt population in the lake and decreased the resultant drift downstream hurting size quality. The overall result is a diminished fishery.

Below McKay Station, project outflows cascade over the 15-mile premier whitewater boating reach between McKay and Debsconeag before flowing into Ambajejus Lake in the North Twin Development impoundment and diversion dam located 21 miles below McKay Station. Like McKay, North Twin is a peaking operation relying on storage from the four lakes that comprise its impoundment. North Twin impoundment lake levels fluctuate throughout the year from 1.5 feet after spring refill to 3.5 feet during the late summer to 12 feet or more during the winter months. Flows into the North Twin Impoundment come from releases from Ripogenus and tributary inflow as well as water pumped from the Millinocket Lake Storage Development.

Flows into North Twin are augmented by the Millinocket Lake Storage Development pumping water into Ambejejus Lake in support of hydropeaking operations at North Twin. Impoundment levels at Millinocket Lake Storage Development fluctuate 10 feet because of its pumping for North Twin Station as well as the release of an unnatural steady state minimum flow of 60 cfs from Millinocket Lake Dam into the 9.4-mile reach of Millinocket Stream between Millinocket Lake and Shad Pond below the Millinocket Development. The pumping at Millinocket Lake diverts flows that would otherwise be available for downstream flows on Millinocket Stream, eliminates natural flow variability beneficial to aquatic habitat and recreation, degrades water quality, and increases the hydropeaking on the West Branch of the Penobscot in the Penobscot Mills project area.

The North Twin Dam, located 33 miles below the Ripogenus Dam, is a 7 MW hydropower development with three turbines with a combined hydraulic capacity of 4500 cfs. The powerhouse, located adjacent to the North Twin Dam, operates in hydropeaking mode fluctuating flows from a minimum flow of 2000 of 3000 cfs up to the 4500 cfs hydraulic capacity of the project. Project outflows are released into a riverine reach leading to Quakish Lake, the impoundment for the Millinocket Development located 2.6 miles below the North Twin Dam.

Inasmuch as Quakish Lake has negligible storage capacity, the licensee's characterization of its operations at Millinocket and the lower developments as run-of-river is misleading in several respects. The Penobscot Mills Hydroelectric Project is a hydropeaking project from North Twin to East Millinocket because each hydropower development is successively passing peaking flows from the upstream development. None of these developments can be characterized as run-of river because they generate power based on the flow regime at North Twin and rely on the operational flexibility provided by the North Twin and Millinocket Lake storage reservoirs. Characterizing the Millinocket Development as run-of-river obscures the substantial impact of project operations by implying that it

passes natural flows and protects the natural flow regime.

More significantly, the 37 MW Millinocket Development dams and diverts the West Branch of the Penobscot River at Stone Dam where the current license requirements fail to mandate any minimum or naturally variable flow into the 4.5-mile natural river channel of the Penobscot River leading to Shad Pond, a section of the Penobscot River that the licensee incongruously calls the "Back Channel", a characterization objectionable to the Penobscot Indian Nation and numerous stakeholders. While the Licensee is required to release a minimum flow of 3,000 cfs from North Twin Development from August 22 through October 15 and 2,000 cfs from Shad Pond at other times, no minimum or naturally variable flows are passed at Stone Dam, leaving the natural river channel nearly dewatered at most times. The only flow in the natural river is from tributary inflow in the lower reach when available and at times when upstream flows exceed the 4,305 cfs hydraulic capacity of the Millinocket powerhouse, primarily during the spring runoff.

Flows from Millinocket Development, Millinocket Lake Storage Development, and leakage or spill from Stone Dam converge on Shad Pond downstream from Millinocket Development with a required minimum flow of 2,000 cfs leading to the Dolby impoundment. Like Millinocket, the licensee mischaracterizes the Dolby Development as run-of-river. In reality, the Millinocket, Dolby, and East Millinocket Developments, like Ripogenus and North Twin, are hydropeaking projects that successively pass altered flows from the upstream developments rather than passing unaltered flow or reregulating discharges to more closely mimic the natural flow regime.

The Dolby Development, located approximately 8 miles below the Millinocket Development and approximately two miles above East Millinocket Development, has a 16.5 MW powerhouse with a hydraulic capacity of 4,350 cfs. Both Dolby and East Millinocket have negligible usable storage. Flows from the Dolby tailrace flow into the West Branch of the Penobscot River to the East Millinocket Development located 1.9 miles downriver. The Drainage area at East Millinocket is 2,111 sq. mi.. East Millinocket powerhouse has a combined hydraulic capacity of 4,200 cfs. The Penobscot Mills project flows into the Medway project, also owned by GLHA, before reaching the mainstem of the Penobscot River.

## Impact of Project Facilities & Operations on Resources

### Aquatic Habitat & Fish Passage

For more than a century, the dams on the mainstem and tributaries of the Penobscot River have decimated native species of sea-run fish including Atlantic Salmon and Shad. While efforts over the past two decades have resulted in the removal of the Veazie and Great Works dams, improvements to fish passage, and opening of hundreds of miles of habitat, the continued presence of hydropower dams continue to have deleterious effects on numerous fish species and recreation opportunity. The harm caused by the hydropower dams on the Penobscot is evident in the licensee's dams at East Millinocket, Dolby, Millinocket, North Twin, and Ripogenus. Once home to Atlantic Salmon, river herring, and other native fish species, what remains today is a managed fishery with landlocked Salmon, smelt, and warm water fish species.

Restoration of the Penobscot River will require an assessment of each dam along the mainstem and

tributaries to provide meaningful improvements for fish passage through the relicensing process.

Fish passage at the Penobscot Mills and Ripogenus hydroelectric projects is virtually nonexistent except for North Twin where passage is provided for landlocked Salmon between the Millinocket and North Twin impoundments. The dewatering of bypassed reaches below the Ripogenus and Millinocket dams has eliminated habitat that would be otherwise suitable for various species. The East Millinocket and Dolby projects lack any fish passage for river herring and there are no Shad in Shad Pond. Restoration of the river reach from the Ripogenus impoundment to the East Millinocket tailrace will require the restoration of flows to dewatered river reaches, installation of appropriate fish passage at each development, and the restoration of a Shad fishery in Shad Pond. Restoration of flows on the West Branch below Stone Dam would provide 4.5 miles of suitable habitat that is presently dewatered by the licensee.

The reach below from McKay Station to below Nesowadnehunk Falls is known for its wild landlocked salmon fishery. While Atlantic salmon are known to have proceeded upstream past Ripogenus Falls top Penobscot Stream, this reach is not designated Atlantic salmon critical habitat. Emphasis should be on optimizing the anadromous fish passage in the Penobscot Mills Project and optimizing the habitat for landlocked salmon in the Ripogenus Project. Anadromous fish passage in the Penobscot Mills Project will improve the overall health of the watershed and benefit Atlantic salmon restoration efforts in the mainstem of the Penobscot. The Penobscot Nation holds treaty-reserved sustenance fishing rights in the Penobscot River that would be served. Tribe has advocated for the installation of full depth angled trash racks with a dedicated downstream bypass to protect downstream migrants (primarily eels and brook trout). It is well established that Atlantic salmon cannot be successfully without restoring their co-evolved species, on the West Branch, American eels, American shad and river herring.

**Whitewater Boating**

The West Branch of the Penobscot River is known internationally as among the most important rivers for whitewater boating in the Northeast and draws tens of thousands of whitewater boaters annually seeking to enjoy the scenic beauty of the West Branch of the Penobscot River and its dramatic rapids. Paddlers traveling to the Maine Woods region have a positive economic impact on the region and support the outdoor recreation economy, impacts that far exceeds the value of power generated by these hydroelectric projects.

The West Branch of the Penobscot River, where the projects are located, is treasured by local residents and visitors to the area who enjoy boating, angling, swimming and hiking throughout the recreation season. Eco-tourism and outdoor recreation form the foundation of the local economy, relying heavily on the resources impacted by these projects. Unfortunately, project facilities and operations diminish recreation opportunities on the West Branch of the Penobscot River, and diminish the natural beauty of the area, obstructing natural river flow, dewatering dramatic waterfalls, rapids and other sections of the natural river essential to the enjoyment of designated and existing uses of these rivers. AW and AMC have identified four sections of the West Branch of the Penobscot River located in the project boundaries for the Ripogenus and Penobscot Mills projects as providing high quality whitewater boating opportunities. These sections are as follows:

**Ripogenus Dryway:**

The section of the West Branch from Ripogenus Dam to McKay Station, known as the Upper Gorge or Ripogenus Dryway, is a .75-mile reach with sufficient gradient structure to provide a highly valuable whitewater boating opportunity with sufficient flow. This section of the West Branch cascades over a series of ledges and other geologic features through a remote, narrow gorge setting before paddlers enter the lower gorge below McKay Station. This section has been periodically run by paddlers during spillage from the Ripogenus Dam, demonstrating that this section should be considered a whitewater boating resource. Unfortunately, opportunities to boat this section are infrequent as they only occur when flows are above station capacity, or when the project is offline. The aesthetic quality of this reach also attracts hikers along the Upper Gorge Trail. While precise flow ranges for this section of the river are unknown, anectodical information from those who have previously boated this reach shows that the Ripogenus Dryway is boatable at flows at 400-2200+ cfs and provides flows in the Class III/IV range of difficulty.

These flows within the normal operating range of the project and would require that the licensee forego generation and restore natural river flows in Upper Ripogenus Gorge.

The reach is watered by100 cfs flows from July 1 to September 30. These flows come from a sluiceway which provides the warmest water from Ripogenus-Chesuncook-Caribou Lake, and do not function as fishing flows as intended. The warmwater attracts fallfish, not salmonids. An IFIM fisheries habitat study conducted during the last relicensing shows that flows in the Upper Gorge would provide a fishery there.

Here is what the applicable Maine statutes say:

> MRSA §467¶7C(1)c: From Ripogenus Dam through Ripogenus Gorge to the McKay powerhouse - Class B.
> MRSA §465¶3A: “3. A. Class B waters must be of such quality that they are suitable for the designated uses of drinking water supply after treatment; fishing; agriculture; recreation in and on the water; industrial process and cooling water supply; hydroelectric power generation, except as prohibited under Title 12, section 403; navigation; and as habitat for fish and other aquatic life. The habitat must be characterized as unimpaired. [PL 2003, c. 227, §3 (AMD); PL 2003, c. 227, §9 (AFF); PL 2005, c. 561, §10 (AFF).]”
> MRSA §466(11): ‘"Unimpaired" means without a diminished capacity to support aquatic life.’

Dewatering the gorge for nine months out of the year is contrary to Maine environmental law, the habitat cannot be considered unimpaired. Minimum flows to the dryway must be provided year-round to provide aquatic habitat as required by Maine statutes.

*Ripogenus Dryway at high flow*

*Ripogenus Dryway at base flow conditions*

*Ripogenus Dryway from the crest of Ripogenus Dam*

*Ripogenus Dryway during a high flow event showing whitewater paddling features*

**McKay Station:**

The West Branch of the Penobscot River below McKay Station is the arguably the most renowned whitewater river in the northeast, its closest comparable river reach being the Gauley River in West Virginia. The upper section below McKay features a series of Class III – V rapids through the Penobscot Gorge and Cribworks sections to Big Eddy. This section of the West Branch is known for its powerful hydraulics, waterfall drops, stunning views of Mount Katahdin and frequent wildlife sightings. The 15-mile reach down to Debsconeag provides both rafters and private boaters with an unequaled boating opportunity in the region.

Under its current FERC license, the licensee is required to release daytime flows ranging from 1800-2300 between May 1 – October 1 with flows varying within this range depending on the day of week and hydrologic conditions. While this flow range is well utilized by both private boaters and commercial outfitters, the licensee has not conducted a controlled-flow whitewater boating study on this river reach using the widely accepted *Whittaker* protocols developed in 2005 to identify minimum acceptable and optimal flow ranges.

*Penobscot Gorge downstream of McKay Station*

*Cribworks Rapid on the West Branch of the Penobscot River near Telos Road*

*Rapids on the West Branch of the Penobscot River*

**Stone Dam:**

The Penobscot Mills Dryway or Stone Dam Dryway between Stone Dam and Shad Pond on the West Branch of the Penobscot River, is a 4.5-mile river reach that the licensee refers to as the "Back Channel", which has the potential to provide a highly valuable whitewater boating opportunity to paddlers with a wide range of abilities if sufficient flows were provided. Under current FERC license conditions, the licensee is not required to release any minimum flow into this lengthy river reach as all flows are diverted into the Millinocket powerhouse rather than flowing naturally into the river.

The flow diversion at Stone Dam and the dewatering of the 4.5-mile reach of the West Branch of the Penobscot River destroys aquatic habitat, obstructs sediment transport, reduces water quality, and eliminates valuable recreational boating and angling opportunities that would otherwise be available if sufficient flow were provided. This section of the river contains ample gradient and geologic features that would provide high quality aquatic habitat as well as whitewater boating and angling opportunities under appropriate flow conditions. The reach also contains Grand Falls, a significant geologic feature located 2.7 miles below Stone Dam. Rarely, flows are spilled over Stone Dam, except when upstream flows from North Twin exceed 4305 cfs and the impoundment is at capacity. Dewatered throughout the year except during high flows that are beyond the capacity of the project to store or generate power, the dewatered Grand Falls is a natural and recreational treasure along this reach significantly impacted by the projects.

Higher flows into the Back Channel can be released from an inflatable rubber flashboard system and is currently operated at times by deflating the pneumatic rubber flashboard system to provide flows of 200 cfs and then ramping up at an interval of 400 cfs an hour until downstream flow targets are met or until Stone Dam falls to 459.45 FTMSL.

This section of the West Branch has been run by numerous whitewater boaters when flows on the West Branch exceed the hydraulic capacity of the Millinocket Development. While this river reach is clearly boatable, minimum acceptable and optimal flow ranges are unknown, and the licensee has not previously performed a controlled-flow whitewater boating study using the widely accepted *Whittaker* protocols developed in 2005. Boaters previously paddling this reach have determined that this reach contains Class III/IV rapids that provide a high-quality whitewater boating experience under suitable flow conditions. as shown on the image that follows.

*West Branch of the Penobscot River Below Stone Dam Showing Spillage*

*West Branch of the Penobscot River Below Stone Dam at Grand Falls Showing Spillage (Occasional)*

*West Branch of the Penobscot River Below Stone Dam at Grand Falls Dewatered (Typical)*

*Grand Falls on the West Branch of the Penobscot River below Stone Dam on the Penobscot Mills Dryway (Unknown flow)*

Current operations affecting operation of Stone Dam are contrary to Maine Statutes.

> MRSA §467¶7C(1)f: From the outlet of Ferguson and Quakish Lakes to its confluence with Millinocket Stream - Class C.
>
> MSR Title 38 §465(4). "4. Class C waters. Class C shall be the 4th highest classification.
>
> A. Class C waters must be of such quality that they are suitable for the designated uses of drinking water supply after treatment; fishing; agriculture; recreation in and on the water; industrial process and cooling water supply; hydroelectric power generation, except as prohibited under Title 12, section 403; navigation; and as a habitat for fish and other aquatic life.
>
> B. Class C waters must be of sufficient quality to support all species of fish indigenous to those waters and to maintain the structure and function of the resident biological community…"
>
> C. Discharges to Class C waters may cause some changes to aquatic life, except that the receiving waters must be of sufficient quality to support all species of fish indigenous to the receiving waters and maintain the structure and function of the resident biological community."

Watering the reach is needed to meet Maine statutory requirements for designated uses other than hydroelectric production: fishing, recreation and habitat.

Watering the reach would be compliant with the EPA's April 2024 ruling regarding access to resources in ceded Native American lands. "The U.S. Environmental Protection Agency (EPA) is finalizing revisions to the Clean Water Act (CWA) water quality standards (WQS) regulation to add requirements for states establishing WQS in waters where Tribes hold and assert rights to CWA-protected aquatic and aquatic-dependent resources reserved through treaties, statutes, or Executive orders." [A Rule by the Environmental Protection Agency on 05/02/2024. Citation: 89 FR 35717]

Improvements to whitewater, recreation and aesthetics must be accompanied by minimum flows to support aquatic habitat.

**Millinocket Stream:**

Millinocket Stream between Millinocket Lake and Shad Pond has the potential to provide whitewater boating opportunity if sufficient flows are provided. While there is no river gage and the licensee does not publicly release flow information on spill from the Millinocket Lake Dam, whitewater boating is an existing use on this 9.4-mile river reach during spill conditions.

In its prior relicensing of the Penobscot Mills Hydroelectric Project, the licensee acknowledged the whitewater boating potential of this reach in response to FERC's AIR, stating that the reach between Millinocket Lake and Shad Pond is a recreational resource when flows greater than 250 cfs are released from the Millinocket Lake Dam including the Class III Locomotive Rips (or Choo-Choo Falls). While the information was solely based on a conversation with several boaters who previously paddled the reach, a more in-depth study is required to evaluate the recreational value of the resource more thoroughly.

**Relicensing Studies**

In response to stakeholder study requests, FERC issued a Study Plan Determination on May 13, 2022, as modified by the Study Modification Determination on July 23, 2023, requiring that GLHA conduct a number of studies that impact recreational use, habitat restoration, aesthetics, and other non-power values. Stakeholders previously filed comments in response to the Initial Study Report and Updated Study Report and incorporate those comments by reference and summarize them below. Inasmuch as GLHA has not completed all required studies or responded to all additional information requests by FERC and stakeholders, we reserve the right to file additional comments, and if necessary additional study modification requests, once those studies are complete and additional information has been provided. Studies conducted to date have failed to inform the full range of options for future project operations that will best balance project harms and benefits in this complex and highly modified river segment.

**Historic Operations Data Assessment Study**

As more fully explained in AW/AMC Initial Study Report Comments, the Ripogenus and Penobscot Mills hydroelectric projects were last licensed in 1996. At the time of the last relicensing, the project provided power to the Millinocket and East Millinocket paper mills. Those paper mills closed in 2008 and 2013, respectively, and the projects were converted to provide power to the electric grid in 2014. Although the project purpose changed in 2014 following the closure of the paper mills, the Water Management Plan, including the required minimum flows to the West Branch Penobscot bypassed reaches and Millinocket Stream, is based on the project purpose of supplying power to the paper mills at the time of the last relicensing. The study does not address historical changes in the timing of generation since the closure of the paper mills and the repurposing of the project.

The Ripogenus Dam impounds the West Branch creating a 710,000-acre-foot impoundment that fluctuates by 44 feet and causing negative impacts to Ripogenus Lake, Caribou Lake, Chesuncook Lake, Moose Pond, Brandy Pond, and Black Pond. Project operations at Ripogenus divert flows into a penstock bypassing the natural river channel, leaving .75 miles of the West Branch dewatered except for an unnatural minimum flow of 12-100 cfs when flows are less than the 3500 cfs hydraulic capacity of McKay Station. Under its current license, the licensee is required to release minimum flows at McKay Station ranging from 1000-2300 cfs at different times of day and at different times of year that support power generation, aquatic habitat below McKay Station, and whitewater boating and other recreation.

Project operations at McKay alter flows by impounding and gradually releasing flows on the West Branch. Project operations at McKay adversely affect water quality by raising water temperature and lowering dissolved oxygen in the impounded lakes, reducing sediment transport, harming the littoral zone, and limiting stream access upstream from the dam. Downstream from the dam, the natural river channel between Ripogenus Dam and McKay Station is adversely affected by the inadequate minimum flow and by the loss of naturally variable flows that have an adverse effect on aquatic habitat and whitewater boating use in the Upper Gorge. An examination of historical flow data demonstrates the infrequency of spill below Ripogenus Dam

when the impoundment is full and inflows exceed the 3,500 cfs McKay Station hydraulic capacity.

Spill below Ripogenus Dam is infrequent even during even the highest water years and is generally limited to the high flows that typically occur at tail end of the spring freshet when the impoundment fills after the annual winter drawdown. The licensee manages the project to maximize generation by lowering the reservoir elevation during the winter to avoid spill — what the study report euphemistically and offensively calls “waste flow”, but which are actually the restored natural flows to the West Branch of the Penobscot River. This artificial lowering of the impoundment reduces the number of boatable days in the Upper Gorge and beneficial effects of high flows on aquatic habitat.

Millinocket Lake Storage serves as one of several impoundments for the Millinocket Development with a fluctuating impoundment affecting upstream and downstream aquatic habitat. Flows on Millinocket Stream are diverted by Millinocket Lake Dam and then pumped to Ambajejus Lake joining inflows from the Ripogenus Project into North Twin. The pumping station was constructed in 1950 to provide additional water for generation of power for the paper mills. With the demise of the paper mills, the flow diversion and partial dewatering of Millinocket Stream provides power to the grid and profit to the licensee. Lake Millinocket and Millinocket Station essentially function similar to Ripogenus in that flows are diverted by Millinocket Lake Dam through a series of impoundments before flowing into the Millinocket Station tailrace and back into Millinocket Stream.

The effect of this diversion is the partial dewatering of Millinocket Stream leaving only a minimum flow of 60 cfs or less to support aquatic habitat. The flow diversion at Millinocket Dam disrupts river connectivity due to the lack of fish passage, obstructs sediment transport and water quality, and reduces flow variability. The licensee operates two pumps with a combined hydraulic capacity of 244 cfs to pump water from Millinocket Lake to Ambajejus Lake. The pumps typically operate from 16-63 percent of the time throughout the year, with near continuous pumping typically occurring throughout much of the warmer summer months in all water year types, often reducing outflows from 300 cfs down to a meager 60 cfs for much of the year. Since there is no gage on Millinocket Stream, the flow data is based on a calculated flow, so the accuracy of this data cannot be verified.

The Millinocket Development also functions as a typical hydropower project with Stone Dam impounding the West Branch of the Penobscot River, a bypassed reach on the West Branch of the Penobscot River below Stone Dam, and a powerhouse at Millinocket Station discharging diverted flows into Shad Pond before rejoining the West Branch at Shad Pond. Under the current FERC license, the bypassed reach of the West Branch has been completely dewatered by the Stone Dam other than minimal leakage or infrequent spillage over the flashboards.

The 1996 FERC license disregarded the environmental consequences of the complete dewatering of the West Branch below Stone Dam based on the economic impact to the paper mills owned by the then licensee, Great Northern Paper. The dewatering of the West Branch below Stone Dam can no longer be justified by the economic impact on Great Northern Paper whose paper mills no longer operate, their crumbling structures marring what would otherwise be a pristine landscape.

The dewatering below Stone Dam has disrupted river connectivity, destroyed aquatic habitat, eliminated recreation opportunities, and degraded cultural resources.

**Operations Model**

FERC's Study Plan Determination required that GLHA complete an Operations Model Study to evaluate alternative modes of operation against a baseline scenario to evaluate the impact of alternatives on water availability, power generation, aquatic resources, recreation, and other values. At the request of AW/AMC, GLHA invited stakeholders to submit various scenarios, and GLHA agreed to some but not all of the requested model runs. The model runs requested by AW/AMC were intended to simulate the following scenarios:

- Minimum flow in Upper Gorge
- Whitewater boating releases in Upper Gorge
- Minimum flow below Stone Dam
- Whitewater boating releases below Stone Dam
- Elimination of pumping at Millinocket Lake Storage
- Whitewater boating releases in Millinocket Stream

GLHA agreed to all of the model runs requested by AW/AMC with the exception of the 400 cfs minimum flow in the bypassed reach below Ripogenus Dam. Inasmuch as GLHA agreed to the 200 cfs model run requested by USFWS and the results are relatively linear, the effect of the 400 cfs minimum bypassed reach flow in the Upper Gorge can be easily extrapolated from the model run results. Below are the results of those model runs:

| No. | Scenario Name | Requestor(s) | Project Area | Summary of Alternative Scenario Evaluated by the Model** | Summary of Modeling Result: Compared to BaselineR3 | Effect of Scenario on Average Annual Generation Compared to BaselineR3 | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | RIF | NTWIN | MILL | DOLBY | EMILL |
| 9 | 1000RecUpperGorge | AW/AMC | Ripogenus Bypass Flow (Upper Gorge) | • 5/1-10/1, provide 1,000 for 4 hours on 1 weekend day each week from 10:00-14:00. | • Requested scenario has minimal effects on Ripogenus impoundment elevations, timing of flows, and generation at McKay Station based on the approximately 330-acre-feet of water per release event. | 0% | 0% | 0% | 0% | 0% |
| 10 | 200UpperGorge | USFWS | | • 24/7/365, provide 200 cfs in the Ripogenus bypass reach | • Requested scenario results in slightly lower Ripogenus Impoundment elevations, as model strives to efficiently utilize McKay Station to pass downstream flows while maintaining 200 cfs in bypassed reach.<br>• Increased outflows from Ripogenus at times results in a slight increase in spill occurring at downstream developments. | -6.9% | 1.0% | 0.4% | -0.2% | -0.1% |
| 11 | 200StoneDam | USFWS MDEP MDIFW | Millinocket Bypass Flow (below Stone Dam) | • 24/7/365, provide 200 cfs from Stone Dam. | • Requested scenario results in an increase in the number days of spill at Dolby dam as compared to BaselineR3 due to the difference in timing and magnitude of releases from the Millinocket powerhouse and dam. | 0% | 0% | -4.9% | 0% | 0% |
| 12 | 400StoneDam | AW/AMC | | • 24/7/365, provide 400 cfs from Stone Dam. | • Requested scenario results in a small decrease in Millinocket Impoundment elevations as compared to BaselineR3 due to the difference in timing and magnitude of releases from Millinocket powerhouse and dam.<br>• Requested scenario results in an increase in the number days of spill at Dolby and East Millinocket dams as compared to BaselineR3 due to the difference in timing and magnitude of releases from the Millinocket powerhouse and dam. | 0% | 0% | -10.0% | -0.1% | 0% |
| 13 | 2300RecStoneDam | AW/AMC | | • 5/1 – 10/1, provide 2300 cfs from Stone Dam for 4 hours on 1 weekend day each week from 10:00-14:00. | • Requested scenario results in an increase in the number days of spill at Dolby and East Millinocket dams as compared to BaselineR3 due to the difference in timing and magnitude of releases from Millinocket powerhouse and dam. | 0% | 0% | -0.6% | 0% | -0.1% |
| 14 | NoMillLakePumping | AW/AMC | Millinocket Stream Flow | • No Pumping from Millinocket Lake Storage to North Twin. | • Requested scenario results in slightly lower North Twin Impoundment elevations and flows.<br>• Requested scenario results in slightly higher Millinocket Lake Impoundment elevations.<br>• Requested scenario results in very small differences in impoundment elevations and flows downstream of North Twin as compared to BaselineR3 due to the difference in timing and magnitude of releases from Millinocket Lake. | 0.1% | -1.6% | -1.2% | -0.1% | -0.1% |
| 15 | 600RecMillStream | AW/AMC | | • 6/1 – 10/1, provide 600 cfs from dam for 4 hrs on 1 weekend day each week for WW boating from 10:00-14:00 | • Requested scenario results in very small differences in impoundment elevations and flows as compared to BaselineR3. | 0% | 0% | 0% | 0% | 0% |

**The information in the table represents the conditions that were evaluated by the model, which may slightly differ from what was requested as indicated in the May 3, 2024 filing with FERC included as Attachment A of this report.

The results of all model runs requested by AW/AMC (including the 200 cfs bypassed reach model run requested by USFWS) demonstrate the viability of each of the AW/AMC requested scenarios. Specifically, the model runs demonstrate the following:

- Providing 1000 cfs whitewater releases from Ripogenus Dam into the Upper Gorge one weekend day each week for four hours from May 1 to October 1 will have no effect on annual

generation.

- Providing 200 cfs bypassed reach flow in the Upper Gorge, rather than the current 12/100 bypassed reach flow, will result in a 2.6% reduction in total generation reduction at Ripogenus and Penobscot Mills.
- Providing 400 cfs bypassed reach flow below Stone Dam, rather than the current no bypassed reach flow (leakage 12/121 cfs), will result in a 3% reduction in total generation reduction at Ripogenus and Penobscot Mills. Unclear whether this accounts for leakage flows.
- Providing 2300 cfs whitewater releases from Stone Dam into the West Branch bypassed reach one weekend day each week for four hours from May 1 to October 1 will have a 0.2% effect on annual generation. This effect would be reduced in the likely event that a minimum flow from Stone Dam into the West Branch is required under a new project license.
- Eliminating pumping from Millinocket Lake Storage into North Twin impoundment will result in a 0.5% reduction in total generation reduction at Ripogenus and Penobscot Mills.
- Providing 600 cfs whitewater releases from Millinocket Lake Storage Dam into Millinocket Stream one weekend day each week for four hours from May 1 to October 1 will have no effect on annual generation.

Overall, these operations model runs demonstrate that providing scheduled whitewater boating releases in the Upper Gorge and Millinocket Stream will have no effect on generation at the projects, and that providing scheduled whitewater boating releases below Stone Dam will have a negligible effect on generation. The Level 1 whitewater boating study on these three reaches and comments by numerous stakeholders demonstrates that the Upper Gorge, Stone Dam, and Millinocket Stream river reaches are highly desirable by a wide range of recreational users and would provide more natural river functions when paired with appropriate minimum and variable flows. Additionally, eliminating pumping operations from Millinocket Lake and ending the flow diversion into North Twin will have minimal effect on generation and would restore flows and natural river function to Millinocket Stream.

In addition, AW; AMC; TU; Caribou, Chesuncook Lake Camp Associations; Chesuncook Dam Camp Owners Association; the Allagash Gateway Campground; and Andre Emerson Cushing Corporation submitted a joint request for ops model runs that would accommodate additional requirements. Brookfield rejected this request. These organizations will next focus on agreeing on sets of ops model runs that will be submitted in the near term. This will include scenarios outside the limits that Brookfield has dictated for the model runs.

A key issue regarding the Ops Model remains the fill elevation for the lake. Even though a Brookfield representative stated at the USR Meeting that Brookfield had filled Ripogenus-Chesuncook Lake to over 939 asl this spring, Brookfield refuses to conduct Ops Model runs above that elevation. Brookfield's own data shows that it has filled the lake to above that level often in the past: Operations data from 2010-2022 shows lake elevation on May 15th at 940 asl or above every year except 2012, 2013, 2015, 2016 and 2021. Given these data, the upper limit should be 941.6 asl, the physical, but safe limits created by Ripogenus Dam. By failing to run the Ops Model at a more realistic and historically accurate fill regime, Brookfield is misleading the available fill volumes, making less profitable flow scenarios seem less feasible than they truly are. Stated another way, if Brookfield raised the lake fill level, it could offset or at least mitigate the economic impacts of increased minimum flows required for other purposes. This 2.6 feet of

elevation equates to billions of cubic feet of water with enormous potential use, not just for power generation but to provide flows to maintain lake levels allowing access to boat ramps in Ripogenus-Chesuncook Lake and flow into Ripogenus Gorge to create both whitewater and recreational fishing opportunities as well as improve the aquatic habitat. It is well established that Brookfield uses even smaller amounts of water level variance elsewhere in Maine in its many run-of river projects to conduct peaking operations, varying flows to maximize the profitability of its electricity, but degrading both the aquatic habitat and recreational fishing opportunities in the process. Efficient management of lake fill levels can mitigate this degradation.

**Recreation**

As more fully explained in the AW/AMC Initial Study Report and Updated Study Report Comments, GLHA conducted a recreation study as required by FERC's Study Plan Determination and Study Modification Determination evaluating both formal and informal recreation sites. While the study report collected useful data on formal and informal recreation sites, the report's conclusions that all recreation sites are in good condition and its failure to make recommendations for improvement is unsupported by the study results. The deficiencies in the study report are particularly egregious at the whitewater boating access sites where the need for improvements is apparent. In the Upper Gorge, for example, there is no marked or improved trail leading down to the river that would enable whitewater boaters, as well as anglers and hikers, to easily descend the steep embankment to boat this river reach when sufficient flows are present, enable access tranquil fishing spots, or enjoy aesthetic views of the Upper Gorge.

At McKay Station, the rafting put-in needs improvement to provide safe river access. Additionally, there is no sanitation at the lower access area where rafters are dropped off as the only portable sanitation unit is locked. There is no signage directing rafters to summit the steep access road to locate the toilets at the upper parking area. The access road to the lower drop off location is available only to commercial outfitters but not to other boaters.

At Stone Dam, there is no clearly marked parking area across Quakish Lake, there is no easy egress at Stone Dam, and no land access to Stone Dam is provided. These areas are all used during spill events when flows are restored to these river reaches; however, the difficult access and lack of real-time flow information inhibit recreational use. To assess project effects on this recreation opportunity, the licensee needs to expand the geographic scope of the study to include informal recreation access areas identified by stakeholders.

In performing its NEPA analysis of project effects, we encourage FERC to carefully examine the study data in the recreation and whitewater boating study reports and stakeholder comments rather than GLHA's unsupported conclusions about the adequacy of formal and informal recreation sites. Given that GLHA has declined to prepare a Recreation Management Plan, we request that FERC develop appropriate PM&E measures that address project effects on recreational resources including adequate parking and river access. We also recommend that this study be read in conjunction with the operations model study, angler flow study, whitewater boating study, and the USGS gage study as these studies and potentially others are intended to address project effects on recreational resources. These measures should include flow and impoundment level notification, safety signage, parking, sanitation, recreation flow releases, and

improvements to access in impoundments, bypassed reaches in the Upper Gorge, Stone Dam, and Millinocket Stream, and riverine reaches affected by project operations.

**Whitewater Boating**

At the request of AW/AMC and following FERC's Study Plan Determination, GLHA conducted a whitewater boating study to assess project effects on whitewater boating opportunities on four river reaches in the project boundary: 1) Upper Gorge between Ripogenus Dam and McKay Station; 2) Below McKay Station to Debsconeag; 3) Millinocket Stream below Millinocket Lake Dam; and, 4) West Branch between Stone Dam and Shad Pond. The intent of the study is to assess potential whitewater boating opportunities and to identify the acceptable and optimal flow ranges for whitewater boating by individuals currently or potentially utilizing these river reaches under current or alternative modes of operation, evaluate the adequacy of put-in and take-out locations and the need for access improvements, and identify flow information needs that would support whitewater boating use. FERC-approved whitewater boating studies routinely follow the standard methodology as described in Whittaker et al., in "*Flows and Recreation: A guide to studies for river professionals"* (2005). This methodology is designed to assess the presence, quality, and preferred flow ranges for river-based boating resources in a stepwise manner. The process steps are generally 1) desktop analyses, 2) on-land feasibility assessment, and/or on-water single flow assessment, 3) on-water multiple flow assessment.

While AW/AMC requested that GLHA follow the full study methodology with appropriate off ramps before proceeding to the next stage, GLHA initially conducted only a Level 1 desktop analysis on each of the four river reaches identified by American Whitewater. The Level 1 component of the study was sufficient for the McKay Station and Millinocket Stream in that it confirmed that these two-river reaches provide valuable whitewater boating opportunities when sufficient flows are present.

The reach below McKay Station has long been considered the premier whitewater boating run in New England containing scenic gorges and powerful hydraulics that provide thrilling rafting and kayaking opportunities throughout the summer. While this region in Maine was once known for its paper mills that were the mainstay of the local economy, today the region is known for its outdoor recreation that drives the local economy. Rafting the West Branch below McKay Station draws tourists from throughout the country to experience the scenic views and rapids below the powerhouse. Whitewater boating flows from McKay Station are required under GLHA's current license and range from 1800 to 2300 cfs depending on the water year type and day of the week throughout the boating season. Whitewater boating below McKay Station results in no loss of generation.

In addition to the reach below McKay Station, Millinocket Stream below Millinocket Lake Dam has the potential to offer whitewater boating opportunities of a very different character. Over the past three years, the annual Millinocket X-Stream Canoe Race has been held on this section of the river. The race is a 7.3-mile whitewater race for canoes, kayaks, and paddle boards on the Millinocket Stream in Maine. This section is appropriate for both novice and intermediate boaters. The annual event has drawn up to 100 participants and demonstrated considerable paddler and spectator interest. Opportunities to boat on Millinocket Stream are extremely limited

due the GLHA's current operations that divert flows into Millinocket Lake into North Twin impoundment through pumping operations that leave Millinocket Stream without sufficient flows for boating throughout most of the year. The primary obstacles to recreational boating at Millinocket Stream are the lack of boatable minimum flows, pumping operations, the lack of real-time flow information, and the lack of scheduled boating releases required under the current license.

While the Level 1 analysis at McKay Station and Millinocket Stream was sufficient to identify minimum acceptable and optimal flow ranges and no further study was necessary on these two river reaches, insufficient information was obtained on the potential whitewater boating opportunities in the Upper Gorge and on the West Branch below Stone Dam and further study following the Whittaker methodology is warranted. While the Level 1 study was insufficient, it did provide limited information demonstrating the whitewater boating potential of the Upper Gorge and Stone dam sections.

Flows below Ripogenus Dam into the Upper Gorge dryway are infrequent due to GLHA's flow diversion at Ripogenus into the penstock for power generation. Local paddlers have boated this reach infrequently when inflows exceed the hydraulic capacity of McKay Station and impoundment storage is at maximum capacity. While there is no flow gage in the bypassed reach and GLHA does not report bypassed reach flows on the Safe Waters website, local boaters have reported that this reach contains highly valuable whitewater boating opportunities at a variety of flow levels.

At lower flows, perhaps 600 cfs by some reports, this reach provides intermediate boating above McKay Station. At higher flows, perhaps 1000 cfs, rapids become more challenging as hydraulics become more powerful. At a range of flow levels, paddlers have reported that paddling the Upper Gorge is important because it considerably lengthens the whitewater boating run through the Ripogenus Gorge below McKay Station by adding as many as six additional rapids to the run providing more appealing recreation opportunities for advanced and expert paddlers. Current minimum flows of 12 to 100 cfs are insufficient to provide whitewater boating opportunities in the Upper Gorge dryway. The primary obstacles to use of this river reach are the flow diversion, lack of boatable minimum flows, lack of scheduled releases, and the inadequacy of access from the Ripogenus hiking trail down to the river.

As with the Upper Gorge, the section of the West Branch below Stone Dam is a hidden whitewater boating resource that is largely dewatered by the Penobscot Mills project. With no required minimum flow below Stone Dam under the current license, the only flows present in this dewatered river reach come from leakage from flashboards, spill when inflows into Quakish Lake exceed the hydraulic capacity of the Millinocket Development, or backflow from Shad Pond. There is no real-time flow gage on the West Branch below Stone Dam and this information is not reported on the Safe Waters website. Access is also a major impediment to use as GLHA does not allow public access though its easement and accessing Stone Dam via Quakish Lake involves a 2-mile flat water paddle. Access may also be available to lands on the river right over lands controlled by Katahdin Forest Management.

Over the years, this section of the West Branch has been paddled by whitewater boaters at various flows, but not enough is known about minimum and optimal boating levels. At very high flows, this run provides a continuous series of Class III.IV rapids as the river approaches Grand Falls, a Class IV rapid with challenging hydraulics suitable for intermediate and advanced paddlers. At lower flow levels, the run is suitable for intermediate paddlers. At the request of American Whitewater, FERC required GLHA to proceed with the Level2 study phase including an on-water flow evaluation. As described in more detail in our Updated Study Report comments, GLHA has the capacity to release variable flows from its inflatable gate structure including flows of 2000 cfs to meet minimum downstream flow requirements when the Millinocket powerhouse trips offline. Through the Level 2 study phase, we intend to evaluated the boating potential of this river reach at this flow level and reserve the right to supplement our comments when the final study report is completed.

**Aesthetics**

GLHA was required to perform an aesthetics study to evaluate project effects on aesthetic view opportunities at both projects. Regrettably, this study was conducted in a way that poorly informs FERC NEPA analysis. Rather than evaluate the aesthetic effect of impoundment fluctuations, flow diversions, and peaking operations, GLHA randomly photographed lakes and omitted views that highlight degraded aesthetic view and then evaluated those views using its own paid consultant, and later, asked stakeholders to review those same photographs. In a subsequent phase, it allowed a study group to view these locations in person at additional locations, but the result was more of an anecdotal opinion survey rather than a systematic assessment of aesthetic impact of project operations. Missing from this study is an evaluation of shoreline aesthetics at minimum and maximum impoundment levels, as well as views of the Upper Gorge at various levels from both Ripogenus Dam and the lower Ripogenus Gorge. Comments filed by numerous stakeholder and comments at the scoping and study report meetings attest to the negative impact of project operations at impoundments and dewatered river reaches at the projects.

**Compliance Issues**

July 7, 2023 McKay Station Trip Event. FERC Compliance has not resolved the complaint regarding the event. No interim solution has been identified. Video obtained during the Ramping Study on July 14 and 24, 2024 shows that additional mortality can occur even when flows are reduced to 1000 cfs in the vicinity of the McKay Station hydro discharge.

Millinocket Stream Stocking. Recent stockings have violated the Penobscot Mill Project License, Article 413 that requires brook trout, three to a pound, be stocked in May. Additionally, larger brook trout are stocked in mid-October after local fishing interest has diminished. If this can't be corrected, other more effective mitigation should be discussed."

Holbrook Bypass flows. Flows provided during generator trip events violate Article 406 of the current license. The bypass was designed to provide flows when main river flows are in the 2400 cfs range. The bypass was designed to support the landlocked salmon population by providing needed juvenile recruits. When flows decrease, the bypass is no longer suitable landlocked

salmon rearing habitat. The habitat has largely been taken over by brook trout juveniles. “We simply request that the Licensee continue to operate and maintain the Holbrook Side Channel as outlined in the current license, Order approving recommendations of habitat improvement plan under Article 406.” [MDIFW PAD Comments October 8, 2021, page 12]. The bypass was a mitigation measure included in the current license, higher base flows restore this mitigation measure.

**FERC Process**

The Signatories request that an Environmental Impact Statement (EIS) be required for these relicensings in lieu of an Environmental Analysis (EA). This is necessary because of the size and complexity of the projects, and has the potential to highlight deficiencies in project studies.

**Preliminary NGO Request for New License Terms and Conditions**

The Signatories submit their list of desired features for incorporation into the new license as Attachment A.

**Conclusion**

The signatories appreciate the opportunity to submit these comments on the Draft License Application for the Ripogenus – Penobscot Mills relicensing.

Preliminary Stakeholders Requests for Inclusion in Ripogenus and Penobscot Mills License

# ATTACHMENT

# Preliminary Stakeholders Requests for Inclusion in the Ripogenus and Penobscot Mills Licenses

**Ripogenus-Chesuncook Lake**

1. Fill the lake to 940.6 (1 foot below full pond) by May 15th, drawdown no more than 1 foot every 28 days until July 31.

Justification:

a. Meets loon habitat and nesting requirements
b. Provides for smelt spawning and incubation
c. Promotes shorebird nesting
d. Potential protection of wood turtle reproductive sites
e. Maintains and stabilizes the littoral zone (plankton and juvenile smelt)
f. Provides water for summer recreation needs
g. Parallels MEDEP and MDIFW Operations Model requests
h. Provides water for summer recreation, fisheries and generation needs
i. Mirrors current plan for other project lakes
j. Meets or restores ME DEP water quality standards
k. Supported by GLHA Water Use Plan in current license

2. Maximum 1 foot lake drawdown per month from July 31-October 15, maintaining a minimum lake level of 935.6 on October 15

Justification:

a. Supported as possible (within 1 foot) by Ops Model run with minimal downstream impact
b. This was accomplished in 2013, a dry/average hydrologic year, while still generating 238,835 mw
c. Boat landings remain usable
d. Provides for the gradual drawdown cited in DLA and other GLHA submissions
e. Maintains aesthetic value of lakes
f. Provides safe lake access
g. Ensures remote campsites are safely accessible and aesthetically pleasing
h. Provides salmonid access to tributary streams
i. Provides improved angler access to the Upper West Branch (September)
j. This will provide habitat conditions at the confluence of Umbazookus Stream suitable for Lake Whitefish spawning activities: staging, spawning, and post spawning out migration. Allagash Stream offers nearby adult Lake White fish as a donor source therefore, a small undetected relic population may exist, and this elevation provides an opportunity for natural recolonization.

k. Reduces navigation hazards
l. Meets or restores ME DEP water quality standards
m. Supported by GLHA Water Use Plan in current license

3. Set the operating (when power is being generated) minimum at McKay Station flow at 2400 cfs during the biological growing season (May1 -October 15) and at 2200 cfs from October 16-april 30th

Justification:

a. Similar to how operated under Great Northern Paper and supported by the 1996 Flow Management Plan
b. The water is available if McKay Station operations are modified.
c. Meets Maine Department Water Quality Standards
d. Stabilize aquatic macroinvertebrate populations
e. Stabilize habitats for various fish populations
f. Restore fishing opportunity to its historic levels (1978-1991)

4. Provide river flows capable of meeting required Holbrook Bypass channel (article 406) flows or reengineer the Bypass gate system to meet the required flow during low flow events.

Justification:

a. The Bypass was designed to provide flows when main river flows are in the 2400 cfs range.
b. Support the Landlocked salmon population by providing needed juvenile recruits
c. When flows decrease, the Bypass is no longer suitable landlocked salmon rearing habitat. The habitat has largely been taken over by brook trout juveniles.
d. "We simply request that the Licensee continue to operate and maintain the Holbrook Side Channel as outlined in the current license, Order approving recommendations of habitat improvement plan under Article 406." [MDIFW PAD Comments October 8, 2021, page 12]
e. The bypass was a mitigation measure included in the current license, higher base flow restores this mitigation.

5. Water Upper Ripogenus Gorge year-round at higher than leakage flows with minimum flows of 350 cfs. From June 15 to September 15, this must be from a deep gate, not the sluiceway. These flows would be subtractive from summer whitewater flow requirements. Example: 2400 cfs would be supplied by 2050 cfs from McKay Station, 350 cfs from a deep gate release.

Justification:

a. Higher, year-round flows support fishing and aesthetics
b. Provides new whitewater paddling and buffers generator trip events
c. Water over the sluiceway currently provided is the warmest in the lake and does not provide the fishing flows the release was designed to provide. An IFIM from last relicensings shows the fisheries value. [Need quote, cite] 350 cfs has been requested by the whitewater community.

d. Current sluiceway 100 cfs sluiceway flows from July 1 to September 30 are attractive to fallfish, not the salmonids that are sought after recreationally. The 100 cfs does not achieve its design purpose.

e. Current dewatering practices (9 months out of the year) are contrary to Maine environmental law, the habitat cannot be considered unimpaired.

1. MRSA §467¶7C(1)c: From Ripogenus Dam through Ripogenus Gorge to the McKay powerhouse - Class B.
2. MRSA §465¶3A: "3. A. Class B waters must be of such quality that they are suitable for the designated uses of drinking water supply after treatment; fishing; agriculture; recreation in and on the water; industrial process and cooling water supply; hydroelectric power generation, except as prohibited under Title 12, section 403; navigation; and as habitat for fish and other aquatic life. The habitat must be characterized as unimpaired. [PL 2003, c. 227, §3 (AMD); PL 2003, c. 227, §9 (AFF); PL 2005, c. 561, §10 (AFF).]"
3. MRSA §466(11): "Unimpaired" means without a diminished capacity to support aquatic life."

f. 350 cfs minimum flows in Ripogenus Gorge would satisfy Maine statutory requirements for designated uses other than hydroelectric production: fishing, recreation and habitat.

6. Whitewater releases for Rip Gorge from 5/1-10/1, flows 1000 cfs, 1 weekend day weekly, 4 hours

Justification:

a. Ripogenus Gorge contains sufficient gradient and structure resulting in a continuous series of rapids between Ripogenus Dam and McKay Station suitable for intermediate to advances whitewater boaters

b. This reach is suitable at a range of flow levels with flows between 600 cfs to 1000+ having been identified as optimal.

c. Substantially extends the length of whitewater boating reach that would otherwise begin at McKay Station.

d. Operations Model indicates this is possible with little to no impact on project generation.

e. Whitewater boating study and comments by public indicate that there is substantial demand for boating in the Ripogenus Gorge dryway.

7. Require mid-winter assessment and reporting of snowpack, long and short-term weather forecasts, and impoundment levels to determine if operations modifications (e.g. reduced outflow) are necessary to secure water for spring refill.

Justification:

a. With greater energy demands predicted for the winter months (ISONE Report to Maine Legislature, Jan, 2023) this needs to be done to support spring refill.

8. USGS gauge installed to record and report levels and flows - located between Little and Big Eddy Pool. Include a temperature gage as is usually installed at a USGS flow gage site.

Justification:

a. The updated Study Report (USR) contains information in Appendix B.
b. Exact location would be determined by further study.
c. Implementation would be relatively easy to accomplish.
d. This is the new license provision with the highest likelihood of adoption.

9. Lake level elevations for all sites (including storage ponds) reported on Safe Waters.

Justification:

a. Lake boaters need to know this information for safe navigation and to be able to anticipate the condition of the boat landings, and other access.
b. Relatively easy to accomplish
c. This is public information that is currently available for North Twin and Millinocket Lakes

10. Set minimum flows for trip events and other conditions based on empirical data.

Justification:

a. There is no study data to support minimum flows in the current license and minimum safe flows are unknown> 1422 cfs is the aquatic base flow based on a rough guideline, 1300 cfs is unsupported by data, 1000 cfs is a round number, 400 or 500 cfs has been demonstrated to strand and kill fish and macro-invertebrates.
b. TU repeatedly requested flows below 1000 cfs during the Ramping Study that Brookfield refused to provide
c. Reports from ramping Study volunteer observers were that even at flows of nominal 1000 cfs in the reach below Little Ambejackmockamus Falls known to be a major spawning area, some gravels were exposed and others were covered only by 2 to 3 inches of water.
d. Ramping Study volunteers reported stranded, dewatered caddis larvae with minimum mobility that were exposed during nominal 1000 cfs flows
e. Without further study, biologically appropriate minimum flows must be assumed to be aquatic base flows of 1422 cfs per longstanding USFWS guidance for the Northeastern United States [USFWS Interim Regional Policy for New England Stream Flow Recommendations, dated May 11, 1999].

11. Adopt conditions that restrict peaking TDB maintain 1800 to 2400 cfs flows during the growing period, May 1 to October 15.

Justification:

a. MDIWF request: [MDIFW PAD Comments October 8, 2021, page 12] “As the literature is replete with examples of the detrimental impacts on the riverine fisheries and aquatic communities from rapid changes in flow, and that the literature indicates that flow changes of less than 25% per hour (ramping rate) can mitigate impacts from peaking power, we request flow records to evaluate the frequency of flow changes that exceed 25%.”

b. Reduce caddis mortality, especially Hydropsyche and Rhyacophila.

c. Reduce strandings shown to occur when switching between one, two or three generator operations.

d. Improved flow stability benefiting overall health of the system.

12. Decrease the number and severity of “flow excursions” through automated flow restoration at Rip/McKay and/or restore dam keeper

Justification:

a. Generator trip events that were demonstrated to strand and kill fish and macro-invertebrates. happen on the average of once a year and last for over 4 hours according to Brookfield’s own data. This is unacceptable.

b. Automated Rip deep gates or reinstalling a dam keeper would result in reducing down time and provided for Brookfield’s stated concerns for safety in Ripogenus Gorge.

c. Brookfield’s stated concerns for safety in the Ripogenus Gorge are unsupported by logic or study data. They are only designed to keep from having to water Ripogenus Gorge.

13. Develop an operational Ripogenus project “Rule Curve” based on 1972 to -present mass inflow data and a full pond elevation of 941.6 feet. This will provide lake level guidance and should include a drought or "low water" year plan.

Justification:

a. Currently, Chesuncook, Caribou and Ripogenus lakes water is the “go to” source of water during drought years, causing profound drawdowns and associated negative impacts

b. Low water modifications need to be spread across all user groups

c. As with above requests, items 1-3, this will protect fisheries, aquatic communities, commercial, private and public recreational users and public recreational sites.

d. Rule curve will help secure year-round water storage

e. Used successfully by Great Northern Paper from 1972-2002 and accepted by FERC in the 1996 Environment Impact Statement.

14. Restore whitefish to Ripogenus - Chesuncook Lake

Justification:

a. Whitefish present in last relicensing.

b. Whitefish not sampled in latest assemblage studies.

c. Project operations a major factor in extirpation. Varying lake levels are the most likely cause.

**Penobscot Mills**

1.Reduce minimum flows from North Twin from 2000 cfs to 1500 cfs

Justification:

a. Maintain upstream lake levels and all associated benefits.
b. Only lowers North Twin .7 feet during the recreational season according to the Ops Model.
c. Adequate for downstream requirements.
d. Provides additional flexibility for releases upstream.
e. Need for downstream dilution no longer exists.

2. Water the West Branch below Quakish Lake / Stone Dam year-round with more than leakage flows of 700 to 1000 cfs minimum flow.

Justification:

a. This would maintain macroinvertebrates and landlocked salmon fishery of all life stages, not just brook trout and juveniles.
b. This could provide a new year-round fishery
c. Brookfield's aquatic habitat study shows that higher flows would support adult salmon and brook trout fisheries
d. This would provide new paddling and whitewater opportunities
e. Current operations are contrary to Maine Statutes

MRSA §467¶7C(1)f: From the outlet of Ferguson and Quakish Lakes to its confluence with Millinocket Stream - Class C.

MSR Title 38 §465(4). "4. Class C waters. Class C shall be the 4th highest classification.

A. Class C waters must be of such quality that they are suitable for the designated uses of drinking water supply after treatment; fishing; agriculture; recreation in and on the water; industrial process and cooling water supply; hydroelectric power generation, except as prohibited under Title 12, section 403; navigation; and as a habitat for fish and other aquatic life.

B. Class C waters must be of sufficient quality to support all species of fish indigenous to those waters and to maintain the structure and function of the resident biological community…"

C. Discharges to Class C waters may cause some changes to aquatic life, except that the receiving waters must be of sufficient quality to support all species of fish indigenous to the receiving waters and maintain the structure and function of the resident biological community."

f. This would need Maine statutory requirements for designated uses other than hydroelectric production: fishing, recreation and habitat
g. Watering the reach would be compliant with the EPA's April 2024 ruling regarding access to resources in ceded Native American lands. "The U.S. Environmental Protection Agency (EPA) is finalizing revisions to the Clean Water Act (CWA) water quality standards (WQS) regulation to add requirements for states establishing WQS in waters where Tribes hold and assert rights to CWA-protected aquatic and aquatic-dependent resources reserved through treaties, statutes, or Executive orders." [A Rule by the Environmental Protection Agency on 05/02/2024. Citation: 89 FR 35717]

h. Watering the main channel instead of diverting the water to the Millinocket Project would not affect downstream minimum flow requirements.

i. The only objection to higher flows is that the water would no longer be used for generation, and Brookfield's profits would suffer.

3. Establish fish passage for indigenous anadromous species over their former range, upstream extent: Shad Pond and Millinocket Stream and eel passage in Penobscot Mills System. River herring include alewives and blueback herring.

Justification:

a. These waters are within the historical range of anadromous fish.

b. The Penobscot Indian Nation was promised a sustenance fishery in the Penobscot that has yet to be delivered. This would be a step in restoring the fishery.

c. Restoration of anadromous species would improve the overall health of the watershed.

d. Restoration would aid Atlantic salmon restoration in the greater watershed, especially in the critical Atlantic salmon habitat that is downstream.

e. NGOs should support MDMR requests

f. "Put shad back in Shad Pond."

g. MDIFW has expressed concerns that this would introduce invasive species. A sorting facility could prevent this problem.

h. Denying fish passage to indigenous species is contrary to Maine statute as interpreted by the courts;

S.D. Warren Company v. Board of Environmental Protection, 2005 ME 27, 868 A.2d 210 (2005) ("S.D. Warren I"); S.D. Warren Company v. Board of Environmental Protection, 547 US 370 (2006) ("S.D. Warren II"). In S.D. Warren I at 442, the Court concluded that the narrative criteria at 38 M.R.S.A. § 465, which requires waters "of sufficient quality to support all indigenous fish species," was intended to be an integral part of the water quality standards for the BEP to consider. The Court also concluded, based upon the specificity of the designated uses at 38 M.R.S.A. § 465, that the Legislature's purpose for the language "suitable for the designated uses" was "that the designated uses actually be present." The court also stated that when those uses are not presently being achieved, the Legislature intended the quality of the water be enhanced so that the uses are achieved (internal citations omitted).

4. Provide whitewater releases into the West Branch below Stone Dam 1 weekend day weekly at 2300 cfs for 4 hours from 5/1-10/1.

Justification:

a. The West Branch between Stone Dam and Shad Pond contains sufficient gradient and structure to provide high quality whitewater boating opportunities with sufficient flows.

b. Continuous Class II/III rapids at suitable flows.

c. Grand Falls is a significant Class III/IV whitewater boating feature.

d. Aesthetic views of the West Branch below Stone Dam from the water are exceptional.

e. Whitewater boating opportunities are available at a range of flows above 1000 cfs with optimal flows being estimated as above 2000 cfs. Boating study is ongoing.

f. GLHA has the ability to release at least 2000 cfs through its inflatable gate structure that provides pond level control according to its LIHI application.
g. Operations Model indicates this is possible with little impact on generation.

5. Provide whitewater releases into Millinocket Stream on 1 weekend day weekly at 600 cfs for 4 hours from 5/1-10/1.

Justification:

a. Scenic Class II river reach below Millinocket Lake and Millinocket
b. Current 60 cfs minimum flow inadequate for boating
c. Annual Millinocket X-Treme Canoe Race demonstrates strong recreation demand
d. 600 cfs provides optimal flow for novice boaters
e. Water from Millinocket Lake pumped to North Twin for generation, reducing flows available for recreation on Millinocket Lake.
f. No effect on generation based on Operations Model.

6. Ceasing pumping at Millinocket Lake 5/1 - 10/1

Justification:

a. No pumping from Millinocket Lake into North Twin during summer boating season.
b. Pumping would still occur during higher flow period (e.g., spring freshet).
c. Pumping allowed when the project would otherwise spill utilizing excess water.
d. Little effect on generation.
e. Reserve water in Millinocket Lake for recreational use in Millinocket Stream during the recreational boating season.

**General Project Requests to Enhance Recreation**

1. Add lands to project boundary

Justification:

a. Recreation sites and recreation access related to project effects and operations should be included in the project boundary, which may include, but not limited to:
b. Vehicle access, including parking, to the Penobscot River at Stone Dam
c. Vehicle access, including parking, to the Millinocket Lake outlet
d. The public should be allowed to visit and enjoy these areas and to access the Penobscot River below Stone Dam and Millinocket Stream below Millinocket Lake for whitewater paddling, fishing, and other purposes.
e. Since flows are controlled by the licensee into these river reaches, the licensee should be required to provide public access.

2. Protect/maintain parking for fishing access sites along the Golden Road and below Telos Bridge

Justification:

a. The Golden Road is being allowed to change to gravel from paved road.
b. Plowing is obscuring pull offs for parking to access popular fishing spots.
c. Photos taken July 25, 2024 graphically illustrate the problem
d. There is a growing safety hazard from logging trucks.
e. A mechanism needs to be in place to protect parking over the 40-year span of the new license.

3. Improve Gorge Trail improvements to include new signage of parking areas, a kiosk, map of the trail showing scenic overlooks, length and slope, as well as showing trail access to the river. The trail needs more regular maintenance to clear back overgrowth, remove blowdowns, and fix drainage issues. Side trails need to be developed and added to connect to water level creating a trail network for public use.

Justification:

a. Assess will be needed to access improved fishing and paddling opportunities that minimum flows in Ripogenus Gorge will provide.
b. Aesthetics study does not provide photos showing contrasting flow levels in Upper Ripogenus Gorge.
c. NGOs working with local groups and individuals to obtain photos of the gorge at various flow levels.

4. Develop a comprehensive Recreation Management Plan that includes a robust maintenance schedule for all recreation sites, in collaboration with stakeholders, including but not limited to:

- Significant increases in the size of parking lots at launch sites at the project lakes. Almost every survey and focus group identifying parking as far too limited at boat ramps and launch sites.
- Rebuild boat launches that are too steep and not meeting user expectations such as Dead Man's Curve, and McKay Station which is both an extremely long walk for private boaters and on very uneven terrain.
- Correct deficiencies with boat launch docks noted by some users.
- Consistent kiosks, signage and maps at all recreation sites that shows all natural and recreational features that a user map encounter, as well as public safety information.
- A winter recreation specific map, focused on snowmobile, cross-country skiing and other winter activities that frequently use project boat launches for access to frozen lakes. Develop and coordinate with the greater Millinocket winter trail network to establish a comprehensive winter recreation plan.
- Providing real-time data of lake elevation levels for motorized and non-motorized users.
- Add new public access as a FERC approved recreation site to the Stone Dam site, perhaps along the existing GHLA road at the toe of Stone Dam from the east or through the Wildlife Management Area.
- Add new public access as a FERC approved recreation site at the outlet of Millinocket Lake to Millinocket Stream, perhaps along the existing road from the west used by GHLA to access the outlet.

- Add additional public access sites to the Wildlife Management area providing for more clear information and access for public use of these 2,300 acres for hunting, fishing, hiking, camping, dispersed recreation, and environmental education of the wildlife management activities taking place. A specific property management plan for this site, in concert with wildlife managers, should be developed to allow for increased and robust public uses for recreation while maintaining habitat values.

Justification:

a. The trails, recreation sites, and boat launches need to be monitored and maintained to ensure best access and experience, and maintenance plans should be developed and included in a comprehensive recreation management plan.

b. Trails, recreation sites, and boat launches are lacking basic amenities that the public demands, such as sufficient parking, docks, kiosks with recreation maps and other information, clearly marked signage of parking areas and directional signage to recreation sites, trailblazes, and seasonally appropriate information such as winter snowmobiling route finding and points of interest in the winter that may differ from the warm seasons.

c. New public access points are needed below Stone Dam, at the Millinocket Lake outlet, and the Wildlife Management Area.

d. The Wildlife Management Area represents a very large land area in the project boundary that can be better utilized for public use and enjoyment. The access road off of Route 11 has no signage, information about recreation opportunities or wildlife management activities, and is not integrated in the growing outdoor recreation amenities offered in the greated Millinocket area. Even community generated content on sites like AllTrails and Strava shows that the public is not visiting this area. A comprehensive site management plan should be developed in concert with stakeholder to fully realize the potential of these lands and the access that they provide to the Penobscot River below Stone Dam.

e. Users consistently reported in surveys and focus groups that parking at almost all boat launch sites was inadequate and that parking lots were frequently at capacity.

f. Access at Stone Dam and at the Millinocket Lake outlet are needed for project related recreation.

g. Expand winter recreation opportunities and coordinate them with surrounding landowners.

h. Some commenters found boat launches to be too steep and hard to use.

5. Remove fencing by around project facilities, McKay Station.

Justification:

a. MDIFW requested stream access to project sites are presently blocked by fencing.

b. Fencing needs to be removed at McKay Station, North Twin and Mill One.

c. Access needs to be provided at Stone Dam and the Dolby tailrace to support fishing and paddling recreational uses.

6. Improve access to the Debsconeag Falls area to support fishing and boating.

Justification:

a. Debsconeag Falls is a solid class 4/5 rapid located just over 2 miles below the existing Nevers Corner take out for commercial rafting. It would offer an excellent addition to the whitewater currently offered in the area but is almost never used by either private boaters or the commercial industry due to the poor quality of the access road leading to it.
b. It also offers an additional strong fishing opportunity that suffers the same lack of use.
c. Improvement of the road would provide additional class 4/5 boating opportunity and increased fishing opportunity with no change in flows from the baseline.
d. Adds opportunity without system management changes.

7. Establish boating/rafting/fishing access near Abol Bridge, on river right just below the bridge, or at another suitable site in the area with suitable parking.

Justification:

a. Demand for softer adventure on the river has grown at a time when the Rafting industry as a whole has contracted.
b. Providing a suitable access or egress point at Abol Bridge would allow for better service and accommodation for the growing user group that seeks softer adventure than is currently available on the West Branch of the Penobscot

8. Provide boat (launching) access to the base of Pockwockamus Falls, an historical May-early June fishing (boat) fishing area

Justification:

a. Needed to access the resource.
b. This access is frequently used by fishermen and women and boaters seeking to avoid the more difficult whitewater above.

9. Provide access by road to the east bank of the West Branch below Stone Dam.

Justification:

a. Providing minimum flows below Stone Dam at any reasonable level will provide fishing, paddling and perhaps whitewater opportunities.
b. Currently, the west shore is accessible using logging trails.
c. There is no good access from the east shore.
d. Paddlers assess the reach by a long paddle across Quakish Lake. This will be unacceptable once the reach is watered.
e. Owner Katahdin Forest Management may be amenable to the proposal.

**Recreations facilities improvements at specific sites -** Parking, ramp, amenities at launches

1. Chesuncook Dam Boat Launch - maintain site of, and primitive nature of launch with the following improvements: remove large boulders and improve substrate of launch to the 935.1 water

level, build a wind break on the northwest side of ramp, pay for and expand winter plowing, annual maintenance of ramp to repair erosion and ice damage.

Justification:

a. Provides safe, reliable access to project waters including public campsites
b. Enhances the safety of boats and trailers being launched. Currently there is repeated damage to these.
c. Supports commercial businesses
d. Ensures safe navigation between and within project lakes
e. Protects aesthetics of lakes and campsites
f. Ops Model Study demonstrates this as possible with minimum impact

2. Caribou Lake Boat Launch - increase parking both summer and winter, annual maintenance of ramp to repair erosion and ice damage. Maintain a usable water level of 936.7 or higher, as indicated in the Recreation Study from May 15th to the end of Labor Day weekend

Justification:

a. This is the level the boat launch is usable according to the Recreational Study
b. Provides safe, reliable access to lakes
c. Ensures safe navigation of project lakes
d. Supports commercial businesses
e. Protects aesthetics of lakes and campsites

3. Ambajejus Boat Launch/Millinocket Lake Boat Launch - Provide Adequate parking

Justification:

a. Current parking is inadequate during times of peak use: weekend and holidays.
b. Restricts access to both Ambejejus and Millinocket Lakes.
c. Appears to be within the project boundary.
d. Photos will be provided documenting the problem

Debbie-Anne A. Reese, Acting Secretary
Federal Energy Regulatory Commission
888 First Street, NE
Washington, DC 20426

August 11, 2024

**Subject: Ripogenus Hydroelectric Project (FERC No. 2572-133)**
**Penobscot Mills Hydroelectric Project (FERC No. 2458-247)C**

Comments and study request supplemental to August 1, 2024 JOINT NGO STAKEHOLDER COMMENTS ON DRAFT LICENSE APPLICATION

**Dear Secretary Reese:** **Via Electronic Filing**

This filing is supplemental to the joint Stakeholder comments of August 1, 2024. My filing seeks to expand and detail fish and aquatic communities( and angler issues, only briefly or not mentioned, in the joint Stakeholder comments and attachment. These critical areas of concern were mostly ignored in the Draft License Application (DLA).

The Operations Model continues to be the cornerstone of the licensing effort. Despite the presentation of a well-done work product, this model is flawed. The lack of incorporating in-system inflow information, the use of generation as a default value, and the inclusions of theoretical spill and flood events at Ripogenus Dam makes the modeling result problematic. I continue my requests for an independent peer-reviewed water use model.

The DLA appears to duplicate the June 18, 2021 Licensee's PAD. This is disappointing. While continually repeating the theme that nothing has changed since the issuance of the 1996 FERC License, the Licensee continues to foist its opinions on Agencies, stakeholders and FERC staff by citing legal statutes, and fragmentary study results. Nothing could be further from the truth, and the Licensee needs to be forced to prove its case.

The existing License was based on Great Northen Paper (GNP) production and accompanying power demands. Hydro-generation was 24x7 and daily minimum operating flows were never considered by FERC or MeDEP; neither was lake level management as GNP needed storage to meet winter power demands. Following the "Rule Curve" was a necessity. When the Licensee assumed control of daily flow management, the existing Licensee and its "loopholes" provided an operational bonanza not foreseen by those of us involved in the 1991-1996 Licensing event. The current mode of operation has been an environmental disaster. Fish, aquatic communities, and angling have all suffered. The separate Ripogenus and Penobscot Mills Projects relicensing events offer the agencies a chance to correct past unforeseeable errors

The most salient issue that demonstrates the degradation of the Ripogenus Project is the Ripogenus Impoundment's earlier and extreme drawdown that resulted in the expatriation of Lake whitefish. With the change in ownership, operations shifted from the gradual drawdown of the Great Northen Paper era to the current generate and drain mode of storage management. Lake Whitefish are a species of priority to Maine Department of Inland Fisheries and Wildlife (MeDIFW). Some form of remediation is needed. Several possibilities exist. One being hoping for a small relic population e.g., a handful of adult fish, which might repopulate the Chesuncook basin if suitable lake elevations e.g., 936 ft, were present in

November. The MeDIFW comments "MeDIFW believes that changes in water level management may be the of reason for these declines" (1991 Rip Application) and August 1, 2024 echoed these thoughts.

Central to the Ripogenus Project (Project) issues are fish and aquatic communities of the Ripogenus Impoundment. Juvenile fish (namely smelt), insects, and plankton populations feed not only the impoundment's fish communities but also the fish populations downstream West Branch of the Penobscot River (West Branch). This aquatic biological interaction cannot be understated. What happens in Ripogenus happens in the West Branch.

Landlocked salmon (salmon) are the principal Ripogenus Project sport fish. Salmon, as sub-adult and adults are dependent on Rainbow smelt (smelt) and favor juvenile smelt. Based on MeDIFW's 2020-2023 Ripogenus Impoundment salmon stomach analysis and GNP samples (see 1991 Application), smelt less than four an half inches are exclusively utilized as forage by salmon. Larger smelt are not useful to the Project's salmon populations. Without the presence of an abundant juvenile smelt population, the impoundment and downstream salmon population will continue to fail to meet MeDIFW management goals.

Currently there is extremely limited information on the current Ripogenus Impoundment smelt population. This information is from MeDIFW's limited 2021 time-available smelt drift net collections downstream of McKay Station. When compared to the historical 26,000 pound (1983-1988) annual average, this 2021 study collected a dismal few smelt. As a result of poor juvenile smelt production and export during the last 20 years impoundment and riverine salmon growth has declined (see accession numbers 20230929-5100 and 20240719-5207 and 2023 fish assemblage studies). Information on the status of the Ripogenus Impoundment juvenile smelt population as reflected by West Branch smelt "drift" is needed. FERC should request smelt collections, presumably through (yearlong) weekly West Branch drift net sampling.

The status of Ripogenus Impoundment plankton and macroinvertebrate communities has been overlooked by the Licensee and in the resulting DLA. These guilds that are dependent on littoral areas and juvenile smelt are dependent on zooplankton abundance as a food source. Lost or shifts in littoral areas have impacted plankton communities and shifted the age structure of the impoundment's smelt population (see fish assemblage study). Although smelt have been occasionally observed in early May, small juvenile smelt are no longer observed floating down the West Branch or washed up on the shore of the Big Eddy. As a result, West Branch salmon no longer meet the 18 inch average length reported in the 1996 EIS.

In addition to the lack of juvenile smelt, aquatic macro invertebrates are no longer providing a food source to West Branch salmonids at historical levels (see Appendix C, Table 5.2.30). Mayfly hatches were sparse/non existent in mid river areas during late May, and caddis hatches were reduced during June and July (personal observations). As noted in earlier filing, aquatic insects (namely caddis flies) provide a critical summer maintenance diet to sub adult and adult salmon. Aquatic macro invertebrates are vulnerable to sudden shifts in flow as well as low flow events that constrict aquatic habitats. Higher McKay Station minimum operating flows may be required, additional habitat-based flow studies are needed.

The combination of a shift in market driven power production that along with the Project lake level management, caused a loss of smelt drift and the resultant poor salmon growth. This is reflected in the reduction in West Branch angler use. Historically (1973 – 1991) angling effort extended from the Abol

Bridge Campground upstream to McKay Station. Peak angler use exceeded 7,000 angler days in 1985 and again in 1988 (Ripogenus Project Application Vol II Table E3.1-4). Current West Branch angler effort is limited and concentrated to the upper mile and a half of river (personal observations) with the exception being Nesowadenhunk Falls. Angling is a form of recreation. However, in several "recreation surveys" anglers and angler effort were effectively ignored. The lack of a person (survey clerk) to perform on-site interviews results in a major data void. The impact on fishing opportunity as flows dramatically rise and fall has reduced fishability, namely the ability to wade. Angling is a designated use. Fishing effort, catch, and access must be described and then restored to their historical levels.

While the joint Stakeholder's filing encompassed most boating issues, there was no mention of West Branch anglers who fish from watercraft. Low McKay flows impact launching and loading canoes, boats, and large float tubes. Most notable of these access problems are loading and unloading relatively heavy Drift boats, an angling method used by West Branch guides when fishing the Big Eddy -Little A, and Horserace reaches. However, any watercraft user, motorized or not, will find launching and loading a boat, canoe or float tube at Little Ambejackmockamus and Nesowadenhunk Deadwaters and the site a half mile below Nesowadenhunk Stream impossible as flows approach 1800 cfs.

The August 1, 2024 filing speaks of flows but generally in terms of boating needs. Boating, aquatic and fish communities' flow goals are generally compatible, and request for short term releases e.g., kayaking, are no different than occasional historical flow "bumps". However, while boaters do not need daylong flows, macroinvertebrate and fish communities require 24x7 protection. Therefore, minimum operating (when power is being generated) flows are required to protect immobile aquatic insects and juvenile fish, namely salmonids. There is no need for additional studies, as historic (GNP) baseflow of 2400 cfs are known to protect all aquatic resources.

The current license includes two somewhat arbitrary West Branch flow requirements. The spawning and incubation flow based Is on an ABF recommendation of 1422 and includes provisions for low fall inflows. Outage flows of more than three days in duration are either the 1991 License application suggested 1300 cfs, or the current 1000cfs flow that is based solely on turbine efficiency. Neither of these requirements are based on empirical data. The spawning and incubation flow requirements or goals are linked to storage and inflows in early November. However, these somewhat random flow prescriptions fail to consider the redd's ability to meet late winter (salmonid) incubation flow goals. At issue, and totally overlooked, is the suitability of potential spawning areas at these lower flows. Substrate(s) (gravel, cobble) depths and upwelling flows need to be identified and their location noted. The ability of these redds, at yet to be discovered spawning sites, to survive super-cooled flows (anchor ice) during the winter needs to be investigated. Low West Branch winer flows need to be addressed through on-site studies.

The recently conducted ramping study was an example of the Licensee' s continuing effort to obfuscate facts. While the Licensee's consultant performed in a well-organized and professional manner, the study design doomed the outcome. Aquatic insects are known to be vulnerable to sudden flow changes. There was no attempt to collect drifting aquatic insects before, during and flows were return to normal. This was a major mistake. Shutting down two McKay Units is not a gradual, staged shutdown over a defined (30-60 minute) time period. What I learned from my assigned site above Little A Falls was that it took approximately 75 minutes for a rapid change in pool elevation to occur. I also saw dead and stranded salmon and aquatic insects (stoneflies were the most visible) but that was not new information. An additional study will only kill more juvenile fish, (and) aquatic insects; boating and fishing opportunities with little gain. I suggest that FERC staff simply recommend a ramping rate, perhaps 25% every hour.

The DLA continues to boast of the North Twin salmon spawning tributary access results. This study, while well executed and presented, was essentially a duplication of GNP earlier efforts, albeit ignoring MeDIFW's request for radio tagging. The tributary study was conducted without any proof of salmon being present before, during or after spawning activity . Shore spawning was addressed in what can be best described as a "desk top study". The few Redds location in the lower section of Nahmakanta Strem were from an unknown source. The Licensee is again attempting to gas light the readers; "*a telemetry study is not necessary to establish the timing of or location of spawning areas, as the timing and location of landlocked salmon spawning.....*" (Responses to Comments on the USR July 30. 2024). Where did the fish originate and where did they go? I ask that FERC require a radio telemetry with 30 adult salmon from each of the Pemadumcook and South Twin basins.

The current FERC Licensee is more energy generating friendly than any new Licensee. For this reason, the Licensee is in no hurry to obtain a new licensee. The ongoing licensing process is likely to continue for another two to three years; post licensing studies even longer. Ongoing studies have been at the Licensee's control with study execution malleable. Some independent oversight is needed. I continue to urge FERC to require the Licensee to provide funding to MeDIFW for a full-time staff position dedicated to current needs i.e., smelt drift net collection data and angler surveys, as well as future licensing needs.

The Fish and aquatic communities of the Ripogenus Project need to be returned to the 1996 levels. Currently, little in-situ biological information on lake dwelling smelt and plankton and riverine angler use is available. This paucity of aquatic data and angler use needs to be addressed. Thank you for providing me with the opportunity to expand the initial stakeholder comments and requests along with raising several issues not previously mentioned.

Subject: **Follow-on NGO Requests for Ops Model Runs for the Ripogenus Project (P-2572) and the Penobscot Mills Project (P-2458)**

Dear Acting Secretary Reese:

American Whitewater, the Appalachian Mountain Club, Caribou and Chesuncook Lake Camp Associations, Allagash Gateway Campground, Andre Emerson Cushing Corporation and Maine Council of Trout Unlimited ("NGOs" or "signatories") submit this follow-on request for Ops Model runs in response to the Great Lakes Hydro America, LLC ("Brookfield") letter dated February 5, 2024, Subject: Ripogenus Hydroelectric Project (FERC No. 2572-133) Penobscot Mills Hydroelectric Project (FERC No. 2458-247) Operations Model Technical Workshop Follow-up. Per discussions at the Ops Model Meeting held in Bangor on July 10, 2024, we believe that this represents a timely submission.

**Background.**

NGOs previously submitted their joint request for Ops Model Runs by their letter dated March 5, 2024. The requests represented the major user groups and stakeholders of the river and lakes, including fishermen and women on both the lakes and rivers, whitewater boaters, hikers, canoeists, campers at public campsites, and camp owners. We asked that special consideration be given to these requests. Brookfield chose not to run all the requests. The NGOs have been working as a unified group to refine our original request to better support user needs, the requirements of the Federal Power Act, and the requirements of applicable Maine environmental statutes.

**Model Run Requests.**

The model runs specified in Attachment A need to be run to cover a wider range of options than Brookfield has allowed. Our analysis leads us to believe the parameters we have developed to define these runs are feasible. These runs are essential to understanding the full range of feasible operating parameters for the projects. Once the results of these runs have been obtained, the NGOs will be able to refine the features they wish to be included in the new license beyond those listed in their Draft License Application (DLA) Comments.

**Issues.**

Lake Level. A basic conflict remains regarding what is the maximum fill level that should be permitted for an Ops Model run. Brookfield maintains that this should be 939 feet. Brookfield's justification for the lower fill level centers around flood control. They have not supported it with data. The burden is on Brookfield to justify their position, and the signatories assert that if Brookfield intends to maintain this stance that they must provide an engineering study, formal risk assessment, emergency cction plan, or other documentation that demonstrates what remains an uncorroborated assertion.

The NGO maintain that 941.6 feet is the actual fill limit of Ripogenus – Chesuncook – Caribou Lake. This is supported by:

1. Any map published within the last 100 years that shows the lake elevation as 942 feet.
2. That 941.6 is the level specified in the current license.
3. Brookfield's own signage at the McKay Station shows the "NORMAL HIGH WATER" elevation as 941.59 feet. The sign used to be located near the powerhouse but has been moved to the upper parking area. Photo 1 is a partial image of the sign. Please note that the top of the intake structure is a foot higher.
4. Data Brookfield submitted shows that on most years, it has filled the lake to over 939 feet. Operations data from 2010-2022 shows lake elevation on May 15th at 940 asl or above every year except 2012, 2013, 2015, 2016 and 2021.[1]

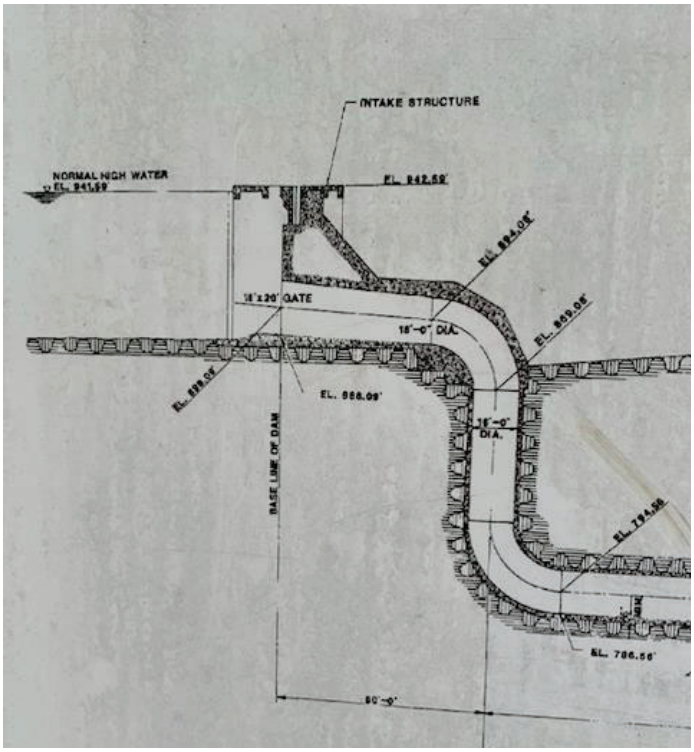

Photo 1

5. Those who have known Ripogenus – Chesuncook – Caribou Lake over the years know that Great Northern Paper filled the lake fully for years without incident. Attachment B is an affidavit attesting to that fact. The NGOs expect that more affidavits will be executed in the upcoming weeks and months with similar content.

This request gives some leeway and requests that the fill height of 940.6 feet be used for the spring fill height.

[1] Hourly Operations Data (2000-2022) filed electronically in MS Excel format) (Supplement to the Historic Operations Data Assessment Study Report filed as Appendix A of the April 22, 2023 Initial Study Report.

Accurate baseline data: Target elevations for the lakes above Ripogenus Dam as listed in the Operations Model Study are 939 on both May 10 and July 1, yet in all of Baseline 3 models the elevation is 937 and 937.2 for May and June, and 935. 1 for July. These numbers are claimed to be the average elevations from 1999-2021. This is yet another misuse of mathematical data. Averages are used when there are no outliers. Median is the more accurate measurement to use when a data set has outliers, as impoundment elevations most certainly do. Using data from 2000 - 2022 provided by the applicant, the median lake elevation on May 15 is 939.78, on June 939.44 and on July 1, 938.28. These differences are significant and serve to skew data. We request that Baseline 3 be modified with accurate data.

From Operations Study[2]

| | |
|---|---|
| May 10 | 939 |
| Jul 1 | 939 |

From Operations Model Baseline 3[3]

| | |
|---|---|
| May | 937.0 |
| June | 937.2 |
| July | 935.1 |

Overall Accuracy of the Ops Model. Inconsistencies like the one noted above continue to erode confidence in the Ops Model. After using words like calibration and validation during the Ops Model Workshop, Brookfield subsequently revised the key model feature: effects of flow regimes from McKay Station on lake levels on Ripogenus – Chesuncook – Caribou. Lack of a flow gage on the West Branch below McKay Station requires that a number of assumptions must be made regarding this complex river system. Prior concerns stated by NGOs and individuals regarding the accuracy of the model remain a matter of record.

Minimum flow. 1422 cfs is the spawning and incubation flow specified in the current license, and a preliminary analysis of the Ramping Study indicates that this may be a safe flow. Until Brookfield can produce data showing lower flows do not cause significant stranding and mortality, this is the flow that should be used as a minimum, and this is reflected in our Ops Model run request. The Ramping Study (results currently unpublished) shows that there is stranding and mortality at 1000 cfs. The dead brook trout in Photo 2 taken by volunteer Team 2 on July 17, 2024 illustrates this; over 40 stranded fish were photographed across from the McKay Station discharge that would have died if the 1000 cfs study flow had been allowed to persist. The Stranding Study conducted in October of 2022 conclusively demonstrated that extensive stranding and mortality occur during generator trip events that drop flows to 500 cfs.

Photo 2

[3] Operations Model Logic and Validation Report 2024, Appendix B93; Operations Model Study Report, page 56, Table 2 with explanation on page 13.

Cold water flow through upper Ripogenus Gorge. Brookfield rejected the request for an Ops Model run for "Release of a minimum flow of 300 cfs through the deep gates except during periods when overflow would put 300 cfs into the upper gorge."[4] Based on further analysis, the NGOs have changed this request to 350 cfs. It should be noted that this request is subtractive. Example: if the whitewater minimum flow was 2400 cfs, 2050 cfs would be released through the generators, 350 cfs from a cold-water source, see remarks below regarding costs. For this reason, it should be assumed to be feasible. Required total whitewater flows would not be affected by this request.

**Additional concerns**

Ramping. Ramping should be implemented in the new license to decrease stranding and mortality per MDIFW guidance: "Changes in hourly rates of flow in the West Branch of the Penobscot River downstream of the Ripogenus Project to be limited to no more than 25%."[5] The NGOs do not see this as needing to be reflected in Ops Model run requests.

**Conclusion**

The signatories appreciate the opportunity to submit this request and trust that it will be run as requested.

# Requests for Additional Operations Model Runs

## Lake Level Scenario Requests

**Request 1:**

This is a slight modification of what was titled Scenario No. 3 in the first model runs.
***We request it be rerun using 940.1 as full pond.****

- **Ripogenus Lake Elevation:**
  - Target Lake Elevations
    - 5/15 940.1
    - 6/1 940.1
    - 7/1 939.1
    - 8/1 938.1
    - 9/1 937.1
    - 10/1 936.1
    - 10/15 935.6

* Note: Changes from Scenario 3 are indicated by ***bold italics text***.

- **North Twin Lake Elevation:**
  - Winter drawdown Target Elevation 482.0 on 4/1
  - Target Lake Elevations:
    - 1/1 483.0
    - 2/1 483.0
    - 3/1 482.0
    - 4/1 482.0
    - 5/1 488.7
    - 5/10 490.4
    - 6/1 490.4
    - 7/1 490.4
    - 8/1 489.9
    - 9/1 489.0
    - 10/1 488.6
    - 11/1 486.0
    - 12/1 484.0
    -
- **North Twin Minimum Flow Request 1 (included in Scenario 1):**
  - From 8/22 – 10/15 provide a flow of 3,000 cfs as long as North Twin elevation is >488.42 feet and Ripogenus Lake elevation meets above criteria; otherwise, provide 1,500 cfs during this period and remainder of year.

**Request 2:**

- **Ripogenus Lake Level Elevation:**
  - Same as Request 1 but with a ***maximum winter drawdown not to exceed 925.***

**Request 3:**

**North Twin Minimum Flow Request 2. Includes all elements of Request 1:**

- From 8/22 – 10/15 provide a minimum flow of 3,000 cfs as long as North Twin elevation is >488.42 feet and Ripogenus Lake elevation meets above criteria; otherwise, ***provide 2,000 cfs during this period and remainder of year.***

## Fisheries/Habitat Flow Requests

**Request 4:**

Provide ***350 cfs cold water flow in the Upper Gorge 24/7/365***. This flow would also be subtractive as explained above.

**Request 5:**

Establish a ***minimum flow of 1422 cfs below McKay Station 24/7/365*.**

Previous NGO requests already include resources of interest, anticipated benefits, and success/benefit metrics so for the sake of brevity, they are not duplicated here.

Please see previous NGO Ops Model Requests as needed.

Debbie-Anne A. Reese
Acting Secretary
Federal Energy Regulatory Commission
888 First Street, N.E.
Washington, D.C. 20426

Dear Acting Secretary Reese:

My name is William Cushing and the connection I have with the Ripogenous Impoundment is both profound and enduring. My love for the Ripogenous rooted deeply in my formative years and has extended into my adult life. During my childhood, between 1964 and 1980, I spent every weekend and nearly every day during summer exploring our family property bordering the impoundment. I vividly remember the winters with partially heavy snowfalls, as my father made sure I took an active role in maintaining the snow-laden property. This land was not just a place of leisure but a significant part of my upbringing. In those days, the impoundment always reached full pond elevation.

A crucial detail in my memories from that time is the Ripogenous' water levels. I remember one day; while exploring as a child, my grandfather showed me where the gage was located and how it was used to measure the impoundment's water level. Typically, after the winter snow melted and as the season transitioned into spring, the Ripogenous would typically reach the high-water mark of 941.6 (944) feet with the melting snow and seasonal rain. Throughout the spring, the water level would gradually decrease by roughly a foot per month. There was almost a rhythm to the way the Ripogenous changed pond elevation.

However, upon returning to the property as an adult in 2005/2006, I noticed significant changes in the behavior of the impoundment's water levels. The once predictable drawdown was no longer present. Instead, the water levels fluctuated in ways that were unfamiliar and inconsistent with my childhood experiences.

This shift is more than a change in water levels due to climate change; it reflects a broader transformation in how the natural resources are managed and the impact of such changes on local ecosystems. Observing this transformation has deepened my appreciation for the intricate balance required to manage natural resources sustainably. It also underscores the importance of understanding historical patterns and their implications for current and future environmental stewardship.

Historically, the Ripogenous Impoundment was managed by Great Northern Paper until the sometime in the 1980s. During their management, Great Northern Paper excelled in balancing the Ripogenous' natural resources with Great Northern's business objectives. However, since that management transitioned to Great Lakes Hydro America, LLC., there has been a noticeable change in the water management practices. Most recently, it has come to my attention that Great Lakes Hydro America plans to change the Ripogenous' full pond elevation

from 941.6 (944) feet to 939 feet. The once-familiar, consistent water levels in the Ripogenous have been replaced by greater variability, affecting the natural cycle I once knew. I anticipate this will only worsen if Great Lakes Hydro America is permitted to further reduce the accepted full pond elevation of the Ripogenous.

My personal connection to the Ripogenous Impoundment has provided me with a unique perspective on the interplay between human activity and natural systems. It has also reinforced my commitment to advocating for responsible and informed management practices that honor both historical patterns and ecological integrity. As I continue to engage with this land and its changing environment, I am driven by a desire to bridge the gap between past experiences and present realities, striving to contribute to solutions that respect both heritage and sustainability.

Sincerely,

Dated: 8.2.24

William Cushing

STATE OF MAINE
PENOBSCOT, ss.

August 2, 2024

Subject: Comments on P-2572-133 Draft License Application by Brookfield/GLHA

Dear Acting Secretary Reese:

I wish to comment on statements contained in Exhibit E in the Draft License Application recently submitted by Brookfield/GLHA.

.

1. On page E-13 of Exhibit E principal features of the Ripogenus Project are enumerated including this description: “a 20.8 mile impoundment having a normal full pond elevation of 941.59 feet (ft) with a surface area of 29,270 acres”. When various iterations of flow modeling requests are described by the applicant a lower pond elevation (hence less storage capacity) is utilized. I conclude this is done primarily or exclusively for the benefit of the applicant. This is blatantly unfair to stakeholders who point to increased storage as a means of accommodating various concerns and interests expressed in this docket.

2. On Page E-24 of Exhibit E the applicant states: “The Ripogenus Project impoundment is managed on an annual cycle to dampen the variability and occasional extremes of seasonal precipitation and runoff through storage within the impoundment.“ Management of impoundments generally does what is described in that sentence; however more than occasional extremes in daily flow changes are quite common downstream from McKay Station, unfortunately coinciding with the period of the year when much of a year's growth of salmon would be occurring.

3. When describing the effects of proposed operations on riverine aquatic habitat downstream of McKay Station GLHA states: “Proposed operations would continue to maintain and promote a world class landlocked salmon fishery in the 21-mile long reach of the West Branch downstream of McKay Station.” In fact, the record contains comments from numerous individuals and stakeholders stating that the quality of the fishery has declined from historical levels. I infer that those individuals would not characterize the current state of the fishery as “world class.” Further, on page E-222, the results of raft electrofishing surveys conducted in 2022 show that the mean weight of 48 landlocked salmon classified as adults captured in those surveys was 84.4 grams. Converting to non-metric units, the average weight of salmon classified as adults in these surveys was 3 ounces. World class?

By most accounts the salmon fishery in the West Branch Penobscot River below McKay Station is a high quality fishery; however concerns that it has been diminished by current operating procedures

should not be dismissed.

Thank you for the opportunity to comment on this important matter.

Philip Hulbert
895 Brickhouse Hill Rd.
East Meredith, NY 13757

**Subject: A rebuttal of Fish and Aquatic Communities Information Presented in the August 16, 2024 NGO Requests for Ops Model Runs for the Ripogenus Project (P-2572) and the Penobscot Mills Project (P-2458)**

Dear Secretary Reese,

This filing seeks to rebuke the stakeholders August 16, 2024 Ops Model request(s) that dealt with fish, (and) aquatic communities, and angling as they relate to the West Branch of the Penobscot River (West Branch) flow and to the Ripogenus Impoundment's ability to maintain higher lake elevations. This section of the stakeholder's request was not based on science, makes faulty assumptions, and provides erroneous information.

The stakeholder's Ops Model requests make an attempt to blend aquatic communities flow needs with boating flows, namely 350 cfs in the Upper Gorge. These are two separate guilds. In most cases, ramped boating flows have little or no impact on aquatic communities. While I endorse providing boaters with specified flow events, boating flows should be considered separately as FERC attempts to balance competing users.

The new Ripogenus Project license will set minimum operating and emergency flows below Ripogenus Dam and McKay Station that will last for thirty years. Soon to be produced Ops Model iterations need to be based on science rather than fiction.

I concur with the stakeholder's premise that West Branch fish and aquatic communities need protection during low flow periods i.e., flow less than 2200 cfs. However, "*Establishing 1422 cfs flow 24x7x365"* Ops Model request is simply not based on science. Furthermore, this is the wrong time frame to make definitive claims regarding license prescriptions. The 1996 License 1422 cfs spawning and incubation flow prescription was unproven then and remains unproven now. During the biologically active May 1 to

October 15 period, the flow goal is to protect aquatic insects living on and under the substrates; not eggs buried in four to eight inches of gravel. Any attempt to prescribe spawning and incubation flows for the biologically active May 1 to October 15 period is not based on science and is simply a guess. This stakeholder request, as presented, fails to consider fish and aquatic community needs during this biologically critical period.

In the strongest possible language, I object to the use of "1422 cfs" as a possible biologically active season operating minimum flow, and it should be stricken from any model run. Determining a minimum operating flow during the biologically active season will be a cornerstone of any new FERC License. Dewatering almost half the river is not the answer.

The stakeholder's 1422 cfs request is based on facts not in evidence. It was simply one lay person's opinion and makes no biological sense. The recently conducted ramping study is based on flow change over time, and has NOTHING to do with the amount of aquatic habitat available at various flows. The stakeholder's make an apple to oranges comparison that should be ignored. Sadly, there is little or no information on aquatic macroinvertebrates' habitat at lower flows and to suggest otherwise is grossly misleading.

Finally, any reference to 1422 cfs ignores a major user group. Many West Branch anglers fish from drift boats, mostly on guided trips. At flows below 2200 cfs launching and more importantly, loading watercrafts, namely relatively heavy drift boats becomes either difficult or impossible. Ironically this low operating flow suggestion further reduces a group (anglers) usage they claim to be protecting. `

The stakeholder's request includes "Provide **350 cfs cold water flow in the Upper Gorge 24/7/365".** While this request is acceptable as a boating flow iteration it should not be a fisheries issue. Flows greater than 200 cfs "flies in the face of MeDIFW" goal of 100 cfs (August 1, 2024, filing). As this flow request relates to fisheries, a 365 cfs flow results in losses to salmonid habitat and fishing opportunity. Flows of between 100 and 200 cfs maximize (juvenile) salmonid habitats and fishing opportunity (Ripogenus License Application pages 280 and 283). To repeat again, periodic ramped boating releases, if done mid-day, will have no significant impacts on fisheries goals.

The reference to "24x7x365" cold water is misleading and ignores limnology and physics. The period when cold water is needed is approximately the June 15-September 15 period, and that flow should be, as MeDIFW requested, through a deep gate. Additionally, the area of available Ripogenus Lake hypolimnion water is limited to the approximate ten-foot band between the base of the intake structure and the base of the deep gate, and the 500-750 acres of Ripogenus lake deep water. The supply of "cold water" is very limited. Limnological data can be found in the Big A Project Application (P-3779). Perhaps the Licensee can find this datum and make it available and the volume of Ripogenus Lake's cold/cool water determined.

In prior stakeholder filings there have been multiple ramping requests. FERC will very likely require ramping as a License condition. The recent Ops Model requests failed to mention up and down ramping of the proposed boating flows. While a final ramping prescription is not available, potential ramping requirements will increase the loss of impoundment (Ripogenus, North Twin or Quakish) storage by an additional 50-100% (depending on the rate chosen) for a four-hour boating flow event. Ops Model runs should account for ramping requirements.

In a continuation of my effort to correct the record, photo two is misleading. The pictures of trapped salmonids refer to trout and this is incorrect. Clearly the smaller fish is a landlocked salmon fry. The resolution of the second fish pictured makes identification impossible.

In their Ripogenus Dam boating flow releases Ops Model run requests, the stakeholder failed to mention how the flows would be delivered to the Upper Gorge. The reader is left guessing the source of water, warm log sluice water, or cooler deep gate water. Both methods lead to other issues. A cold-water deep gate withdrawal reduces the already stressed volume of cold/cooler Rip Impoundment water. A log sluice or warm water withdrawal adds a thermal factor to the equation. The stakeholders should consult with MeDIFW and clarify this question: hot or cold?

I ask the Licensee to disregard the stakeholders Ops Model run request of 1422 cfs as it relates to the biologically active period beginning on May 1 and continuing through October 15. I request that the referenced Ops Model run flow be set at 2000 cfs, a flow that closely parallels the historical Great Northen Paper (GNP) operations. Historical GNP flows are known to support aquatic macroinvertebrates populations as well as a world class West Branch landlocked salmon population. Ramping should be applied to

flow changes, "MeDIFW *recommends changes in hourly rates of flow in the West Branch of the Penobscot River downstream of the Ripogenus Project to be limited to no more than 25%."* (August 1, 2024). Other possible ramping prescriptions exists.

Thank you for the opportunity to correct the record. It is my hope that the Licensee and FERC staff will give serious considerations to my comments and requests.

Ed Spear

On the evening of August 21, 2024, the Mckay/Ripogenus total flow went down to 1,000 cfs (as was noted on the Safe Waters website and was witnessed first hand as I work at Big Eddy Campground, located downstream of Mckay.) Later in the evening it was scheduled to return to 1,800 - 2,000 cfs. I did not see this increase because I had retired inside for the evening. The following morning, August 22, I was talking to a seasonal camper who was out fishing the night before. He was wading about thigh deep in front of his campsite during the low flow of 1,000 cfs. Very quickly and all of a sudden the water rose and it was up to his abdomen. He hurriedly had to retreat to shore in order to avoid being overtaken by the increase in flow. There was no warning via a siren. Nothing.

This is not the first time this summer that the river flow has increased dramatically and no siren is given letting the public know that a change in flow is occurring. This is a huge safety concern. I don't believe I need to explain the potential risk outcomes due to this negligence.

Please return to the practice of sounding the alarm when the river flow increases significantly.

9/3/24

Debbie-Anne A. Reese, Secretary
Federal Energy Regulatory Commission

Washington, DC 20426

**Subject: Ripogenus Hydroelectric Project (FERC No. 2572-133) Updated Study Report comments.**

Dear Secretary Reese,

The following comments are in regard to the follow up release of the raw data of User Surveys in the Updated Study Report (USR) for Ripogenus Project (P-2572-133) submitted on behalf of members of the Caribou Chesuncook Lake Camp Associations.

As we noted in a previous filing, all surveys completed by camp owners and users of the remote campsite were not included in the final results. The raw data has been released, but to date there have not been any summaries to include the results of the excluded surveys. Given that the data is extremely difficult to read in the raw form, I have organized and collated the comments for easy reading and interpreting. We know FERC representatives are extremely busy and thought this format might be helpful.

39 surveys were completed for the **Caribou Lake Boat Launch**

Comments included:

- With the drought condition and excessive water releases I am afraid we have lost some of our fish and loon populations.
- This year the lake level has been great and I am able to swim, use a boat, and get into Chesuncook lake by boat. Swimming is much easier not having to walk across a boulder field. I hope that levels will remain up at a reasonable level for the summer
- The Caribou Lake water level this summer (2022) is great. There is safe access to the lake by boat/canoe and for swimming. Last summer (2021) due to the water level being so low we were unable to launch a boat or access the lake for any form of recreation.
- We have owned property on Caribou Lake since 1988. We have spent countless hours fishing, canoeing, boating, swimming, picnicking, hiking, hunting, snowshoeing etc. with our family over the years. We are deeply concerned because current dam management evidences a severe lack of respect for the rights and interest of property owners such as ourselves; it also is lacking

attentiveness to water quality and practices which support essential environmental requirements of fisheries and wildlife. We have seen first-hand the detrimental impacts of extreme variability in lake levels with severe low water resulting in loss of extensive mussel beds, decreased loon nesting sites, diminished trout/salmon feeder fish habitat, decreased habitat for ducks, geese, etc. Increased temperature rotting vegetation=decreased available oxygen and decreased water quality. Extreme low water levels due to poor dam management a major factor. We have measured a decade or more than 1/10 mile from the "high water" mark at the edge of our property, to the "low" level as early as June 1, many times! A lake such as Caribou, and Chesuncook is measured by more than the megawatts generated by the turbines at Ripogenus-Its quality and value are calculated by measures more stringent than cfs. Ask those of us who live there: When water quality suffers, we all pay a price. We used to drink the water in this lake- we don't anymore.

- Only that we are the third generation at our camp, which was the first built on Caribou Lake in 1964. So we've seen the evolution of the water level issue, and have no doubt it has gotten worse in the last 10-20 years.
- I own land and a camp on Caribou Lake, water levels for the past several years have been so low we have been unable to use my dock or launch our boat at my personally owned boat launch on Caribou Lake. Additionally access to McKay station area has been very restrictive over the past few years.
- I have spent annual spring summer and fall vacations on Caribou Lake my whole life. (43yrs) my parents bought our camp in 1981 while it was on leased land, they now own the small lot. This area means a lot to me. I have and still do enjoy boating, fishing, hiking, hunting grouse and woodcock, swimming, paddling, walking the dogs, and sightseeing. We have an amazing view of Katahdin from our cabin. The waterfront camp is an amazing place to unplug, relax, and explore nature at its finest! Please consider the camp owners while maintaining access and water levels on Caribou/Chesuncook Lake!

Liked least at the **Caribou Boat Launch** include:

- Boat launch could be better
- The inability to access the lake due to low water levels
- Rocky boat launch
- The water level is being run down far too quickly to allow for support of balanced usage and water quality in Caribou/Chesuncook lakes, as well as impacts noted above. Rocks and shallow areas are silted, with large expanses of vegetation growing in areas exposed by extensive drawdown early in the season, previous years, now flooded by high water earlier this year (see note about Ragged Lake) resulting in rotting algae and silt covered plant growth/weeds. The stench is noticeable on hot days. Swimming and wading is unpleasant when this residue is left on our skin. Further, the impact of both increased temp, and depletion of

available oxygen for aquatic life caused by decomposing organics is detrimentally affecting water quality.
- Water too low to swim
- Unreliable boat launch capacity.
- too many rocks making it difficult to launch boat due low water...
- The only thing I can think of is having more parking for truck and trailer.
- Putting my boat in
- Not well maintained…
- Dealing with boat launching and swimming access challenging due to low water levels.
- Water level of lake could be higher. The beaches were longer than other years.
- In the year 2020 and 2021 the lake was too low, this year 2022 the lake was normal high
- Getting the boat in and out of the water.
- This should not be considered a boat launch for fishing
- Water Level
- The abnormal water level
- No bathroom/ outhouse

62 surveys were completed for the **Chesuncook Dam Boat Launch**

Comments included:

- The lake levels need to be monitored better and not such a draw down. It makes things very difficult…. different hazard
- Please keep Chesuncook lake filled with water!
- Nice to see water level back to normal levels as in the past
- Lake drawdowns are extreme. The dewatering of the Ripogenus watershed are a gross display of dam mismanagement. There needs to be updated studies on the lakes needs recreational needs, camp owner's needs, environmental impacts of such extreme drawdowns of the impoundment on the ecosystems of the connecting bodies of water. Remote campsite access during these extreme drawdowns is very dangerous and borderline not worth attempting a trip. The scenic views during these drawdowns resembles the landscape of mars (this is not a compliment). The wildlife that relies on the impoundments water for sustenance is driven away to find another source (moose, loons, deer, lynx, bobcat, ect) New studies and hard critical evidence of the lake need to be done.
- I am a fly fisherman and really want to see salmon fishing remain both a Maine tradition and a lucrative opportunity for folks in this region. I hope that damn releases can be used to support a healthy population in the west branch. Also, as a user of Chesuncook and waterways upstream, I hate to see the massive withdrawals of water from this ecosystem. The water levels of Chesuncook have been massive in recent years and this has to have an impact on fish species, and as a result all species that thrive on water and fish for a living. I think that the

fishery can be a good representation of a healthy environment, and pushing that to the limit for the sake of increasing energy output is shortsighted and doesn't see how this will impact Maine in the future.

- Our family has had a lease by the ranger's camp since 1953 I have never seen the lake as low as it was last year. The boat ramp was so bad I stopped bringing my power boat after the second trip. I hope this doesn't continue to happen. Please keep it up at a decent level for the summer months.
- The recreational opportunities for visitors to the lake and my fellow lease holders are greatly diminished by the low water levels that we have seen in the past few years in the late summer and fall.
- it is much easier to access the lake when the water is higher
- Please maintain public access and good quality to this lake!
- Please keep the lake full. having the lake full or near full makes it much safer to be on summer and winter. if they choose to keep these water low, I will go elsewhere.
- Water level
- Please improve the boat launch on Chesuncook and keep the lake level up.
- I do fish the West Branch and I have fished there when the water was extremely low exposing a lot of the river bottom and seen pools of small fish trapped and just waiting to die.
- The third largest lake in Maine should have a safe and reasonably usable boat launch. It would be fairly easy to put in protection from the wind (rock barrier) and a small dock to tie up to while parking your vehicle or loading, unloading the boat and for older folks to get in or out of the boat safely.
- Please preserve water levels in lakes for the good of all.
- This is an area that is extremely important to me and a favorite spot to visit with friends and family. Chesuncook Lake needs to remain adequately filled throughout the year to remain a recreation gem for boaters, anglers, and more.
- Fill Lakes
- We have been going to this area regularly for 40 years, for work, and later, recreation. We've visited friends with a camp on Chesuncook lake's shore for 20 plus years- absolutely wonderful area when there's a lake, not worth it when it's 1/4 mile to the water at the boat launch and in front of the camp, and trying to boat to our favorite spots up and down the lake. Did not go at all this past year- so disappointing. Please leave water in the lake!
- I have great concerns for the sustainability of the marine life affected by the water fluctuations caused by the Ripogenus Dam. Although I am no expert, I have heard that the togue population has crashed to the point of almost being eliminated due to the lower of the lake level after the tongue spawn in the shallow waters. I have also heard that the smelt populations are also in decline due to a lack of stagnation that offers habitat to smelt prey. Smelt are a fundamental species in the overall ecosystem and a decline in smelt could result in decline in other fish species.

- The recreational opportunities would be enhanced by consistent, stable water levels during the summer recreational season so visitors can plan a trip and be certain the lake is accessible and useable.
- The Chesuncook Dam boat launch needs very significant improvement. Chesuncook lake should be filled every spring and have drawdown restrictions until the end of the recreational season at the end of September.
- Very concerned about the impact on fish and recreation that the Rip Dam management impacts. Nobody I spoke to thinks that current management cares at all about the fishery or the recreational opportunities
- The entire years of 2021 and 2022 the Lake levels were extremely low (maybe 30 feet low) making it virtually impossible to boat on the lakes and ice fishing was difficult and poor fishing.
- The lake water level this year 2022 was great but the last few years the lake was not useable due to the low water levels. It was dangerous to walk to water because of the distance over rocks
- Summer 2021 was a nightmare. Inability to access other lakes/ inability to traverse lake in spots even in canoe. Inability to draw water from lake. Really the drawdowns made the lake almost impossible to really recreate on. Brookfield's drawdowns of the lake were irresponsible as they were so extreme. The fish stocks suffered. The whole natural environment suffered. 2022 was much better however 2021 should not be allowed to occur again. There must be safeguards implemented to protect the environment and human usage of one of the most beautiful areas of our state (in our country!)
- Water levels need to be addressed.
- I enjoyed my recreational experiences at Chesuncook Lake so much more this summer than last summer (2021) when the lake was disastrously low. In 2021, it was nearly impossible to launch a boat because of the low water level at the Chesuncook Lake boat launch. I had to cancel two trips to the lake in the fall because my family couldn't put our boat in the water. The low water level of 2021 also impacted my recreational experiences once on the lake. It made navigation much more challenging, and it prevented us from exploring Caribou and Ripogenus from Chesuncook Lake. The lake is not as breathtaking when there is over half a mile of rocky, barren shorefront where there is supposed to be water. We also had to walk for 15+ minutes to get to camp from the shore in the summer of 2021, making getting water from the lake difficult and swimming more tedious. This summer, it was an entirely different recreational experience. The full lake makes it easy to put the boat in the water and on-the-water navigation is much easier. We spent a great day fishing in June on both Chesuncook and Caribou. Swimming, kayaking, and canoeing was more enjoyable when we didn't have to walk or drag boats across an endless rocky beach. Chesuncook Lake provides one of the most spectacular recreational settings in all of Maine, but the lake needs to have a certain amount of water in it for this to be true. That wasn't the case in 2021, but it was in 2022.

- Keeping the lake full, or at high levels makes for a much better time. 1. much easier to launch a boat 2. the fishing is better 3. less underwater obstacles that may damage boats and engines
- Please keep the lake levels as high as possible. Being a camp owner and contributing taxes to the state it is not fair to lower the levels to unusable levels
- Would like to see lake level stay higher during boating season, plus improve boat launch ramp
- Keep that water high!
- We own a 21 ft party boat and sometimes we don't feel comfortable to launch @ Chesuncook due to low water levels
- The lake levels are great this year. In the past it has been very hard to get to camp due to low lake levels
- Over the past few summers, the water level has been very low at Chesuncook lake
- Consistency. It seems water levels were much more consistent. Currently seems to be extremes so low makes most sites I visit and camp unusable for lake
- I just hope that the lake can be kept high and usable. Then we would come more often!

Least liked comments for the **Chesuncook Dam Boat Launch** included:

- The water levels
- The wind!
- The difficult of the boat launch. Not user friendly.
- Water level dropped over the past week
- Lake levels from 3 weeks prior have dropped a vertical of 5 ft
- The boat launch and the lake level.
- I was so happy it was a short walk down to the boat and not several hundred yards!
- gained 3ft of beach in 3 days
- Worries about water levels
- Boat landing very tricky to navigate
- The water levels
- The water levels
- road conditions/lake level
- Difficulty launching the boat
- Boat launch area and very low lake levels. Exposed shorelines.
- The boat launch experience is frustrating and hazardous depending on the wind and water level.
- Difficulty navigating low water
- lake water levels
- Lake levels in the summer of 2021 were so low they made recreating extremely difficult. Levels were much higher in 2022 which improved the experience considerably.

- Can't say it enough; Low Water
- Not being able to enjoy a fabulous part of Maine with our family like we have for many decades.
- Seeing the lake level so low
- Low water levels in the summer
- The boat landing and low lake water levels.
- The fact that there wasn't enough parking for the launch
- Water levels
- Low water levels in 2021.
- low to no water
- It's difficult to carry gear down to the water because of how rocky the boat launch is.
- Flat tire
- Chesuncook Rd. Condition
- Launch the boat
- Parking
- 4 season accessibility
- road quality getting to the boat launch

29 surveys were completed for the **Remote Campsites.**

Comments included:

- Please commit to managing the water resources in this area in a way that preserves the pristine wilderness and waterway
- These recreation opportunities are crucial resources in the north Maine woods. Maine has a long tradition of public recreation on private land. The easements that make recreation in and around Chesuncook and the West Branch are a prime example and should continue to be ? generations for years to come
- Water level was great this trip. In previous years, water levels were much lower on West Branch Penobscot, making areas difficult to navigate by canoe.
- Something must be done about the water levels on the 3 connecting lakes. Power capacity and rafting water release is too high.
- The recreational opportunities are severely impacted because of the low water levels in the Penobscot Mills Recreation Sites. There is a significant negative impact because of this. Fellow wilderness canoers and campers are upset about the loss of water in the last few years and will not promote trips in the affected areas.
- Keep the water high for best recreation!
- Lake level stay high
- We loved this Chesuncook L. We spent 5 days exploring all the Northern tributaries seeing 4 moose. However - in talking to locals + cabin owners we were appalled + disheartened that Brookfield Power has indiscriminately discharged such volume to drawn down this lake - causing 1/2-mile mud flats to shore (2020 + 2021?). Bad for wildlife + fish + recreation. Why has recreation visits been slow this year? Maybe because many are reluctant to visit not knowing what they will find. Highly suggest

Brookfield be mandated minimum discharge to be releasing. Saw the photos - shameful Greed

Least liked comments for the **Remote Campsites** included:

- The lower water level made accessing campsites and launches difficult.
- Low water levels
- Shockingly low water levels. Once you get on the river, despite checking reports, you could get stranded and have to slog (walk the boat) through many miles. This could be avoided with proper dam release management.
- Low water levels
- Chesuncook lake water is too low
- Lake levels vary year to year. This year it has been very high at Chesuncook, compared to last year's very low lake level, same as previous couple years. The varying lake levels affect erosion at the remote sites, fishing, and challenge navigation with boats.
- The fishing was lousy + no vegetation on shorelines. What Brookfield has done w/ these massive discharges is ruining this lake. They need to be watched + managed closely.

58 surveys were completed at **Other Sites.**

Comments included:

- 2020+2021 the lake level in Chesuncook lake drained below the "normal" 12'-15' each season. Particularly 2021, Chesuncook Lake was too low to even kayak to Pine Stream campsite, Canvas Dam Campsite, or to paddle around Gero Island. There were no great Blue Herons, white egrets, very few ospreys visiting in their typical coves in the northern area of the lake. Continue to promote carry in/carry out, keep Chesuncook lake high.
- The dams are drawing down the water levels too much for canoeing and fishing.
- Just concern on retaining a reasonable lake level through the end of September on Caribou Lake
- please keep the water levels high enough thru the summer so it can be enjoyed by all. People spend a lot of money to come
- Please keep lake levels more regular from season to season
- Yes, please consider the fishery when regulating water flow- it's been managed better with previous ownership so it could be done again. Consistent water flow is better for nature. Don't just think of your pocket book!!
- Lake level needs to be maintained higher
- Restore and stabilize the releases from McKay to save a valuable historic fishery
- I think the lowering of the lakes have affected the ecosystem birds and fish
- Brookfield's inability to keep the lake at an agreed 941.6 from sea level stable during the summer months i.e. May June July August makes for a devastating

long-term effects on the fishery wildlife and safety of the recreational opportunities On Ripogenus, Caribou, and Chesuncook lakes

- The old timers say the low water level of the Chesuncook lake the past couple years hurt the smelt population since the big salmon were not coughing up smelts next to the boat and their bellies were empty in the spring. When the water is low the graveyard point boat launch and dock is pretty unusable
- Having spent the past 30 years coming to the area, it is abundantly clear that recreational use above and below Rip Dam has increased and continues to, and is an important industry for the economy of the area. This means the conservation of these areas and their usability, and the voices of the people using them, are of upmost importance in planning for the future.
- Kayaking and wildlife viewing at Chesuncook Village area is excellent when water levels are high. Not as accessible if low.
- This is a treasured area, a gem for outdoor recreation of a variety of sorts. Its habitats deserve to be cared for, including the affects on downstream fisheries. It has appeared in recent years the only uses given major consideration were rafting and electricity generation!!!
- Water levels have been adversely impacted by poor dam maintenance at Ragged Lake, Seboomook Lake and Ripogenus Lake.
- Keep water levels consistent and at a sustainable height for fish and loon populations.
- Manipulation of water levels has severely impacted the environment for birds , wildlife, and fish. Lake water levels have been much lower over the past few years(not including the bridge/dam situation at Ragged Lake)
- Would hope water levels would support boating and access for camp owners.

Least liked comments for the **Other Sites** included:

- Low water levels
- The water levels
- Low water levels
- Water level in river needs to be more consistent. Severly affected the fishing
- It is a bit of a treacherous climb up slippery rocks and thru woods to access Gero Island campsite #3.
- The campsites need help. Lots of washed-out stairs and bog bridges to outhouses are in disrepair.
- Low water levels
- The water levels are not what they should be. Fishing condition has deterriorated in the last 10 years
- Water levels have been lower than levels 50+ years ago...
- Water level to low
- Roads were awful
- My most recent visit, water levels were high. Over the last few years though I've seen them lower than I ever could have imagined and not only is it unpleasant to

look at but makes recreating more difficult and dangerous. I'm not a biologist but I imagine it has negative impacts on wildlife.
- Great today, but in past years the varying levels of water in the lake and contributing river / stream
- I was most upset with the fact that the water levels could be lowered to such drastic levels that it affected the local ecology. In addition, it has become apparent that the dams are not being maintained to a level that would have prevented recent failures at Ragged, Ripogenus, and Seboomook Dams.
- This year the lake level is normal but big reductions in lake level over the past two years severely limit fishing, boating and boat access between Caribou and Chesuncook Lake.
- It was low tide at the Lake. Water level was severely low.

10 surveys were completed at **Unknown Sites.**

Comments included:

- Water flow management must improve in order to maintain the fisheries and overall ecosystem. The area survives on recreational opportunities, if these are destroyed by poor water management (fishery destruction, lake level drops exposing massive areas of shoreline in front of camps and boat landings, low river for rafting etc.) the area economy will crumble.
- The water level in Chesuncook is unpredictable. This year it is very high but last 2-3 yrs we could literally walk across from one side to the other.
- I am concerned about the lake levels.
- Family owned camp since our grandfather built it in 1964. First camp on Caribou. Concerned about water levels and mismanaged seasons for the past 15+ years.
- The level of the water right now is great. Easier boat launching. There are no exposed cribs. Years past the level was extremely low making wildlife viewing by boat nearly impossible. I've seen Chesuncook lake so low that it resembled Lake Powell and Lake Mead during their drought. Imagine the impact on the fish and tourism. People come to see our beautiful lakes and mountains. Fewer canoe adventurers came thru Chesuncook Village. The water level directly impacts fishing along with drawing in tourism.
- Do not put profits before people - keep water levels up and work out a system where water usage is measured for both power and consumer recreation as it was intended for...or propose a state takeover??

Least liked comments for the **Unknown Sites** included:

- access to the water
- Water levels
- The Golden Road is a mess!

- The thought of dead fish when the water is drained so low.
- traffic and low water

These comments clearly demonstrate how lake water levels and current boat landing conditions impact a recreational user's experience. It is our hope that these concerns will be addressed with meaningful Protection, Mitigation and Enhancement measures in the Final License Application.

Thank you for the opportunity to comment and your continued efforts to reach a balanced license.

Sincerely,

Bill Houston

Queensbury, New York, 12804

**Subject: Determination on Requests for Study Modifications and New Studies**

Dear Mr. Scarzello:

Pursuant to 18 C.F.R. § 5.15 of the Commission's regulations, this letter contains the determination on requests for modifications to the approved study plan and a new study for the Great Lakes Hydro America, LLC's (GLHA) Ripogenus Hydroelectric Project No. 2572-133 and the Penobscot Mills Hydroelectric Project No. 2458-247 (collectively, the "Projects"). The Projects are located on the West Branch of the Penobscot River and on Millinocket Stream in Piscataquis and Penobscot Counties, Maine. The determination is based on the study criteria set forth in section 5.9(b) and 5.15(d), (e), and (f) of the Commission's regulations, applicable law, Commission policy and practice, and the record of information.

Background

The study plan determination (SPD) for the Projects was issued on May 13, 2022, and required GLHA to conduct 24 studies, including a *Water Quality Study* comprising five components, and file an initial study report (ISR) on those studies by May 13, 2023.[1] GLHA filed the ISR on April 24, 2023, and held ISR meetings from May 2-4, 2023, to

[1] On February 17, 2023, Commission staff approved GLHA's request to modify the schedule for filing the ISR by moving the date up from May 13, 2023 to April 22, 2023. Because April 22 fell on a Saturday, GLHA timely filed the ISR on the next business day, which was April 24, 2023.

present the ISR results. On September 19, 2023, Commission staff issued a determination on the requests to modify the study plan.

On April 22, 2024, GLHA filed an updated study report (USR), and on May 3, 2024, GLHA filed a draft application to relicense the project. GLHA held USR meetings on May 15 and 16, 2024, and filed a meeting summary on May 31, 2024. On June 28, 2024, GLHA filed a supplement to the USR, which contained Operations Modelling results for 15 operational scenarios and recreation survey data from 330 recreation use surveys.

Comments

Comments on the USR, USR meeting summary, and USR supplement were filed by Edward Spear on May 1, May 9, May 23,[2] July 19, and July 29, 2024; Commission staff on June 14, 2024; American Whitewater and Appalachian Mountain Club on June 24, 2024; the Caribou Chesuncook Lake Camp Association, the Chesuncook Dam Camp Association, and the Chesuncook Village Association on June 24 and September 3, 2024; the Maine Department of Inland Fisheries & Wildlife (Maine DIFW) on June 27, 2024; George Forgette on June 27, 2024; the Maine Bureau of Parks and Lands on June 28, 2024; Maine Professional River Outfitters on June 30, 2024; and the Maine Council of Trout Unlimited on July 1, 2024. GLHA filed reply comments on July 30, 2024.

Many of the comments filed do not specifically request modifications to the approved study plan or additional studies. For example, many of the comments relate to GLHA's operations or contemplate potential protection, mitigation, and enhancement measures. In addition, some of the comments provide additional information; address elements of on-going studies; note potential effects on environmental resources; offer views regarding on-going consultation; express concern on the presentation of data and the results of the studies; or suggest methods for integrating or interpreting study results. This determination does not address such comments, but only addresses specific recommendations to modify the approved study plan or conduct new studies. Moreover, this determination does not address requests for modifications to studies that were previously requested, but not required by prior study plan determinations (e.g., Edward Spear's request for an Atlantic salmon radio-tagging study; and Edward Spear's and

[2] On February 9, 2024, in response to an operations modeling workshop held by GLHA on January 31 and February 1, 2024, Mr. Spear filed a letter requesting a landlocked salmon spawning and incubation flow study for the West Branch of the Penobscot River downstream from McKay Station (Ripogenus Project). In the February 9 filing, Mr. Spear addresses the study criteria in sections 5.9(b) and 5.15(e) of the Commission's regulations. Mr. Spear, again, requests this study in his May 23, 2024 filing, but without addressing the study criteria.

George Forgette's requests for a Ripogenus impoundment plankton and smelt study, including smelt drift through McKay Station).

Study Plan Determination

Pursuant to section 5.15(d) of the Commission's regulations, any proposal to modify a required study must be accompanied by a showing of good cause and must include a demonstration that: (1) the approved study was not conducted as provided for in the approved study plan; or (2) the study was conducted under anomalous environmental conditions or that environmental conditions have changed in a material way. As specified in section 5.15(e), requests for new information gathering or studies must include a statement explaining: (1) any material change in law or regulations. applicable to the information request; (2) why the goals and objectives of the approved study could not be met with the approved study methodology; (3) why the request was not made earlier; (4) significant changes in the project proposal or that significant new information material to the study objectives has become available; and (5) why the new study request satisfies the study criteria in section 5.9(b). In addition, as specified by section 5.15(f), any requests for new information gathering or studies in response to a USR must demonstrate extraordinary circumstances warranting approval.

As indicated in Appendix A, requests associated with one study were approved, and modifications to five other studies were not approved. Appendix A also summarizes the determination for a requested new study. The basis for these findings is explained in Appendix B (existing studies) and Appendix C (new study). Commission staff considered all study plan criteria in accordance with sections 5.9(b), 5.15(d) and (e), as well as 5.15(f) of the Commission's regulations.[3] However, only the specific study criteria relevant to the determination are referenced in Appendices B and C.

Nothing in this determination is intended, in any way, to limit any agency's proper exercise of its independent statutory authority to require additional studies.

[3] Additional time was needed to review and respond to voluminous filings; therefore, pursuant to section 5.29(f)(2) of the Commission's regulations, section 5.15(c)(6) is waived to provide the additional time needed to review and address the filings.

If you have any questions, please contact Allan Creamer at (202) 502-8365, or via email at allan.creamer@ferc.gov.

Sincerely,

for
Terry L. Turpin
Director
Office of Energy Projects

Enclosures: Appendix A – Summary of Determinations on Requested Modifications to Approved Studies and Request for a New Study

Appendix B – Staff Recommendations on Requested Modifications to Approved Studies

Appendix C – Staff Recommendation on Requested New Study

## APPENDIX A

## SUMMARY OF DETERMINATIONS ON REQUESTED MODIFICATIONS TO APPROVED STUDIES AND REQUEST FOR NEW STUDY

**Requested Study Modifications (*see* Appendix B for Discussion)**

# APPENDIX B

## STAFF RECOMMENDATIONS ON REQUESTED MODIFICATIONS TO APPROVED STUDIES

### 1. Operations Model – cost/benefit analysis using Loomis (2000)[8]

Background

Great Lakes Hydro America, LLC (GLHA) operates the Ripogenus Project as a store-and-release facility, with an annual seasonal drawdown that allows for management of water levels and flows in the downstream reaches of the West Branch and mainstem of the Penobscot River. The Ripogenus Project works in coordination with the upstream Storage Project (FERC No. 2634) and the downstream Penobscot Mills Project, which receives flows from the Ripogenus Project. GLHA operates the Ripogenus and Penobscot Mills Projects (collectively, the Projects) as a combined system using a system-wide rule curve dating back to the 1970s.

The approved study plan required GLHA to develop an operations model using the Computer Hydro Electric Operations and Planning Software (CHEOPS). GLHA developed, calibrated, and verified the model during the first year of studies and refined it during the second year of studies based on stakeholder comments on the Initial Study Report, as well as comments received during GLHA's modeling workshop held January 31 and February 1, 2024. GLHA included the refined model in the Updated Study Report (USR) and presented a summary of the model during the USR meetings on May 15 and 16, 2024. GLHA used the model to simulate elevations, on an hourly basis, for each of the Projects' impoundments under various operating constraints (i.e., minimum flows, starting impoundment levels, and hydrology). Based on stakeholder requests, GLHA modeled 15 alternative operational scenarios. GLHA filed the results on June 28, 2024, and met with the stakeholders to discuss the results on July 10, 2024.

Requested Study Modification

In its comments on the *Operations Model Study*,[9] the Maine Council of Trout Unlimited (Maine TU) asserts that the modeling results, to date, show a need for an alternative cost/benefit analysis to determine the economic benefits that would result from enhancement of environmental resources associated with individual modeling scenarios. Maine TU claims that such a valuation analysis is needed to put model results

[8] Loomis, J.B. 2000. Environmental Valuation Techniques in Water Resource Decision Making. Journal of Water Resource Planning and Management, 126(6):339.

[9] *See* Maine TU's July 1, 2024 Filing at 3-4.

in perspective, as Maine TU believes that the results are based on changes in generation at each development. To address this concern, Maine TU requests that the *Operations Model Study* be modified to include an economic cost/benefit analysis component based on Loomis (2000). The goal of the analysis would be to derive an economic value for the environmental resources affected by alternative operational scenarios (e.g., flow changes).

Comments on Requested Study Modification

In its reply comments, GLHA responded to comments received from Maine TU, American Whitewater and Appalachian Mountain Club (AW/AMC), and the Camp Associations,[10] on the *Operations Model Study*. GLHA states that the CHEOPS model is not generation driven, accurately reflects the Projects' current operations, and meets the overall goals and objectives for the model. However, GLHA did not specifically respond to Maine TU's request for an economic valuation for resources affected by alternative operational scenarios.

Discussion and Recommendation

Our assessment of the license application(s) will be done using the information gathered from the various studies conducted, or being conducted, by GLHA [section 5.9(b)(4)]. Potential beneficial and adverse effects of the various operating scenarios on environmental resources can be reasonably identified in those studies, and we will use this information to inform potential license conditions [section 5.9(b)(5)]. Moreover, we do not need to put dollar values on the environmental resources to characterize the beneficial and adverse effects of the various operational scenarios. Therefore, we do not recommend that GLHA be required to conduct cost/benefit analyses of environmental resources using Loomis (2000), as requested.

**2. Penobscot Mills Bypass Channel Fishability/Wadability Study**

Background

The approved study plan required GLHA to conduct a *Penobscot Mills Bypass Channel Fishability/Wadability Study*. The goal of the study was to evaluate conditions that affect suitable wading (e.g., water depth and velocity) and fishability under a range of flows that would support the Maine Department of Inland Fisheries & Wildlife's (Maine DIFW) fishery management interests for the West Branch downstream from Stone Dam. The study area was the West Branch, about 1 mile downstream from Stone Dam. The study used a phased approach that included an angler field assessment of three

[10] *See* n. 7 *supra*.

different flows [93, 236, 392 cubic feet per second (cfs[11])] and the existing PHABSIM (Physical Habitat Simulation) model used in the IFIM (Instream Flow Incremental Methodology) study. The model allowed GLHA to simulate conditions that affect wading conditions in, and fishability of, the reach beyond those physically experienced by the anglers during the study's field component. The details of the study's methodology are in GLHA's *Angler Flow Evaluation Study Report – West Branch Downstream of Stone Dam*.[12]

Requested Study Modifications

In its comments, AW/AMC argues that the study failed to follow the approved study methodology, in that the highest flow evaluated was 392 cfs, and flows of 420, 700, and 1,000 cfs were not evaluated, as required by the approved study plan. Moreover, AW/AMC asserts that the study arbitrarily used short casting distances and fixed wading points not reflecting the habits of experienced anglers, all of which led to unsupported conclusions about optimal angling flows. Therefore, AW/AMC requests that GLHA repeat the study following the approved methodology and coordinate with Maine TU on the implementation of the study plan.

Comments on Requested Study Modifications

In its reply comments, GLHA maintains that the study was completed in accordance with the approved study plan. GLHA states that the study evaluated angling and wadability at flows between 50 and 1,000 cfs by relying on a field component that evaluated flows released from Stone Dam and a modeling component that was used to assess fishability and wadability at higher flows. GLHA notes that the approved study plan did not require the release of 420, 700, and 1,000 cfs, but only that flows between 50 and 1,000 cfs be evaluated. GLHA also notes that none of the anglers that participated in the field component of the study, including representative of Maine DIFW and Maine TU, expressed concern in the field regarding the flows released. Instead, participants observed that a flow of 392 cfs created conditions that began to restrict their ability to comfortably wade the reach. As to casting distance, GLHA states that the distance of 30

[11] The study design contemplated a high flow of about 700 cfs. However, Stone Dam has no operable gates to control flow into the West Branch. Rather, flows pass over the spillway, which is equipped with wooden flashboards and a pneumatic dam system. To provide the mid and high flows for the angler study, the headpond elevation of Quakish Lake was increased in small increments to minimize the risk of flashboard failure, but also to spill water over the top of the flashboards. Flows were not gaged during the angler evaluation but were confirmed based on readings at a temporary staff gage installed at the study site and an established stage discharge rating curve.

[12] *See* Appendix D of GLHA's April 22, 2024 Updated Study Report.

feet was not set arbitrarily, but, rather, was the approximate average casting distance observed during the field portion of the study.

Discussion and Recommendation

The goal of the *Penobscot Mills Bypass Channel Fishability/Wadability Study* was to evaluate a range of flows that would allow safe wading and angling in the West Branch downstream from Stone Dam. The approved study plan did not identify or require specific flow releases (i.e., 420, 700, and 1,000 cfs), other than existing leakage (estimated to be between 17 and 100 cfs) and the potential for a second flow release in the range of 400 to 700 cfs. The flows of 93, 236, 392 cfs released during the field portion of the study fall within, or meet the intent of, the flow ranges approved as part of the study plan.

The field effort involved a group of anglers, of varied experience, evaluating wading conditions and fishability at leakage flow ("low;" 93 cfs), as well as two higher flows (236 and 392 cfs). The angling survey questionnaire used during the evaluation was jointly developed by GLHA and Maine DIFW, and asked anglers to rate the following: (a) ability to walk the shoreline/bank; (b) number of desirable fishing spots; (c) wadability; (d) ability to cast to desirable areas; (e) velocity of water for casting; (f) maximum depth for wading; and (g) overall impressions of the experience. Anglers also reported information on safe wading conditions, and water depth and velocity were recorded at locations the anglers reported wading becoming uncomfortable. The empirical data collected during the field effort were used to develop angler suitability metrics,[13] which were used in the PHABSIM model to evaluate angling and wading suitability at the flows experienced by anglers in the field (i.e., 93, 236, and 392 cfs), as well as flows of 50, 300, 420, 700, and 1,000 cfs. The methodology, as described above, is consistent with the approved study design.

Regarding casting distance, the approved study plan did not establish a defined casting distance to a "fish lie" or desirable angling area. Rather, the casting distance was to be calculated in the field, which was done. We understand that experienced anglers, under favorable conditions, may be able to consistently cast a line farther than 30 feet to reach a fish lie. However, limiting the casting distance to an average of 30 feet does not invalidate the study or its results regarding fishability of specific flows. Moreover, using

[13] The information collected during the angler surveys (i.e., depth and velocity limitations) were used to create a wading suitability index that was entered into the PHABSIM model to produce a weighted usable area curve for wading conditions in the study area. PHABSIM calculates suitable area across 1,000 linear feet of stream length, such that the results are "weighted" to account for the length of an entire study area.

an "average" takes into account a range of casting distances, some shorter and some longer than 30 feet, in determining fishability of any given flow.

The methodology used by GLHA is reasonable and consistent with standard and accepted flow evaluation techniques for evaluating wading and angling suitability in rivers like the West Branch [section 5.9(b)(6)], and the information obtained from this study is sufficient to inform a licensing decision for the Penobscot Mill Project [section 5.9(b)(5)]. Moreover, the study was conducted as provided for in the approved study plan [section 5.15(d)]. Therefore, we do not recommend that GLHA repeat the *Penobscot Mills Bypass Channel Fishability/Wadability Study* at higher flows, and with different (higher) average casting distances, as requested.

**3. Recreation Study**

Background

The approved study plan required GLHA to conduct a *Recreation Study*. As part of the study, GLHA was to: (1) inventory and map existing Commission-approved project recreation sites; (2) evaluate recreation use at project recreation sites; (3) conduct user surveys at the project recreation sites, and online, to assess activities (including angling), site conditions, satisfaction with existing facilities, and recommendations regarding the sites and facilities; (4) conduct qualitative interviews or focus groups to obtain information on the informal and formal recreation sites; and (5) assess the accessibility and useability of select project boat ramps (i.e., Chesuncook Dam Point Boat Launch, Caribou Lake Put-In, Millinocket Lake Boat Launch, Ambajejus Lake Boat Launch, and South Twin Lake Boat Launch) under existing drawdowns, and identify any changes that would ensure the accessibility and usability of the boat launches throughout the recreation season under the range of potential new water levels.

Requested Study Modifications

In its comments, Maine TU, AW/AMC, as well as the Camp Associations request that recreational surveys for the non-project lake campsites and the Big Eddy Campground be included in the survey report. Moreover, Maine TU requests that surveyors be deployed in the field to collect data as part of a third year of studies.

Reply Comments

In its reply comments, GLHA states that the results for all surveys (project and non-project sites) were filed with the Commission on June 28, 2024. GLHA also maintains that the *Recreation Study* was completed in accordance with the approved goals and objectives for the study. Moreover, GLHA indicates that the study results will

be evaluated in the final license application, as necessary, to inform its recreation enhancement proposal(s).

Discussion and Recommendation

The remote campsites mentioned by the commentors are not project recreation sites, are not in the project boundary, and were not required to be studied. As to study methodology, GLHA's focus group process is an acceptable approach to collect information on formal and informal recreation sites at the Projects [section 5.9(b)(6)]. During the two focus groups, GLHA presented data to the focus group participants and collected sufficient information on recreation use at the Projects' recreation sites, as well as non-project recreation sites [section 5.9(b)(4)]. All this survey data has been filed with the Commission and is sufficient to inform licensing decisions for the Projects [section 5.9(b)(5)].

Regarding the requests for additional in-person surveys, GLHA redeployed their survey kiosks during the second study season, allowing them to collect recreation data from the summer and winter recreation seasons. This allowed for more recreationists to be surveyed than in-person surveying, due to the size and remoteness of the Projects [section 5.9(b)(7)]. Moreover, the combination of focus group sessions and the redeployment of the survey kiosks provided thorough locational and topical recreation use input [section 5.9(b)(6)]. Therefore, we do not recommend that the *Recreation Study* be modified to include a third survey season with in-person surveys.

**4. Whitewater Boating Assessment**

Background

The approved study plan for the first year of studies required that GLHA conduct a *Whitewater Boating Assessment*, equivalent to a Whittaker Level 1 study,[14] using a combination of a literature review, a survey of whitewater boaters, and hydrologic analyses for four study reaches associated with the projects: (1) West Branch downstream from McKay Station to Debsconeag Falls; (2) West Branch downstream from Ripogenus Dam to McKay Station ("Upper Gorge" or "dryway"); (3) West Branch

[14] Whittaker *et al*. (2005) provides a generally accepted whitewater boating methodology that involves a phased approach consisting of three progressive levels: (1) a Level 1 desktop analysis; (2) a Level 2 on-land feasibility assessment and/or on-water single-flow feasibility assessment; and (3) a Level 3 intensive study, including multiple flows. *See* Whittaker, D., Shelby, B., and J. Gangemi. 2005. Flows and recreation: a guide to studies for river professionals. Hydropower Reform Coalition. Available at http://npshistory.com/publications/rtca/nri/flows-recreation.pdf.

downstream from Stone Dam to Shad Pond; and (4) Millinocket Stream downstream from Millinocket Lake Storage Dam. The approved study plan also recognized that, depending on the findings of the first study season, a Level 2 or Level 3 study may be needed. GLHA conducted the *Whitewater Boating Assessment* on each of the four study reaches in 2022.

The approved study plan for the second year of studies required a Level 2 study for the West Branch downstream from Stone Dam to Shad Pond.[15] We stated that a Whittaker Level 2 study for boating the West Branch downstream from Stone Dam would: (1) identify the reach's flow-dependent attributes; (2) assess the feasibility and potential quality of boating opportunities there; and (3) estimate necessary flow ranges for boating the river. Moreover, the approved study plan required that the Level 2 study include boating the reach to "Assess the feasibility and potential quality of boating opportunities and estimate flow ranges by boating the river at a single flow."[16]

Requested Study Modifications

AW/AMC and Christopher Howe assert that GLHA has not completed the Level 2 whitewater boating evaluation downstream from Stone Dam and has not held a planning meeting with AW/AMC to coordinate the study implementation. AW/AMC requests that GLHA complete this study in accordance with the approved study. In addition, Maine TU requests that the on-water portion of the Level 2 study be conducted in Summer of 2024.

Reply Comments

In its reply comments, GLHA indicates that it has scheduled a meeting with stakeholders to determine the feasibility and logistics of safely performing an on-water boating assessment in the West Branch downstream from Stone Dam. GLHA states that if a reasonable study approach can be developed that allows the study to be conducted safely, the on-water Level 2 assessment of the reach will be completed.

Discussion and Recommendation

Currently, there is no formal put-in for the reach downstream from Stone Dam. Interviewees, of which there were only two, reported paddling about 2 miles across Quakish Lake and portaging Stone Dam to gain access to the reach. Releases from Stone Dam are typically made by deflating the pneumatic dam. However, such flow releases

[15] Director of the Office of Energy Projects' September 19, 2023 Determination at B-28.

[16] For more information, please refer to Whittaker *et al*. (2005). *See* n. 14 *supra*.

for recreation boating opportunities cannot be controlled, and the exact flow would not be precise.

As stated in the September 19, 2023 Determination, a Whittaker Level 2 study is necessary to provide information on the reach's flow-dependent attributes, assess the feasibility and potential quality of boating opportunities in the reach, and assess the flow ranges needed for boating the river [section 5.9(b)(4)]. Therefore, we recommend that GLHA conduct a Level 2 study by boat in the West Branch downstream from Stone Dam, as requested and required by the approved study plan. We also recommend that the study proceed, if it can be conducted safely, and that the study be done with experienced boaters at a single flow, includes use of an appropriate evaluation form, and is followed by a focused group discussion to assess the reach's boating feasibility, flow-dependent attributes, and the potential flow ranges for boating.

## 5. Aesthetics Study

Background

The approved study plan required GLHA to conduct a study of aesthetics at the Projects. The first year of studies, based on the Bureau of Land Management's Visual Resource Management methodology, documented the scenic views, vistas, riverscapes, and other noteworthy features of the Projects from Key Observation Points (KOPs) where the Projects are frequently viewed by the public. The study was designed to augment and update existing information on the scenic and visual resources provided at the Projects. GLHA identified KOP locations,[17] conducted an initial field inventory, and photo documented aesthetic resources from the KOP locations. The approved study plan required the *Aesthetics Study* to be conducted in consultation with Maine Bureau of Parks and Lands (Maine BPL), AW/AMC, the Camp Associations, and other interested stakeholders. This consultation did not occur during the first year of studies. Instead, GLHA collected baseline photo documentation of noteworthy features and then proposed to assemble a focus group to participate in supplementing the existing information on aesthetics at the Projects. The approved study plan for the second year of studies required a virtual assessment of the KOPs by an Aesthetics Focus Group.

Proposed Study Modifications

In its comments, AW/AMC requests that the *Aesthetics Study* incorporate a dropbox or other video sharing system to host user videos and photos that can be used as part of the study. Additionally, AW/AMC states that the study should compare flows at

[17] The KOP locations were described in GLHA's Revised Study Plan filed on March 23, 2023.

different impoundment levels, and use more than one key observation point in Ripogenus Gorge. Maine BPL and Maine TU, in their comments, request that GLHA include the photos of the Ripogenus impoundment submitted by the Caribou and Chesuncook Lakes Camp Association as part of the analysis, as they believe the (low water) conditions captured in those photos better represent the conditions that boaters and campers are likely to experience. Finally, during the May 15, 2024 USR Meeting, Kathy Houston and Bob Nasdor requested that the public be allowed to view user videos of the Projects.

Reply Comments

In its reply comments, GLHA states that the goal of the *Aesthetics Study* was not to compare the effects of the seasonal drawdown of the project impoundment(s), but rather to establish a baseline assessment of the views associated with the Projects and augment existing information. GHLA asserts that there is sufficient existing information related to aesthetics.

Discussion and Recommendation

Regarding modifying the *Aesthetics Study* to include a third survey season with different impoundment levels and additional KOPs, GLHA conducted the *Aesthetics Study*, with stakeholder participation, as required by the approved study plan [section 15(d)(1)]. Based on our review of the study results, the information provided by the study is adequate to describe aesthetic conditions at the Projects under a range of operational scenarios [section 5.9(b)(4)] and analyze aesthetic issues in the environmental document and inform licensing decisions for the Projects [section 5.9(b)(5)]. Regarding requests for a drop box and including stakeholder photos and videos in the assessment, we note that photos and videos can be uploaded to the Commission's eFiling system at https://www.ferconline.ferc.gov/FERCOnline.aspx. The eFiling system accepts two types of video formats (.WMV and .MPG). Stakeholders are welcome to file any additional photos and videos into the project record for Commission staff's consideration and use in its environmental analyses. Therefore, we do not recommend modifying the *Aesthetics Study*, as requested.

**6. Environmental Justice Study**

Background

The approved study plan for the first year of studies required that the *Environmental Justice Study* be conducted in consultation with the Penobscot Indian Nation and other stakeholders. GLHA conducted the study to assess the Projects' potential to affect minority and low-income populations in the project vicinity. However,

the information in the ISR did not contain a consultation record with any stakeholders.[18] The Director's September 19, 2023, Determination required that the second year of studies include an *Environmental Justice Study* with a geographic scope of 5 miles, instead of the original 1 mile around the Projects. The Determination also required GLHA to consult with, and conduct the study with, the Penobscot Indian Nation and other stakeholders.

Requested Study Modifications

It its comments, AW/AMC states that the study should not only include an analysis of the effects on those residing within a specified radius around the Projects, but also the effects on the wider community, including Tribal members and vulnerable populations that use project waters for subsistence fishing, recreational enjoyment, and traditional cultural uses and/or artifacts. AW/AMC asserts that the study fails to present a complete picture of potential project effects because it ignores ongoing project operations.

Reply Comments

GLHA, in its reply comments, states that it conducted the study in accordance with the goals and objectives of the approved study plan, and that it continues to perform outreach to the Penobscot Indian Nation regarding this study and the relicensing of the Projects.

Discussion and Recommendation

The approved study plan indicated that a description of socioeconomic conditions would be required in the final license application, and that this information, along with the results of the *Environmental Justice Study*, would be sufficient to address existing information gaps regarding the effects of continuing to operate the Projects on socioeconomics and environmental justice communities [section 5.9(b)(4)]. Moreover, GLHA's study identified low-income environmental justice communities in six of the nine census block groups within a large, 5-mile study area. GLHA attempted, and continues to attempt, to engage with the Penobscot Indian Nation and other stakeholders. Additionally, GLHA conducted additional outreach with interested stakeholders to include the towns of Millinocket, East Millinocket, and Medway. This information, along with the required information on socioeconomic resources, will be sufficient to inform licensing decisions for the Projects [section 5.9(b)(5)]. Finally, GLHA conducted

[18] During the ISR Meeting (May 2-4, 2023), GLHA indicated that it was approaching the study in two phases, and that Phase 2 would include additional outreach with the Penobscot Indian Nation.

the study in accordance with the approved study plan, including enlarging the scope, making attempts to contact the Penobscot Indian Nation, and conducting outreach meetings [section 15(d)(1)]. Therefore, we do not recommend that the geographic scope of the *Environmental Justice Study* be expanded, as requested.

# APPENDIX C

## STAFF RECOMMENDATION ON REQUESTED NEW STUDY

### West Branch Flow Study – Atlantic Salmon Spawning/Rearing Habitat Downstream from McKay Station

Background

Under the current license for the Ripogenus Project (Article 402), Great Lakes Hydro America, LLC (GLHA) operates McKay Station to provide minimum flows to the West Branch for aquatic resources, as well as whitewater boating.[19] These minimum flows normally are released through McKay Station. However, during unit or station outages, the flows are released through a gate at Ripogenus Dam. The minimum flows for aquatic resources are:

- 1,000 cubic feet per second (cfs) (September 16 through October 14);
- At least 1,422 cfs, or inflow, but not less than 1,300 cfs (October 15 through November 15) for salmon spawning; and
- Greater than 1,422 cfs, or the established spawning flow for the year (November 16 through June 7) for salmon incubation.

In is comments, Edward Spear asserts that recent operational modeling iterations highlight the need to confirm the suitability of the current aquatic flows required by the existing license to protect landlocked salmon spawning and incubation habitat in the West Branch of the Penobscot River (West Branch) downstream from McKay Station. Mr. Spear states that there is no empirical data or other information on the suitability of the existing salmon spawning and incubation flows when McKay Station's releases fall below 2,000 cfs, and that additional scientific study is needed to fill this information gap. Mr. Spear specifically requests that the suitability of historical salmon spawning and incubation habitat,[20] as well as habitat in the Holbrook Side Channel (required by existing license Article 406), be evaluated at flows of 1,800, 1,450, and 1,000 cfs. Mr. Spear claims that the existing 1,000-cfs flow was set to optimize turbine efficiency, the spawning and incubation flow of 1,422 cfs is based on the New England Aquatic Base

[19] *See* Table 4.1-1 in GLHA's draft licensed application filed May 3, 2024.

[20] Historical landlocked salmon spawning locations include Holbrook Pool (north side of river), Line Pool, and Abol Bridge Pool, which are all areas downstream from McKay Station.

Flow (ABF) Policy developed by the U.S. Fish and Wildlife Service,[21] and no thought was given to flows of 2,000 cfs or higher (e.g., 2,400 cfs) for economic reasons (i.e., the Ripogenus Project provided power to nearby paper mills).

Requested Study

Mr. Spear states that any aquatic flow required by the license needs to be biologically supported. Therefore, Mr. Spear requests that GLHA conduct a flow study in the West Branch downstream from McKay Station. The goal of the study is to verify that any aquatic flows required by the new license are biologically suitable and support landlocked salmon reproductive needs. Mr. Spear's recommended study would include: (1) visually identifying areas of favorable spawning substrates that are contiguous with historical spawning locations; (2) using GPS (Global Positioning System), or other appropriate methods, to overlay the areas with favorable spawning substrate with those of favorable depth and velocity; (3) using standard, accepted methodologies, to measure water velocity, water depth, degree of embeddedness, and the percentage of fines in potential spawning locations; and (4) a verification process.[22]

Reply Comments

In its reply comments, GLHA states that the existing minimum flow regime for the West Branch downstream from McKay Station was established based on FWS's standard-setting method for determining aquatic base flows (i.e., New England ABF Policy). GLHA also states that the ABF flows were implemented to provide stable river flows during the entire critical spawning and incubation periods for landlocked Atlantic salmon (October 15 thru June 7) to promote spawning, protect salmon eggs from desiccation, and confine spawning to deeper channel areas that are protected from freezing in the winter months. GLHA notes that the spawning and incubation flows included in the existing license were based on 10 years of field observations by

[21] The ABF Policy is defined as 1 cfs per square mile of drainage area for the salmon spawning season and 0.5 cfs per square mile for the remainder of the year. *See* https://www.des.nh.gov/sites/g/files/ehbemt341/files/documents/2020-01/wd-11-3.pdf, Attachment 1, Appendix A.

[22] Should salmon spawning and incubation flows be in the 1,000- to 1,800-cfs range during the spawning period (November 1-15), the verification process would entail GLHA returning to the sampling locations (e.g., Line and Abol Bridge Pools) after Nov 15. The suitability of spawning substrates and river velocities at various redds would be verified through direct observation. Protection of incubating eggs would require enumerating the redds in the spawning area and collecting data on water velocities (surface and bottom), as well as depths of selected redds. For the Abol Bridge Pool, the verification process would account for tributary inflow.

professional fish biologists.[23] Finally, GLHA states that its 2022 study of the river reach downstream from McKay Station, which is characterized as a set of deep, swift pools and rapids, shows that 1,000 cfs: (1) provides sufficient water for zone of passage (i.e., volitional upstream and downstream movements); (2) supports resident fish species (e.g., landlocked salmon and brook trout), as well as other aquatic organisms; and (3) wets the river channel from bank to bank. GLHA did not respond to Mr. Spear's request for a flow study.

Discussion and Recommendation

The drainage area at the Ripogenus Project is 1,422 square miles. Consistent with the New England ABF Policy, the existing fall and winter flow of 1,422 cfs is equal to an ABF flow of 1.0 cfs per square mile. The minimum flow of 1,000 cfs is equal to 0.7 cfs per square mile of drainage, which is higher than the 0.5 cfs per square mile of drainage (or 711 cfs) recommended by the New England ABF Policy.

Notwithstanding the origin of the existing flows, standard setting methods, such as the New England ABF Policy, are scientifically acceptable approaches to establishing aquatic flows in rivers like the West Branch [section 5.9(b)(6)]. Such methods provide a conservative approach to developing flows that are protective of aquatic resources without the need to do (or in the absence of) costly site-specific flow studies or evaluations (Lang, 1999)[24] [section 5.9(b)(7)]. In addition, using a conservative, standard-setting approach to establish aquatic base flows is sufficient to inform a licensing decision for the Ripogenus Project [section 5.9(b)(5)]. Finally, there has been no material change in any law or regulation applicable to the information request [section 5.15(e)(1)], nor does the study request sufficiently explain why the study was not requested earlier [section 5.15(e)(3)]. Finally, the extraordinary circumstances criterion of section 5.15(f) has not been met. Therefore, we do not recommend that GLHA conduct a flow study downstream from McKay Station, as requested.

# Report of Observations – July 17 and July 24, 2024
## Ramping Study of West Branch of the Penobscot River below McKay Station

Stephen G. Heinz, Maine TU Council FERC Coordinator, September 9, 2024

## Introduction

A study was conducted by Brookfield Renewable (Brookfield) with test events occurring on July 17 and July 24, 2024 to comply with the Federal Energy Regulatory Commission (FERC) Study Plan Determination.[1] Although Brookfield calls this a "Ramping Study" and we have continued to use that title to avoid confusing it with the 2022 Stranding Study, it was not a true ramping study using the methodology of Smokorowski et al. as it did not incorporate gradual step downs of flow and it did not collect data on resultant macroinvertebrate drift. It is difficult to see it as an appropriate follow-up to the Stranding Study because it was conducted at a different time of year (July versus October) and was preceded by different flow patterns.

Brookfield had originally announced the study by email[2] to a small distribution of stakeholders in April proposing to conduct the study June 12 and June 19. TU's response[3] requested the study be conducted in late September or early October because the proposed dates were during the weeks of highest aquatic biological activity, when mortality would be greatest due to temperature, and when TU volunteers would likely be unavailable. MDIFW asked that the studies be in: "late July or early August. Anytime we are conducting landlocked salmon recruitment/population studies, we typically wait until late July or August, so the yoy are large enough to observe/handle."[4] TU asked that low flow observations be conducted during the study.[5] The study plan provided did not cover all the areas where TU volunteers had observed strandings observing the Stranding Study conducted in October of 2022. TU declined to provide participants for the study but noted that it would conduct independent observations.

[2] Email from Jesse Wechsler. Kleinschmidt Associates of April 26. 2024, Subject: Ripogenus Project Ramping Study Planning.

[3] Steve Heinz email dated April 30, 2024, Subject: Ripogenus Project Ramping Study Planning.

[4] Tim Obrey email dated May 2, 2024, Subject: Ripogenus Project Ramping Study Planning.

[5] Id., "TU intends to propose a safe flow study be conducted as an adjunct to the Ramping Study and proposes to discuss this at the upcoming USR Meeting in Bangor. TU is still unaware of data supporting the flows that comprise the terms and conditions of the current license. The 400 cfs trip event flows allowed under the current license have been demonstrated to cause extensive mortality to fish and macro-invertebrates. If data exists to justify 1000 cfs as a minimum flow in terms of strandings, then please direct us to the study data that shows that. Similarly, if data exists to justify spawning and incubation flow of 1422 to 1300 cfs, then please direct us to that as well. To our knowledge, the 1422 cfs only reflects the general guidance for minimum flow developed by USFWS for New England waters: the catchment area in square miles. More specific data is needed to condition the new license."

Brookfield moved the dates to July when the mortality due to temperature would likely be higher,[6] a date that made comparisons with the Stranding Study less valid. TU comments that the study methodology was inadequate were not acted on,[7] and the study did not include provisions for study of macro-invertebrate drift. "Consultation" consisted of Brookfield informing us of the basics of the releases. We do appreciate that Brookfield employees and contractors were present at the volunteer briefings on both dates to ensure safety and coordination.

TU persisted in requesting lower minimum flows for the study[8] that Brookfield stated would be 1200 cfs.[9] At Big Eddy Campground on July 17, Brookfield Relicensing Manager Mike Scarzello stated that minimum study flows would be 1035 cfs.

This report is organized as follows:

Introduction – page 1
Study Event: July 17, 2024 – page 2
Conclusions – page 7
Attachment List – page 8
Study Event: July 24, 2024 – page 34
Conclusions – page 36
Attachment List – page 38
Overall Conclusions – page 59
Recommendations – page 63

## Study Event 1 - July 17, 2024

## Methods

Volunteers were instructed to assemble at Big Eddy Campground at 1:00 p.m. on July 17, 2024. A briefing was presented that covered safety, data collection, team composition and area assignment. All volunteers took the briefing, and signed hold harmless/photo authorization forms. Brookfield Relicensing Manager Mike Scarzello and Senior Kleinschmidt Associate Jesse Wechsler along with other formal Brookfield study participants were present.

Safety Instructions:

Work in pairs, keep buddy within sight and sound

[6] Email from Jesse Wechsler. Kleinschmidt Associates of June 26. 2024, Subject: Ripogenus Project Ramping Study Planning.

[7] Steve Heinz email dated May 23, 2024, Subject: Ripogenus Project Ramping Study Planning.

[8] Steve Heinz email dated July 1, 2024, Subject: Ripogenus Project Ramping Study Planning.

[9] Email from Jesse Wechsler. Kleinschmidt Associates of July 13, 2024, Subject: Ripogenus Project Ramping Study Planning.

Wear a PFD, use a wade stick and studded or felt soled boots if/as needed

Primary hazards are slipping and tripping

Take your time and do a thorough search – it's safer and more effective

If someone is injured and you have to go for help, get them out of the watercourse first

Nearest hospital is Millinocket Regional Hospital, 200 Somerset St, Millinocket, ME 04462. This is off Route 11 just past and north of where it is joined by the Golden Road

Event set for 2:00 to 7:00. Pick a watered rock in your vicinity and check for water level periodically - everyone headed to shore at 7:00.

Brookfield may deploy drones. If they do, go to shore until they pass.

Don't get stuck on far bank below the Big Eddy

Water and a snack recommended

Rain gear per forecast

Check out before you leave – everyone must be accounted for

Leave the watercourse if lightning or thunder are noted.

Data Collection Instructions:

Take photos from your vantage point at 15-minute intervals starting at 2:00

Go to areas where you suspect strandings after the water starts to drop

Photo document unconnected pools; document anything alive that you find in unconnected pools - if in doubt, document

Key information: time, location, brief description, photo # , fish species, micro-invertebrate species, other

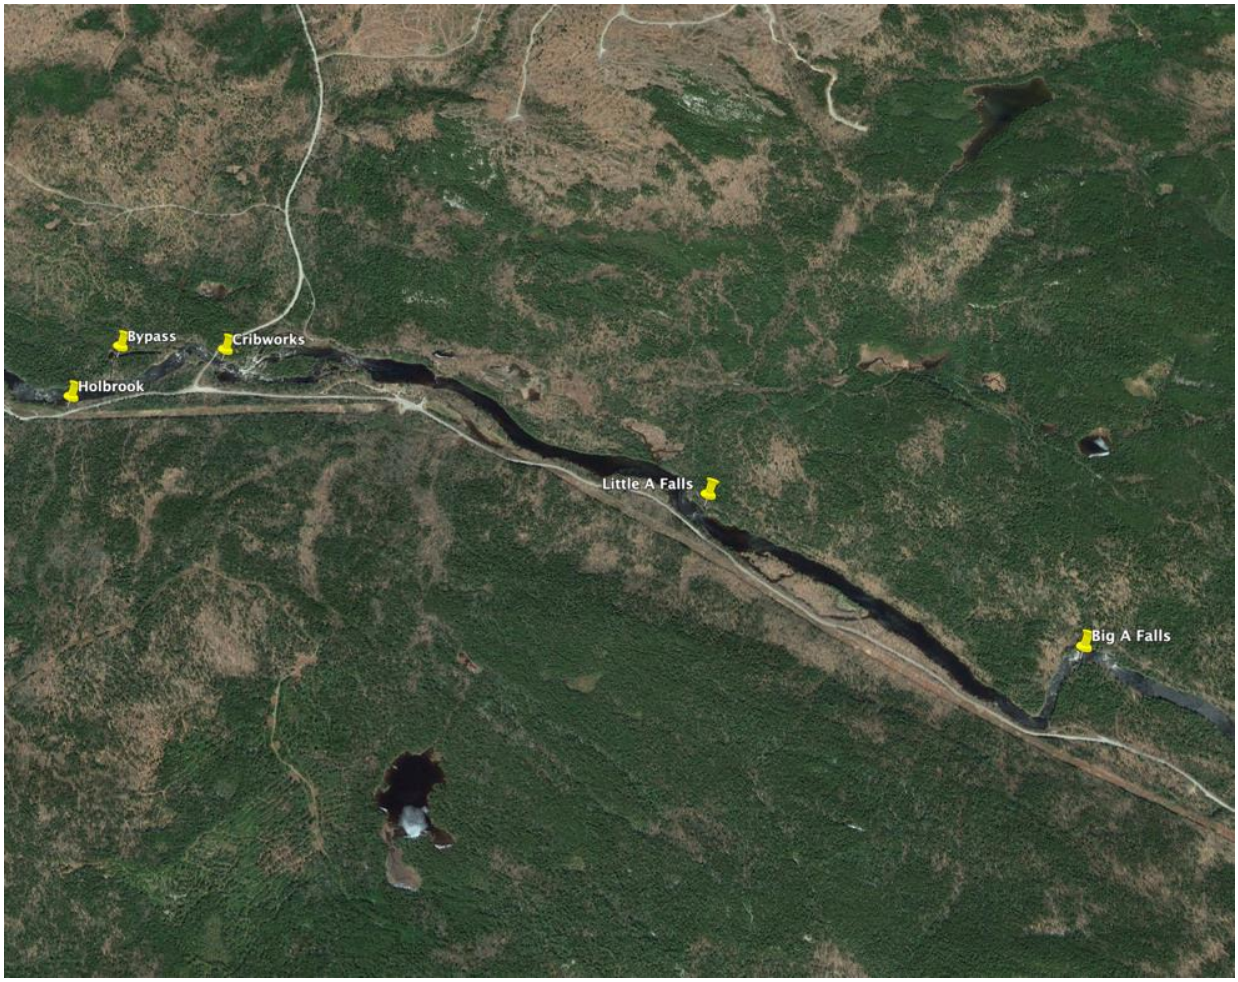
Use the data sheet provided if you can't keep this all on your phone

Be prepared to show what area you covered at the end of the day and provide a narrative account of your activities

Give the Brookfield/IFW crews a wide berth, do not get in their way, muddy waters, engage them, etc.

As soon as you can, upload your photos to the appropriate folder within https://drive.google.com/drive/folders/1UH_7jwBSjfhio2dBQWY-wlFDoxYNPb3u?usp=sharing

Team Composition:



| Team # | members | affiliation | reach |
|---|---|---|---|
| 1 | Mark Gregory | TU | ByPass |
| | Steve Eppich | TU | ByPass |
| 2 | Mike Enos | TU | Holbrook |
| | Jim Hayes | Penobscot Fly Fishers | Holbrook |
| 3 | Neal Hagstrom | TU | Cribworks |
| | Steve Heinz | TU | Cribworks |
| 4 | Russ Vickery | TU | Little A |
| | Ed Spear | Unaffiliated | Little A |
| 5 | Garrett Murth | TU | Big A |
| | John Murphy | TU | Big A |

Team members and kayakers were given the opportunity to review this report. All teams and kayakers confirmed the data contained in this report.

General Area:

Reaches were assigned to be consistent with the five covered during the Stranding Study where stranded fish were found. Figure 1 shows their general locations.

**Figure 1**

General. Each team was given a paper map with the areas of stranding noted during the Stranding Study highlighted in red. These areas were based on where stranded fish were found during the Stranding Study. Suggested vantage points were suggested from which to observe and photograph the receding waters.

Holbrook. The Holbrook side channel and portions on the north bank between the tail of the Little Eddy and where the side channel rejoins the main stem of the river had been assigned during the Stranding Study. Strandings were not expected to occur in the bypass during this study. Map included as attachment A

Holbrook. The south bank of the main channel between the tail of the Little Eddy and Telos Bridge. Map is included as Attachment D.

Cribworks. Area from Telos Bridge to the head of the Big Eddy. Map is included as Attachment G.

Little A Falls. South bank and side channels of the area below Little A Falls. Map is included as Attachment J.

Big A Falls. The east and south banks of Big A Falls and area downstream of the falls to the first riffle. Map is included as Attachment M.

McKay. Area immediately across from McKay Station turbine discharge.

## Results

Flows the day prior to the event were reported as 3200 cfs. The day of the event they were raised to the maximum of 3600 cfs. At 2:00, flows were dropped to the minimum that Brookfield reported in the field as 1035 cfs. The event was scheduled to continue to 7:00 p.m., but Brookfield's and TU's teams were all off the river by about 5:30 and two-generator flow of 2100 cfs was restored at around 6:00 p.m. It should be noted that observations were interrupted by a 20-to-30-minute downpour that occurred about 3:45.

Strandings occurred at a lower rate than was observed during the Stranding Study and fewer salmonids were observed stranded. That levels were only dropped to 1035 cfs rather than the 500 cfs lows of the Stranding Study may account for this. TU hopes that this was not an indication of loss of abundance from the generator trip event that occurred July 7, 2023. This difference may also be due to the fact that the study event occurred nearly three months earlier in the year when parr are smaller. It should also be noted that water levels during the week prior to the study event fluctuated between 3000 during the day and 1800 in the evening, but were 2000 to 2200 cfs prior to the Stranding Study Event making comparisons less valid.

| Team | Fish* | Minnows# | Dead fish & minnows | Invertebrates |
|---|---|---|---|---|
| 1 | 8 | 0 | 8& | Numerous stonefly nymphs and other aquatic insects, 3 crawfish |
| 2 | 5 | 0 | 5@ | 100s of nymphal insects, multiple crayfish |
| 3 | 0 | 2 | 0 | Numerous, mostly stonefly nymphs |
| 4 | 1 | 36 | 1 | Many |
| 5 | 2 | 25 | 16+ | Over 50 stonefly nymphs counted |
| Total | 16 | 63 | 30+ | Quite numerous |

Legend on following page

* Fish were defined as all salmonids and others over 2 inches in length
# Minnows were defined as fish under 2 inches in length
& One dead white perch likely not related to study event
@ Landlocked salmon mortality not related to study event

| | | | | |
|---|---|---|---|---|
| Mercer | 43 | 5 | 0 | Too numerous to count |
| Grand Total | 59 | 68 | 30+ | Many |

Fish. Fewer stranded fish were observed compared to the Stranding Study of 2022.

Invertebrates. Macro-invertebrates were present in abundance. Species included golden stonefly nymphs (Perlidae), black stonefly nymphs (Pteronarcyidae), green rock worm (Rhyacophila), dragon fly nymphs, crayfish, leeches and others.

Minnows. Species included black-nose dace, sculpin, fallfish and others

Photography. Selected team imagery is included with the attachments that are organized by teams. Additional imagery is available for viewing online at https://drive.google.com/drive/folders/1UH_7jwBSjfhio2dBQWY-wlFDoxYNPb3u?usp=drive_link

Additional coverage of the event was provided by Maine Guide Todd Mercer who observed the area directly across from the discharge from McKay Station from a kayak. About 40 salmonids were observed trapped there. Later in the evening, the fish were still alive but trapped. If the low flows had persisted or gone lower than the 1035 cfs provided, we believe that mortality would have occurred.

In an independent effort, kayakers Chris Howe and Miles Puleio kayaked from McKay Station down to the head of the Nesownedahunk Deadwater. They also observed strandings with greatest effect reported upstream.

## Discussion

Area Coverage. The actual area that the 5 volunteer teams covered was relatively small compared to the area specified in the FERC Study Plan Determination[10] or as defined in TU comments on the Draft Stranding Study Plan.[11] The minimum flows of 1000 cfs did not dewater the high stranding area in Team 3's reach, and precluded Team 4 from reaching the north bank of their area, a high stranding and

[10] SPD, page B-4: "...downstream from the McKay Station discharge to Nesowadnehunk Falls."

[11] Maine TU Council letter dated September 23, 2022, Subject: Comments of Maine Council of Trout Unlimited on the Draft Fish Stranding Study Plan, page 2.

mortality area in the Stranding Study. A ballpark figure for close coverage of the area was 1 to 2 % of the area FERC specified in the SPD.

Predation. Predation was not observed during the Ramping Study events of either day. We believe that stranded minnows and macro-invertebrates would have experienced predation-related mortality if flows higher than the 1000 cfs study flows had not been immediately restored.

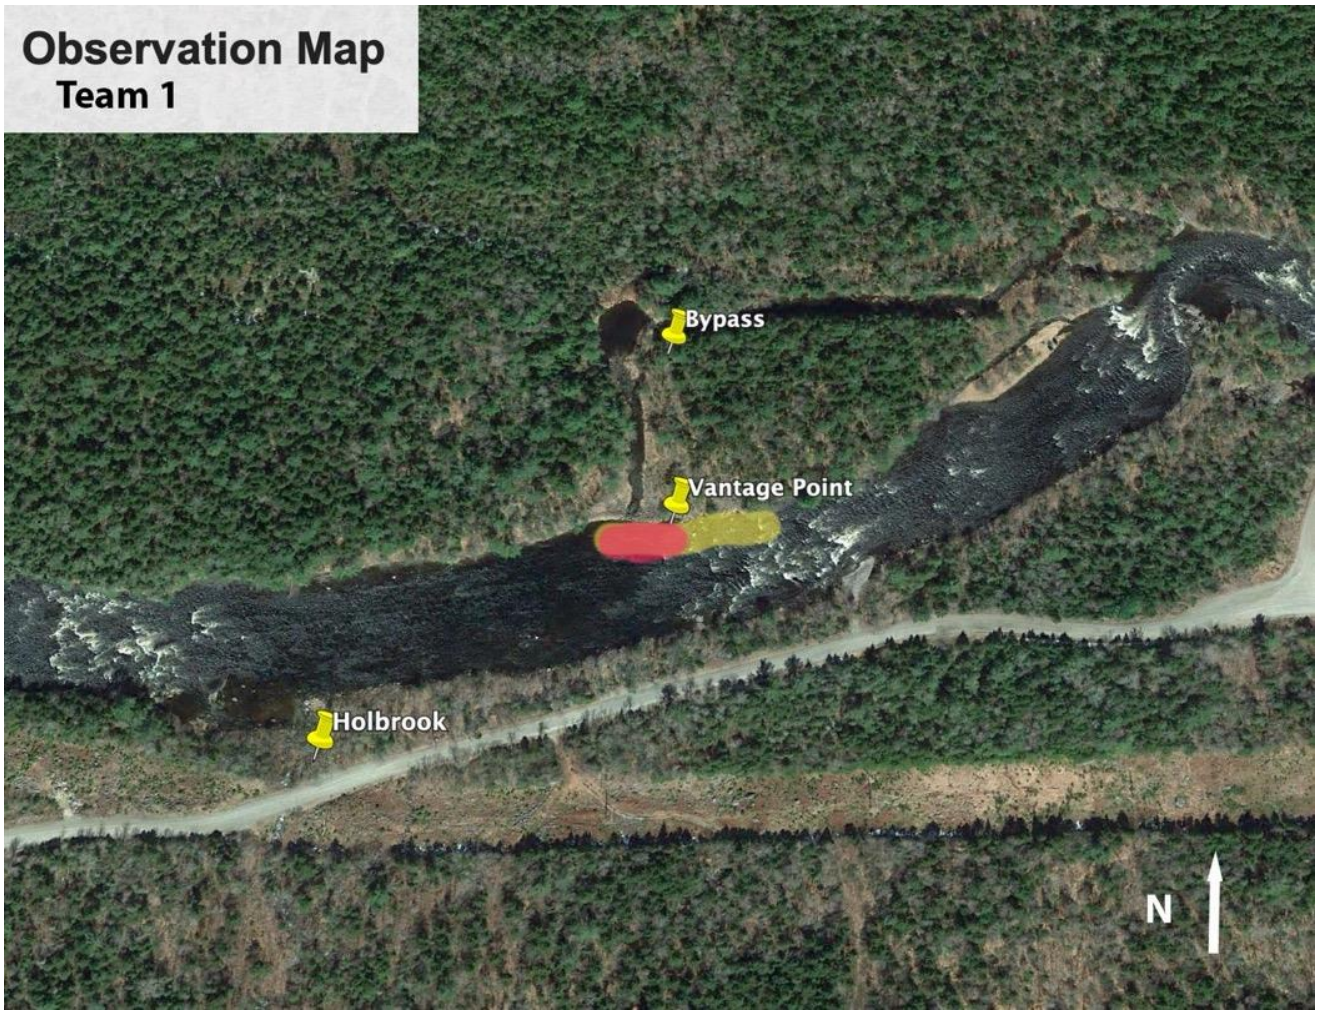
Mortality Factors. Air temperatures approaching 90 degrees F were observed on the July 17 event. A downpour that passed through the study area likely prevented significant mortality to stranded Macro-invertebrates. Lesser mortality would have been incurred by relatively mobile macro-invertebrates such as crayfish and stonefly nymphs, high mortality would have been the outcome for leeches, caddisfly larvae and mayfly nymphs. Without the rain, caddis larvae would likely have been greatly affected.

Larger Ecological Effects. Few dead fish or macro-invertebrates were observed, and fewer stranding strandings occurred. While the Stranding Study identified some areas of high stranding and mortality, the Ramping Study teams did not, but did observe some stranding on the margins of their reaches.

## Conclusion

The observations conducted by TU teams deployed during the July 17 Study Event demonstrate that stranding and mortality occur downstream from McKay Station when flows are reduced abruptly from 3600 cfs to 1035 cfs. Fewer salmonid strandings were observed and that could be because there are fewer salmonid YOY present following the July 7, 2023 generator trip event where mortality was observed, and was presumably wide spread. The study event was conducted nearly three months earlier in the year than the Stranding Study, and the smaller-sized salmonid parr may have been in different locations or affected differently. TU has persistently asked that the Ramping Study be conducted in Late September or early October. Conducting the study at a different time of the year compromises comparisons with the Stranding Study. Time of day appeared to be a factor as well with reflection and glare being more problematic during the afternoon as opposed to the morning timeframe of the Stranding Study with a lower sun angle.

The strandings at McKay Station that Todd Mercer provided had not been imaged before, and this provided additional surety that the reports of mortality from July 8, 2023 following the trip event were accurate. This and observations by the kayakers indicated that some amount of stranding and mortality occurs throughout the reach that is highly dependent on micro-topography, and the only way to accurately assess strandings would be to survey the entire reach.



Video obtained by Chris Howe showed the incredible abundance of macro-invertebrates in the gorge that had not been imaged in the Stranding Study. Caddis were abundant and their larvae are immobile or with limited mobility making them highly susceptible to mortality under either flow decrease scenario. The waterline established by nominal 2000 cfs summer flows was visible, and mortality to

these larvae would start to occur when flows go below that line and increase exponentially with lower flows.

## Attachment A

yellow: coverage area, red; Previous high stranding

## Attachment B

Debrief Sheet – Team 1

Team Members: Mark Gregory and Steve Eppich

Reach: Area outside of the Holbrook Side Channel berm and area immediately downstream

Percent Coverage: 100%

Vantage point photos: 2:20 to 4:35

Number of stranded fish: 8, all dead

Number of stranded invertebrates: numerous stonefly nymphs and other aquatic insects, 3 crawfish

Number of stranded others: none

Narrative: The team arrived at their assigned reach at 2:15 p.m. Water levels had already dropped approximately 24”. Observed 4 salmon parr about 2 inches in length, black dace minnows and one white perch.

Investigated the area downstream but did not observe strandings there. No observable changes after 3:00 p.m. The team departed the area at 3:45 and returned to the campground.

Dead brook trout parr

Dead large blacknose dace

## Attachment D

yellow: coverage area, red; previous high stranding area

## Attachment E

Debrief Sheet – Team 2

Team Members: Mike Enos and Jim Hayes

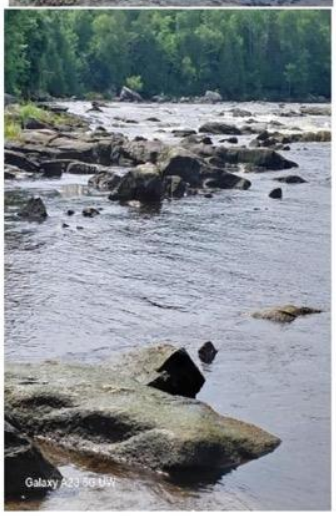
Reach: Holbrook

Percent Coverage: 100%

Vantage point photos: yes

Number of stranded fish: 4 small dead brook trout and one previously injured 12-inch landlocked salmon

Number of stranded invertebrates: thousands of insect larvae, 24 crayfish



Number of stranded others: 12 minnows

Narrative: Team arrived at vantage point at 2:00 p.m. and took photos showing initial water levels. By 2:10, the water had fallen 10 inches, by 2:15, it was down 16 inches, by 2:30 down 26 inches and by 2:45 it was down maybe 30 inches and stable.

At 2:45, we started a shoreline survey and found stranded aquatic insects, fish and crayfish. At 3:50, we'd completed covering the survey area and retired during the rain storm until 4:45.

## Attachment H

Debrief Sheet – Team 3

Team Members: Neal Hagstrom and Steve Heinz

Reach: Cribworks

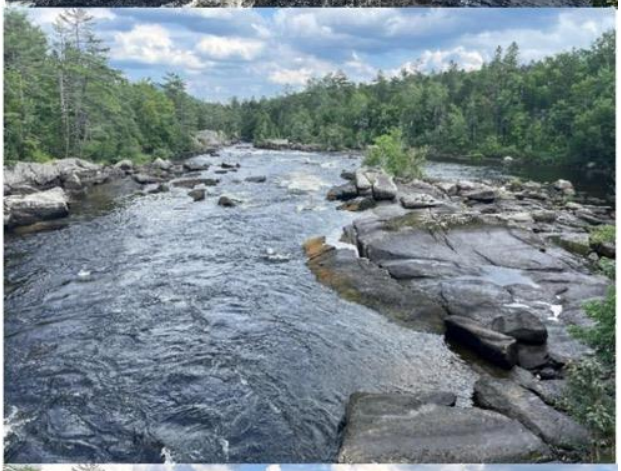
Percent Coverage: 75%

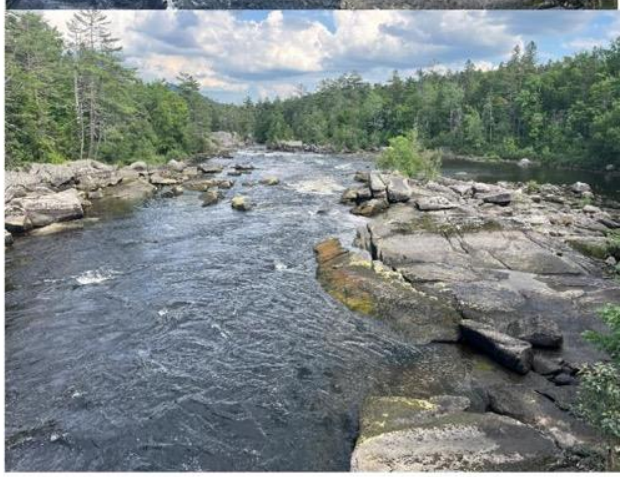
Vantage point photos: multiple

Number of stranded fish: 1 possible stranded salmon parr observed, no photos

Number of stranded invertebrates: Macro-invertebrates included black and golden stonefly nymphs, green rockworms, and leeches

Number of stranded others: 9 minnows, all alive





Narrative:

Team arrived at Telos Bridge at 2:00 and established a vantage point just south of the bridge. Took photos river left, straight down and river right toward high stranding area noted in Stranding Study. Quickly observed water levels starting to drop. Stranded pools formed by 2:17 on the right below Telos Bridge. Observed possible salmon parr, minnows and many stranded stonefly nymphs with no mortality observed. No usable images obtained of stranded minnows. Continued vantage point shots until 3:00 p.m. High stranding area noted in the Stranding Study did not dewater at minimum flows. Investigated area on river left from bridge to Cribworks. Photographed a stranded leech and a stranded sculpin and other minnows. Returned to vantage point for additional photos at 3:45 and 4:20. Departed the reach shortly after.

## Attachment K

Debrief Sheet – Team 4

Team Members: Ed Spear and Russ Vickery

Reach: Little A Falls

Percent Coverage: 20%, others observed in areas downstream, flow precluded access to north bank

Vantage point photos: yes

Number of stranded fish: I dead salmon parr

Number of stranded invertebrates: many including 100s of stonefly nymphs and some crayfish

Number of stranded others: ~36 shiner minnows

Narrative: The team arrived at the reach before 2:00 and began taking vantage point photos. 1000 cfs flows precluded coverage of high stranding areas from Stranding Study on the north bank. Water stabilized and the crew investigated possible strandings areas at 3:15. Our reach was an area with gradient, depth and substrates favorable to juvenile salmon and macro-invertebrates of different species. Team observed stranded aquatic insects and dead, stranded and escaping fish.

Our location at the top of Little A Falls was an area with gradient, depth and substrates favorable to Juvenile salmon and obviously, Aquatic Macroinvertebrates of different species. After perhaps an hour of falling water, this area became hydraulically isolated from the main channel and any “significant” flow. Fish, including salmon young-of-the year (YOY) began moving, some toward the small braided outlet channel. I observed at least one YOY escape downstream and out of the area being drained of flow, slowly losing depth and velocity. Stone flies were crawling everywhere, mayflies that tend to be sub-surface were not obvious. Macro-invertebrates that appeared to be cased caddis were often observed, but this could possibly have been some species of diptera.

A heavy shower arrived about 4:00 that ended our observation period, watered the reach, increasing flow, and wetting areas that might have otherwise dried up. We departed the area shortly thereafter.

Stranded stonefly nymph

## Attachment M

yellow: coverage area, red; previous high stranding

## Attachment N

Debrief Sheet – Team 5

Team Members: Garrett Murch and John Murphy

Reach: Big A Falls

Percent Coverage: 80%

Vantage point photos: 2:20 to 4:35

Number of stranded fish: two - one stranded brook trout (alive), one dead 10 ” landlocked salmon

Number of stranded invertebrates: many including over 50 stonefly nymphs, 2 crayfish and 4 caddis nymphs.

Number of stranded others: About 24 dace minnows, all dead.

Narrative: The team arrived at the reach at 2:06 and established 3 vantage points: 1 at 2:06, 2 at 2:12, and 3 at 2:23. Team observed a drop in water levels at all sites at 2:50. At 3:07, about a 1-foot drop was observed at Point 2, and isolated pools began to form. Stranded stonefly nymphs were noted at Point 3 at 3:15 and at Point 1 at 3:24. At 3:30, 5 stranded minnows were noted at Points 2 and 3. Heavy rain started at 3:50. Work resumed at 4:25. Point 2 contained the most strandings: a dead 10 inch landlocked salmon, a stranded brook trout parr, and over 15 dead dace. A stranded crayfish was noted at 4:35. The team departed the area shortly after. The number of stranded caddis and golden stones was quite sizeable in certain locations.

## Attachment Q

Selected photos, additional and brief video available at https://drive.google.com/drive/folders/1gGlTz0ZGEZ9a3iOo2y3l5kEFKop6NwWQ?usp=drive_link

Miles Puleio and Chris Howe traveled downstream from McKay Station to the head of Nesowadnehunk Deadwaters by kayak. Miles Puleio provided photos that showed strandings in areas that map study would not have indicated were worthy of investigation. Based on this and the observations of Team 4 who could not access the high stranding areas identified in the Stranding Study, specific topography drives stranding and mortality throughout the entire reach that they covered, but decreasing downstream as the rate of change attenuated. It would be difficult to accurately quantify without assigning observers to cover the entire reach. Selected photos follow:

Stranded brook trout parr

Stranded crayfish

Stranded minnows, stonefly nymph and crayfish

Stranded brook trout parr

Chris Howe made a video of his efforts that is at https://drive.google.com/file/d/1NqAET8naBmkGZhpyJDolzV00NIUrXfZ0/view?usp=sharing While the movie captures stranded salmonids and even a brown bullhead catfish photo below, what is truly remarkable is the abundance of nymphs and aquatic insect larva. The video gives you a better appreciation of the impacts on aquatic life than this representative frame from the video.

Stranded brown bullhead catfish

Abundant caddis larvae

## Study Event 1 - July 24, 2024

## Methods

Volunteers were instructed to assemble at Big Eddy Campground at 1:00 p.m. on July 24, 2024. A briefing was presented that covered safety, data collection, team composition and area assignment. All volunteers took the briefing, and signed hold harmless/photo authorization forms. Senior Kleinschmidt Associates Jesse Wechsler along with a few other formal Brookfield study participants were present. Safety and data collection instructions were as had been given on July 17.

| Grand Total | 32 | 82 | 4 | Numerous |

Fish. Fewer stranded fish were observed than during the Stranding Study and slightly less than the July 17 study event. Little mortality was observed, but we believe that mortality would have been the result if the low flow was maintained or the temperature conditions worse than the air temperatures in the mid-70s and water temperatures in the low 70s.

Invertebrates. Macro-invertebrates were present in abundance. Species included golden stonefly nymphs (Perlidae), black stonefly nymphs (Pteronarcyidae), green rock worm (Rhyacophila), dragon fly nymphs, crayfish, leeches and others.

Minnows. Species included black-nose dace, sculpin, fallfish and others.

Photography. Selected team imagery is included with the attachments that are organized by teams. Additional imagery is available for viewing online at https://drive.google.com/drive/folders/1Wt5DG3qIfhYe_ufNtITUM0U7ykVgDPpx?usp=drive_link

Additional coverage of the event was provided by Maine Guide Todd Mercer who observed the area directly across from the discharge from McKay Station from a kayak. Over 20 salmonids were observed trapped there. Later in the evening, the fish were still alive but trapped. Two-generator operation flows of 1800 cfs were restored quickly, but we believe that mortality would have resulted if low flows had persisted or gone lower than the ~1000 cfs study flow. A video of the stranding pool is included with the photography.

In an independent effort, kayakers Chris Howe and Miles Puleio kayaked from McKay Station to Big Eddy Campground. Their results were similar to those obtained on July 17. Photos and video were provided.

## Discussion

Area Coverage. The actual area that the 5 volunteer teams covered was relatively small compared to the area specified in the FERC Study Plan Determination[12] or as defined in TU comments on the draft stranding study plan.[13] The minimum flows of 1000 cfs did not dewater the high stranding area in Team 3's reach, and precluded Team 4 from reaching the north bank of their area, a high stranding and mortality area in the Stranding Study. A ballpark figure for close coverages of the area was 1 to 2 % of the area FERC specified in the SPD.

Predation. Predation was not observed during the Ramping Study events of either day. We believe that stranded minnows and macro-invertebrates would have experienced mortality if the 1000 cfs flows were not immediately restored.

Mortality Factors. Environmental factors were relatively benign compared to the July 17 event with temperatures in the 70s and cloudy skies.

Larger Ecological Effects. Fewer dead fish or macro-invertebrates were observed, and fewer strandings occurred. While the Stranding Study identified some areas of high stranding and mortality, the Ramping Study teams did not, but did observe some stranding on the margins of their reaches.

## Conclusion

The observations conducted by TU teams deployed during the July 24 Study Event demonstrate that stranding and mortality occur downstream from McKay Station when flows are reduced from ~2400 cfs to ~1000 cfs, but the stranding rate is similar to the more drastic reduction from 3600 cfs to 1000 cfs. Lingering effects from the July 17 event could be a factor. It should be noted that Team 2 found no

[12] SPD, page B-4: "...downstream from the McKay Station discharge to Nesowadnehunk Falls."

[13] Maine TU Council letter dated September 23, 2022, Subject: Comments of Maine Council of Trout Unlimited on the Draft Fish Stranding Study Plan, page 2.

strandings during the event of July 24, when the July 17 counterparts did; Team 3 found many more stranding during the July 24 event than it did during the July 17 event: and, the area at McKay where over 40 salmonids were discovered stranded saw about half the strandings that occurred on July 17. Variation in the number of strandings between events could be based on any number of factors. We think that the habitat disruption and mortality caused by the study event on July 17 affected the results on July 24. Without a multi-year study, it is difficult to identify specific causes.

The stranded fish would likely have become mortalities had the low flow conditions persisted. The study event was conducted nearly three months earlier in the year than the Stranding Study, and the smaller-sized salmonid parr may have been in different locations or affected differently.

The abundant caddis larvae would likely have been mortalities as well, had the 1000 cfs flows, legal under the current license, been allowed to persist. The waterline established by nominal 2000 cfs summer flows was visible, and mortality to these larvae would start to occur when flows go below that line and increase exponentially with lower flows.

Debrief Sheet – Team 1

Team Members: Max Tritt and David Bean

Reach: Area outside of the Holbrook Side Channel berm and area immediately downstream

Percent Coverage: 100%

Vantage point photos: 2:00 to 5:00

Number of stranded fish: 2 dead fish

Number of stranded invertebrates: numerous stonefly nymphs, 6 crawfish, leeches

Number of stranded others: 25 minnows including black nose dace

Narrative: The team arrived at their assigned reach at 2:00 and took vantage point photos. By 3:15, stranding pools had formed. At 3:00, stranded crayfish and stoneflies were observed. At 3:40, a dead salmon and some stranded minnows were observed. Team departed the reach at 5:00.

Additional note: The Holbrook bypass remained watered throughout the event.

Debrief Sheet – Team 3

Team Members: Neal Hagstrom and Steve Heinz

Reach: Cribworks

Percent Coverage: 75%

Vantage point photos: multiple

Number of stranded fish: 1 brook trout and at least 3 fallfish

Number of stranded invertebrates: Macro-invertebrates included black and golden stonefly nymphs, green rockworms, and leeches

Number of stranded others: 40 minnows, all alive

Narrative:

Team arrived at Telos Bridge at 2:00 and established a vantage point just south of the bridge and began taking vantage point photos that persisted throughout the period. Stranding pools developed below the south end of Telos Bridge by 2:35 that were investigated, but no stranded organisms were observed. Further flow reduction and dewatering noted by 3:13. Multiple stranding pools formed where fallfish, minnows and macro-invertebrates were observed. The high stranding area observed during the stranding study again did not form at the ~1000 cfs flow. Crossed over to north bank and observed more strandings including, a brook trout, leeches and other aquatic insects. Departed the reach at 4:00

Debrief Sheet – Team 4

Team Members: Mac McClain and Sean Beauregard

Reach: Little A Falls

Percent Coverage: 20%, flow precluded access to north bank.

Vantage point photos: 2:00 to 4:00 p.m.

Number of stranded fish: 4 fish all alive including 3 landlocked salmon parr

Number of stranded invertebrates: >55 live macro-invertebrates including >50 stonefly nymphs, 3 crayfish, 1 Isonychia nymph, and 1 leech

Number of stranded others: 11 live minnows

Narrative: The team arrived at the reach at 1:30 p.m. and took vantage point photos at 15-minute intervals until 4:00. Shortly after 4:00, we moved from the vantage point noting 3 stranded parr flopping on the rocks, which we assisted back into the main channel. We doubt these individuals would have survived if low flows were maintained. We moved as far upstream as possible, noting a larger fish stranded in a backchannel that we could not access to photograph. Stranded crayfish, parr, and stoneflies were observed in small pools formed from dewatering. The most abundant order observed in the study area were stoneflies in the form of nymphs; we observed over 50 individuals in the study area. We departed the area at 5:15.

## Overall Conclusions

The observations conducted by TU teams deployed during the Stranding Study conducted October 5, 2022 demonstrate that significant stranding and mortality occur downstream from McKay Station when flows are reduced from whitewater flows to generator trip event flows of ~500 cfs. While stranding decreased in either of the Ramping Study flow scenarios of July 17 and July 24, 2024, the stranding rates experienced when flows decrease from ~2400 cfs to ~1000 cfs are less but similar to the more drastic reduction of from 3600 cfs to 1000 cfs. Lingering effects from the July 17 event could be a factor in the results of July 24. It should be noted that Team 2 found no strandings during the event of July 24, when the July 17 counterparts did; Team 3 found many more stranding during the July 24 event than it did during the July 17 event: and, the area at McKay where over 40 salmonids were discovered stranded saw about half the strandings that occurred on July 17. Variation in the number of strandings between events could be based on any number of factors. Without a multi-year study, it is difficult to identify specific causes.

The stranded fish documented in the study would likely have become mortalities had the low flow conditions persisted. The study event was conducted nearly three months earlier in the year than the Stranding Study, and the smaller-sized salmonid parr may have been in different locations or affected differently. Accurate comparisons are impossible, and the key unanswered question is why so many fewer salmonid parr were found. Stranded caddis larvae were abundant in Ripogenus Gorge and suffer high mortality any time flows drop below 1000 cfs in any scenario. The waterline established by nominal 2000 cfs summer flows was visible, and mortality to these larvae would start to occur when flows go below that line and increase exponentially with lower flows. A safe minimum flow still needs to be determined that is more than 1000 cfs in the current license. Even the 1422 cfs spawning and incubation flows in the current license need to be studied.

During the July 17th and July 24th ramping studies. TU volunteers documented rapid surface water declines over very short time periods, less than an hour. The flow reduction on the 17th was from 3600 cfs to 1035 cfs or a 70% reduction in channel flow. Changes in flows were observed to have stabilized at most sites within an hour of the initial reduction.

The flow reduction on the 24th was a two-step reduction. The first step at 2:00 pm was from 3600 cfs to 2400 cfs or a 34% reduction in flow. The second step at 3:00 pm was a 2400 cfs to 1000 cfs step or a 59% reduction in flow. Again, TU team observations indicated channel water levels stabilizing approximately 1 hour after each flow change. Although Brookfield called this a “Ramping Study” and we have continued to use that title to avoid confusing it with the 2022 Stranding Study, it was not a true ramping study using the methodology of Smokorowski et al. as it did not incorporate gradual step downs of flow and it did not collect data on resultant macroinvertebrate drift. A true ramping study still needs to be conducted to inform the relicensing.

There is a considerable body of literature that discusses the effect of water level changes on riverine ecosystems Hayes et al. 2024, Smokorowski et al. 2011, Irvine et al. 2015, Lewis and Healy, 2012. The papers focus on Peaking Operations vs Run-of-the-River (“Natural flow”). The primary ways that

ramping rates are evaluated are by 1) Vertical Ramping speed -drop in water level per hour, 2) Lateral Ramping speed- the lateral retreat of water across the wide, flat gravel bars, 3) Percent change in Channel Volume. The vertical ramping rate standard used by DOF is presented in Cathcart 2005 (Table 6.3 duplicated below from Cathcart, 2005). These references are listed at the end of the document.

| Time of Year | Life Stage History | Day Ramp Rate | Night Ramp Rate |
|---|---|---|---|
| February 16 to June 15 | Salmon Fry | No Ramping | 2 inches/hour |
| June 16 to October 31 | Steelhead and Trout Fry | 1 inch/hour | 1 inch/hour |
| November 1 to February 15 | Not Indicated in Standards | 2 inches/hour | 2 inches/hour |

**Notes:**
1) Ramp rate refers to change in stage.

Observations and photographs captured the water level changes from the stadia rod installed at Holbrook Bypass observed on July 24th. These Stadia Readings were listed with photo times in Attachment BB.

The times and water height readings were converted to Vertical Down Ramping Rates and are presented in the figure below. As can be seen the Vertical down ramping rates were 25 times higher than what recommended as a standard by DOF Canada.

Smokorowski et al. 2011, showed that there are operational ways to minimize the effects of down ramping on the river system: “The combination of reduced ramping rate and minimum discharge appeared to conserve invertebrate abundance and diversity, fish biomass, fish condition, and food web length.”

There are flowage rules that could be required that could significantly improve the biotic integrity of the W. Branch Penobscot. Cathcart (2005) presented the Canadian Department of Oceans and Fisheries flow standard in this publication and reviewed how various turbines could be operated to comply with their operational flow restriction standards. Smokorowski et al. 2011 suggests an operational rule that flows should be reduced by no more than 25% of the previous hour's flow. Overall, these requirements to moderate the rate that flows change will require changes in operational procedures (Lewis and Healy) and may result in some loss of generation capacity. 2-D hydrological modeling can identify the river sections that are spawning and rearing areas susceptible to dewatering and determine surface elevations/minimum flows needed to protect these areas.

## Recommendations

TU recommends that FERC require a 2-D hydrological study (per Smokorowski et al. 2011) to define minimum flows that will keep lateral bars inundated to protect juvenile salmonids and aquatic invertebrates and to define the parameters of safe flows between 1000 and 2000 cfs. While the abrupt flow decline of the Ramping Study does demonstrate the potential for significant fauna losses, it did not demonstrate what the impacts of true ramped flow decline would be. While the study clearly shows how not to reduce flow, it is a start for determining the future flow regimes based on further study. Given the abundance of literature on ramping flows, it would be reasonable to explore how to incorporate one the several systems that have been found to minimize injury to riverine biota. The use of set vertical inches/hour flow reduction or previous hour's flow percentage reduction are options, both are systems easy to use and for documenting compliance when a USGS gage is on the system.

Subject: Project 2572. A Response to FERC Staff's September 5, 2024 Filing: Determination on Requests for Study Modifications and New Studies

Dear Secretary Reese, VIA Electronic Filing

Current FERC policy/regulations appear to encourage public participation in licensing processes. Given this reasonable interactive policy, it seems unreasonable to require a lay population to adhere to a strict set of legal standards. Moreover, material presented in Appendix C of the above referenced filing not only holds the public responsible for meeting difficult legal and policy standards, but in this case, ignores the history of the existing FERC Project 2572 1996 License.

The following text deals with the history of the Ripogenus 1991-1996 Licensing process and the very limited current fish and aquatic communities' information provided in the ongoing licensing process. The end point of these arguments is that the Licensee has not demonstrated the adequacy of an artificially imposed West Branch of the Penobscot River (West Branch) spawning and incubation Aquatic Based Flow (ABF) coupled with the impact of the current, highly variable, peaking operation.

In their reply comments, the Licensee makes a number of statements that are either irrelevant or simply unfounded. In maintaining the theme that nothing has changed with the shift to peaking operation, the Licensee provides no in-situ West Branch fisheries evidence to support their position. In fact, current limited West Branch fisheries data show a Landlocked salmon (salmon) fishery in precipitous decline.

In an attempt to prove the adequacy of the ABF 1422 cfs West Branch spawning and incubation flow, the Licensee cites zone of passage study results. The ability of a fish, salmon in this case, to move up and down a river reach, has zero relationship to spawning success in the West Branch downstream of McKay Station. To use Zone of Passage in the context of a spawning flow demonstrates the futility of the Licensee's arguments and the weakness of their case.

The Licensee continues that 1000 cfs flow “supports resident fish species”. How 1000 cfs related to the ABF question is unclear. This unsupported statement and any low flow (less than1800 cfs) number is refuted by the scant 2022-2023 study results (fish assemblage studies) and information (2022 and 2023 salmon age growth data) provided by the stakeholders. Limited fisheries (and aquatic communities) data clearly demonstrate that the current salmon population is not meeting MeDIFW goals. Salmon spawning and incubation success is a major component of the West Branch fisheries management.

In their reply comments, the Licensee seems confused with the origin and purpose of ABF recommendations. ABF is a generic prescription of flows developed from unregulated streams that is then applied to regulated streams. As the then Great Norther Paper Mills needed constant, stable base flows, no thought was given to the possibility of a highly disruptive, current peaking operation. Most importantly, when important flow prescriptions are agency or FERC mandated, post license issuance studies are required to ensure the adequacy of the flow requirement. FERC required such studies for the Holbrook Bypass spawning Channel (Article 406) . However for the reason stated above, constant moderate base flows e.g., 2400 cfs, not for the 1422 spawning and incubation flow. The adequacy of this (artificial) ABF flow remains unknown.

The Licensee’s reply comments continue, “GLHA notes that the spawning and incubation flows included in the existing license were based on 10 years of field observations by professional fish biologists.” The Licensee is referring to studies that I conducted during a period when stable 24x7 base flows were required for paper production. Ironic, isn’t it? To repeat earlier comments, there were NO STUDIES that dealt with proposed 1422 cfs spawning and incubation flow. If the Licensee believes such a study results exist, they should produce summary reports or the field data sheets.

During the FERC staff *Discussion and Recommendation* section, they cite the adequacy of general ABF recommendations. I agree with FERC staff that in the absence of empirical date, ABF is a possible “starting point”. It is difficult to understand how a generic flow can be declared anything other than a starting point without supporting information. FERC calls the existing ABF conservative [section 5.9(b)(5)]. Environmental laws and policy generally require that the action errs on the side of the resource. Whether “conservative” refers to the volume of flow or protection of the yet to be confirmed spawning (and incubation) locations is not stated. Without in-situ data, the ABF impacts either positive or negative remain unknown.

FERC staff notes that this study request was not made earlier [section 5.15(e)(3)]. Without information e.g., salmon age growth, outage studies, or Ops model iterations presented during the last two years, such a request would have been baseless. It seems unfair to encourage public participation and then deny participants the opportunity to request study(s) once they have reviewed (limited) information collected during a two plus year period of FERC or Maine Department of Environmental Protection required studies.

FERC staff referenced costs. Compared to monies spent on North Twin Impoundment tributary access, West Branch stranding and “ramping” studies the cost of 1422 cfs spawning study is de minimis. The suggested study requires a two person crew, on site for several hours, with a repetition several weeks later. Surely a multinational conglomerate can afford this relatively inexpensive cost.

Thank you for the opportunity to respond to the critical issue of flows, including spawning and incubation flows. I request that FERC staff understand the lay person’s limitations as stakeholder attempting to deal with complicated protocols and regulations imposed by a complex licensing process. The fact that stakeholder requests, including my filings, fail to meet stringent formatting requirements, should not be an excuse for automatic dismissal. The future of West Branch fish and aquatic communities is at stake. Please reconsider your ruling.

Washington, D.C. 20426

**Electronically Filed**

**RE: Ripogenus Project (FERC P-2572) and Penobscot Mills Project (P-2458)**
**Second Request for Operations Model Run**

Dear Secretary Reese:

The following request for a second Operations Model run for the Ripogenus Project (P-2572) and Penobscot Mills Project (P-2458) is submitted on behalf of members of the Caribou and Chesuncook Camp Associations. The overall results of our initial Ops Model Run request were favorable; the attached proposed model run builds on those results. We greatly appreciate FERC continuing this iterative modeling process during the licensing application period.

**Introduction**

The purpose of this submittal is twofold: (1) to request, for a second time, that our preferred Ops Model scenario be run exactly as originally submitted, and (2) to request that the derivation of elevation 939.00 as "target full pond elevation" be substantiated by actual data and/or an Ops Model simulation.

We would like to thank the Licensee (GLHA) and their consultant (HDR) for preparing and conducting the virtual conference call on July 10, 2024 in which the *Operations Model – Alternative Scenario Results* were presented. Following that conference call and a review of comments submitted to FERC on the Updated Study Report, the Camp Associations have developed a single Operations Model Alternative Scenario request which follows this letter.

The system operation has changed markedly over the last 10 - 15 years, and the environmental impacts have been documented in numerous submittals during this ILP process. Simply put: under GLHA's operation the average summer lake drawdown has increased dramatically with profound impacts.

For the Camp Associations, the overall purpose of the proposed *Alternative Scenario* submitted herein, and the operations modeling in general, is to demonstrate that an operating model which emphasizes stable water levels, is possible, has been attained in wet, dry and average weather years, and is a preferable and sustainable approach.

**The Operations Model Purpose**

It is important to view the CHEOPS model output results for this project in the proper context. GLHA has stated that they will not be using the CHEOPS model for future operational purposes. The model was developed solely for relicensing projects, is essentially being used as a mediation tool, and will not be used in the future as an actual "operations model". In that light, the following quotes from the Technical Workshop presentation should be kept in mind when interpreting the scenario results, and scenario requests:

> *"...accuracy is highly dependent on input data; consequently, Operations Model results should be viewed in a relative, rather than an absolute, context."*
>
> *"Goal of model runs is to weigh the relative impact from one scenario to another."*
>
> *"Purpose of the Model is not to mimic actual operations but rather to reasonably characterize system operations and evaluate effects of alternative operating scenarios."*
>
> *"..it must always be foremost in model discussions that the Operations Model should be used to assess the relative impacts between scenarios. What this means is model verification is the only time it is appropriate to compare Operations Model results with historical data."*

**Initial Operations Model Results**

A total of 15 model request scenarios were submitted to FERC by various parties in March 2024, evaluated by GLHA/HDR, and presented in a spreadsheet in the Operations Model Study Report dated June 28, 2024. We have selected **Scenario 3** as the best option to present and further evaluate (1) the lake elevation schedules for Ripogenus and North Twin and (2) recreation flow requests.

**Scenario 3** included a new target elevation schedule for Ripogenus Lake, a slightly modified target elevation schedule for North Twin Lake, and a proposed reduced outflow (from 3,000 cfs to 1,500 cfs) from North Twin Lake under certain flow conditions. The proposed target elevation schedules were designed based on actual historical elevation data for Ripogenus Lake and North Twin Lake (predominantly using pre-2012 data for normal, wet and dry years) and represent more stable water levels with reduced drawdowns (in comparison to the current operating conditions).

Of the 15 model requests analyzed by HDR, **Scenario 3** appeared to be the only scenario run that showed the most positive results. As reported by HDR, the **Scenario 3** results compared to the BaselineR3 resulted in the following:

- higher Ripogenus Lake elevations most notably in the late summer/fall,

- lower minimum flows of 1,500 cfs from North Twin result in higher North Twin Lake elevations through the most significant drought and ability to maintain 1,500 cfs through almost the entire drought of 2001-2003,

- higher impoundment elevations in the fall result in increases in spill occurrences, (*These increases are minor. At Ripogenus only 2.8 more days more at most, occurring in the month of November with an average monthly increase of only 0.7 days. At North Twin the number of days of spill decreases or stays the same in nine months and only increases at most by 0.5 days occurring in October.)*

- scenario results in North Twin Lake elevations in August within 8 inches of the current license,

- the only scenario analyzed that does not impact recreational flows.

We are not surprised that the scenario works well – it is based on observed historical data!

The following 3 pages were submitted with the original **"Scenario 3"** request and describe the resources of interest, anticipated benefits, and success/benefit metrics.

Note: **Scenario 3** was the ID number assigned by HDR. The Camp Association originally submitted our two requests as Scenario 1 and Scenario 2 as shown on the following pages.

| Caribou and Chesuncook Lake Camp Owners Association | **Scenario 2 Request** (combined with all elements of Scenario 1 and reduce outflows at Shad Pond to 1,500 cfs) | Page 1 of 1 |
|---|---|---|
| **Requested modification to the baseline scenario** | **Resources of interest and anticipated benefits** | **Success/ Benefit metrics** |
| **Current:** *A minimum flow of 3,000 cfs from the North Twin Development is provided from August 22 through October 15, as long as the impoundment elevation exceeds 488.42 feet. Otherwise, approximately 2,000 cfs is typically released from the North Twin Development to meet the minimum flow requirement of 2,000 cfs at Shad Pond, which is located downstream of the Millinocket and Millinocket Lake Developments*<br><br>**Requested:** ***A minimum flow of 3,000 cfs from the North Twin Development is provided from August 22 through October 15, as long as the impoundment elevation of North Twin exceeds 488.42 feet and the Ripogenus Lake elevations meet the requirements of Request 1. Otherwise, approximately 1500 cfs is typically released from the North Twin Development to meet the minimum flow requirement of 1500 cfs at Shad Pond, which is located downstream of Millinocket Dam and Millinocket Stream*** | Resource of Interest:<br>• Ripogenus Lake<br>• Caribou Lake<br>• Chesuncook Lake<br>• Ambajejus Lake<br>• Pemadumcook Lake<br>• North Twin Lake<br>• South Twin Lake<br><br>Anticipated Benefits<br><br>• Ensure relatively stable lake levels throughout the recreational season in **both** the North Twin and Ripogenus Developments.<br><br>• This minimum flow requirement was originally put in place to ensure water quality standards were met due to effluent from the Millinocket and East Millinocket mills and town waste water. Since the two mills are no longer operating, a lesser flow below Shad Pond will likely meet water quality requirements. | • Are lake levels being maintained that are **beneficial to fisheries, and wildlife**, ensure **boating and recreational safety,** and provide **recreational access**?<br><br>• Are Bureau of Public Lands **campsites accessible and safely usable**?<br><br>• Do the actual water elevations at Ripogenus Dam and North Twin Dam match the schedule prescribed in Scenario 1 herein? |
| | | |

**Original Operations Model Run Request was Altered**

There was only one problem with the scenario HDR ran – they changed the springtime high water target elevation for Ripogenus from 940.1 (1.5 feet below spill crest) to 939.00 (2.6 feet below spill crest). This change was not requested. Given that our original request (which we consider a verification comparison to historical data that predates this new 939.00 target elevation) was not honored, we are making the request again.

**Second Request for Operations Model Verification Run**

Attached to this letter is a second request to **run Scenario 3 as originally submitted** with the target full pool elevation set at 940.1 on 5/15 and 6/1 only**.** This scenario result will allow a direct comparison to historical observed data and will help to establish model verification, bearing in mind that "*model verification is the only time it is appropriate to compare Operations Model results with historical data."*

The attached **Scenario 3** Operations Model also contains several proposed revisions from the initial run. The North Twin Lake winter drawdown has been reduced per DIFW guidance. The monthly target elevation schedule also has listed elevations for each month.

**Recreational Flows Determined to be Outside the Ops Model**

Several periodic releases for whitewater and/or fisheries have been proposed. Based on the flow rate and duration, it is our opinion that these flows, if run in a subtractive manner (reduce flow from McKay by equal amount to maintain recreational flow at a constant rate), will not significantly impact lake levels and can be excluded from this requested Ops Model run. To quote the Ops Model report: "*Operations Model results should be viewed in a relative, rather than an absolute, context."*

**Ripogenus Target Full Pond Elevation at 939.00**

The Operations Model sets the "Target Full Pond Elevation" for Ripogenus at 939.00 (2.6 feet below the actual full pond elevation of 941.59 (say 941.6)). Although we understand that the model allows the water elevation to exceed elevation 939.00, no data, simulations or text have been included to support the need for 2.6 feet of freeboard. Our model scenario set the target elevation at 940.1 (allowing 1.5 feet of freeboard).

**Request for Technical Justification for Target Full Pond Elevation at 939.00**

GLHA has recently adopted elevation 939.00 as the "working pool elevation" for Rip Dam. We assume that the Emergency Action Plan is based on Ops Model scenarios, or other calculations, that demonstrate the need for 2.6 feet of freeboard as a Public Safety necessity during the springtime ice-out/freshet. Please provide this documentation. Establishing a lower full pond elevation, and effectively eliminating substantial littoral zone and two billion or more cubic feet of storage, should be an informed decision based on data that lead to a defensible elevation

number. No data has been presented to support elevation 939.00 as the "working pool elevation". The CHEOPS model should be used to simulate whatever catastrophic storm GLHA is planning for that would require 2.6 feet of freeboard. We are in favor of public safety measures implemented to mitigate climate change impacts, provided they are based on sound engineering and planning.

Thank you for considering these comments.

Respectfully submitted,

Michael J. Hudson, Hydrogeologist, Member
Caribou and Chesuncook Lake Camp Associations

Attachment: Request for Operations Model Run

**REQUEST FOR OPERATIONS MODEL RUN**

**Original Scenario No.: 3**
**Original Scenario ID: RipNTwinElevLev1MinInst (with minor revisions)**

- **Ripogenus Lake Elevation:**
  - Winter drawdown lower limit to be elev. 925.1 on 4/1
  - Target Lake Elevations
    - 1/1 929.6
    - 2/1 927.1
    - 3/1 925.1
    - 4/1 925.1
    - 5/1 935.0
    - 5/10 940.1
    - 6/1 940.1
    - 7/1 939.1
    - 8/1 938.1
    - 9/1 937.1
    - 10/1 936.1
    - 10/15 935.6
    - 11/1 934.1
    - 12/1 932.6

- **North Twin Lake Elevation:**
  - Winter drawdown lower limit to be elev. 482.0 on 4/1
  - Target Lake Elevations:
    - 1/1 483.0
    - 2/1 483.0
    - 3/1 482.0
    - 4/1 482.0
    - 5/1 488.7
    - 5/10 490.4
    - 6/1 490.4
    - 7/1 490.4
    - 8/1 489.9
    - 9/1 489.0
    - 10/1 488.6
    - 11/1 486.0
    - 12/1 484.0
    -

- **North Twin Minimum Flow:**
  - From 8/22 – 10/15 provide 3,000 cfs as long as North Twin elevation is >488.42 feet and Ripogenus Lake elevation meets above criteria; otherwise, provide 1,500 cfs during this period and remainder of year.
