

Section 17
Wastewater

The proposed Maine GenLead Project will not require subsurface wastewater disposal for continued operation and maintenance activities. The project involves the construction and operation of an electric transmission line and slight modifications to an existing substation in Chester, Maine. Permanent subsurface wastewater disposal facilities will not be required. Sewage or other wastes will not be produced on-site during operation and maintenance of the proposed project.

Maine GenLead, LLC or its contractors will place temporary chemical toilets at the construction areas to provide for wastewater disposal needs during the construction phase of the project, and contract with licensed waste disposal companies for toilet maintenance and cleaning.
