- ○ Ephemeral (drying out completely in most years)
- ○ Unknown

Explain:

Small area with shallow water depth likely drys in late spring

■ Maximum depth at survey: ○ 0-12" (0-1 ft.) ◉ 12-36" (1-3 ft.) ○ 36-60" (3-5 ft.) ○ >60" (>5 ft.)

■ Approximate size of pool (at spring highwater): Width: 115 ○ m ◉ ft Length: 175 ○ m ◉ ft

■ Predominate substrate in order of increasing hydroperiod:

- ◉ Mineral soil (bare, leaf-litter bottom, or upland mosses present)
- ○ Mineral soil (sphagnum moss present)
- ○ Organic matter (peat/muck) shallow or restricted to deepest portion
- ○ Organic matter (peat/muck) deep and widespread

■ Pool vegetation indicators in order of increasing hydroperiod (check all that apply):

- ☑ Terrestrial nonvascular spp. (e.g. haircap moss, lycopodium spp.)
- ☐ Dry site ferns (e.g. spinulose wood fern, lady fern, bracken fern)
- ☑ Moist site ferns (e.g. sensitive fern, cinnamon fern, interrupted fern, New York fern)
- ☐ Moist site vasculars (e.g. skunk cabbage, jewelweed, blue flag iris, swamp candle)
- ☑ Sphagnum moss (anchored or suspended)
- ☐ Wet site ferns (e.g. royal fern, marsh fern)
- ☑ Wet site shrubs (e.g. highbush blueberry, maleberry, winterberry, mountain holly)
- ☑ Wet site graminoids (e.g. blue-joint grass, tussock sedge, cattail, bulrushes)
- ☐ Aquatic vascular spp. (e.g. pickerelweed, arrowhead)
- ☐ Floating or submerged aquatics (e.g. water lily, water shield, pond weed, bladderwort)
- ☐ No vegetation in pool

■ Faunal indicators (check all that apply):

- ☐ Fish
- ☐ Bullfrog or Green Frog tadpoles
- ☐ Other:

iii. Inlet/Outlet Flow Permanency

Type of inlet or outlet (a seasonal or permanent channel providing water flowing into or out of the pool):

- ○ No inlet or outlet
- ○ Intermittent inlet or outlet
- ○ Permanent inlet or outlet (channel with well-defined banks and permanent flow)
- ◉ Other or Unknown (explain):_____

6. VERNAL POOL INDICATOR INFORMATION

a. Indicator survey dates: 2019-5-2

b. Indicator abundance criteria and pool survey effort

- Is pool depression bisected by 2 ownerships (straddler pool)? ○ Yes ◉ No
- Was the entire pool surveyed for egg masses? ◉ Yes ○ No; what % of entire pool surveyed? ____
- For each indicator species, indicate the exact number of egg masses, confidence level for species determination, and egg mass maturity. Separate cells are provided for separate survey dates.

INDICATOR SPECIES	Egg Masses (or adult Fairy Shrimp)									Tadpoles/Larvae[4]					
	Visit #1	Visit #2	Visit #3	Confidence Level[1]			Egg Mass Maturity[2]			Observed			Confidence Level[1]		
Wood Frog															
Spotted Salamander	21			3			M								
Blue-spotted Salamander															
Fairy Shrimp[3]															

1-Confidence level: 1 = <60%, 2 = 60-95%, 3 = >95%

2-Egg mass maturity: F= Fresh (<24 hrs), M= Mature (round embryos), A= Advanced (loose matrix, curved embryos), H= Hatched or Hatching

3-Fairy shrimp: X = present

4-Tadpoles/larvae: X = present

c. Rarity criteria

- Note any rare species associated with vernal pools. Observations should be accompanied by photographs.

SPECIES	Method of Verification*			CL**	SPECIES	Method of Verification*			CL**
	P	H	S			P	H	S	
Blanding's Turtle	☐	☐	☐		Wood Turtle	☐	☐	☐	
Spotted Turtle	☐	☐	☐		Ribbon Snake	☐	☐	☐	
Ringed Boghaunter	☐	☐	☐		Other:	☐	☐	☐	

*Method of verification: P = Photographed, H = Handled, S = Seen

**CL - Confidence level in species determination: 1= <60%, 2= 60-95%, 3= >95%

d. Optional observer recommendation:

☑ SVP ☐ Potential SVP ☐ Non Significant VP ☐ Indicator Breeding Area

e. General vernal pool comments and/or observations of other wildlife:

Large natural pool in forested community,Small area of suitable vernal pool habitat in forest, shrub and herbaceous communities.

Send completed form and supporting documentation to: Maine Dept. of Inland Fisheries and Wildlife
Attn: Vernal Pools
650 State Street, Bangor, ME 04401

NOTE: Digital submission (to Jason.Czapiga@maine.gov) of vernal pool field forms and photographs is only acceptable for projects with 3 or fewer assessed pools; larger projects must be mailed as hard copies.

INSTRUCTIONS:

- **Complete all 3 pages of form thoroughly. Most fields are required for pool registration.**
- **Clear photographs of a) the pool AND b) the indicators (one example of each species egg mass) are required for all observers.**

Observer's Pool ID: V-DC-190503-01 **MDIFW Pool ID:** _____

1. PRIMARY OBSERVER INFORMATION

a. Observer name: Duane Choquette

b. Contact and credentials previously provided? ○ No (submit Addendum 1) ◉ Yes

2. PROJECT CONTACT INFORMATION

a. Contact name: ○ same as observer ◉ other Dana Valleau

b. Contact and credentials previously provided? ○ No (submit Addendum 1) ◉ Yes

c. Project Name: Apex, Downeast Wind

3. LANDOWNER CONTACT INFORMATION

a. Are you the landowner? ○ Yes ◉ No If no, was landowner permission obtained for survey? ◉ Yes ○ No

b. Landowner's contact information (required)

Name: Joseph Tibbetts Phone: ____

Street Address: 278 Saco Road City: Columbia State: ME Zip: 04623

c. ☑ Large Projects: check if separate project landowner data file submitted

4. VERNAL POOL LOCATION INFORMATION

a. Location Township: Cherryfield

Brief site directions to the pool (using mapped landmarks):

Pool is located in forested landscape, approximately 5 feet west of gravel access road and approximately 2,000 feet west of the Pleasant River.

b. Mapping Requirements

i. USGS topographic map OR aerial photograph with pool clearly marked.

ii. GPS location of vernal pool (use Datum NAD83 / WGS84)

Longitude/Easting: -67.927285 Latitude/Northing: 44.805744

Coordinate system: WGS84

Check one:

☒ GIS shapefile
- send to Jason.Czapiga@maine.gov; observer has reviewed shape accuracy (Best)

☐ The pool perimeter is delineated by multiple GPS points. (Excellent)
- Include map or spreadsheet with coordinates.

☐ The above GPS point is at the center of the pool. (Good)

☐ The center of the pool is approximately____ ○ m ○ ft in the compass direction of degrees from the above GPS point. (Acceptable)

5. VERNAL POOL HABITAT INFORMATION

a. Habitat survey date (only if different from indicator survey dates on page 3): _____

b. Wetland habitat characterization

■ Choose the best descriptor for the landscape setting:

- (●) Isolated depression
- ( ) Floodplain depression
- ( ) Pool associated with larger wetland complex
- ( ) Other: _____

■ Check all wetland types that best apply to this pool:

- [x] Forested swamp
- [ ] Shrub swamp
- [ ] Peatland (fen or bog)
- [ ] Emergent marsh
- [ ] Wet meadow
- [ ] Lake or pond cove
- [ ] Abandoned beaver flowage
- [ ] Active beaver flowage
- [ ] Slow stream
- [ ] Floodplain
- [ ] Mostly unvegetated pool
- [ ] ATV or skidder rut
- [ ] Dug pond or borrow pit
- [ ] Roadside ditch
- [ ] Other: _

c. Vernal pool status under the Natural Resources Protection Act (NRPA)

i. Pool Origin: (●) Natural ( ) Natural-Modified ( ) Unnatural ( ) Unknown

If modified, unnatural or unknown, describe any modern or historic human impacts to the pool **(required):**

ii. Pool Hydrology

■ Select the pool's estimated hydroperiod AND provide rationale in box **(required):**

- ( ) Permanent
- ( ) Semi-permanent (drying partially in all years and completely in drought years)
- (●) Ephemeral (drying out completely in most years)
- ( ) Unknown

Explain:

Small area with shallow water depth likely drys in late spring

■ Maximum depth at survey: ( ) 0-12" (0-1 ft.) (●) 12-36" (1-3 ft.) ( ) 36-60" (3-5 ft.) ( ) >60" (>5 ft.)

■ Approximate size of pool (at spring highwater): Width: 90 ( ) m (●) ft Length: 125 ( ) m (●) ft

■ Predominate substrate in order of increasing hydroperiod:

- ( ) Mineral soil (bare, leaf-litter bottom, or upland mosses present)
- ( ) Mineral soil (sphagnum moss present)
- ( ) Organic matter (peat/muck) shallow or restricted to deepest portion
- ( ) Organic matter (peat/muck) deep and widespread

■ Pool vegetation indicators in order of increasing hydroperiod (check all that apply):

2. PROJECT CONTACT INFORMATION

a. Contact name: ○ same as observer ◉ other Dana Valleau

b. Contact and credentials previously provided? ○ No (submit Addendum 1) ◉ Yes

c. Project Name: Apex, Downeast Wind

3. LANDOWNER CONTACT INFORMATION

a. Are you the landowner? ○ Yes ◉ No If no, was landowner permission obtained for survey? ◉ Yes ○ No

b. Landowner's contact information (required)

Name: Joseph Tibbetts Phone: ____

Street Address: 278 Saco Road City: Columbia State: ME Zip: 04623

c. ☑ Large Projects: check if separate project landowner data file submitted

4. VERNAL POOL LOCATION INFORMATION

a. Location Township: Cherryfield

Brief site directions to the pool (using mapped landmarks):

Pool is located in forested landscape, approximately 1,900 feet north of blueberry fields, approximately 1,800 feet west of gravel access road, approximately 2,500 feet west of the Pleasant River, and approximately 2,700 feet northeast of Colonel Brook.

b. Mapping Requirements

i. USGS topographic map OR aerial photograph with pool clearly marked.

ii. GPS location of vernal pool (use Datum NAD83 / WGS84)

Longitude/Easting: -67.931878 Latitude/Northing: 44.79806

Coordinate system: WGS84

Check one:

☒ GIS shapefile
- send to Jason.Czapiga@maine.gov; observer has reviewed shape accuracy (Best)

☐ The pool perimeter is delineated by multiple GPS points. (Excellent)
- Include map or spreadsheet with coordinates.

☐ The above GPS point is at the center of the pool. (Good)

☐ The center of the pool is approximately____ ○ m ○ ft in the compass direction of degrees from the above GPS point. (Acceptable)

5. VERNAL POOL HABITAT INFORMATION

a. Habitat survey date (only if different from indicator survey dates on page 3): _____

b. Wetland habitat characterization

■ Choose the best descriptor for the landscape setting:

- (•) Isolated depression
- ( ) Floodplain depression
- ( ) Pool associated with larger wetland complex
- ( ) Other: _____

■ Check all wetland types that best apply to this pool:

- [x] Forested swamp
- [ ] Shrub swamp
- [ ] Peatland (fen or bog)
- [ ] Emergent marsh
- [ ] Wet meadow
- [ ] Lake or pond cove
- [ ] Abandoned beaver flowage
- [ ] Active beaver flowage
- [ ] Slow stream
- [ ] Floodplain
- [ ] Mostly unvegetated pool
- [ ] ATV or skidder rut
- [ ] Dug pond or borrow pit
- [ ] Roadside ditch
- [ ] Other: _

c. Vernal pool status under the Natural Resources Protection Act (NRPA)

i. Pool Origin: (•) Natural ( ) Natural-Modified ( ) Unnatural ( ) Unknown

If modified, unnatural or unknown, describe any modern or historic human impacts to the pool **(required):**

ii. Pool Hydrology

■ Select the pool's estimated hydroperiod AND provide rationale in box **(required):**

- ( ) Permanent
- (•) Semi-permanent (drying partially in all years and completely in drought years)
- ( ) Ephemeral (drying out completely in most years)
- ( ) Unknown

Explain:

Small area with shallow water depth likely drys in late spring

■ Maximum depth at survey: (•) 0-12" (0-1 ft.) ( ) 12-36" (1-3 ft.) ( ) 36-60" (3-5 ft.) ( ) >60" (>5 ft.)

■ Approximate size of pool (at spring highwater): Width: 30 ( ) m (•) ft Length: 45 ( ) m (•) ft

■ Predominate substrate in order of increasing hydroperiod:

- (•) Mineral soil (bare, leaf-litter bottom, or upland mosses present)
- ( ) Mineral soil (sphagnum moss present)
- ( ) Organic matter (peat/muck) shallow or restricted to deepest portion
- ( ) Organic matter (peat/muck) deep and widespread

■ Pool vegetation indicators in order of increasing hydroperiod (check all that apply):

- [ ] Terrestrial nonvascular spp. (e.g. haircap moss, lycopodium spp.)
- [ ] Dry site ferns (e.g. spinulose wood fern, lady fern, bracken fern)
- [ ] Moist site ferns (e.g. sensitive fern, cinnamon fern, interrupted fern, New York fern)
- [ ] Moist site vasculars (e.g. skunk cabbage, jewelweed, blue flag iris, swamp candle)
- [x] Sphagnum moss (anchored or suspended)
- [ ] Wet site ferns (e.g. royal fern, marsh fern)
- [ ] Wet site shrubs (e.g. highbush blueberry, maleberry, winterberry, mountain holly)
- [ ] Wet site graminoids (e.g. blue-joint grass, tussock sedge, cattail, bulrushes)
- [ ] Aquatic vascular spp. (e.g. pickerelweed, arrowhead)
- [ ] Floating or submerged aquatics (e.g. water lily, water shield, pond weed, bladderwort)
- [ ] No vegetation in pool

■ Faunal indicators (check all that apply):

- [ ] Fish
- [ ] Bullfrog or Green Frog tadpoles
- [ ] Other:

iii. Inlet/Outlet Flow Permanency

Type of inlet or outlet (a seasonal or permanent channel providing water flowing into or out of the pool):

- (•) No inlet or outlet
- ( ) Intermittent inlet or outlet
- ( ) Permanent inlet or outlet (channel with well-defined banks and permanent flow)
- ( ) Other or Unknown (explain):_____

6. VERNAL POOL INDICATOR INFORMATION

a. Indicator survey dates: 2019-5-3, 2019-5-24

b. Indicator abundance criteria and pool survey effort

- Is pool depression bisected by 2 ownerships (straddler pool)? ○ Yes ◉ No
- Was the entire pool surveyed for egg masses? ◉ Yes ○ No; what % of entire pool surveyed? ____
- For each indicator species, indicate the exact number of egg masses, confidence level for species determination, and egg mass maturity. Separate cells are provided for separate survey dates.

INDICATOR SPECIES	Egg Masses (or adult Fairy Shrimp)									Tadpoles/Larvae[4]					
	Visit #1	Visit #2	Visit #3	Confidence Level[1]			Egg Mass Maturity[2]			Observed			Confidence Level[1]		
Wood Frog	8			3			M								
Spotted Salamander	8	3		3	3		F	A							
Blue-spotted Salamander															
Fairy Shrimp[3]															

1-Confidence level: 1 = <60%, 2 = 60-95%, 3 = >95%
2-Egg mass maturity: F= Fresh (<24 hrs), M= Mature (round embryos), A= Advanced (loose matrix, curved embryos), H= Hatched or Hatching
3-Fairy shrimp: X = present
4-Tadpoles/larvae: X = present

c. Rarity criteria

- Note any rare species associated with vernal pools. Observations should be accompanied by photographs.

SPECIES	Method of Verification*			CL**	SPECIES	Method of Verification*			CL**
	P	H	S			P	H	S	
Blanding's Turtle	☐	☐	☐		Wood Turtle	☐	☐	☐	
Spotted Turtle	☐	☐	☐		Ribbon Snake	☐	☐	☐	
Ringed Boghaunter	☐	☐	☐		Other:	☐	☐	☐	

*Method of verification: P = Photographed, H = Handled, S = Seen
**CL - Confidence level in species determination: 1= <60%, 2= 60-95%, 3= >95%

d. Optional observer recommendation:

☐ SVP ☐ Potential SVP ☑ Non Significant VP ☐ Indicator Breeding Area

e. General vernal pool comments and/or observations of other wildlife:

Small area of suitable vernal pool habitat in forested community.

Send completed form and supporting documentation to: Maine Dept. of Inland Fisheries and Wildlife
Attn: Vernal Pools

- [ ] Bullfrog or Green Frog tadpoles

iii. Inlet/Outlet Flow Permanency

Type of inlet or outlet (a seasonal or permanent channel providing water flowing into or out of the pool):

- (•) No inlet or outlet
- ( ) Intermittent inlet or outlet
- ( ) Permanent inlet or outlet (channel with well-defined banks and permanent flow)
- ( ) Other or Unknown (explain):_____

6. VERNAL POOL INDICATOR INFORMATION

a. Indicator survey dates: _____

b. Indicator abundance criteria and pool survey effort

- Is pool depression bisected by 2 ownerships (straddler pool)? ○ Yes ◉ No
- Was the entire pool surveyed for egg masses? ◉ Yes ○ No; what % of entire pool surveyed? ____
- For each indicator species, indicate the exact number of egg masses, confidence level for species determination, and egg mass maturity. Separate cells are provided for separate survey dates.

INDICATOR SPECIES	Egg Masses (or adult Fairy Shrimp)									Tadpoles/Larvae[4]					
	Visit #1	Visit #2	Visit #3	Confidence Level[1]			Egg Mass Maturity[2]			Observed			Confidence Level[1]		
Wood Frog															
Spotted Salamander	18	13		3	3		F	A							
Blue-spotted Salamander															
Fairy Shrimp[3]															

1-Confidence level: 1 = <60%, 2 = 60-95%, 3 = >95%
2-Egg mass maturity: F= Fresh (<24 hrs), M= Mature (round embryos), A= Advanced (loose matrix, curved embryos), H= Hatched or Hatching
3-Fairy shrimp: X = present
4-Tadpoles/larvae: X = present

c. Rarity criteria

- Note any rare species associated with vernal pools. Observations should be accompanied by photographs.

SPECIES	Method of Verification*			CL**	SPECIES	Method of Verification*			CL**
	P	H	S			P	H	S	
Blanding's Turtle	☐	☐	☐		Wood Turtle	☐	☐	☐	
Spotted Turtle	☐	☐	☐		Ribbon Snake	☐	☐	☐	
Ringed Boghaunter	☐	☐	☐		Other:	☐	☐	☐	

*Method of verification: P = Photographed, H = Handled, S = Seen
**CL - Confidence level in species determination: 1= <60%, 2= 60-95%, 3= >95%

d. Optional observer recommendation:

☐ SVP ☐ Potential SVP ☑ Non Significant VP ☐ Indicator Breeding Area

e. General vernal pool comments and/or observations of other wildlife:

Small area of suitable vernal pool habitat in forest, shrub and herbaceous communities. 18 spotted salamander egg masses. Second visit needed

Send completed form and supporting documentation to: Maine Dept. of Inland Fisheries and Wildlife
Attn: Vernal Pools
650 State Street, Bangor, ME 04401

NOTE: Digital submission (to Jason.Czapiga@maine.gov) of vernal pool field forms and photographs is only acceptable for projects with 3 or fewer assessed pools; larger projects must be mailed as hard copies.

Comments:

Maine State Vernal Pool Assessment Form

INSTRUCTIONS:

- **Complete all 3 pages of form thoroughly. Most fields are required for pool registration.**
- **Clear photographs of a) the pool AND b) the indicators (one example of each species egg mass) are required for all observers.**

Observer's Pool ID: V-JR-190503-01 **MDIFW Pool ID:** _____

1. PRIMARY OBSERVER INFORMATION

a. Observer name: Joe Roy

b. Contact and credentials previously provided? ○ No (submit Addendum 1) ◉ Yes

2. PROJECT CONTACT INFORMATION

a. Contact name: ○ same as observer ◉ other Dana Valleau

b. Contact and credentials previously provided? ○ No (submit Addendum 1) ◉ Yes

c. Project Name: Apex, Downeast Wind

3. LANDOWNER CONTACT INFORMATION

a. Are you the landowner? ○ Yes ◉ No If no, was landowner permission obtained for survey? ◉ Yes ○ No

b. Landowner's contact information (required)

Name: Joseph Tibbetts Phone: ____

Street Address: 278 Saco Road City: Columbia State: ME Zip: 04623

c. ☑ Large Projects: check if separate project landowner data file submitted

4. VERNAL POOL LOCATION INFORMATION

a. Location Township: Cherryfield

Brief site directions to the pool (using mapped landmarks):

Pool is located in forested landscape, approximately 20 feet east of gravel access road and approximately 1,700 feet west of the Pleasant River.

b. Mapping Requirements

i. USGS topographic map OR aerial photograph with pool clearly marked.

ii. GPS location of vernal pool (use Datum NAD83 / WGS84)

Longitude/Easting: -67.926317 Latitude/Northing: 44.805927

Coordinate system: WGS84

Check one:

☒ GIS shapefile
- send to Jason.Czapiga@maine.gov; observer has reviewed shape accuracy (Best)

☐ The pool perimeter is delineated by multiple GPS points. (Excellent)
- Include map or spreadsheet with coordinates.

☐ The above GPS point is at the center of the pool. (Good)

☐ The center of the pool is approximately____ ○ m ○ ft in the compass direction of degrees from the above GPS point. (Acceptable)

5. VERNAL POOL HABITAT INFORMATION

a. Habitat survey date (only if different from indicator survey dates on page 3): _____

b. Wetland habitat characterization

■ Choose the best descriptor for the landscape setting:

- (●) Isolated depression
- ( ) Floodplain depression
- ( ) Pool associated with larger wetland complex
- ( ) Other: _____

■ Check all wetland types that best apply to this pool:

- [x] Forested swamp
- [ ] Shrub swamp
- [ ] Peatland (fen or bog)
- [ ] Emergent marsh
- [ ] Wet meadow
- [ ] Lake or pond cove
- [ ] Abandoned beaver flowage
- [ ] Active beaver flowage
- [ ] Slow stream
- [ ] Floodplain
- [ ] Mostly unvegetated pool
- [ ] ATV or skidder rut
- [ ] Dug pond or borrow pit
- [ ] Roadside ditch
- [ ] Other: _

c. Vernal pool status under the Natural Resources Protection Act (NRPA)

i. Pool Origin: (●) Natural ( ) Natural-Modified ( ) Unnatural ( ) Unknown

If modified, unnatural or unknown, describe any modern or historic human impacts to the pool **(required):**

ii. Pool Hydrology

■ Select the pool's estimated hydroperiod AND provide rationale in box **(required):**

- ( ) Permanent
- (●) Semi-permanent (drying partially in all years and completely in drought years)
- ( ) Ephemeral (drying out completely in most years)
- ( ) Unknown

Explain:

Small area with shallow water depth likely drys in late spring

■ Maximum depth at survey: ( ) 0-12" (0-1 ft.) (●) 12-36" (1-3 ft.) ( ) 36-60" (3-5 ft.) ( ) >60" (>5 ft.)

■ Approximate size of pool (at spring highwater): Width: 75 ( ) m (●) ft Length: 200 ( ) m (●) ft

■ Predominate substrate in order of increasing hydroperiod:

- (●) Mineral soil (bare, leaf-litter bottom, or upland mosses present)
- ( ) Mineral soil (sphagnum moss present)
- ( ) Organic matter (peat/muck) shallow or restricted to deepest portion
- ( ) Organic matter (peat/muck) deep and widespread

■ Pool vegetation indicators in order of increasing hydroperiod (check all that apply):

- [x] Terrestrial nonvascular spp. (e.g. haircap moss, lycopodium spp.)
- [ ] Dry site ferns (e.g. spinulose wood fern, lady fern, bracken fern)
- [x] Moist site ferns (e.g. sensitive fern, cinnamon fern, interrupted fern, New York fern)
- [ ] Moist site vasculars (e.g. skunk cabbage, jewelweed, blue flag iris, swamp candle)
- [ ] Sphagnum moss (anchored or suspended)
- [ ] Wet site ferns (e.g. royal fern, marsh fern)
- [x] Wet site shrubs (e.g. highbush blueberry, maleberry, winterberry, mountain holly)
- [ ] Wet site graminoids (e.g. blue-joint grass, tussock sedge, cattail, bulrushes)
- [ ] Aquatic vascular spp. (e.g. pickerelweed, arrowhead)
- [ ] Floating or submerged aquatics (e.g. water lily, water shield, pond weed, bladderwort)
- [ ] No vegetation in pool

■ Faunal indicators (check all that apply):

- [ ] Fish
- [ ] Bullfrog or Green Frog tadpoles
- [ ] Other:

iii. Inlet/Outlet Flow Permanency

Type of inlet or outlet (a seasonal or permanent channel providing water flowing into or out of the pool):

- ( ) No inlet or outlet
- ( ) Intermittent inlet or outlet
- ( ) Permanent inlet or outlet (channel with well-defined banks and permanent flow)
- (●) Other or Unknown (explain): _____

6. VERNAL POOL INDICATOR INFORMATION

a. Indicator survey dates: 2019-5-3

b. Indicator abundance criteria and pool survey effort

- Is pool depression bisected by 2 ownerships (straddler pool)? ○ Yes ◉ No
- Was the entire pool surveyed for egg masses? ◉ Yes ○ No; what % of entire pool surveyed? ____
- For each indicator species, indicate the exact number of egg masses, confidence level for species determination, and egg mass maturity. Separate cells are provided for separate survey dates.

INDICATOR SPECIES	Egg Masses (or adult Fairy Shrimp)									Tadpoles/Larvae[4]

b. Wetland habitat characterization

■ Choose the best descriptor for the landscape setting:

- (•) Isolated depression
- ( ) Floodplain depression
- ( ) Pool associated with larger wetland complex
- ( ) Other: _____

■ Check all wetland types that best apply to this pool:

- ☐ Forested swamp
- ☐ Shrub swamp
- ☐ Peatland (fen or bog)
- ☐ Emergent marsh
- ☐ Wet meadow
- ☐ Lake or pond cove
- ☐ Abandoned beaver flowage
- ☐ Active beaver flowage
- ☐ Slow stream
- ☐ Floodplain
- ☐ Mostly unvegetated pool
- ☐ ATV or skidder rut
- ☐ Dug pond or borrow pit
- ☐ Roadside ditch
- ☐ Other: _

c. Vernal pool status under the Natural Resources Protection Act (NRPA)

i. Pool Origin: (•) Natural ( ) Natural-Modified ( ) Unnatural ( ) Unknown

If modified, unnatural or unknown, describe any modern or historic human impacts to the pool **(required):**

ii. Pool Hydrology

■ Select the pool's estimated hydroperiod AND provide rationale in box **(required):**

- ( ) Permanent
- ( ) Semi-permanent (drying partially in all years and completely in drought years)
- (•) Ephemeral (drying out completely in most years)
- ( ) Unknown

Explain:

■ Maximum depth at survey: (•) 0-12" (0-1 ft.) ( ) 12-36" (1-3 ft.) ( ) 36-60" (3-5 ft.) ( ) >60" (>5 ft.)

■ Approximate size of pool (at spring highwater): Width: 25 ( ) m (•) ft Length: 25 ( ) m (•) ft

■ Predominate substrate in order of increasing hydroperiod:

- (•) Mineral soil (bare, leaf-litter bottom, or upland mosses present)
- ( ) Mineral soil (sphagnum moss present)
- ( ) Organic matter (peat/muck) shallow or restricted to deepest portion
- ( ) Organic matter (peat/muck) deep and widespread

■ Pool vegetation indicators in order of increasing hydroperiod (check all that apply):

- ☐ Terrestrial nonvascular spp. (e.g. haircap moss, lycopodium spp.)
- ☐ Dry site ferns (e.g. spinulose wood fern, lady fern, bracken fern)
- ☐ Moist site ferns (e.g. sensitive fern, cinnamon fern, interrupted fern, New York fern)
- ☐ Moist site vasculars (e.g. skunk cabbage, jewelweed, blue flag iris, swamp candle)
- ☐ Sphagnum moss (anchored or suspended)
- ☐ Wet site ferns (e.g. royal fern, marsh fern)
- ☑ Wet site shrubs (e.g. highbush blueberry, maleberry, winterberry, mountain holly)
- ☐ Wet site graminoids (e.g. blue-joint grass, tussock sedge, cattail, bulrushes)
- ☐ Aquatic vascular spp. (e.g. pickerelweed, arrowhead)
- ☐ Floating or submerged aquatics (e.g. water lily, water shield, pond weed, bladderwort)
- ☐ No vegetation in pool

■ Faunal indicators (check all that apply):

- ☐ Fish
- ☐ Bullfrog or Green Frog tadpoles
- ☐ Other:

iii. Inlet/Outlet Flow Permanency

Type of inlet or outlet (a seasonal or permanent channel providing water flowing into or out of the pool):

- (•) No inlet or outlet
- ( ) Intermittent inlet or outlet
- ( ) Permanent inlet or outlet (channel with well-defined banks and permanent flow)
- ( ) Other or Unknown (explain):_____

6. VERNAL POOL INDICATOR INFORMATION

a. Indicator survey dates: 2019-5-3, 2019-5-24

b. Indicator abundance criteria and pool survey effort

- Is pool depression bisected by 2 ownerships (straddler pool)? ○ Yes ◉ No
- Was the entire pool surveyed for egg masses? ◉ Yes ○ No; what % of entire pool surveyed? ____
- For each indicator species, indicate the exact number of egg masses, confidence level for species determination, and egg mass maturity. Separate cells are provided for separate survey dates.

INDICATOR SPECIES	Egg Masses (or adult Fairy Shrimp)									Tadpoles/Larvae[4]					
	Visit #1	Visit #2	Visit #3	Confidence Level[1]			Egg Mass Maturity[2]			Observed			Confidence Level[1]		
Wood Frog											500			3	
Spotted Salamander															
Blue-spotted Salamander															
Fairy Shrimp[3]															

1-Confidence level: 1 = <60%, 2 = 60-95%, 3 = >95%
2-Egg mass maturity: F= Fresh (<24 hrs), M= Mature (round embryos), A= Advanced (loose matrix, curved embryos), H= Hatched or Hatching
3-Fairy shrimp: X = present
4-Tadpoles/larvae: X = present

c. Rarity criteria

- Note any rare species associated with vernal pools. Observations should be accompanied by photographs.

SPECIES	Method of Verification*			CL**	SPECIES	Method of Verification*			CL**
	P	H	S			P	H	S	
Blanding's Turtle	☐	☐	☐		Wood Turtle	☐	☐	☐	
Spotted Turtle	☐	☐	☐		Ribbon Snake	☐	☐	☐	
Ringed Boghaunter	☐	☐	☐		Other:	☐	☐	☐	

*Method of verification: P = Photographed, H = Handled, S = Seen
**CL - Confidence level in species determination: 1= <60%, 2= 60-95%, 3= >95%

d. Optional observer recommendation:

☐ SVP ☐ Potential SVP ☑ Non Significant VP ☐ Indicator Breeding Area

e. General vernal pool comments and/or observations of other wildlife:

Small area of suitable vernal pool habitat in shrub and herbaceous community. Small area, likely less than necessary egg massesbased on tadpoles count. No egg masses at first observations

Send completed form and supporting documentation to: Maine Dept. of Inland Fisheries and Wildlife
Attn: Vernal Pools
650 State Street, Bangor, ME 04401

NOTE: Digital submission (to Jason.Czapiga@maine.gov) of vernal pool field forms and photographs is only acceptable for projects with 3 or fewer assessed pools; larger projects must be mailed as hard copies.

Attn: Vernal Pools
650 State Street, Bangor, ME 04401

NOTE: Digital submission (to Jason.Czapiga@maine.gov) of vernal pool field forms and photographs is only acceptable for projects with 3 or fewer assessed pools; larger projects must be mailed as hard copies.

For MDIFW use only Reviewed by MDIFW Date: _____ Initials: _____

This pool is: ☐ **Significant** ☐ **Potentially Significant** but lacking critical data ☐ **Not Significant** due to: ○ does not meet biological criteria. ○ does not meet MDEP vernal pool criteria.

Comments:

Maine State Vernal Pool Assessment Form

INSTRUCTIONS:

- **Complete all 3 pages of form thoroughly. Most fields are required for pool registration.**
- **Clear photographs of a) the pool AND b) the indicators (one example of each species egg mass) are required for all observers.**

Observer's Pool ID: V-RJ-190430-05 **MDIFW Pool ID:** _____

1. PRIMARY OBSERVER INFORMATION

a. Observer name: Randi Jackson

b. Contact and credentials previously provided? ○ No (submit Addendum 1) ◉ Yes

2. PROJECT CONTACT INFORMATION

a. Contact name: ○ same as observer ◉ other Dana Valleau

b. Contact and credentials previously provided? ○ No (submit Addendum 1) ◉ Yes

c. Project Name: Apex, Downeast Wind

3. LANDOWNER CONTACT INFORMATION

a. Are you the landowner? ○ Yes ◉ No If no, was landowner permission obtained for survey? ◉ Yes ○ No

b. Landowner's contact information (required)

Name: Neil Tenan Phone: ____

Street Address: 359 Willey District Rd City: Cherryfield State: ME Zip: 04622

c. ☑ Large Projects: check if separate project landowner data file submitted

4. VERNAL POOL LOCATION INFORMATION

a. Location Township: Cherryfield

Brief site directions to the pool (using mapped landmarks):

While traveling west on Bombing Range Road, turn to head north on Hawks Hill Road. Then after almost a mile, the pool is half a mile east.

b. Mapping Requirements

i. USGS topographic map OR aerial photograph with pool clearly marked.

ii. GPS location of vernal pool (use Datum NAD83 / WGS84)

Longitude/Easting: -67.859825 Latitude/Northing: 44.779575

Coordinate system: WGS84

Check one:

☒ GIS shapefile
- send to Jason.Czapiga@maine.gov; observer has reviewed shape accuracy (Best)

☐ The pool perimeter is delineated by multiple GPS points. (Excellent)
- Include map or spreadsheet with coordinates.

☐ The above GPS point is at the center of the pool. (Good)

☐ The center of the pool is approximately____ ○ m ○ ft in the compass direction of degrees from the above GPS point. (Acceptable)

5. VERNAL POOL HABITAT INFORMATION

a. Habitat survey date (only if different from indicator survey dates on page 3): _____

b. Wetland habitat characterization

■ Choose the best descriptor for the landscape setting:

- (•) Isolated depression
- ( ) Floodplain depression
- ( ) Pool associated with larger wetland complex
- ( ) Other: _____

■ Check all wetland types that best apply to this pool:

- [ ] Forested swamp
- [x] Shrub swamp
- [ ] Peatland (fen or bog)
- [ ] Emergent marsh
- [ ] Wet meadow
- [ ] Lake or pond cove
- [ ] Abandoned beaver flowage
- [ ] Active beaver flowage
- [ ] Slow stream
- [ ] Floodplain
- [ ] Mostly unvegetated pool
- [ ] ATV or skidder rut
- [ ] Dug pond or borrow pit
- [ ] Roadside ditch
- [ ] Other: _

c. Vernal pool status under the Natural Resources Protection Act (NRPA)

i. Pool Origin: (•) Natural ( ) Natural-Modified ( ) Unnatural ( ) Unknown

If modified, unnatural or unknown, describe any modern or historic human impacts to the pool **(required):**

ii. Pool Hydrology

■ Select the pool's estimated hydroperiod AND provide rationale in box **(required):**

- ( ) Permanent
- (•) Semi-permanent (drying partially in all years and completely in drought years)
- ( ) Ephemeral (drying out completely in most years)
- ( ) Unknown

Explain:

Small area with shallow water depth likely drys in late spring

■ Maximum depth at survey: ( ) 0-12" (0-1 ft.) (•) 12-36" (1-3 ft.) ( ) 36-60" (3-5 ft.) ( ) >60" (>5 ft.)

■ Approximate size of pool (at spring highwater): Width: 20 ( ) m (•) ft Length: 50 ( ) m (•) ft

■ Predominate substrate in order of increasing hydroperiod:

- (•) Mineral soil (bare, leaf-litter bottom, or upland mosses present)
- ( ) Mineral soil (sphagnum moss present)
- ( ) Organic matter (peat/muck) shallow or restricted to deepest portion
- ( ) Organic matter (peat/muck) deep and widespread

■ Pool vegetation indicators in order of increasing hydroperiod (check all that apply):

- [ ] Terrestrial nonvascular spp. (e.g. haircap moss, lycopodium spp.)
- [ ] Dry site ferns (e.g. spinulose wood fern, lady fern, bracken fern)
- [ ] Moist site ferns (e.g. sensitive fern, cinnamon fern, interrupted fern, New York fern)
- [ ] Moist site vasculars (e.g. skunk cabbage, jewelweed, blue flag iris, swamp candle)
- [ ] Sphagnum moss (anchored or suspended)
- [ ] Wet site ferns (e.g. royal fern, marsh fern)
- [ ] Wet site shrubs (e.g. highbush blueberry, maleberry, winterberry, mountain holly)
- [ ] Wet site graminoids (e.g. blue-joint grass, tussock sedge, cattail, bulrushes)
- [ ] Aquatic vascular spp. (e.g. pickerelweed, arrowhead)
- [ ] Floating or submerged aquatics (e.g. water lily, water shield, pond weed, bladderwort)
- [ ] No vegetation in pool

■ Faunal indicators (check all that apply):

- [ ] Fish
- [ ] Bullfrog or Green Frog tadpoles
- [x] Other: None.

iii. Inlet/Outlet Flow Permanency

Type of inlet or outlet (a seasonal or permanent channel providing water flowing into or out of the pool):

- (•) No inlet or outlet
- ( ) Intermittent inlet or outlet
- ( ) Permanent inlet or outlet (channel with well-defined banks and permanent flow)
- ( ) Other or Unknown (explain):_____

6. VERNAL POOL INDICATOR INFORMATION

a. Indicator survey dates: 2019-4-30, 2019-5-24

b. Indicator abundance criteria and pool survey effort

- Is pool depression bisected by 2 ownerships (straddler pool)? ○ Yes ◉ No
- Was the entire pool surveyed for egg masses? ◉ Yes ○ No; what % of entire pool surveyed? ____
- For each indicator species, indicate the exact number of egg masses, confidence level for species determination, and egg mass maturity. Separate cells are provided for separate survey dates.

INDICATOR SPECIES	Egg Masses (or adult Fairy Shrimp)									Tadpoles/Larvae[4]					
	Visit #1	Visit #2	Visit #3	Confidence Level[1]			Egg Mass Maturity[2]			Observed			Confidence Level[1]		
Wood Frog											3000			3	
Spotted Salamander															
Blue-spotted Salamander															
Fairy Shrimp[3]															

1-Confidence level: 1 = <60%, 2 = 60-95%, 3 = >95%
2-Egg mass maturity: F= Fresh (<24 hrs), M= Mature (round embryos), A= Advanced (loose matrix, curved embryos), H= Hatched or Hatching
3-Fairy shrimp: X = present
4-Tadpoles/larvae: X = present

c. Rarity criteria

- Note any rare species associated with vernal pools. Observations should be accompanied by photographs.

SPECIES	Method of Verification*			CL**	SPECIES	Method of Verification*			CL**
	P	H	S			P	H	S	
Blanding's Turtle	☐	☐	☐		Wood Turtle	☐	☐	☐	
Spotted Turtle	☐	☐	☐		Ribbon Snake	☐	☐	☐	
Ringed Boghaunter	☐	☐	☐		Other:	☐	☐	☐	

*Method of verification: P = Photographed, H = Handled, S = Seen
**CL - Confidence level in species determination: 1= <60%, 2= 60-95%, 3= >95%

d. Optional observer recommendation:

☐ SVP ☑ Potential SVP ☐ Non Significant VP ☐ Indicator Breeding Area

e. General vernal pool comments and/or observations of other wildlife:

Small area of suitable vernal pool habitat in shrub and herbaceous community. No egg masses observed. Tadpoles observed. Unable to determine if significant number.

Send completed form and supporting documentation to: Maine Dept. of Inland Fisheries and Wildlife

- [ ] Moist site vasculars (e.g. skunk cabbage, jewelweed, blue flag iris, swamp candle)
- [ ] Sphagnum moss (anchored or suspended)
- [ ] Wet site ferns (e.g. royal fern, marsh fern)
- [ ] Wet site shrubs (e.g. highbush blueberry, maleberry, winterberry, mountain holly)
- [ ] Wet site graminoids (e.g. blue-joint grass, tussock sedge, cattail, bulrushes)
- [ ] Aquatic vascular spp. (e.g. pickerelweed, arrowhead)
- [ ] Floating or submerged aquatics (e.g. water lily, water shield, pond weed, bladderwort)
- [ ] No vegetation in pool
- [x] Other: None.

■ Faunal indicators (check all that apply):

- [ ] Fish
- [ ] Bullfrog or Green Frog tadpoles

iii. Inlet/Outlet Flow Permanency

Type of inlet or outlet (a seasonal or permanent channel providing water flowing into or out of the pool):

- ( ) No inlet or outlet
- ( ) Intermittent inlet or outlet
- ( ) Permanent inlet or outlet (channel with well-defined banks and permanent flow)
- (•) Other or Unknown (explain): culvert out

6. VERNAL POOL INDICATOR INFORMATION

a. Indicator survey dates: 2019-5-1, 2019-5-22

b. Indicator abundance criteria and pool survey effort

- Is pool depression bisected by 2 ownerships (straddler pool)? ○ Yes ◉ No
- Was the entire pool surveyed for egg masses? ◉ Yes ○ No; what % of entire pool surveyed? ____
- For each indicator species, indicate the exact number of egg masses, confidence level for species determination, and egg mass maturity. Separate cells are provided for separate survey dates.

INDICATOR SPECIES	Egg Masses (or adult Fairy Shrimp)									Tadpoles/Larvae[4]					
	Visit #1	Visit #2	Visit #3	Confidence Level[1]			Egg Mass Maturity[2]			Observed			Confidence Level[1]		
Wood Frog	1			3											
Spotted Salamander	5	3		3	3			A							
Blue-spotted Salamander	0														
Fairy Shrimp[3]															

1-Confidence level: 1 = <60%, 2 = 60-95%, 3 = >95%
2-Egg mass maturity: F= Fresh (<24 hrs), M= Mature (round embryos), A= Advanced (loose matrix, curved embryos), H= Hatched or Hatching
3-Fairy shrimp: X = present
4-Tadpoles/larvae: X = present

c. Rarity criteria

- Note any rare species associated with vernal pools. Observations should be accompanied by photographs.

SPECIES	Method of Verification*			CL**	SPECIES	Method of Verification*			CL**
	P	H	S			P	H	S	
Blanding's Turtle	☐	☐	☐		Wood Turtle	☐	☐	☐	
Spotted Turtle	☐	☐	☐		Ribbon Snake	☐	☐	☐	
Ringed Boghaunter	☐	☐	☐		Other:	☐	☐	☐	

*Method of verification: P = Photographed, H = Handled, S = Seen
**CL - Confidence level in species determination: 1= <60%, 2= 60-95%, 3= >95%

d. Optional observer recommendation:

☐ SVP ☐ Potential SVP ☑ Non Significant VP ☐ Indicator Breeding Area

e. General vernal pool comments and/or observations of other wildlife:

Small area of suitable vernal pool habitat in shrub and herbaceous community.

Send completed form and supporting documentation to: Maine Dept. of Inland Fisheries and Wildlife
Attn: Vernal Pools
650 State Street, Bangor, ME 04401

NOTE: Digital submission (to Jason.Czapiga@maine.gov) of vernal pool field forms and photographs is only acceptable for projects with 3 or fewer assessed pools; larger projects must be mailed as hard copies.

For MDIFW use only Reviewed by MDIFW Date: _____ Initials: _____

This pool is: ☐ **Significant** ☐ **Potentially Significant** but lacking critical data ☐ **Not Significant** due to: ○ does not meet biological criteria. ○ does not meet MDEP vernal pool criteria.

Comments:

Maine State Vernal Pool Assessment Form

INSTRUCTIONS:

- **Complete all 3 pages of form thoroughly. Most fields are required for pool registration.**
- **Clear photographs of a) the pool AND b) the indicators (one example of each species egg mass) are required for all observers.**

Observer's Pool ID: V-RJ-190501-02 **MDIFW Pool ID:** _____

1. PRIMARY OBSERVER INFORMATION

a. Observer name: Randi Jackson

b. Contact and credentials previously provided? ○ No (submit Addendum 1) ◉ Yes

2. PROJECT CONTACT INFORMATION

a. Contact name: ○ same as observer ◉ other Dana Valleau

b. Contact and credentials previously provided? ○ No (submit Addendum 1) ◉ Yes

c. Project Name: Apex, Downeast Wind

3. LANDOWNER CONTACT INFORMATION

a. Are you the landowner? ○ Yes ◉ No If no, was landowner permission obtained for survey? ◉ Yes ○ No

b. Landowner's contact information (required)

Name: Neil Tenan Phone: ____

Street Address: 359 Willey District Rd City: Cherryfield State: ME Zip: 04622

c. ☑ Large Projects: check if separate project landowner data file submitted

4. VERNAL POOL LOCATION INFORMATION

a. Location Township: Cherryfield

Brief site directions to the pool (using mapped landmarks):

While traveling west on Bombing Range Road, turn to head north on Hawks Hill Road. Then after one-quarter of a mile, the pool is on the left just north of V-RJ-190501-01.

b. Mapping Requirements

i. USGS topographic map OR aerial photograph with pool clearly marked.

ii. GPS location of vernal pool (use Datum NAD83 / WGS84)

Longitude/Easting: -67.866135 Latitude/Northing: 44.769617

Coordinate system: WGS84

Check one:

☒ GIS shapefile
- send to Jason.Czapiga@maine.gov; observer has reviewed shape accuracy (Best)

☐ The pool perimeter is delineated by multiple GPS points. (Excellent)
- Include map or spreadsheet with coordinates.

☐ The above GPS point is at the center of the pool. (Good)

☐ The center of the pool is approximately____ ○ m ○ ft in the compass direction of degrees from the above GPS point. (Acceptable)

5. VERNAL POOL HABITAT INFORMATION

a. Habitat survey date (only if different from indicator survey dates on page 3): _____

b. Wetland habitat characterization

■ Choose the best descriptor for the landscape setting:

- (•) Isolated depression
- ( ) Floodplain depression
- ( ) Pool associated with larger wetland complex
- ( ) Other: _____

■ Check all wetland types that best apply to this pool:

- [ ] Forested swamp
- [x] Shrub swamp
- [ ] Peatland (fen or bog)
- [ ] Emergent marsh
- [ ] Wet meadow
- [ ] Lake or pond cove
- [ ] Abandoned beaver flowage
- [ ] Active beaver flowage
- [ ] Slow stream
- [ ] Floodplain
- [ ] Mostly unvegetated pool
- [ ] ATV or skidder rut
- [ ] Dug pond or borrow pit
- [ ] Roadside ditch
- [ ] Other: _

c. Vernal pool status under the Natural Resources Protection Act (NRPA)

i. Pool Origin: ( ) Natural (•) Natural-Modified ( ) Unnatural ( ) Unknown

If modified, unnatural or unknown, describe any modern or historic human impacts to the pool **(required):**

Ruts (e.g. skidder, ORVs , etc.)

ii. Pool Hydrology

■ Select the pool's estimated hydroperiod AND provide rationale in box **(required):**

- ( ) Permanent
- (•) Semi-permanent (drying partially in all years and completely in drought years)
- ( ) Ephemeral (drying out completely in most years)
- ( ) Unknown

Explain:

Small area with shallow water depth likely drys in late spring

■ Maximum depth at survey: ( ) 0-12" (0-1 ft.) (•) 12-36" (1-3 ft.) ( ) 36-60" (3-5 ft.) ( ) >60" (>5 ft.)

■ Approximate size of pool (at spring highwater): Width: 20 ( ) m (•) ft Length: 50 ( ) m (•) ft

■ Predominate substrate in order of increasing hydroperiod:

- (•) Mineral soil (bare, leaf-litter bottom, or upland mosses present)
- ( ) Mineral soil (sphagnum moss present)
- ( ) Organic matter (peat/muck) shallow or restricted to deepest portion
- ( ) Organic matter (peat/muck) deep and widespread

■ Pool vegetation indicators in order of increasing hydroperiod (check all that apply):

- [ ] Terrestrial nonvascular spp. (e.g. haircap moss, lycopodium spp.)
- [ ] Dry site ferns (e.g. spinulose wood fern, lady fern, bracken fern)
- [ ] Moist site ferns (e.g. sensitive fern, cinnamon fern, interrupted fern, New York fern)
- [ ] Moist site vasculars (e.g. skunk cabbage, jewelweed, blue flag iris, swamp candle)
- [ ] Sphagnum moss (anchored or suspended)
- [ ] Wet site ferns (e.g. royal fern, marsh fern)
- [ ] Wet site shrubs (e.g. highbush blueberry, maleberry, winterberry, mountain holly)
- [ ] Wet site graminoids (e.g. blue-joint grass, tussock sedge, cattail, bulrushes)
- [ ] Aquatic vascular spp. (e.g. pickerelweed, arrowhead)
- [ ] Floating or submerged aquatics (e.g. water lily, water shield, pond weed, bladderwort)
- [ ] No vegetation in pool

■ Faunal indicators (check all that apply):

- [ ] Fish
- [ ] Bullfrog or Green Frog tadpoles
- [x] Other: None.

iii. Inlet/Outlet Flow Permanency

Type of inlet or outlet (a seasonal or permanent channel providing water flowing into or out of the pool):

- (•) No inlet or outlet
- ( ) Intermittent inlet or outlet
- ( ) Permanent inlet or outlet (channel with well-defined banks and permanent flow)
- ( ) Other or Unknown (explain):_____

6. VERNAL POOL INDICATOR INFORMATION

a. Indicator survey dates: 2019-5-1, 2019-5-22

b. Indicator abundance criteria and pool survey effort

- Is pool depression bisected by 2 ownerships (straddler pool)? ○ Yes ◉ No

c. ☑ Large Projects: check if separate project landowner data file submitted

4. VERNAL POOL LOCATION INFORMATION

a. Location Township: Cherryfield

Brief site directions to the pool (using mapped landmarks):

While traveling west on Bombing Range Road, turn to head north on Hawks Hill Road. Then after four-tenths of a mile, the pool is almost one-quarter mile west.

b. Mapping Requirements

i. USGS topographic map OR aerial photograph with pool clearly marked.

ii. GPS location of vernal pool (use Datum NAD83 / WGS84)

Longitude/Easting: -67.870897 Latitude/Northing: 44.770709

Coordinate system: WGS84

Check one:

☒ GIS shapefile
- send to Jason.Czapiga@maine.gov; observer has reviewed shape accuracy (Best)

☐ The pool perimeter is delineated by multiple GPS points. (Excellent)
- Include map or spreadsheet with coordinates.

☐ The above GPS point is at the center of the pool. (Good)

☐ The center of the pool is approximately____ ○ m ○ ft in the compass direction of degrees from the above GPS point. (Acceptable)

5. VERNAL POOL HABITAT INFORMATION

a. Habitat survey date (only if different from indicator survey dates on page 3): _____

b. Wetland habitat characterization

■ Choose the best descriptor for the landscape setting:

- (●) Isolated depression
- ( ) Floodplain depression
- ( ) Pool associated with larger wetland complex
- ( ) Other: _____

■ Check all wetland types that best apply to this pool:

- [x] Forested swamp
- [ ] Shrub swamp
- [ ] Peatland (fen or bog)
- [ ] Emergent marsh
- [ ] Wet meadow
- [ ] Lake or pond cove
- [ ] Abandoned beaver flowage
- [ ] Active beaver flowage
- [ ] Slow stream
- [ ] Floodplain
- [ ] Mostly unvegetated pool
- [ ] ATV or skidder rut
- [ ] Dug pond or borrow pit
- [ ] Roadside ditch
- [ ] Other: _

c. Vernal pool status under the Natural Resources Protection Act (NRPA)

i. Pool Origin: (●) Natural ( ) Natural-Modified ( ) Unnatural ( ) Unknown

If modified, unnatural or unknown, describe any modern or historic human impacts to the pool **(required):**

ii. Pool Hydrology

■ Select the pool's estimated hydroperiod AND provide rationale in box **(required):**

- ( ) Permanent
- (●) Semi-permanent (drying partially in all years and completely in drought years)
- ( ) Ephemeral (drying out completely in most years)
- ( ) Unknown

Explain:

■ Maximum depth at survey: ( ) 0-12" (0-1 ft.) (●) 12-36" (1-3 ft.) ( ) 36-60" (3-5 ft.) ( ) >60" (>5 ft.)

■ Approximate size of pool (at spring highwater): Width: __ ( ) m (●) ft Length: __ ( ) m (●) ft

■ Predominate substrate in order of increasing hydroperiod:

- (●) Mineral soil (bare, leaf-litter bottom, or upland mosses present)
- ( ) Mineral soil (sphagnum moss present)
- ( ) Organic matter (peat/muck) shallow or restricted to deepest portion
- ( ) Organic matter (peat/muck) deep and widespread

■ Pool vegetation indicators in order of increasing hydroperiod (check all that apply):

- [ ] Terrestrial nonvascular spp. (e.g. haircap moss, lycopodium spp.)
- [ ] Dry site ferns (e.g. spinulose wood fern, lady fern, bracken fern)
- [ ] Moist site ferns (e.g. sensitive fern, cinnamon fern, interrupted fern, New York fern)
- [ ] Moist site vasculars (e.g. skunk cabbage, jewelweed, blue flag iris, swamp candle)
- [ ] Sphagnum moss (anchored or suspended)
- [ ] Wet site ferns (e.g. royal fern, marsh fern)
- [ ] Wet site shrubs (e.g. highbush blueberry, maleberry, winterberry, mountain holly)
- [ ] Wet site graminoids (e.g. blue-joint grass, tussock sedge, cattail, bulrushes)
- [ ] Aquatic vascular spp. (e.g. pickerelweed, arrowhead)
- [ ] Floating or submerged aquatics (e.g. water lily, water shield, pond weed, bladderwort)
- [ ] No vegetation in pool
- [x] Other: None.

■ Faunal indicators (check all that apply):

- [ ] Fish
- [ ] Bullfrog or Green Frog tadpoles

iii. Inlet/Outlet Flow Permanency

Type of inlet or outlet (a seasonal or permanent channel providing water flowing into or out of the pool):

- (●) No inlet or outlet
- ( ) Intermittent inlet or outlet
- ( ) Permanent inlet or outlet (channel with well-defined banks and permanent flow)
- ( ) Other or Unknown (explain):_____

6. VERNAL POOL INDICATOR INFORMATION

a. Indicator survey dates: 2019-5-1, 2019-5-22

b. Indicator abundance criteria and pool survey effort

- Is pool depression bisected by 2 ownerships (straddler pool)? ○ Yes ◉ No
- Was the entire pool surveyed for egg masses? ◉ Yes ○ No; what % of entire pool surveyed? ____
- For each indicator species, indicate the exact number of egg masses, confidence level for species determination, and egg mass maturity. Separate cells are provided for separate survey dates.

INDICATOR SPECIES	Egg Masses (or adult Fairy Shrimp)									Tadpoles/Larvae[4]					
	Visit #1	Visit #2	Visit #3	Confidence Level[1]			Egg Mass Maturity[2]			Observed			Confidence Level[1]		
Wood Frog	0														
Spotted Salamander	4	2		3	3			A							
Blue-spotted Salamander	0														
Fairy Shrimp[3]															

1-Confidence level: 1 = <60%, 2 = 60-95%, 3 = >95%
2-Egg mass maturity: F= Fresh (<24 hrs), M= Mature (round embryos), A= Advanced (loose matrix, curved embryos), H= Hatched or Hatching
3-Fairy shrimp: X = present
4-Tadpoles/larvae: X = present

c. Rarity criteria

- Note any rare species associated with vernal pools. Observations should be accompanied by photographs.

SPECIES	Method of Verification*			CL**	SPECIES	Method of Verification*			CL**
	P	H	S			P	H	S	
Blanding's Turtle	☐	☐	☐		Wood Turtle	☐	☐	☐	
Spotted Turtle	☐	☐	☐		Ribbon Snake	☐	☐	☐	
Ringed Boghaunter	☐	☐	☐		Other:	☐	☐	☐	

*Method of verification: P = Photographed, H = Handled, S = Seen
**CL - Confidence level in species determination: 1= <60%, 2= 60-95%, 3= >95%

d. Optional observer recommendation:

☐ SVP ☐ Potential SVP ☑ Non Significant VP ☐ Indicator Breeding Area

e. General vernal pool comments and/or observations of other wildlife:

Small area of suitable vernal pool habitat in forested community.

Send completed form and supporting documentation to: Maine Dept. of Inland Fisheries and Wildlife
Attn: Vernal Pools
650 State Street, Bangor, ME 04401

NOTE: Digital submission (to Jason.Czapiga@maine.gov) of vernal pool field forms and photographs is only acceptable for projects with 3 or fewer assessed pools; larger projects must be mailed as hard copies.

For MDIFW use only Reviewed by MDIFW Date: _____ Initials: _____

This pool is: ☐ **Significant** ☐ **Potentially Significant** but lacking critical data ☐ **Not Significant** due to: ○ does not meet biological criteria. ○ does not meet MDEP vernal pool criteria.

Comments:

Maine State Vernal Pool Assessment Form

INSTRUCTIONS:

- **Complete all 3 pages of form thoroughly. Most fields are required for pool registration.**
- **Clear photographs of a) the pool AND b) the indicators (one example of each species egg mass) are required for all observers.**

Observer's Pool ID: V-RP-190430-04 **MDIFW Pool ID:** _____

1. PRIMARY OBSERVER INFORMATION

a. Observer name: Ray Peck

b. Contact and credentials previously provided? ○ No (submit Addendum 1) ◉ Yes

2. PROJECT CONTACT INFORMATION

a. Contact name: ○ same as observer ◉ other Dana Valleau

b. Contact and credentials previously provided? ○ No (submit Addendum 1) ◉ Yes

c. Project Name: Apex, Downeast Wind

3. LANDOWNER CONTACT INFORMATION

a. Are you the landowner? ○ Yes ◉ No If no, was landowner permission obtained for survey? ◉ Yes ○ No

b. Landowner's contact information (required)

Name: Neil Tenan Phone: ____

Street Address: 359 Willey District Rd City: Cherryfield State: ME Zip: 04622

c. ☑ Large Projects: check if separate project landowner data file submitted

4. VERNAL POOL LOCATION INFORMATION

a. Location Township: Cherryfield

Brief site directions to the pool (using mapped landmarks):

When traveling west on Bombing Range Road, turn north into the field east of and before Taylor Branch. Then the pool is approximately six-tenths of a mile north northeast.

b. Mapping Requirements

i. USGS topographic map OR aerial photograph with pool clearly marked.

ii. GPS location of vernal pool (use Datum NAD83 / WGS84)

Longitude/Easting: -67.834844 Latitude/Northing: 44.775185

Coordinate system: WGS84

Check one:

☒ GIS shapefile
- send to Jason.Czapiga@maine.gov; observer has reviewed shape accuracy (Best)

☐ The pool perimeter is delineated by multiple GPS points. (Excellent)
- Include map or spreadsheet with coordinates.

☐ The above GPS point is at the center of the pool. (Good)

☐ The center of the pool is approximately____ ○ m ○ ft in the compass direction of degrees from the above GPS point. (Acceptable)

5. VERNAL POOL HABITAT INFORMATION

a. Habitat survey date (only if different from indicator survey dates on page 3): _____

b. Wetland habitat characterization

■ Choose the best descriptor for the landscape setting:

- (●) Isolated depression
- ( ) Floodplain depression
- ( ) Pool associated with larger wetland complex
- ( ) Other: _____

■ Check all wetland types that best apply to this pool:

- ☐ Forested swamp
- ☐ Shrub swamp
- ☐ Peatland (fen or bog)
- ☐ Emergent marsh
- ☐ Wet meadow
- ☐ Lake or pond cove
- ☐ Abandoned beaver flowage
- ☐ Active beaver flowage
- ☐ Slow stream
- ☐ Floodplain
- ☐ Mostly unvegetated pool
- ☐ ATV or skidder rut
- ☐ Dug pond or borrow pit
- ☐ Roadside ditch
- ☐ Other: _

c. Vernal pool status under the Natural Resources Protection Act (NRPA)

i. Pool Origin: (●) Natural ( ) Natural-Modified ( ) Unnatural ( ) Unknown

If modified, unnatural or unknown, describe any modern or historic human impacts to the pool **(required):**

ii. Pool Hydrology

■ Select the pool's estimated hydroperiod AND provide rationale in box **(required):**

- ( ) Permanent
- ( ) Semi-permanent (drying partially in all years and completely in drought years)
- (●) Ephemeral (drying out completely in most years)
- ( ) Unknown

Explain:

Physical and biological hydrology indicators demonstrate water depth and duration

■ Maximum depth at survey: ( ) 0-12" (0-1 ft.) (●) 12-36" (1-3 ft.) ( ) 36-60" (3-5 ft.) ( ) >60" (>5 ft.)

■ Approximate size of pool (at spring highwater): Width: 65 ( ) m (●) ft Length: 70 ( ) m (●) ft

■ Predominate substrate in order of increasing hydroperiod:

- (●) Mineral soil (bare, leaf-litter bottom, or upland mosses present)
- ( ) Mineral soil (sphagnum moss present)
- ( ) Organic matter (peat/muck) shallow or restricted to deepest portion
- ( ) Organic matter (peat/muck) deep and widespread

■ Pool vegetation indicators in order of increasing hydroperiod (check all that apply):

- ☐ Terrestrial nonvascular spp. (e.g. haircap moss, lycopodium spp.)
- ☐ Dry site ferns (e.g. spinulose wood fern, lady fern, bracken fern)
- ☐ Moist site ferns (e.g. sensitive fern, cinnamon fern, interrupted fern, New York fern)
- ☐ Moist site vasculars (e.g. skunk cabbage, jewelweed, blue flag iris, swamp candle)
- ☐ Sphagnum moss (anchored or suspended)
- ☐ Wet site ferns (e.g. royal fern, marsh fern)
- ☑ Wet site shrubs (e.g. highbush blueberry, maleberry, winterberry, mountain holly)
- ☐ Wet site graminoids (e.g. blue-joint grass, tussock sedge, cattail, bulrushes)
- ☐ Aquatic vascular spp. (e.g. pickerelweed, arrowhead)
- ☐ Floating or submerged aquatics (e.g. water lily, water shield, pond weed, bladderwort)
- ☐ No vegetation in pool

■ Faunal indicators (check all that apply):

- ☐ Fish
- ☐ Bullfrog or Green Frog tadpoles
- ☐ Other:

iii. Inlet/Outlet Flow Permanency

Type of inlet or outlet (a seasonal or permanent channel providing water flowing into or out of the pool):

- (●) No inlet or outlet
- ( ) Intermittent inlet or outlet
- ( ) Permanent inlet or outlet (channel with well-defined banks and permanent flow)
- ( ) Other or Unknown (explain):_____

6. VERNAL POOL INDICATOR INFORMATION

a. Indicator survey dates: 2019-4-30, 2019-5-22

b. Indicator abundance criteria and pool survey effort

- Is pool depression bisected by 2 ownerships (straddler pool)? ○ Yes ◉ No
- Was the entire pool surveyed for egg masses? ◉ Yes ○ No; what % of entire pool surveyed? ____
- For each indicator species, indicate the exact number of egg masses, confidence level for species determination, and egg mass maturity. Separate cells are provided for separate survey dates.

INDICATOR SPECIES	Egg Masses (or adult Fairy Shrimp)									Tadpoles/Larvae[4]					
	Visit #1	Visit #2	Visit #3	Confidence Level[1]			Egg Mass Maturity[2]			Observed			Confidence Level[1]		
Wood Frog											4000			2	
Spotted Salamander															
Blue-spotted Salamander															
Fairy Shrimp[3]															

1-Confidence level: 1 = <60%, 2 = 60-95%, 3 = >95%
2-Egg mass maturity: F= Fresh (<24 hrs), M= Mature (round embryos), A= Advanced (loose matrix, curved embryos), H= Hatched or Hatching
3-Fairy shrimp: X = present
4-Tadpoles/larvae: X = present

c. Rarity criteria

- Note any rare species associated with vernal pools. Observations should be accompanied by photographs.

SPECIES	Method of Verification*			CL**	SPECIES	Method of Verification*			CL**

i. Pool Origin: ( ) Natural (•) Natural-Modified ( ) Unnatural ( ) Unknown

If modified, unnatural or unknown, describe any modern or historic human impacts to the pool **(required):**

Hydrology impounded (eg. road, blocked culvert, etc.) Expanded

ii. Pool Hydrology

■ Select the pool's estimated hydroperiod AND provide rationale in box **(required):**

- ( ) Permanent
- (•) Semi-permanent (drying partially in all years and completely in drought years)
- ( ) Ephemeral (drying out completely in most years)
- ( ) Unknown

Explain:

Hydrology created by artificial impoundment Damaged culvert, primitive rd

■ Maximum depth at survey: ( ) 0-12" (0-1 ft.) (•) 12-36" (1-3 ft.) ( ) 36-60" (3-5 ft.) ( ) >60" (>5 ft.)

■ Approximate size of pool (at spring highwater): Width: 150 ( ) m (•) ft Length: 300 ( ) m (•) ft

■ Predominate substrate in order of increasing hydroperiod:

- ( ) Mineral soil (bare, leaf-litter bottom, or upland mosses present)
- (•) Mineral soil (sphagnum moss present)
- ( ) Organic matter (peat/muck) shallow or restricted to deepest portion
- ( ) Organic matter (peat/muck) deep and widespread

■ Pool vegetation indicators in order of increasing hydroperiod (check all that apply):

- [ ] Terrestrial nonvascular spp. (e.g. haircap moss, lycopodium spp.)
- [ ] Dry site ferns (e.g. spinulose wood fern, lady fern, bracken fern)
- [x] Moist site ferns (e.g. sensitive fern, cinnamon fern, interrupted fern, New York fern)
- [ ] Moist site vasculars (e.g. skunk cabbage, jewelweed, blue flag iris, swamp candle)
- [x] Sphagnum moss (anchored or suspended)
- [ ] Wet site ferns (e.g. royal fern, marsh fern)
- [x] Wet site shrubs (e.g. highbush blueberry, maleberry, winterberry, mountain holly)
- [ ] Wet site graminoids (e.g. blue-joint grass, tussock sedge, cattail, bulrushes)
- [ ] Aquatic vascular spp. (e.g. pickerelweed, arrowhead)
- [ ] Floating or submerged aquatics (e.g. water lily, water shield, pond weed, bladderwort)
- [ ] No vegetation in pool

■ Faunal indicators (check all that apply):

- [ ] Fish
- [ ] Bullfrog or Green Frog tadpoles
- [ ] Other:

iii. Inlet/Outlet Flow Permanency

Type of inlet or outlet (a seasonal or permanent channel providing water flowing into or out of the pool):

- ( ) No inlet or outlet
- (•) Intermittent inlet or outlet
- ( ) Permanent inlet or outlet (channel with well-defined banks and permanent flow)
- ( ) Other or Unknown (explain):_____

6. VERNAL POOL INDICATOR INFORMATION

a. Indicator survey dates: 2019-4-30, 2019-5-22

b. Indicator abundance criteria and pool survey effort

- Is pool depression bisected by 2 ownerships (straddler pool)? ○ Yes ○ No
- Was the entire pool surveyed for egg masses? ◉ Yes ○ No; what % of entire pool surveyed? ____
- For each indicator species, indicate the exact number of egg masses, confidence level for species determination, and egg mass maturity. Separate cells are provided for separate survey dates.

INDICATOR SPECIES	Egg Masses (or adult Fairy Shrimp)									Tadpoles/Larvae[4]					
	Visit #1	Visit #2	Visit #3	Confidence Level[1]			Egg Mass Maturity[2]			Observed			Confidence Level[1]		
Wood Frog															
Spotted Salamander	3	1		3	3			A			100			3	
Blue-spotted Salamander															
Fairy Shrimp[3]															

1-Confidence level: 1 = <60%, 2 = 60-95%, 3 = >95%
2-Egg mass maturity: F= Fresh (<24 hrs), M= Mature (round embryos), A= Advanced (loose matrix, curved embryos), H= Hatched or Hatching
3-Fairy shrimp: X = present
4-Tadpoles/larvae: X = present

c. Rarity criteria

- Note any rare species associated with vernal pools. Observations should be accompanied by photographs.

SPECIES	Method of Verification*			CL**	SPECIES	Method of Verification*			CL**
	P	H	S			P	H	S	
Blanding's Turtle	☐	☐	☐		Wood Turtle	☐	☐	☐	
Spotted Turtle	☐	☐	☐		Ribbon Snake	☐	☐	☐

Comments:

Maine State Vernal Pool Assessment Form

INSTRUCTIONS:

- **Complete all 3 pages of form thoroughly. Most fields are required for pool registration.**
- **Clear photographs of a) the pool AND b) the indicators (one example of each species egg mass) are required for all observers.**

Observer's Pool ID: V-RP-190502-01 **MDIFW Pool ID:** _____

1. PRIMARY OBSERVER INFORMATION

a. Observer name: Ray Peck

b. Contact and credentials previously provided? ○ No (submit Addendum 1) ◉ Yes

2. PROJECT CONTACT INFORMATION

a. Contact name: ○ same as observer ◉ other Dana Valleau

b. Contact and credentials previously provided? ○ No (submit Addendum 1) ◉ Yes

c. Project Name: Apex, Downeast Wind

3. LANDOWNER CONTACT INFORMATION

a. Are you the landowner? ○ Yes ◉ No If no, was landowner permission obtained for survey? ◉ Yes ○ No

b. Landowner's contact information (required)

Name: Neil Tenan Phone: ____

Street Address: 359 Willey District Rd City: Cherryfield State: ME Zip: 04622

c. ☑ Large Projects: check if separate project landowner data file submitted

4. VERNAL POOL LOCATION INFORMATION

a. Location Township: Cherryfield

Brief site directions to the pool (using mapped landmarks):

Off Schoodic rd to the west, approximately 1.25 miles south of Long Pond .

b. Mapping Requirements

i. USGS topographic map OR aerial photograph with pool clearly marked.

ii. GPS location of vernal pool (use Datum NAD83 / WGS84)

Longitude/Easting: -67.916297 Latitude/Northing: 44.749326

Coordinate system: WGS84

Check one:

☒ GIS shapefile
- send to Jason.Czapiga@maine.gov; observer has reviewed shape accuracy (Best)

☐ The pool perimeter is delineated by multiple GPS points. (Excellent)
- Include map or spreadsheet with coordinates.

☐ The above GPS point is at the center of the pool. (Good)

☐ The center of the pool is approximately____ ○ m ○ ft in the compass direction of degrees from the above GPS point. (Acceptable)

5. VERNAL POOL HABITAT INFORMATION

a. Habitat survey date (only if different from indicator survey dates on page 3): _____

b. Wetland habitat characterization

■ Choose the best descriptor for the landscape setting:

- ○ Isolated depression
- ○ Floodplain depression
- ◉ Pool associated with larger wetland complex
- ○ Other: _____

■ Check all wetland types that best apply to this pool:

- ☐ Forested swamp
- ☐ Shrub swamp
- ☐ Peatland (fen or bog)
- ☑ Emergent marsh
- ☐ Wet meadow
- ☐ Lake or pond cove
- ☐ Abandoned beaver flowage
- ☐ Active beaver flowage
- ☐ Slow stream
- ☐ Floodplain
- ☐ Mostly unvegetated pool
- ☐ ATV or skidder rut
- ☐ Dug pond or borrow pit
- ☐ Roadside ditch
- ☐ Other: _

c. Vernal pool status under the Natural Resources Protection Act (NRPA)

i. Pool Origin: ◉ Natural ○ Natural-Modified ○ Unnatural ○ Unknown

If modified, unnatural or unknown, describe any modern or historic human impacts to the pool **(required):**

ii. Pool Hydrology

■ Select the pool's estimated hydroperiod AND provide rationale in box **(required):**

- ○ Permanent
- ○ Semi-permanent (drying partially in all years and completely in drought years)
- ◉ Ephemeral (drying out completely in most years)
- ○ Unknown

Explain:

Small area with shallow water depth likely drys in late spring Small area, vegetation

■ Maximum depth at survey: ◉ 0-12" (0-1 ft.) ○ 12-36" (1-3 ft.) ○ 36-60" (3-5 ft.) ○ >60" (>5 ft.)

■ Approximate size of pool (at spring highwater): Width: 6 ○ m ◉ ft Length: 15 ○ m ◉ ft

■ Predominate substrate in order of increasing hydroperiod:

- ○ Mineral soil (bare, leaf-litter bottom, or upland mosses present)
- ◉ Mineral soil (sphagnum moss present)
- ○ Organic matter (peat/muck) shallow or restricted to deepest portion
- ○ Organic matter (peat/muck) deep and widespread

■ Pool vegetation indicators in order of increasing hydroperiod (check all that apply):

b. Landowner's contact information (required)

Name: Neil Tenan Phone: ____

Street Address: 359 Willey District Rd City: Cherryfield State: ME Zip: 04622

c. ☑ Large Projects: check if separate project landowner data file submitted

4. VERNAL POOL LOCATION INFORMATION

a. Location Township: Cherryfield

Brief site directions to the pool (using mapped landmarks):

Rfc nmmj gq qgrs_rcb hsqr ucqr md Njc_q_lr Pgtcp* _nnpmvg k _rcjw m l c k gjc l mprf md Jm l e Nm l b,

b. Mapping Requirements

i. USGS topographic map OR aerial photograph with pool clearly marked.

ii. GPS location of vernal pool (use Datum NAD83 / WGS84)

Longitude/Easting: -67.9218506 Latitude/Northing: 44.7788039

Coordinate system: WGS84

Check one:

☒ GIS shapefile
- send to Jason.Czapiga@maine.gov; observer has reviewed shape accuracy (Best)

☐ The pool perimeter is delineated by multiple GPS points. (Excellent)
- Include map or spreadsheet with coordinates.

☐ The above GPS point is at the center of the pool. (Good)

☐ The center of the pool is approximately____ ○ m ○ ft in the compass direction of degrees from the above GPS point. (Acceptable)

5. VERNAL POOL HABITAT INFORMATION

a. Habitat survey date (only if different from indicator survey dates on page 3): _____

b. Wetland habitat characterization

■ Choose the best descriptor for the landscape setting:

- ○ Isolated depression
- ○ Floodplain depression
- ◉ Pool associated with larger wetland complex
- ○ Other: _____

■ Check all wetland types that best apply to this pool:

- ☑ Forested swamp
- ☐ Shrub swamp
- ☐ Peatland (fen or bog)
- ☐ Emergent marsh
- ☐ Wet meadow
- ☐ Lake or pond cove
- ☐ Abandoned beaver flowage
- ☐ Active beaver flowage
- ☐ Slow stream
- ☐ Floodplain
- ☐ Mostly unvegetated pool
- ☐ ATV or skidder rut
- ☐ Dug pond or borrow pit
- ☐ Roadside ditch
- ☐ Other: _

c. Vernal pool status under the Natural Resources Protection Act (NRPA)

i. Pool Origin: ◉ Natural ○ Natural-Modified ○ Unnatural ○ Unknown

If modified, unnatural or unknown, describe any modern or historic human impacts to the pool **(required):**

ii. Pool Hydrology

■ Select the pool's estimated hydroperiod AND provide rationale in box **(required):**

- ○ Permanent
- ◉ Semi-permanent (drying partially in all years and completely in drought years)
- ○ Ephemeral (drying out completely in most years)
- ○ Unknown

Explain:

Large area with deep water levels Depth and vegetation

■ Maximum depth at survey: ○ 0-12" (0-1 ft.) ◉ 12-36" (1-3 ft.) ○ 36-60" (3-5 ft.) ○ >60" (>5 ft.)

■ Approximate size of pool (at spring highwater): Width: 5 ○ m ◉ ft Length: 25 ○ m ◉ ft

■ Predominate substrate in order of increasing hydroperiod:

- ○ Mineral soil (bare, leaf-litter bottom, or upland mosses present)
- ○ Mineral soil (sphagnum moss present)
- ◉ Organic matter (peat/muck) shallow or restricted to deepest portion
- ○ Organic matter (peat/muck) deep and widespread

■ Pool vegetation indicators in order of increasing hydroperiod (check all that apply):

- ☐ Terrestrial nonvascular spp. (e.g. haircap moss, lycopodium spp.)
- ☐ Dry site ferns (e.g. spinulose wood fern, lady fern, bracken fern)
- ☑ Moist site ferns (e.g. sensitive fern, cinnamon fern, interrupted fern, New York fern)
- ☐ Moist site vasculars (e.g. skunk cabbage, jewelweed, blue flag iris, swamp candle)
- ☑ Sphagnum moss (anchored or suspended)
- ☑ Wet site ferns (e.g. royal fern, marsh fern)
- ☐ Wet site shrubs (e.g. highbush blueberry, maleberry, winterberry, mountain holly)
- ☑ Wet site graminoids (e.g. blue-joint grass, tussock sedge, cattail, bulrushes)
- ☐ Aquatic vascular spp. (e.g. pickerelweed, arrowhead)
- ☐ Floating or submerged aquatics (e.g. water lily, water shield, pond weed, bladderwort)
- ☐ No vegetation in pool

■ Faunal indicators (check all that apply):

- ☐ Fish
- ☐ Bullfrog or Green Frog tadpoles
- ☐ Other:

iii. Inlet/Outlet Flow Permanency

Type of inlet or outlet (a seasonal or permanent channel providing water flowing into or out of the pool):

- ○ No inlet or outlet
- ◉ Intermittent inlet or outlet
- ○ Permanent inlet or outlet (channel with well-defined banks and permanent flow)
- ○ Other or Unknown (explain):_____

6. VERNAL POOL INDICATOR INFORMATION

a. Indicator survey dates: 2019-5-3, 2019-5-24

b. Indicator abundance criteria and pool survey effort

- Is pool depression bisected by 2 ownerships (straddler pool)? ○ Yes ○ No
- Was the entire pool surveyed for egg masses? ◉ Yes ○ No; what % of entire pool surveyed? ____
- For each indicator species, indicate the exact number of egg masses, confidence level for species determination, and egg mass maturity. Separate cells are provided for separate survey dates.

INDICATOR SPECIES	Egg Masses (or adult Fairy Shrimp)									Tadpoles/Larvae[4]					
	Visit #1	Visit #2	Visit #3	Confidence Level[1]			Egg Mass Maturity[2]			Observed			Confidence Level[1]		
Wood Frog	62			3			F								
Spotted Salamander	40			3			F								
Blue-spotted Salamander															
Fairy Shrimp[3]															

1-Confidence level: 1 = <60%, 2 = 60-95%, 3 = >95%

2-Egg mass maturity: F= Fresh (<24 hrs), M= Mature (round embryos), A= Advanced (loose matrix, curved embryos), H= Hatched or Hatching

3-Fairy shrimp: X = present

4-Tadpoles/larvae: X = present

c. Rarity criteria

- Note any rare species associated with vernal pools. Observations should be accompanied by photographs.

SPECIES	Method of Verification*			CL**	SPECIES	Method of Verification*			CL**
	P	H	S			P	H	S	
Blanding's Turtle	☐	☐	☐		Wood Turtle	☐	☐	☐	
Spotted Turtle	☐	☐	☐		Ribbon Snake	☐	☐	☐	
Ringed Boghaunter	☐	☐	☐		Other:	☐	☐	☐	

*Method of verification: P = Photographed, H = Handled, S = Seen

**CL - Confidence level in species determination: 1= <60%, 2= 60-95%, 3= >95%

d. Optional observer recommendation:

☑ SVP ☐ Potential SVP ☐ Non Significant VP ☐ Indicator Breeding Area

e. General vernal pool comments and/or observations of other wildlife:

Small area of suitable vernal pool habitat in forested community. 2Vdone, most masses hatched, river backwater

Send completed form and supporting documentation to: Maine Dept. of Inland Fisheries and Wildlife
Attn: Vernal Pools
650 State Street, Bangor, ME 04401

NOTE: Digital submission (to Jason.Czapiga@maine.gov) of vernal pool field forms and photographs is only acceptable for projects with 3 or fewer assessed pools; larger projects must be mailed as hard copies.

This pool is: ☐ **Significant** ☐ **Potentially Significant** but lacking critical data ☐ **Not Significant** due to: ○ does not meet biological criteria. ○ does not meet MDEP vernal pool criteria.

Comments:

Maine State Vernal Pool Assessment Form

INSTRUCTIONS:

- **Complete all 3 pages of form thoroughly. Most fields are required for pool registration.**
- **Clear photographs of a) the pool AND b) the indicators (one example of each species egg mass) are required for all observers.**

Observer's Pool ID: SVP_18JL **MDIFW Pool ID:** _____

1. PRIMARY OBSERVER INFORMATION

a. Observer name: Jeanna Leclerc, Tom Tetreau

b. Contact and credentials previously provided? ○ No (submit Addendum 1) ◉ Yes

2. PROJECT CONTACT INFORMATION

a. Contact name: ○ same as observer ◉ other Stantec Consulting

b. Contact and credentials previously provided? ○ No (submit Addendum 1) ◉ Yes

c. Project Name: Downeast Wind project

3. LANDOWNER CONTACT INFORMATION

a. Are you the landowner? ○ Yes ◉ No If no, was landowner permission obtained for survey? ◉ Yes ○ No

b. Landowner's contact information (required)

Name: Cherryfield Properties LLC. Phone: _____

Street Address: _____ City: _____ State: _____ Zip: _____

c. ☐ Large Projects: check if separate project landowner data file submitted

4. VERNAL POOL LOCATION INFORMATION

a. Location Township: T18 MD BPP

Brief site directions to the pool (using mapped landmarks):

From Route 1 in Cherryfield, head north on Route 193 to Ridge Road. Take Ridge Road north to Schoodic Road through the blueberry barons. Pool is on the west side of Schoodic Road in the northern portion of the Project.

b. Mapping Requirements

i. USGS topographic map OR aerial photograph with pool clearly marked.

ii. GPS location of vernal pool (use Datum NAD83 / WGS84)

Longitude/Easting: -67.907195 Latitude/Northing: 44.726088

Coordinate system: NAD83

Check one:

◉ GIS shapefile
- send to Jason.Czapiga@maine.gov; observer has reviewed shape accuracy (Best)

○ The pool perimeter is delineated by multiple GPS points. (Excellent)
- Include map or spreadsheet with coordinates.

○ The above GPS point is at the center of the pool. (Good)

○ The center of the pool is approximately _____ m ○ ft ○ in the compass direction of _____ degrees from the above GPS point. (Acceptable)

5. VERNAL POOL HABITAT INFORMATION

a. Habitat survey date (only if different from indicator survey dates on page 3): _____

b. Wetland habitat characterization

■ Choose the best descriptor for the landscape setting:

- ○ Isolated depression
- ○ Floodplain depression
- ◉ Pool associated with larger wetland complex
- ○ Other: _____

■ Check all wetland types that best apply to this pool:

- ☑ Forested swamp
- ☑ Shrub swamp
- ☐ Peatland (fen or bog)
- ☐ Emergent marsh
- ☐ Wet meadow
- ☐ Lake or pond cove
- ☐ Abandoned beaver flowage
- ☐ Active beaver flowage
- ☐ Slow stream
- ☐ Floodplain
- ☐ Mostly unvegetated pool
- ☐ ATV or skidder rut
- ☐ Dug pond or borrow pit
- ☐ Roadside ditch
- ☐ Other: _____

c. Vernal pool status under the Natural Resources Protection Act (NRPA)

i. Pool Origin: ◉ Natural ○ Natural-Modified ○ Unnatural ○ Unknown

If modified, unnatural or unknown, describe any modern or historic human impacts to the pool (**required**):

ii. Pool Hydrology

■ Select the pool's estimated hydroperiod AND provide rationale in box (**required**):

- ○ Permanent
- ○ Semi-permanent (drying partially in all years and completely in drought years)
- ◉ Ephemeral (drying out completely in most years)
- ○ Unknown

Explain:

Wetland contains mineral soil substrate

■ Maximum depth at survey: ◉ 0-12" (0-1 ft.) ○ 12-36" (1-3 ft.) ○ 36-60" (3-5 ft.) ○ >60" (>5 ft.)

■ Approximate size of pool (at spring highwater): Width: 100 ○ m ◉ ft Length: 60 ○ m ◉ ft

■ Predominate substrate in order of increasing hydroperiod:

- ◉ Mineral soil (bare, leaf-litter bottom, or upland mosses present)
- ○ Mineral soil (sphagnum moss present)
- ○ Organic matter (peat/muck) shallow or restricted to deepest portion
- ○ Organic matter (peat/muck) deep and widespread

■ Pool vegetation indicators in order of increasing hydroperiod (check all that apply):

- ☐ Terrestrial nonvascular spp. (e.g. haircap moss, lycopodium spp.)
- ☐ Dry site ferns (e.g. spinulose wood fern, lady fern, bracken fern)
- ☐ Moist site ferns (e.g. sensitive fern, cinnamon fern, interrupted fern, New York fern)
- ☐ Moist site vasculars (e.g. skunk cabbage, jewelweed, blue flag iris, swamp candle)
- ☐ Sphagnum moss (anchored or suspended)
- ☐ Wet site ferns (e.g. royal fern, marsh fern)
- ☑ Wet site shrubs (e.g. highbush blueberry, maleberry, winterberry, mountain holly)
- ☑ Wet site graminoids (e.g. blue-joint grass, tussock sedge, cattail, bulrushes)
- ☐ Aquatic vascular spp. (e.g. pickerelweed, arrowhead)
- ☐ Floating or submerged aquatics (e.g. water lily, water shield, pond weed, bladderwort)
- ☐ No vegetation in pool

■ Faunal indicators (check all that apply):

- ☐ Fish
- ☐ Bullfrog or Green Frog tadpoles
- ☐ Other: _____

iii. Inlet/Outlet Flow Permanency

Type of inlet or outlet (a seasonal or permanent channel providing water flowing into or out of the pool):

- ○ No inlet or outlet
- ◉ Intermittent inlet or outlet
- ○ Permanent inlet or outlet (channel with well-defined banks and permanent flow)
- ○ Other or Unknown (explain): _____

6. VERNAL POOL INDICATOR INFORMATION

a. Indicator survey dates: 04/25/2017, 05/10/2017

b. Indicator abundance criteria and pool survey effort

- Is pool depression bisected by 2 ownerships (straddler pool)? ○ Yes ◉ No
- Was the entire pool surveyed for egg masses? ◉ Yes ○ No; what % of entire pool surveyed? _____
- For each indicator species, indicate the exact number of egg masses, confidence level for species determination, and egg mass maturity. Separate cells are provided for separate survey dates.

INDICATOR SPECIES	Egg Masses (or adult Fairy Shrimp)									Tadpoles/Larvae[4]					
	Visit #1	Visit #2	Visit #3	Confidence Level[1]			Egg Mass Maturity[2]			Observed			Confidence Level[1]		
Wood Frog	0	1		3	3			H			X		3	3	
Spotted Salamander	8	21		3	3		M	M					3	3	
Blue-spotted Salamander	0	0		3	3								3	3	
Fairy Shrimp[3]	0	0		3	3										

1-Confidence level: 1 = <60%, 2 = 60-95%, 3 = >95%

2-Egg mass maturity: F= Fresh (<24 hrs), M= Mature (round embryos), A= Advanced (loose matrix, curved embryos), H= Hatched or Hatching

3-Fairy shrimp: X = present

4-Tadpoles/larvae: X = present

c. Rarity criteria

- Note any rare species associated with vernal pools. Observations should be accompanied by photographs.

SPECIES	Method of Verification*			CL**	SPECIES	Method of Verification*			CL**
	P	H	S			P	H	S

- ☑ Mostly unvegetated pool
- ☐ ATV or skidder rut
- ☐ Dug pond or borrow pit
- ☐ Roadside ditch
- ☐ Other: _____

c. Vernal pool status under the Natural Resources Protection Act (NRPA)

i. Pool Origin: ◉ Natural ○ Natural-Modified ○ Unnatural ○ Unknown

If modified, unnatural or unknown, describe any modern or historic human impacts to the pool (**required**):

ii. Pool Hydrology

■ Select the pool's estimated hydroperiod AND provide rationale in box (**required**):

- ○ Permanent
- ○ Semi-permanent (drying partially in all years and completely in drought years)
- ◉ Ephemeral (drying out completely in most years)
- ○ Unknown

Explain:

Wetland contains mineral soil substrate

■ Maximum depth at survey: ○ 0-12" (0-1 ft.) ◉ 12-36" (1-3 ft.) ○ 36-60" (3-5 ft.) ○ >60" (>5 ft.)

■ Approximate size of pool (at spring highwater): Width: 200 ○ m ◉ ft Length: 75 ○ m ◉ ft

■ Predominate substrate in order of increasing hydroperiod:

- ◉ Mineral soil (bare, leaf-litter bottom, or upland mosses present)
- ○ Mineral soil (sphagnum moss present)
- ○ Organic matter (peat/muck) shallow or restricted to deepest portion
- ○ Organic matter (peat/muck) deep and widespread

■ Pool vegetation indicators in order of increasing hydroperiod (check all that apply):

- ☐ Terrestrial nonvascular spp. (e.g. haircap moss, lycopodium spp.)
- ☐ Dry site ferns (e.g. spinulose wood fern, lady fern, bracken fern)
- ☐ Moist site ferns (e.g. sensitive fern, cinnamon fern, interrupted fern, New York fern)
- ☐ Moist site vasculars (e.g. skunk cabbage, jewelweed, blue flag iris, swamp candle)
- ☐ Sphagnum moss (anchored or suspended)
- ☐ Wet site ferns (e.g. royal fern, marsh fern)
- ☐ Wet site shrubs (e.g. highbush blueberry, maleberry, winterberry, mountain holly)
- ☑ Wet site graminoids (e.g. blue-joint grass, tussock sedge, cattail, bulrushes)
- ☐ Aquatic vascular spp. (e.g. pickerelweed, arrowhead)
- ☐ Floating or submerged aquatics (e.g. water lily, water shield, pond weed, bladderwort)
- ☐ No vegetation in pool

■ Faunal indicators (check all that apply):

- ☐ Fish
- ☐ Bullfrog or Green Frog tadpoles
- ☐ Other: _____

iii. Inlet/Outlet Flow Permanency

Type of inlet or outlet (a seasonal or permanent channel providing water flowing into or out of the pool):

- ◉ No inlet or outlet
- ○ Intermittent inlet or outlet
- ○ Permanent inlet or outlet (channel with well-defined banks and permanent flow)
- ○ Other or Unknown (explain): _____

6. VERNAL POOL INDICATOR INFORMATION

a. Indicator survey dates: 04/26/2017, 05/10/2017

b. Indicator abundance criteria and pool survey effort

- Is pool depression bisected by 2 ownerships (straddler pool)? ○ Yes ◉ No
- Was the entire pool surveyed for egg masses? ◉ Yes ○ No; what % of entire pool surveyed? _____
- For each indicator species, indicate the exact number of egg masses, confidence level for species determination, and egg mass maturity. Separate cells are provided for separate survey dates.

INDICATOR SPECIES	Egg Masses (or adult Fairy Shrimp)									Tadpoles/Larvae[4]					
	Visit #1	Visit #2	Visit #3	Confidence Level[1]			Egg Mass Maturity[2]			Observed			Confidence Level[1]		
Wood Frog	10	7		3	3		F	H			X		3	3	
Spotted Salamander	0	0		3	3								3	3	
Blue-spotted Salamander	0	0		3	3								3	3	
Fairy Shrimp[3]	0	0		3	3										

1-Confidence level: 1 = <60%, 2 = 60-95%, 3 = >95%

2-Egg mass maturity: F= Fresh (<24 hrs), M= Mature (round embryos), A= Advanced (loose matrix, curved embryos), H= Hatched or Hatching

3-Fairy shrimp: X = present

4-Tadpoles/larvae: X = present

c. Rarity criteria

- Note any rare species associated with vernal pools. Observations should be accompanied by photographs.

SPECIES	Method of Verification*			CL**	SPECIES	Method of Verification*			CL**
	P	H	S			P	H	S	
Blanding's Turtle	☐	☐	☐		Wood Turtle	☐	☐	☐	
Spotted Turtle	☐	☐	☐		Ribbon Snake	☐	☐	☐	
Ringed Boghaunter	☐	☐	☐		Other:	☐	☐	☐	

*Method of verification: P = Photographed, H = Handled, S = Seen

**CL - Confidence level in species determination: 1= <60%, 2= 60-95%, 3= >95%

d. Optional observer recommendation:

☐ SVP ☐ Potential SVP ☑ Non Significant VP ☐ Indicator Breeding Area

e. General vernal pool comments and/or observations of other wildlife:

Natural pool with breeding activity.

Send completed form and supporting documentation to: Maine Dept. of Inland Fisheries and Wildlife
Attn: Vernal Pools
650 State Street, Bangor, ME 04401

NOTE: Digital submission (to Jason.Czapiga@maine.gov) of vernal pool field forms and photographs is only acceptable for projects with 3 or fewer assessed pools; larger projects must be mailed as hard copies.

Comments:

Maine State Vernal Pool Assessment Form

INSTRUCTIONS:

- **Complete all 3 pages of form thoroughly. Most fields are required for pool registration.**
- **Clear photographs of a) the pool AND b) the indicators (one example of each species egg mass) are required for all observers.**

Observer's Pool ID: SVP_22TT **MDIFW Pool ID:** _____

1. PRIMARY OBSERVER INFORMATION

a. Observer name: Tom Tetreau

b. Contact and credentials previously provided? ○ No (submit Addendum 1) ◉ Yes

2. PROJECT CONTACT INFORMATION

a. Contact name: ○ same as observer ◉ other Stantec Consulting

b. Contact and credentials previously provided? ○ No (submit Addendum 1) ○ Yes

c. Project Name: Downeast Wind Project

3. LANDOWNER CONTACT INFORMATION

a. Are you the landowner? ○ Yes ◉ No If no, was landowner permission obtained for survey? ◉ Yes ○ No

b. Landowner's contact information (required)

Name: Cherryfield Properties LLC. Phone: _____

Street Address: _____ City: _____ State: _____ Zip: _____

c. ☐ Large Projects: check if separate project landowner data file submitted

4. VERNAL POOL LOCATION INFORMATION

a. Location Township: Columbia

Brief site directions to the pool (using mapped landmarks):

From Route 1 in Cherryfield, head north on Route 193 to Ridge Road. Take Ridge Road north to Pea Ridge Road. Turn east on Pea Ridge Road. Pool is located on north side of Pea Ridge Road near the eastern end of the Project.

b. Mapping Requirements

i. USGS topographic map OR aerial photograph with pool clearly marked.

ii. GPS location of vernal pool (use Datum NAD83 / WGS84)

Longitude/Easting: -67.814523 Latitude/Northing: 44.679795

Coordinate system: NAD83

Check one:

◉ GIS shapefile
- send to Jason.Czapiga@maine.gov; observer has reviewed shape accuracy (Best)

○ The pool perimeter is delineated by multiple GPS points. (Excellent)
- Include map or spreadsheet with coordinates.

○ The above GPS point is at the center of the pool. (Good)

○ The center of the pool is approximately _____ m ○ ft ○ in the compass direction of _____ degrees from the above GPS point. (Acceptable)

5. VERNAL POOL HABITAT INFORMATION

a. Habitat survey date (only if different from indicator survey dates on page 3): _____

b. Wetland habitat characterization

■ Choose the best descriptor for the landscape setting:

- ○ Isolated depression
- ○ Floodplain depression
- ◉ Pool associated with larger wetland complex
- ○ Other: _____

■ Check all wetland types that best apply to this pool:

- ☐ Forested swamp
- ☐ Shrub swamp
- ☑ Peatland (fen or bog)
- ☐ Emergent marsh
- ☐ Wet meadow
- ☐ Lake or pond cove
- ☐ Abandoned beaver flowage
- ☐ Active beaver flowage
- ☐ Slow stream
- ☐ Floodplain
- ☑ Mostly unvegetated pool
- ☐ ATV or skidder rut
- ☐ Dug pond or borrow pit
- ☐ Roadside ditch
- ☐ Other: _____

c. Vernal pool status under the Natural Resources Protection Act (NRPA)

i. Pool Origin: ◉ Natural ○ Natural-Modified ○ Unnatural ○ Unknown

If modified, unnatural or unknown, describe any modern or historic human impacts to the pool (**required**):

ii. Pool Hydrology

■ Select the pool's estimated hydroperiod AND provide rationale in box (**required**):

- ○ Permanent
- ○ Semi-permanent (drying partially in all years and completely in drought years)
- ◉ Ephemeral (drying out completely in most years)
- ○ Unknown

Explain:

shallow water at time of survey

■ Maximum depth at survey: ◉ 0-12" (0-1 ft.) ○ 12-36" (1-3 ft.) ○ 36-60" (3-5 ft.) ○ >60" (>5 ft.)

■ Approximate size of pool (at spring highwater): Width: 50 ○ m ◉ ft Length: 30 ○ m ◉ ft

■ Predominate substrate in order of increasing hydroperiod:

- ○ Mineral soil (bare, leaf-litter bottom, or upland mosses present)
- ○ Mineral soil (sphagnum moss present)
- ○ Organic matter (peat/muck) shallow or restricted to deepest portion
- ◉ Organic matter (peat/muck) deep and widespread

■ Pool vegetation indicators in order of increasing hydroperiod (check all that apply):

Maine State Vernal Pool Assessment Form

INSTRUCTIONS:

- **Complete all 3 pages of form thoroughly. Most fields are required for pool registration.**
- **Clear photographs of a) the pool AND b) the indicators (one example of each species egg mass) are required for all observers.**

Observer's Pool ID: SVP_25TT **MDIFW Pool ID:** _____

1. PRIMARY OBSERVER INFORMATION

a. Observer name: Tom Tetreau

b. Contact and credentials previously provided? ○ No (submit Addendum 1) ◉ Yes

2. PROJECT CONTACT INFORMATION

a. Contact name: ○ same as observer ◉ other Stantec Consulting

b. Contact and credentials previously provided? ○ No (submit Addendum 1) ○ Yes

c. Project Name: Downeast Wind Project

3. LANDOWNER CONTACT INFORMATION

a. Are you the landowner? ○ Yes ◉ No If no, was landowner permission obtained for survey? ◉ Yes ○ No

b. Landowner's contact information (required)

Name: _____ Phone: _____

Street Address: _____ City: _____ State: _____ Zip: _____

c. ☐ Large Projects: check if separate project landowner data file submitted

4. VERNAL POOL LOCATION INFORMATION

a. Location Township: Columbia

Brief site directions to the pool (using mapped landmarks):

From Cherryfield, take Route 1east toward Harrington. Take George Town Woods Road north to western end of transmission line. Pool is located near the western end of the proposed transmission line corridor.

b. Mapping Requirements

i. USGS topographic map OR aerial photograph with pool clearly marked.

ii. GPS location of vernal pool (use Datum NAD83 / WGS84)

Longitude/Easting: -67.816355 Latitude/Northing: 44.668584

Coordinate system: NAD83

Check one:

◉ GIS shapefile
- send to Jason.Czapiga@maine.gov; observer has reviewed shape accuracy (Best)

○ The pool perimeter is delineated by multiple GPS points. (Excellent)
- Include map or spreadsheet with coordinates.

○ The above GPS point is at the center of the pool. (Good)

○ The center of the pool is approximately _____ m ○ ft ○ in the compass direction of _____ degrees from the above GPS point. (Acceptable)

5. VERNAL POOL HABITAT INFORMATION

a. Habitat survey date (only if different from indicator survey dates on page 3): _____

b. Wetland habitat characterization

■ Choose the best descriptor for the landscape setting:

- ○ Isolated depression
- ○ Floodplain depression
- ◉ Pool associated with larger wetland complex
- ○ Other: _____

■ Check all wetland types that best apply to this pool:

- ☑ Forested swamp
- ☑ Shrub swamp
- ☐ Peatland (fen or bog)
- ☑ Emergent marsh
- ☐ Wet meadow
- ☐ Lake or pond cove
- ☐ Abandoned beaver flowage
- ☐ Active beaver flowage
- ☐ Slow stream
- ☐ Floodplain
- ☐ Mostly unvegetated pool
- ☑ ATV or skidder rut
- ☐ Dug pond or borrow pit
- ☐ Roadside ditch
- ☐ Other: _____

c. Vernal pool status under the Natural Resources Protection Act (NRPA)

i. Pool Origin: ○ Natural ◉ Natural-Modified ○ Unnatural ○ Unknown

If modified, unnatural or unknown, describe any modern or historic human impacts to the pool (**required**):

ATV trail crosses wetland through pool

ii. Pool Hydrology

■ Select the pool's estimated hydroperiod AND provide rationale in box (**required**):

- ○ Permanent
- ◉ Semi-permanent (drying partially in all years and completely in drought years)
- ○ Ephemeral (drying out completely in most years)
- ○ Unknown

Explain:

groundwater present

■ Maximum depth at survey: ◉ 0-12" (0-1 ft.) ○ 12-36" (1-3 ft.) ○ 36-60" (3-5 ft.) ○ >60" (>5 ft.)

■ Approximate size of pool (at spring highwater): Width: _____ ○ m ○ ft Length: _____ ○ m ○ ft

■ Predominate substrate in order of increasing hydroperiod:

- ○ Mineral soil (bare, leaf-litter bottom, or upland mosses present)
- ○ Mineral soil (sphagnum moss present)
- ◉ Organic matter (peat/muck) shallow or restricted to deepest portion
- ○ Organic matter (peat/muck) deep and widespread

■ Pool vegetation indicators in order of increasing hydroperiod (check all that apply):

- ☐ Terrestrial nonvascular spp. (e.g. haircap moss, lycopodium spp.)
- ☐ Dry site ferns (e.g. spinulose wood fern, lady fern, bracken fern)
- ☐ Moist site ferns (e.g. sensitive fern, cinnamon fern, interrupted fern, New York fern)
- ☐ Moist site vasculars (e.g. skunk cabbage, jewelweed, blue flag iris, swamp candle)
- ☐ Sphagnum moss (anchored or suspended)
- ☐ Wet site ferns (e.g. royal fern, marsh fern)
- ☑ Wet site shrubs (e.g. highbush blueberry, maleberry, winterberry, mountain holly)
- ☑ Wet site graminoids (e.g. blue-joint grass, tussock sedge, cattail, bulrushes)
- ☐ Aquatic vascular spp. (e.g. pickerelweed, arrowhead)
- ☐ Floating or submerged aquatics (e.g. water lily, water shield, pond weed, bladderwort)
- ☐ No vegetation in pool

■ Faunal indicators (check all that apply):

- ☐ Fish
- ☐ Bullfrog or Green Frog tadpoles
- ☐ Other: _____

iii. Inlet/Outlet Flow Permanency

Type of inlet or outlet (a seasonal or permanent channel providing water flowing into or out of the pool):

- ○ No inlet or outlet
- ◉ Intermittent inlet or outlet
- ○ Permanent inlet or outlet (channel with well-defined banks and permanent flow)
- ○ Other or Unknown (explain): _____

6. VERNAL POOL INDICATOR INFORMATION

a. Indicator survey dates: 04/25/2017,

b. Indicator abundance criteria and pool survey effort

- Is pool depression bisected by 2 ownerships (straddler pool)? ○ Yes ◉ No
- Was the entire pool surveyed for egg masses? ◉ Yes ○ No; what % of entire pool surveyed? _____
- For each indicator species, indicate the exact number of egg masses, confidence level for species determination, and egg mass maturity. Separate cells are provided for separate survey dates.

INDICATOR SPECIES	Egg Masses (or adult Fairy Shrimp)									Tadpoles/Larvae[4]					
	Visit #1	Visit #2	Visit #3	Confidence Level[1]			Egg Mass Maturity[2]			Observed			Confidence Level[1]		
Wood Frog	1			3			A						3		
Spotted Salamander	21			3			F						3		
Blue-spotted Salamander	0			3									3		
Fairy Shrimp[3]	0			3											

1-Confidence level: 1 = <60%, 2 = 60-95%, 3 = >95%

2-Egg mass maturity: F= Fresh (<24 hrs), M= Mature (round embryos), A= Advanced (loose matrix, curved embryos), H= Hatched or Hatching

3-Fairy shrimp: X = present

4-Tadpoles/larvae: X = present

c. Rarity criteria

- Note any rare species associated with vernal pools. Observations should be accompanied by photographs.

SPECIES	Method of Verification*			CL**	SPECIES	Method of Verification*			CL**
	P	H	S			P	H	S	
Blanding's Turtle	☐	☐	☐		Wood Turtle	☐	☐	☐	
Spotted Turtle	☐	☐	☐		Ribbon Snake	☐	☐	☐	
Ringed Boghaunter	☐	☐	☐		Other:	☐	☐	☐	

*Method of verification: P = Photographed, H = Handled, S = Seen

**CL - Confidence level in species determination: 1= <60%, 2= 60-95%, 3= >95%

d. Optional observer recommendation:

☑ SVP ☐ Potential SVP ☐ Non Significant VP ☐ Indicator Breeding Area

e. General vernal pool comments and/or observations of other wildlife:

Natural pool with significant breeding activity and ATV trail crossing through portion.

Send completed form and supporting documentation to: Maine Dept. of Inland Fisheries and Wildlife
Attn: Vernal Pools
650 State Street, Bangor, ME 04401

NOTE: Digital submission (to Jason.Czapiga@maine.gov) of vernal pool field forms and photographs is only acceptable for projects with 3 or fewer assessed pools; larger projects must be mailed as hard copies.

For MDIFW use only Reviewed by MDIFW Date: _____ Initials: _____

This pool is: ☐ **Significant** ☐ **Potentially Significant** but lacking critical data ☐ **Not Significant** due to: ○ does not meet biological criteria. ○ does not meet MDEP vernal pool criteria.

b. Indicator abundance criteria and pool survey effort

- Is pool depression bisected by 2 ownerships (straddler pool)? ○ Yes ◉ No
- Was the entire pool surveyed for egg masses? ◉ Yes ○ No; what % of entire pool surveyed? _____
- For each indicator species, indicate the exact number of egg masses, confidence level for species determination, and egg mass maturity. Separate cells are provided for separate survey dates.

INDICATOR SPECIES	Egg Masses (or adult Fairy Shrimp)									Tadpoles/Larvae[4]					
	Visit #1	Visit #2	Visit #3	Confidence Level[1]			Egg Mass Maturity[2]			Observed			Confidence Level[1]		
Wood Frog	15	0		3	3		F						3	3	
Spotted Salamander	1	63		3	3		F	M					3	3	
Blue-spotted Salamander	0	0		3	3								3	3	
Fairy Shrimp[3]	0	0		3	3										

1-Confidence level: 1 = <60%, 2 = 60-95%, 3 = >95%

2-Egg mass maturity: F= Fresh (<24 hrs), M= Mature (round embryos), A= Advanced (loose matrix, curved embryos), H= Hatched or Hatching

3-Fairy shrimp: X = present

4-Tadpoles/larvae: X = present

c. Rarity criteria

- Note any rare species associated with vernal pools. Observations should be accompanied by photographs.

SPECIES	Method of Verification*			CL**	SPECIES	Method of Verification*			CL**
	P	H	S			P	H	S	
Blanding's Turtle	☐	☐	☐		Wood Turtle	☐	☐	☐	
Spotted Turtle	☐	☐	☐		Ribbon Snake	☐	☐	☐	
Ringed Boghaunter	☐	☐	☐		Other:	☐	☐	☐	

*Method of verification: P = Photographed, H = Handled, S = Seen

**CL - Confidence level in species determination: 1= <60%, 2= 60-95%, 3= >95%

d. Optional observer recommendation:

☑ SVP ☐ Potential SVP ☐ Non Significant VP ☐ Indicator Breeding Area

e. General vernal pool comments and/or observations of other wildlife:

Natural pool with significant breeding activity.

Send completed form and supporting documentation to: Maine Dept. of Inland Fisheries and Wildlife
Attn: Vernal Pools
650 State Street, Bangor, ME 04401

NOTE: Digital submission (to Jason.Czapiga@maine.gov) of vernal pool field forms and photographs is only acceptable for projects with 3 or fewer assessed pools; larger projects must be mailed as hard copies.

For MDIFW use only Reviewed by MDIFW Date: _____ Initials: _____

This pool is: ☐ **Significant** ☐ **Potentially Significant** but lacking critical data ☐ **Not Significant** due to: ○ does not meet biological criteria. ○ does not meet MDEP vernal pool criteria.

Comments:

Maine State Vernal Pool Assessment Form

INSTRUCTIONS:

- **Complete all 3 pages of form thoroughly. Most fields are required for pool registration.**
- **Clear photographs of a) the pool AND b) the indicators (one example of each species egg mass) are required for all observers.**

Observer's Pool ID: SVP_46TT **MDIFW Pool ID:** _____

1. PRIMARY OBSERVER INFORMATION

a. Observer name: Tom Tetreau

b. Contact and credentials previously provided? ○ No (submit Addendum 1) ◉ Yes

2. PROJECT CONTACT INFORMATION

a. Contact name: ○ same as observer ◉ other Stantec Consulting

b. Contact and credentials previously provided? ○ No (submit Addendum 1) ◉ Yes

c. Project Name: Downeast Wind Project

3. LANDOWNER CONTACT INFORMATION

a. Are you the landowner? ○ Yes ◉ No If no, was landowner permission obtained for survey? ◉ Yes ○ No

b. Landowner's contact information (required)

Name: Cherryfield Properties LLC. Phone: _____

Street Address: _____ City: _____ State: _____ Zip: _____

c. ☐ Large Projects: check if separate project landowner data file submitted

4. VERNAL POOL LOCATION INFORMATION

a. Location Township: Colunbia

Brief site directions to the pool (using mapped landmarks):

From Route 1 in Cherryfield, head north on Route 193 to Ridge Road. Take Ridge Road north to Pea Ridge Road through the blueberry barrens. Pool is located on north side of Pea Ridge Road between Schoodic Road and Ell Meadow Road.

b. Mapping Requirements

i. USGS topographic map OR aerial photograph with pool clearly marked.

ii. GPS location of vernal pool (use Datum NAD83 / WGS84)

Longitude/Easting: -67.859329 Latitude/Northing: 44.681186

Coordinate system: NAD83

Check one:

◉ GIS shapefile
- send to Jason.Czapiga@maine.gov; observer has reviewed shape accuracy (Best)

○ The pool perimeter is delineated by multiple GPS points. (Excellent)
- Include map or spreadsheet with coordinates.

○ The above GPS point is at the center of the pool. (Good)

○ The center of the pool is approximately _____ m ○ ft ○ in the compass direction of _____ degrees from the above GPS point. (Acceptable)

5. VERNAL POOL HABITAT INFORMATION

a. Habitat survey date (only if different from indicator survey dates on page 3): _____

b. Wetland habitat characterization

■ Choose the best descriptor for the landscape setting:

- (•) Isolated depression
- ( ) Floodplain depression
- ( ) Pool associated with larger wetland complex
- ( ) Other: _____

■ Check all wetland types that best apply to this pool:

- [x] Forested swamp
- [x] Shrub swamp
- [ ] Peatland (fen or bog)
- [ ] Emergent marsh
- [ ] Wet meadow
- [ ] Lake or pond cove
- [ ] Abandoned beaver flowage
- [ ] Active beaver flowage
- [ ] Slow stream
- [ ] Floodplain
- [ ] Mostly unvegetated pool
- [ ] ATV or skidder rut
- [ ] Dug pond or borrow pit
- [ ] Roadside ditch
- [ ] Other: _____

c. Vernal pool status under the Natural Resources Protection Act (NRPA)

i. Pool Origin: (•) Natural ( ) Natural-Modified ( ) Unnatural ( ) Unknown

If modified, unnatural or unknown, describe any modern or historic human impacts to the pool (**required**):

ii. Pool Hydrology

■ Select the pool's estimated hydroperiod AND provide rationale in box (**required**):

- ( ) Permanent
- ( ) Semi-permanent (drying partially in all years and completely in drought years)
- (•) Ephemeral (drying out completely in most years)
- ( ) Unknown

Explain:

Forested wetland with mineral soils.

■ Maximum depth at survey: (•) 0-12" (0-1 ft.) ( ) 12-36" (1-3 ft.) ( ) 36-60" (3-5 ft.) ( ) >60" (>5 ft.)

■ Approximate size of pool (at spring highwater): Width: 100 ( ) m (•) ft Length: 100 ( ) m (•) ft

■ Predominate substrate in order of increasing hydroperiod:

- (•) Mineral soil (bare, leaf-litter bottom, or upland mosses present)
- ( ) Mineral soil (sphagnum moss present)
- ( ) Organic matter (peat/muck) shallow or restricted to deepest portion
- ( ) Organic matter (peat/muck) deep and widespread

■ Pool vegetation indicators in order of increasing hydroperiod (check all that apply):

- [ ] Terrestrial nonvascular spp. (e.g. haircap moss, lycopodium spp.)
- [ ] Dry site ferns (e.g. spinulose wood fern, lady fern, bracken fern)
- [ ] Moist site ferns (e.g. sensitive fern, cinnamon fern, interrupted fern, New York fern)
- [ ] Moist site vasculars (e.g. skunk cabbage, jewelweed, blue flag iris, swamp candle)
- [ ] Sphagnum moss (anchored or suspended)
- [ ] Wet site ferns (e.g. royal fern, marsh fern)
- [x] Wet site shrubs (e.g. highbush blueberry, maleberry, winterberry, mountain holly)
- [x] Wet site graminoids (e.g. blue-joint grass, tussock sedge, cattail, bulrushes)
- [ ] Aquatic vascular spp. (e.g. pickerelweed, arrowhead)
- [ ] Floating or submerged aquatics (e.g. water lily, water shield, pond weed, bladderwort)
- [ ] No vegetation in pool

■ Faunal indicators (check all that apply):

- [ ] Fish
- [ ] Bullfrog or Green Frog tadpoles
- [ ] Other: _____

iii. Inlet/Outlet Flow Permanency

Type of inlet or outlet (a seasonal or permanent channel providing water flowing into or out of the pool):

- (•) No inlet or outlet
- ( ) Intermittent inlet or outlet
- ( ) Permanent inlet or outlet (channel with well-defined banks and permanent flow)
- ( ) Other or Unknown (explain): _____

6. VERNAL POOL INDICATOR INFORMATION

a. Indicator survey dates: 04/25/2017,

b. Indicator abundance criteria and pool survey effort

- Is pool depression bisected by 2 ownerships (straddler pool)? ○ Yes ◉ No
- Was the entire pool surveyed for egg masses? ◉ Yes ○ No; what % of entire pool surveyed? _____
- For each indicator species, indicate the exact number of egg masses, confidence level for species determination, and egg mass maturity. Separate cells are provided for separate survey dates.

INDICATOR SPECIES	Egg Masses (or adult Fairy Shrimp)									Tadpoles/Larvae[4]					
	Visit #1	Visit #2	Visit #3	Confidence Level[1]			Egg Mass Maturity[2]			Observed			Confidence Level[1]		
Wood Frog	0			3									3		
Spotted Salamander	32			3			F						3		
Blue-spotted Salamander	6			3			M						3		
Fairy Shrimp[3]	0			3											

1-Confidence level: 1 = <60%, 2 = 60-95%, 3 = >95%

2-Egg mass maturity: F= Fresh (<24 hrs), M= Mature (round embryos), A= Advanced (loose matrix, curved embryos), H= Hatched or Hatching

3-Fairy shrimp: X = present

4-Tadpoles/larvae: X = present

c. Rarity criteria

- Note any rare species associated with vernal pools. Observations should be accompanied by photographs.

- ☐ Lake or pond cove
- ☐ Abandoned beaver flowage
- ☐ Active beaver flowage
- ☐ Slow stream
- ☐ Floodplain
- ☐ Mostly unvegetated pool
- ☐ ATV or skidder rut
- ☐ Dug pond or borrow pit
- ☐ Roadside ditch
- ☐ Other: _____

c. Vernal pool status under the Natural Resources Protection Act (NRPA)

i. Pool Origin: ◉ Natural ○ Natural-Modified ○ Unnatural ○ Unknown

If modified, unnatural or unknown, describe any modern or historic human impacts to the pool (**required**):

ii. Pool Hydrology

■ Select the pool's estimated hydroperiod AND provide rationale in box (**required**):

- ○ Permanent
- ○ Semi-permanent (drying partially in all years and completely in drought years)
- ◉ Ephemeral (drying out completely in most years)
- ○ Unknown

Explain:

Wetland contains mineral soil substrate

■ Maximum depth at survey: ○ 0-12" (0-1 ft.) ◉ 12-36" (1-3 ft.) ○ 36-60" (3-5 ft.) ○ >60" (>5 ft.)

■ Approximate size of pool (at spring highwater): Width: 100 ○ m ◉ ft Length: 50 ○ m ◉ ft

■ Predominate substrate in order of increasing hydroperiod:

- ◉ Mineral soil (bare, leaf-litter bottom, or upland mosses present)
- ○ Mineral soil (sphagnum moss present)
- ○ Organic matter (peat/muck) shallow or restricted to deepest portion
- ○ Organic matter (peat/muck) deep and widespread

■ Pool vegetation indicators in order of increasing hydroperiod (check all that apply):

- ☐ Terrestrial nonvascular spp. (e.g. haircap moss, lycopodium spp.)
- ☐ Dry site ferns (e.g. spinulose wood fern, lady fern, bracken fern)
- ☐ Moist site ferns (e.g. sensitive fern, cinnamon fern, interrupted fern, New York fern)
- ☐ Moist site vasculars (e.g. skunk cabbage, jewelweed, blue flag iris, swamp candle)
- ☐ Sphagnum moss (anchored or suspended)
- ☐ Wet site ferns (e.g. royal fern, marsh fern)
- ☑ Wet site shrubs (e.g. highbush blueberry, maleberry, winterberry, mountain holly)
- ☐ Wet site graminoids (e.g. blue-joint grass, tussock sedge, cattail, bulrushes)
- ☐ Aquatic vascular spp. (e.g. pickerelweed, arrowhead)
- ☐ Floating or submerged aquatics (e.g. water lily, water shield, pond weed, bladderwort)
- ☐ No vegetation in pool

■ Faunal indicators (check all that apply):

- ☐ Fish
- ☐ Bullfrog or Green Frog tadpoles
- ☐ Other: _____

iii. Inlet/Outlet Flow Permanency

Type of inlet or outlet (a seasonal or permanent channel providing water flowing into or out of the pool):

- ◉ No inlet or outlet
- ○ Intermittent inlet or outlet
- ○ Permanent inlet or outlet (channel with well-defined banks and permanent flow)
- ○ Other or Unknown (explain): _____

6. VERNAL POOL INDICATOR INFORMATION

a. Indicator survey dates: 04/25/2017,

b. Indicator abundance criteria and pool survey effort

- Is pool depression bisected by 2 ownerships (straddler pool)? ○ Yes ◉ No
- Was the entire pool surveyed for egg masses? ◉ Yes ○ No; what % of entire pool surveyed? _____
- For each indicator species, indicate the exact number of egg masses, confidence level for species determination, and egg mass maturity. Separate cells are provided for separate survey dates.

INDICATOR SPECIES	Egg Masses (or adult Fairy Shrimp)									Tadpoles/Larvae[4]					
	Visit #1	Visit #2	Visit #3	Confidence Level[1]			Egg Mass Maturity[2]			Observed			Confidence Level[1]		
Wood Frog	134			3			F						3		
Spotted Salamander	195			3			F						3		
Blue-spotted Salamander	0			3									3		
Fairy Shrimp[3]	0			3											

1-Confidence level: 1 = <60%, 2 = 60-95%, 3 = >95%

2-Egg mass maturity: F= Fresh (<24 hrs), M= Mature (round embryos), A= Advanced (loose matrix, curved embryos), H= Hatched or Hatching

3-Fairy shrimp: X = present

4-Tadpoles/larvae: X = present

c. Rarity criteria

- Note any rare species associated with vernal pools. Observations should be accompanied by photographs.

SPECIES	Method of Verification*			CL**	SPECIES	Method of Verification*			CL**
	P	H	S			P	H	S	
Blanding's Turtle	☐	☐	☐		Wood Turtle	☐	☐	☐	
Spotted Turtle	☐	☐	☐		Ribbon Snake	☐	☐	☐	
Ringed Boghaunter	☐	☐	☐		Other:	☐	☐	☐	

*Method of verification: P = Photographed, H = Handled, S = Seen

**CL - Confidence level in species determination: 1= <60%, 2= 60-95%, 3= >95%

d. Optional observer recommendation:

☑ SVP ☐ Potential SVP ☐ Non Significant VP ☐ Indicator Breeding Area

e. General vernal pool comments and/or observations of other wildlife:

Natural pool with very significant breeding activity.

Send completed form and supporting documentation to: Maine Dept. of Inland Fisheries and Wildlife
Attn: Vernal Pools
650 State Street, Bangor, ME 04401

NOTE: Digital submission (to Jason.Czapiga@maine.gov) of vernal pool field forms and photographs is only acceptable for projects with 3 or fewer assessed pools; larger projects must be mailed as hard copies.

For MDIFW use only Reviewed by MDIFW Date: _____ Initials: _____

INSTRUCTIONS:

- **Complete all 3 pages of form thoroughly. Most fields are <u>required</u> for pool registration.**
- **<u>Clear photographs</u> of a) the pool AND b) the indicators (one example of each species egg mass) are <u>required</u> for all observers.**

Observer's Pool ID: VP_50TT **MDIFW Pool ID:** _____

1. PRIMARY OBSERVER INFORMATION

a. Observer name: Tom Tetreau

b. Contact and credentials previously provided? ○ No (submit Addendum 1) ◉ Yes

2. PROJECT CONTACT INFORMATION

a. Contact name: ○ same as observer ◉ other Stantec Consulting

b. Contact and credentials previously provided? ○ No (submit Addendum 1) ○ Yes

c. Project Name: Downeast Wind Project

3. LANDOWNER CONTACT INFORMATION

a. Are you the landowner? ○ Yes ◉ No If no, was landowner permission obtained for survey? ◉ Yes ○ No

b. Landowner's contact information (required)

Name: Cherryfield Properties LLC. Phone: _____

Street Address: _____ City: _____ State: _____ Zip: _____

c. ☐ Large Projects: check if separate project landowner data file submitted

4. VERNAL POOL LOCATION INFORMATION

a. Location Township: T18 MD BPP

Brief site directions to the pool (using mapped landmarks):

From Route 1 in Cherryfield, head north on Route 193 to Ridge Road. Take Ridge Road north to Pea Ridge Road through the blueberry barons. Pool is located on north side of Pea Ridge Road between Schoodic Road an Ell Meadow Road.

b. Mapping Requirements

i. USGS topographic map OR aerial photograph with pool clearly marked.

ii. GPS location of vernal pool (use Datum NAD83 / WGS84)

Longitude/Easting: -67.853542 Latitude/Northing: 44.679003

Coordinate system: NAD83

Check one:

◉ GIS shapefile
- send to Jason.Czapiga@maine.gov; observer has reviewed shape accuracy (Best)

○ The pool perimeter is delineated by multiple GPS points. (Excellent)
- Include map or spreadsheet with coordinates.

○ The above GPS point is at the center of the pool. (Good)

○ The center of the pool is approximately _____ m ○ ft ○ in the compass direction of _____ degrees from the above GPS point. (Acceptable)

5. VERNAL POOL HABITAT INFORMATION

a. Habitat survey date (only if different from indicator survey dates on page 3): _____

b. Wetland habitat characterization

■ Choose the best descriptor for the landscape setting:

- ○ Isolated depression
- ○ Floodplain depression
- ◉ Pool associated with larger wetland complex
- ○ Other: _____

■ Check all wetland types that best apply to this pool:

- ☑ Forested swamp
- ☑ Shrub swamp
- ☐ Peatland (fen or bog)
- ☐ Emergent marsh
- ☐ Wet meadow
- ☐ Lake or pond cove
- ☐ Abandoned beaver flowage
- ☐ Active beaver flowage
- ☐ Slow stream
- ☐ Floodplain
- ☐ Mostly unvegetated pool
- ☐ ATV or skidder rut
- ☐ Dug pond or borrow pit
- ☐ Roadside ditch
- ☐ Other: _____

c. Vernal pool status under the Natural Resources Protection Act (NRPA)

i. Pool Origin: ◉ Natural ○ Natural-Modified ○ Unnatural ○ Unknown

If modified, unnatural or unknown, describe any modern or historic human impacts to the pool (**required**):

ii. Pool Hydrology

■ Select the pool's estimated hydroperiod AND provide rationale in box (**required**):

- ○ Permanent

Maine State Vernal Pool Assessment Form

INSTRUCTIONS:

- **Complete all 3 pages of form thoroughly. Most fields are <u>required</u> for pool registration.**
- **<u>Clear photographs</u> of a) the pool AND b) the indicators (one example of each species egg mass) are <u>required</u> for all observers.**

Observer's Pool ID: SVP_53TT **MDIFW Pool ID:** _____

1. PRIMARY OBSERVER INFORMATION

a. Observer name: Tom Tetreau

b. Contact and credentials previously provided? ○ No (submit Addendum 1) ◉ Yes

2. PROJECT CONTACT INFORMATION

a. Contact name: ○ same as observer ◉ other Stantec Consulting

b. Contact and credentials previously provided? ○ No (submit Addendum 1) ◉ Yes

c. Project Name: Downeast Wind project

3. LANDOWNER CONTACT INFORMATION

a. Are you the landowner? ○ Yes ◉ No If no, was landowner permission obtained for survey? ◉ Yes ○ No

b. Landowner's contact information (required)

Name: Cherryfield Properties LLC. Phone: _____

Street Address: _____ City: _____ State: _____ Zip: _____

c. ☐ Large Projects: check if separate project landowner data file submitted

4. VERNAL POOL LOCATION INFORMATION

a. Location Township: Columbia

Brief site directions to the pool (using mapped landmarks):

From Route 1 in Cherryfield, head north on Route 193 to Ridge Road. Take Ridge Road north to Pea Ridge Road. Pool is on the north side of Pea Ridge Road between Schoodic Road and Ell Meadow Road.

b. Mapping Requirements

i. USGS topographic map OR aerial photograph with pool clearly marked.

ii. GPS location of vernal pool (use Datum NAD83 / WGS84)

Longitude/Easting: -67.862239 Latitude/Northing: 44.688345

Coordinate system: NAD83

Check one:

◉ GIS shapefile
- send to Jason.Czapiga@maine.gov; observer has reviewed shape accuracy (Best)

○ The pool perimeter is delineated by multiple GPS points. (Excellent)
- Include map or spreadsheet with coordinates.

○ The above GPS point is at the center of the pool. (Good)

○ The center of the pool is approximately _____ m ○ ft ○ in the compass direction of _____ degrees from the above GPS point. (Acceptable)

5. VERNAL POOL HABITAT INFORMATION

a. Habitat survey date (only if different from indicator survey dates on page 3): _____

b. Wetland habitat characterization

■ Choose the best descriptor for the landscape setting:

- (•) Isolated depression
- ( ) Floodplain depression
- ( ) Pool associated with larger wetland complex
- ( ) Other: _____

■ Check all wetland types that best apply to this pool:

- ☐ Forested swamp
- ☐ Shrub swamp
- ☐ Peatland (fen or bog)
- ☑ Emergent marsh
- ☐ Wet meadow
- ☐ Lake or pond cove
- ☐ Abandoned beaver flowage
- ☐ Active beaver flowage
- ☐ Slow stream
- ☐ Floodplain
- ☐ Mostly unvegetated pool
- ☐ ATV or skidder rut
- ☐ Dug pond or borrow pit
- ☐ Roadside ditch
- ☐ Other: _____

c. Vernal pool status under the Natural Resources Protection Act (NRPA)

i. Pool Origin: (•) Natural ( ) Natural-Modified ( ) Unnatural ( ) Unknown

If modified, unnatural or unknown, describe any modern or historic human impacts to the pool (**required**):

ii. Pool Hydrology

■ Select the pool's estimated hydroperiod AND provide rationale in box (**required**):

- ( ) Permanent
- ( ) Semi-permanent (drying partially in all years and completely in drought years)
- (•) Ephemeral (drying out completely in most years)
- ( ) Unknown

Explain:

shallow depth and terrestrial vegetation throughout

■ Maximum depth at survey: ( ) 0-12" (0-1 ft.) (•) 12-36" (1-3 ft.) ( ) 36-60" (3-5 ft.) ( ) >60" (>5 ft.)

■ Approximate size of pool (at spring highwater): Width: 100 ( ) m (•) ft Length: 100 ( ) m (•) ft

■ Predominate substrate in order of increasing hydroperiod:

- ( ) Mineral soil (bare, leaf-litter bottom, or upland mosses present)
- ( ) Mineral soil (sphagnum moss present)
- (•) Organic matter (peat/muck) shallow or restricted to deepest portion
- ( ) Organic matter (peat/muck) deep and widespread

■ Pool vegetation indicators in order of increasing hydroperiod (check all that apply):

- ☐ Terrestrial nonvascular spp. (e.g. haircap moss, lycopodium spp.)
- ☐ Dry site ferns (e.g. spinulose wood fern, lady fern, bracken fern)
- ☑ Moist site ferns (e.g. sensitive fern, cinnamon fern, interrupted fern, New York fern)
- ☐ Moist site vasculars (e.g. skunk cabbage, jewelweed, blue flag iris, swamp candle)
- ☐ Sphagnum moss (anchored or suspended)
- ☐ Wet site ferns (e.g. royal fern, marsh fern)
- ☐ Wet site shrubs (e.g. highbush blueberry, maleberry, winterberry, mountain holly)
- ☑ Wet site graminoids (e.g. blue-joint grass, tussock sedge, cattail, bulrushes)
- ☐ Aquatic vascular spp. (e.g. pickerelweed, arrowhead)
- ☐ Floating or submerged aquatics (e.g. water lily, water shield, pond weed, bladderwort)
- ☐ No vegetation in pool

■ Faunal indicators (check all that apply):

- ☐ Fish
- ☐ Bullfrog or Green Frog tadpoles
- ☐ Other: _____

iii. Inlet/Outlet Flow Permanency

Type of inlet or outlet (a seasonal or permanent channel providing water flowing into or out of the pool):

- (•) No inlet or outlet
- ( ) Intermittent inlet or outlet
- ( ) Permanent inlet or outlet (channel with well-defined banks and permanent flow)
- ( ) Other or Unknown (explain): _____

6. VERNAL POOL INDICATOR INFORMATION

a. Indicator survey dates: 04/26/2017,

b. Indicator abundance criteria and pool survey effort

- Is pool depression bisected by 2 ownerships (straddler pool)? ○ Yes ◉ No
- Was the entire pool surveyed for egg masses? ◉ Yes ○ No; what % of entire pool surveyed? _____
- For each indicator species, indicate the exact number of egg masses, confidence level for species determination, and egg mass maturity. Separate cells are provided for separate survey dates.

INDICATOR SPECIES	Egg Masses (or adult Fairy Shrimp)									Tadpoles/Larvae[4]					
	Visit #1	Visit #2	Visit #3	Confidence Level[1]			Egg Mass Maturity[2]			Observed			Confidence Level[1]		
Wood Frog	152			3			A						3		
Spotted Salamander	17			3			F						3		
Blue-spotted Salamander	92			3			M						3		
Fairy Shrimp[3]	0			3											

1-Confidence level: 1 = <60%, 2 = 60-95%, 3 = >95%

2-Egg mass maturity: F= Fresh (<24 hrs), M= Mature (round embryos), A= Advanced (loose matrix, curved embryos), H= Hatched or Hatching

3-Fairy shrimp: X = present

4-Tadpoles/larvae: X = present

c. Rarity criteria

- Note any rare species associated with vernal pools. Observations should be accompanied by photographs.

SPECIES	Method of Verification*			CL**	SPECIES	Method of Verification*			CL**
	P	H	S			P	H	S	
Blanding's Turtle	☐	☐	☐		Wood Turtle	☐	☐	☐	
Spotted Turtle	☐	☐	☐		Ribbon Snake	☐	☐	☐	
Ringed Boghaunter	☐	☐	☐		Other:	☐	☐	☐	

*Method of verification: P = Photographed, H = Handled, S = Seen

**CL - Confidence level in species determination: 1= <60%, 2= 60-95%, 3= >95%

d. Optional observer recommendation:

☑ SVP ☐ Potential SVP ☐ Non Significant VP ☐ Indicator Breeding Area

e. General vernal pool comments and/or observations of other wildlife:

Natural pool with very significant breeding activity.

Send completed form and supporting documentation to: Maine Dept. of Inland Fisheries and Wildlife
Attn: Vernal Pools
650 State Street, Bangor, ME 04401

NOTE: Digital submission (to Jason.Czapiga@maine.gov) of vernal pool field forms and photographs is only acceptable for projects with 3 or fewer assessed pools; larger projects must be mailed as hard copies.

For MDIFW use only Reviewed by MDIFW Date: _____ Initials: _____

This pool is: ☐ **Significant** ☐ **Potentially Significant** but lacking critical data ☐ **Not Significant** due to: ○ does not meet biological criteria. ○ does not meet MDEP vernal pool criteria.

b. Indicator abundance criteria and pool survey effort

- Is pool depression bisected by 2 ownerships (straddler pool)? ○ Yes ◉ No
- Was the entire pool surveyed for egg masses? ◉ Yes ○ No; what % of entire pool surveyed? _____
- For each indicator species, indicate the exact number of egg masses, confidence level for species determination, and egg mass maturity. Separate cells are provided for separate survey dates.

INDICATOR SPECIES	Egg Masses (or adult Fairy Shrimp)									Tadpoles/Larvae[4]					
	Visit #1	Visit #2	Visit #3	Confidence Level[1]			Egg Mass Maturity[2]			Observed			Confidence Level[1]		
Wood Frog	0			3									3		
Spotted Salamander	8			3			H						3		
Blue-spotted Salamander	0			3									3		
Fairy Shrimp[3]	0			3											

1-Confidence level: 1 = <60%, 2 = 60-95%, 3 = >95%

2-Egg mass maturity: F= Fresh (<24 hrs), M= Mature (round embryos), A= Advanced (loose matrix, curved embryos), H= Hatched or Hatching

3-Fairy shrimp: X = present

4-Tadpoles/larvae: X = present

c. Rarity criteria

- Note any rare species associated with vernal pools. Observations should be accompanied by photographs.

SPECIES	Method of Verification*			CL**	SPECIES	Method of Verification*			CL**
	P	H	S			P	H	S	
Blanding's Turtle	☐	☐	☐		Wood Turtle	☐	☐	☐	
Spotted Turtle	☐	☐	☐		Ribbon Snake	☐	☐	☐	
Ringed Boghaunter	☐	☐	☐		Other:	☐	☐	☐	

*Method of verification: P = Photographed, H = Handled, S = Seen

**CL - Confidence level in species determination: 1= <60%, 2= 60-95%, 3= >95%

d. Optional observer recommendation:

☐ SVP ☐ Potential SVP ☑ Non Significant VP ☐ Indicator Breeding Area

e. General vernal pool comments and/or observations of other wildlife:

Natural pool with breeding activity.

Send completed form and supporting documentation to: Maine Dept. of Inland Fisheries and Wildlife
Attn: Vernal Pools
650 State Street, Bangor, ME 04401

NOTE: Digital submission (to Jason.Czapiga@maine.gov) of vernal pool field forms and photographs is only acceptable for projects with 3 or fewer assessed pools; larger projects must be mailed as hard copies.

For MDIFW use only Reviewed by MDIFW Date: _____ Initials: _____

This pool is: ☐ **Significant** ☐ **Potentially Significant** but lacking critical data ☐ **Not Significant** due to: ○ does not meet biological criteria. ○ does not meet MDEP vernal pool criteria.

Comments:

Maine State Vernal Pool Assessment Form

INSTRUCTIONS:

- **Complete all 3 pages of form thoroughly. Most fields are required for pool registration.**
- **Clear photographs of a) the pool AND b) the indicators (one example of each species egg mass) are required for all observers.**

Observer's Pool ID: SVP_60TT **MDIFW Pool ID:** _____

1. PRIMARY OBSERVER INFORMATION

a. Observer name: Tom Tetreau

b. Contact and credentials previously provided? ○ No (submit Addendum 1) ◉ Yes

2. PROJECT CONTACT INFORMATION

a. Contact name: ○ same as observer ◉ other Stantec Consulting

b. Contact and credentials previously provided? ○ No (submit Addendum 1) ○ Yes

c. Project Name: Downeast Wind Project

3. LANDOWNER CONTACT INFORMATION

a. Are you the landowner? ○ Yes ◉ No If no, was landowner permission obtained for survey? ◉ Yes ○ No

b. Landowner's contact information (required)

Name: _____ Phone: _____

Street Address: _____ City: _____ State: _____ Zip: _____

c. ☐ Large Projects: check if separate project landowner data file submitted

4. VERNAL POOL LOCATION INFORMATION

a. Location Township: Columbia

Brief site directions to the pool (using mapped landmarks):

From Cherryfield, take Route 1 toward Columbia Falls. Take Station Road north to eastern end of transmission line and substation. Pool is located west of the existing substation.

b. Mapping Requirements

i. USGS topographic map OR aerial photograph with pool clearly marked.

ii. GPS location of vernal pool (use Datum NAD83 / WGS84)

Longitude/Easting: -67.782158 Latitude/Northing: 44.674908

Coordinate system: NAD83

Check one:

◉ GIS shapefile
- send to Jason.Czapiga@maine.gov; observer has reviewed shape accuracy (Best)

○ The pool perimeter is delineated by multiple GPS points. (Excellent)
- Include map or spreadsheet with coordinates.

○ The above GPS point is at the center of the pool. (Good)

○ The center of the pool is approximately _____ m ○ ft ○ in the compass direction of _____ degrees from the above GPS point. (Acceptable)

5. VERNAL POOL HABITAT INFORMATION

a. Habitat survey date (only if different from indicator survey dates on page 3): _____

b. Wetland habitat characterization

■ Choose the best descriptor for the landscape setting:

- ○ Isolated depression
- ○ Floodplain depression
- ◉ Pool associated with larger wetland complex
- ○ Other: _____

■ Check all wetland types that best apply to this pool:

- ☑ Forested swamp
- ☐ Shrub swamp
- ☐ Peatland (fen or bog)
- ☐ Emergent marsh
- ☐ Wet meadow
- ☐ Lake or pond cove
- ☐ Abandoned beaver flowage
- ☐ Active beaver flowage
- ☐ Slow stream
- ☐ Floodplain
- ☐ Mostly unvegetated pool
- ☐ ATV or skidder rut
- ☐ Dug pond or borrow pit
- ☐ Roadside ditch
- ☐ Other: _____

c. Vernal pool status under the Natural Resources Protection Act (NRPA)

i. Pool Origin: ◉ Natural ○ Natural-Modified ○ Unnatural ○ Unknown

If modified, unnatural or unknown, describe any modern or historic human impacts to the pool (**required**):

ii. Pool Hydrology

■ Select the pool's estimated hydroperiod AND provide rationale in box (**required**):

- ○ Permanent
- ○ Semi-permanent (drying partially in all years and completely in drought years)
- ◉ Ephemeral (drying out completely in most years)
- ○ Unknown

Explain:

shallow water, mineral soil substrate.

■ Maximum depth at survey: ◉ 0-12" (0-1 ft.) ○ 12-36" (1-3 ft.) ○ 36-60" (3-5 ft.) ○ >60" (>5 ft.)

■ Approximate size of pool (at spring highwater): Width: _____ ○ m ◉ ft Length: _____ ○ m ◉ ft

■ Predominate substrate in order of increasing hydroperiod:

- ◉ Mineral soil (bare, leaf-litter bottom, or upland mosses present)
- ○ Mineral soil (sphagnum moss present)
- ○ Organic matter (peat/muck) shallow or restricted to deepest portion
- ○ Organic matter (peat/muck) deep and widespread

■ Pool vegetation indicators in order of increasing hydroperiod (check all that apply):

- ☐ Terrestrial nonvascular spp. (e.g. haircap moss, lycopodium spp.)
- ☐ Dry site ferns (e.g. spinulose wood fern, lady fern, bracken fern)
- ☐ Moist site ferns (e.g. sensitive fern, cinnamon fern, interrupted fern, New York fern)
- ☐ Moist site vasculars (e.g. skunk cabbage, jewelweed, blue flag iris, swamp candle)
- ☐ Sphagnum moss (anchored or suspended)
- ☐ Wet site ferns (e.g. royal fern, marsh fern)
- ☑ Wet site shrubs (e.g. highbush blueberry, maleberry, winterberry, mountain holly)
- ☐ Wet site graminoids (e.g. blue-joint grass, tussock sedge, cattail, bulrushes)
- ☐ Aquatic vascular spp. (e.g. pickerelweed, arrowhead)
- ☐ Floating or submerged aquatics (e.g. water lily, water shield, pond weed, bladderwort)
- ☐ No vegetation in pool

■ Faunal indicators (check all that apply):

- ☐ Fish
- ☐ Bullfrog or Green Frog tadpoles
- ☐ Other: _____

iii. Inlet/Outlet Flow Permanency

Type of inlet or outlet (a seasonal or permanent channel providing water flowing into or out of the pool):

- ◉ No inlet or outlet
- ○ Intermittent inlet or outlet
- ○ Permanent inlet or outlet (channel with well-defined banks and permanent flow)
- ○ Other or Unknown (explain): _____

6. VERNAL POOL INDICATOR INFORMATION

a. Indicator survey dates: 06/28/2017

b. Indicator abundance criteria and pool survey effort

- Is pool depression bisected by 2 ownerships (straddler pool)? ○ Yes ◉ No
- Was the entire pool surveyed for egg masses? ◉ Yes ○ No; what % of entire pool surveyed? _____
- For each indicator species, indicate the exact number of egg masses, confidence level for species determination, and egg mass maturity. Separate cells are provided for separate survey dates.

INDICATOR SPECIES	Egg Masses (or adult Fairy Shrimp)									Tadpoles/Larvae[4]					
	Visit #1	Visit #2	Visit #3	Confidence Level[1]			Egg Mass Maturity[2]			Observed			Confidence Level[1]		
Wood Frog	0			3									3		
Spotted Salamander	35			3			H						3		
Blue-spotted Salamander	0			3									3		
Fairy Shrimp[3]	0			3											

1-Confidence level: 1 = <60%, 2 = 60-95%, 3 = >95%

2-Egg mass maturity: F= Fresh (<24 hrs), M= Mature (round embryos), A= Advanced (loose matrix, curved embryos), H= Hatched or Hatching

3-Fairy shrimp: X = present

4-Tadpoles/larvae: X = present

c. Rarity criteria

- Note any rare species associated with vernal pools. Observations should be accompanied by photographs.

BUSINESS CONFIDENTIAL

Executive Summary

Stantec Consulting Services Inc. (Stantec) conducted nocturnal migration radar (radar) surveys for the proposed Downeast Wind Project (DOW or Project) in Washington County, Maine. Radar surveys were completed as part of pre-construction planning efforts in accordance with the Maine Department of Inland Fisheries and Wildlife's *Curtailment Policy and Wind Power Preconstruction Study Recommendations* (June 2015), the US Fish and Wildlife Service's *Land-Based Wind Energy Guidelines* (March 2012), the Project Work Plan dated 17 March 2016, and methods similar to those employed at other wind energy projects in Maine and the Northeast. The objective of the nocturnal radar migration surveys is to document patterns of nocturnal migrants at the Project.

Stantec conducted 3 seasons of radar surveys in fall 2015, spring 2016, and fall 2016 from a central location in the Project area. Stantec surveyed nighttime hours on 20 nights within each of the 3 seasons. During each survey period the radar operated in 2 modes (surveillance [horizontal] and vertical mode). Continuous images produced by the radar were recorded and archived as videos. The videos were visually reviewed to identify and select targets (migrants) and their flight paths, resulting in location, flight height, and flight direction data for each target. Mean hourly, nightly, and seasonal passage rates and flight heights were calculated, as well as seasonal mean flight direction and percent below maximum turbine blade tip height (183 meters [m]).

The radar survey resulted in a total of 643 survey hours (hrs; 227 hrs in fall 2015, 189 hrs in spring 2016 and 227 hrs in fall 2016). The seasonal mean passage rates were 920 ± 52 targets/kilometer/hour (t/km/hr; fall 2015), 469 ± 39 t/km/hr (spring 2016), and 486 ± 30 t/km/hr (fall 2016). The seasonal mean flight height of targets was 428 ± 1 m (1,404 feet ft; fall 2015), 384 ± 2 m (1,261 ft; spring 2016), and 465 ± 1 m (1,526 ft; fall 2016). The seasonal mean flight direction was 255° ± 66° (fall 2015), 68° ± 47° (spring 2016) and 252° ± 73° (fall 2016).

Peak migrant activity occurred in mid- to late September in both fall seasons and in early- to mid-May in the spring season. Seasonal mean flight heights in all seasons were > 200 m above the maximum blade-tip height of the proposed turbines. The mean seasonal passage rate in fall 2015 was nearly double that in fall 2016, indicating yearly variation in levels of nocturnal migration at DOW.

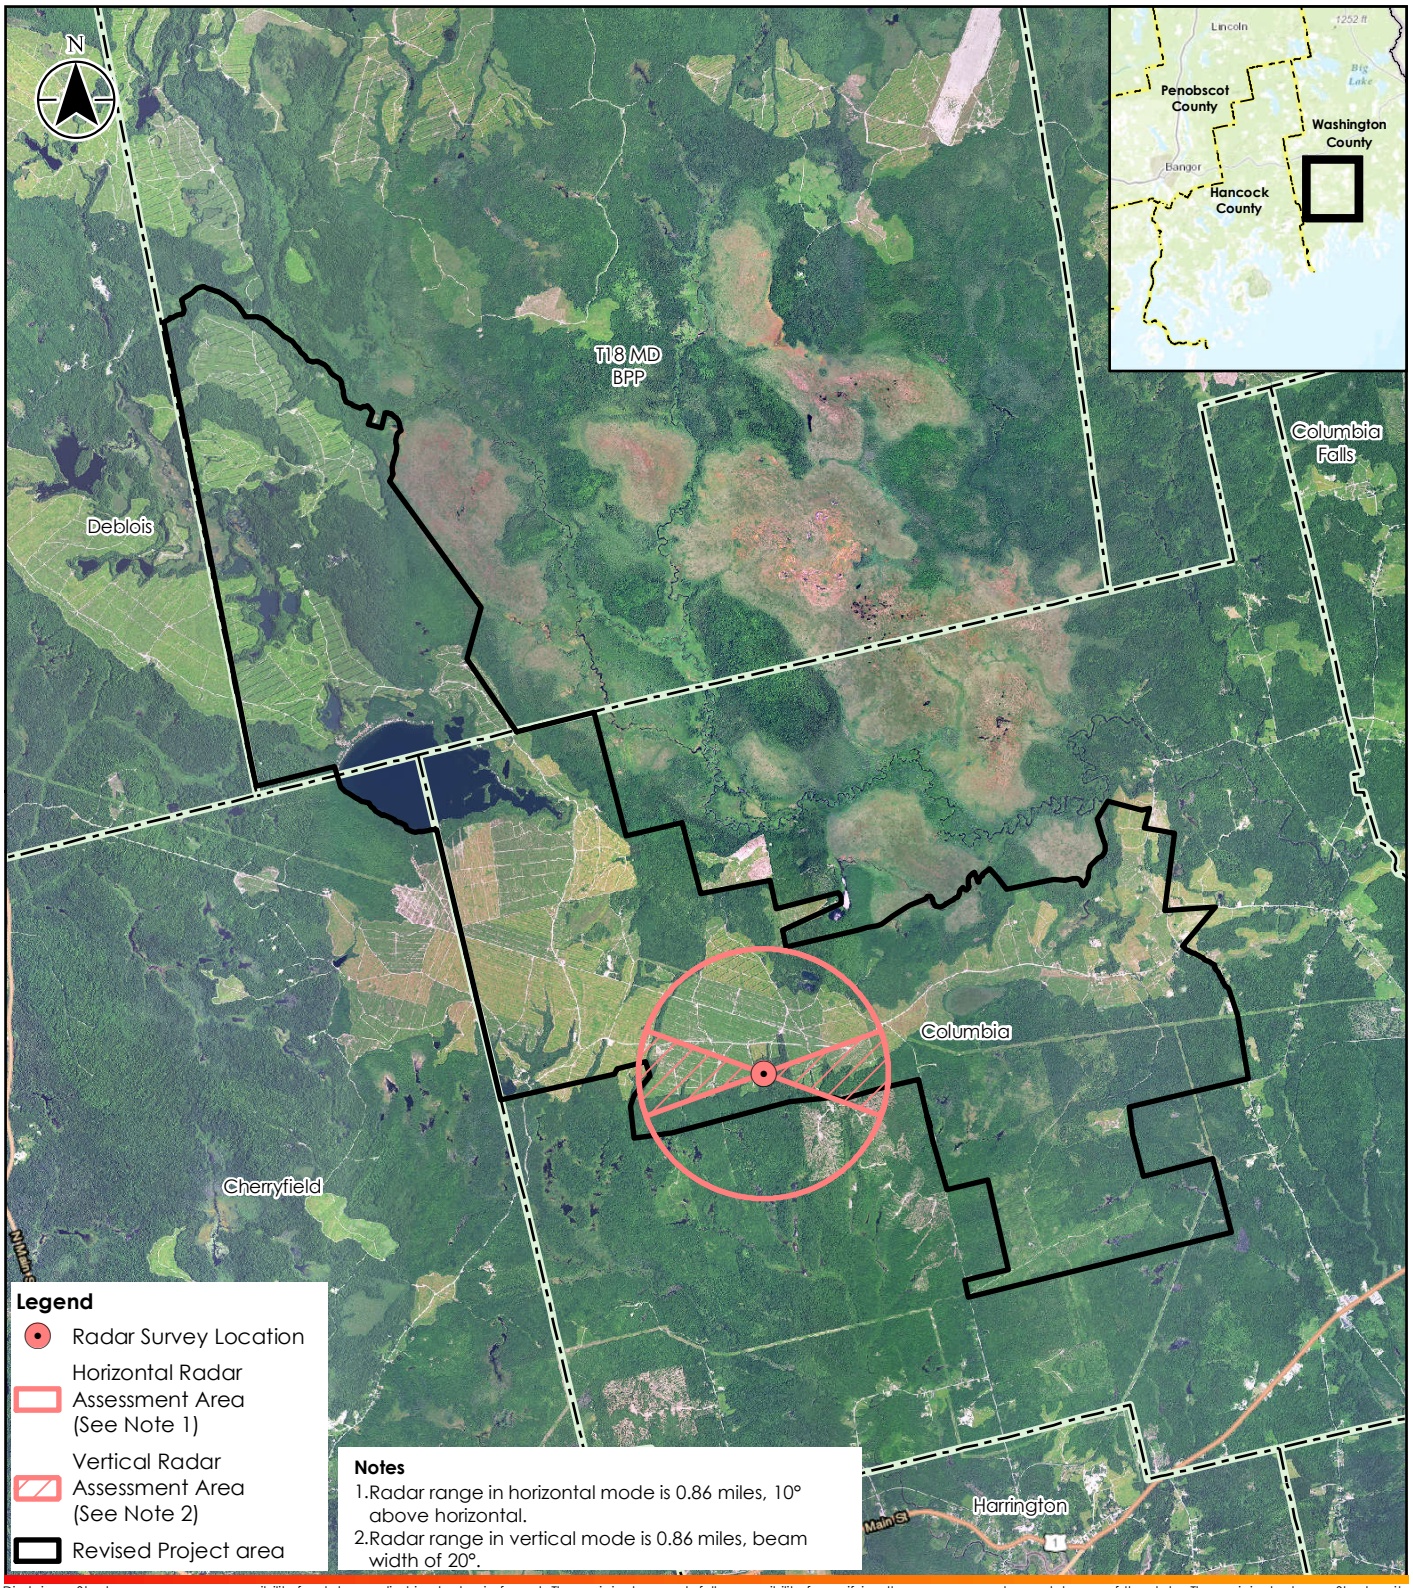
BUSINESS CONFIDENTIAL

1.0 INTRODUCTION

Stantec Consulting Services Inc. (Stantec) conducted nocturnal migration radar (radar) surveys for the proposed Downeast Wind Project (DOW or Project) in Washington County, Maine. Radar surveys were completed as part of pre-construction planning efforts for DOW in accordance with the Maine Department of Inland Fisheries and Wildlife's *Curtailment Policy and Wind Power Preconstruction Study Recommendations* (MDIFW Recommendations; June 2015), the US Fish and Wildlife Service's *Land-Based Wind Energy Guidelines* (March 2012), the Project Work Plan dated 17 March 2016, and methods similar to those employed at other wind energy projects in Maine and the Northeast. The objective of the nocturnal radar migrations surveys was to document patterns of nocturnal migrants at the Project.

2.0 METHODS

Stantec conducted 3 seasons of radar surveys in fall 2015, spring 2016, and fall 2016. This section describes the field survey and data analysis methods.



2.1 FIELD SURVEYS

2.1.1 Deployment

An X-band marine surveillance radar unit was deployed in a central location in the project within an open sand pit (Figure 2-1). The radar system collects data in 2 positions: vertical and horizontal. The vertical scanning radar data provides altitude information on targets up to an altitude of 1.39 km (0.86 mi) by scanning the area within a 20 degree wide beam that moves from horizon to horizon (Figures 2-1, 2-2 and 2-3). The vertical scanning radar was positioned in an east-west direction, approximately perpendicular to the anticipated flightpaths of migrating birds in this region (Figure 2-1). The horizontal radar provides passage rate and flight direction information and scans an area of 10 degrees above the horizontal in all directions out to 1.39 km (0.86 mi) from the unit (Figures 2-1 and 2-3). A setting on the radar unit was activated to record target echos for 30 seconds. This allowed for manual delineation of target echos to determine target flight direction.

Surrounding trees and other landscape features partially obstruct ground-based radar views, causing ground clutter. At DOW, the radar unit antenna was elevated up to 10 meters (m) above ground level to maximize the airspace sampled, and the unit itself was deployed close to surrounding trees which masked the 10-degree beam below the horizontal. Both the radar unit location and antenna elevation limited ground clutter to approximately 8% of the horizontal scanning view. This is well below the ground clutter maximum allowed of 30% under the MDIFW Recommendations, resulting in thorough evaluation of airspace within the sample area (Figure 2-4).

2.1.2 Data Collection

Survey nights were selected based on weather forecast predictions (i.e., nights with no predicted fog or precipitation, calm or following winds, and moderate temperatures) to focus sampling on nights expected to be optimal for migration. Suboptimal nights, i.e., nights with predicted fog, precipitation, strong winds, and/or unusually high or low temperatures, were sampled at a lower frequency than optimal nights.

The radar operated continuously from sunset to sunrise on survey nights. The radar operated for 30 minutes in horizontal mode and 30 minutes in vertical mode during each survey hour. Images produced by the radar were recorded and archived as videos.

2.2 DATA SUMMARY AND ANALYSIS

2.2.1 Radar Data

From each hour of operation, 6 one-minute horizontal samples and 6 one-minute vertical samples were randomly selected for visual analysis. The horizontal videos were visually reviewed to identify and select targets (migrants) and their flight paths, resulting in location and flight direction data for each target. The vertical videos were visually reviewed to identify and select targets resulting in flight height data for each target. Data were summarized using programs and macros designed by Stantec. Mean hourly, nightly, and seasonal passage rates and flight heights were calculated. Passage rate was calculated by extrapolating the number of targets from the 6, 1-minute horizontal samples to the entire hour (i.e., multiplying by 60), then dividing the total number of targets per hour by the diameter of the radar sampling range (2.8 km [1.7 mi]). Nightly and seasonal mean flight direction and percent of targets below maximum turbine blade tip height (183 m) were calculated.

2.2.2 Weather Data

Stantec obtained and used various weather parameters to assess relationships between nocturnal migration patterns and weather conditions. Weather variables were recorded by sensors on the onsite Project met tower. Ambient temperature was obtained from the 5 m sensor, wind direction was obtained from the 30 m sensor, and wind speed was obtained from the 59 m sensor. Data was reported at 10-minute intervals; therefore, Stantec calculated mean nightly temperature, wind direction and wind speed for each survey night.

Visibility and fog occurrence data during nighttime hours (sunset to sunrise) were obtained from the KBHB weather station via Weather Underground (wunderground.com). To determine whether fog was possible we calculated the difference between the temperature and dew point for nighttime hours as reported by the KBHB station (if the difference was < 1°C, and humidity was > 94%, we indicated that fog was possible). To determine the timing of pressure system movement in the region (high, low, or none), we downloaded and interpreted regional

surface weather map images prepared by the National Centers for Environmental Prediction, the Hydro-meteorological Prediction Center, and the National Weather Service.

3.0 RESULTS

3.1 SURVEY EFFORT AND WEATHER SUMMARY

Twenty nights were sampled within each of the 3 seasons for a total of 643 survey hours (hrs) across 60 nights: 227 hrs in fall 2015, 189 hrs in spring 2016 and 227 hrs in fall 2016 (Table 3-1). Fall survey nights were longer than spring survey nights (11– 12 hours in fall, 9 – 10 hours in spring) due to shorter daylight hours in fall. Nightly sky conditions in each season ranged from clear to overcast; however, the majority (58%; n = 35) of survey nights were clear or mostly clear.

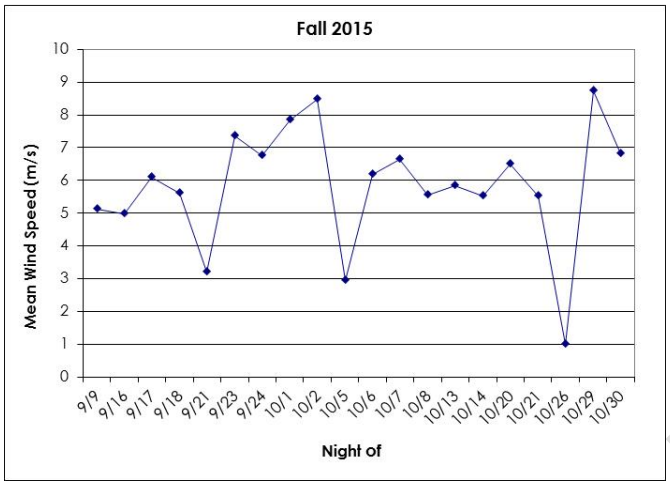
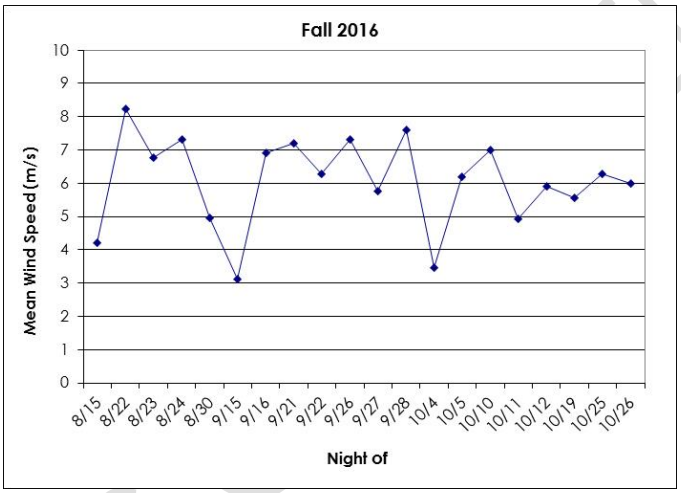
[1] Nightly means calculated using raw met tower data (ME_Gray5736) from onsite Project met tower as provided by Project developer.



[2] Derived from WeatherUnderground.com data - KBHB station.

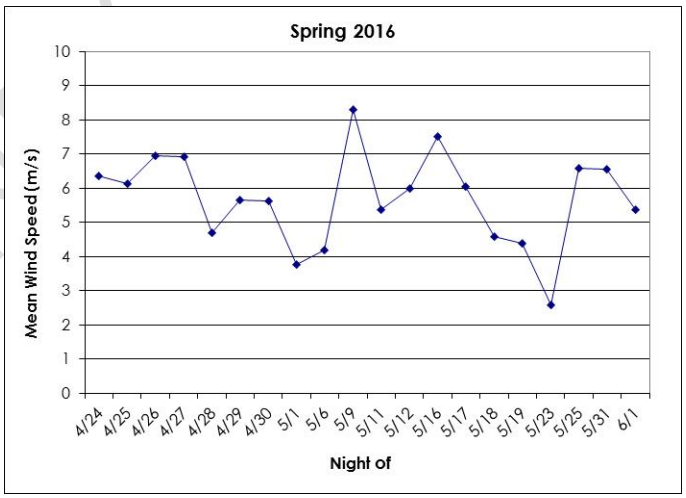


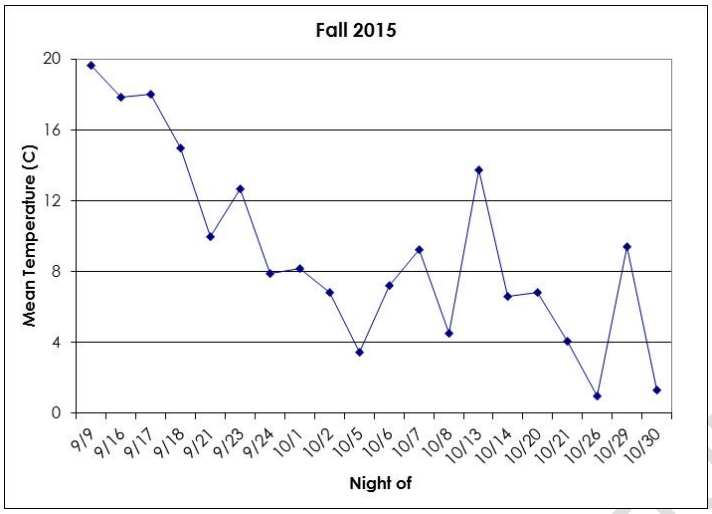
[3] Derived from WeatherUnderground.com - KBHB station. Fog indicated as possible (Y) if the difference between the temperature and dew point was < 1°C and humidity was > 94%.

BUSINESS CONFIDENTIAL

For all survey nights the overall mean nightly wind speed was 6 meters/second (m/s; Figure 3-1). The range in mean nightly wind speed was 1 – 9 m/s in fall 2015, 3 – 9 m/s in fall 2016, and 3 – 8 m/s in spring 2016. Wind speed varied substantially between nights in all 3 seasons.

BUSINESS CONFIDENTIAL





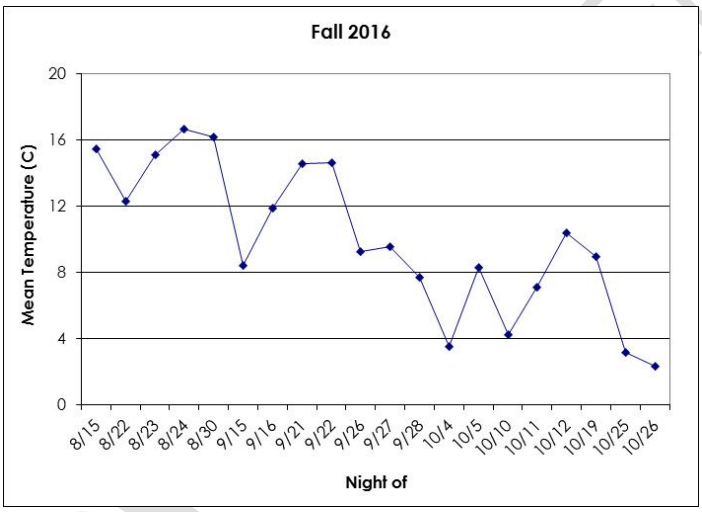


Figure 3-1. Nightly mean wind speed (m/s) in three radar seasons, Downeast Wind Project.

BUSINESS CONFIDENTIAL

For all survey nights the overall mean nightly temperature was 9°C (Figure 3-2). The range in mean nightly temperature was 1 – 20°C in fall 2015, 2 –17°C in fall 2016, and -2 – 20°C in spring 2016. Mean nightly temperature generally decreased with increasing Julian day in fall and increased with increasing Julian day in spring.

BUSINESS CONFIDENTIAL

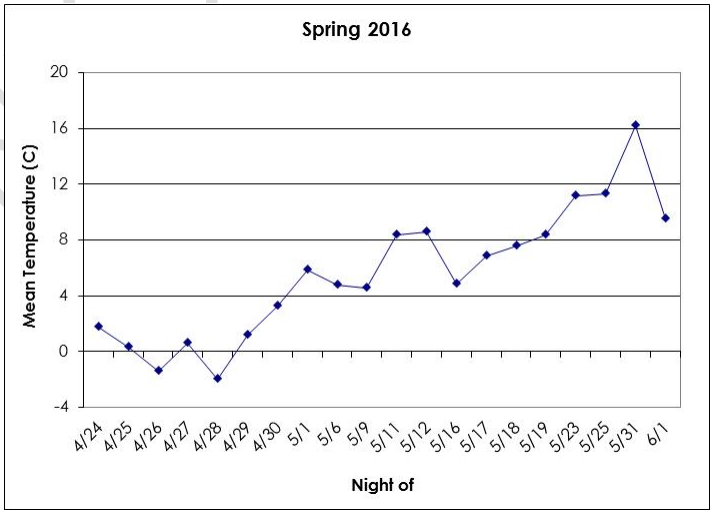

Figure 3-2. Nightly mean temperature (°C) in three radar seasons, Downeast Wind Project.

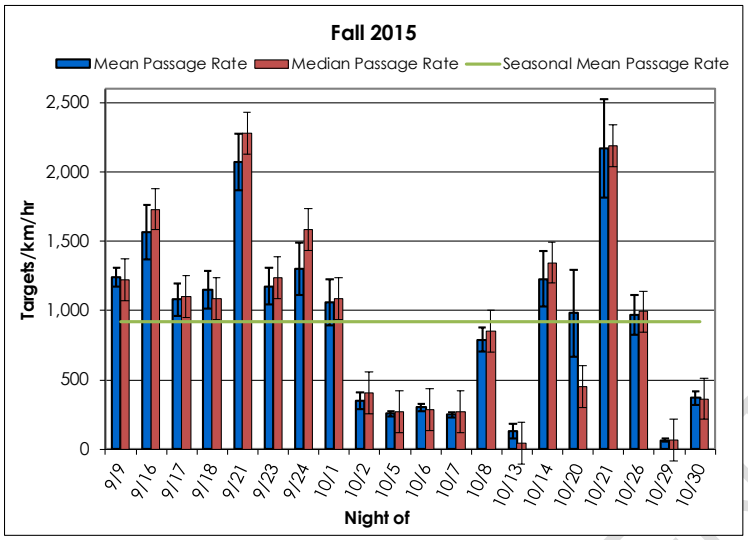
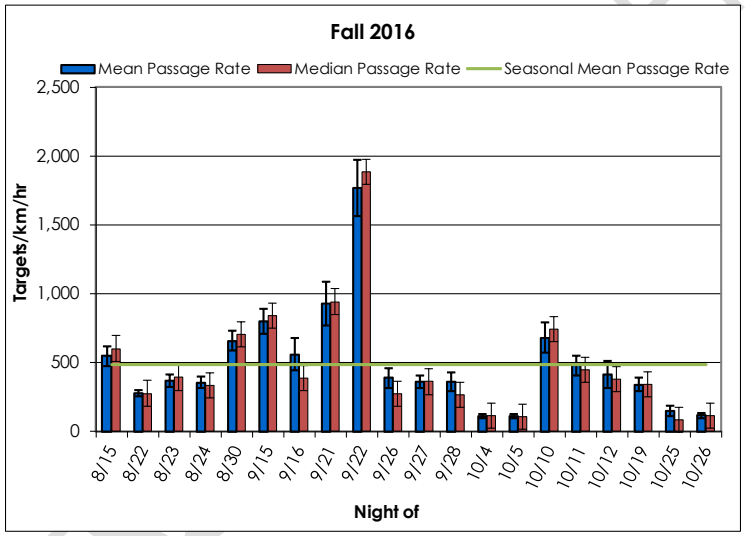
Out of the 60 survey nights, based on the calculated difference between temperature and dew point and the humidity value reported for that night, fog was possible on 15 nights in fall 2015



BUSINESS CONFIDENTIAL

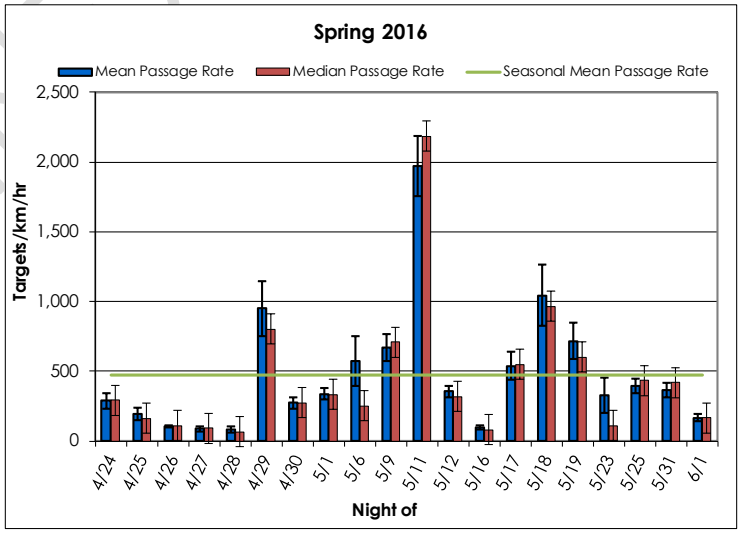


(75% of survey nights), and 6 nights in both spring and fall 2016 (30% of survey nights; though no fog data were available for 7 nights in fall 2016 [35%]). Fog occurred on only 1 night (4 Oct 2016).

3.2 PASSAGE RATES

The mean passage rate in fall 2015 was 920 ± 52 t/km/hr (Appendix A Table 2). Mean passage rates for fall and spring were similar (486 ± 30 t/km/hr in fall 2016 and 469 ± 39 t/km/hr in spring 2016; Appendix A Tables 3 and 4). Migratory activity peaked on multiple nights in fall 2015, and on a single night in both 2016 seasons (Figure 3-3).

BUSINESS CONFIDENTIAL



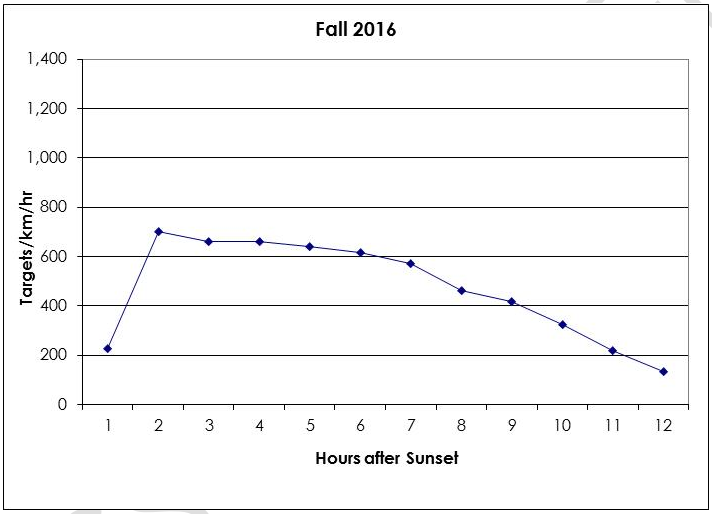


Figure 3-3. Nightly passage rates in three radar seasons, Downeast Wind Project.

BUSINESS CONFIDENTIAL

In all 3 seasons, mean hourly passage rates increased sharply in the first hour after sunset, peaked on or before hour 7, then declined until sunrise (Figure 3-4; Appendix A Tables 2-4). In fall 2016, the decline was a linear relationship between passage rate and hour after sunset.

BUSINESS CONFIDENTIAL

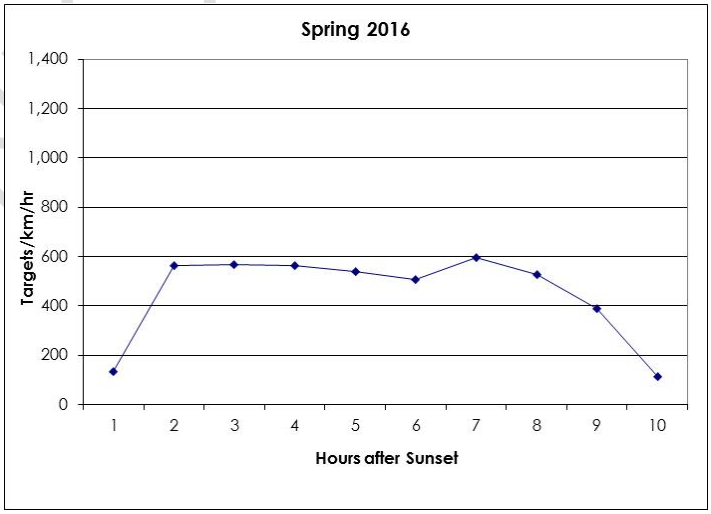

Figure 3-4. Mean hourly passage rates in three radar seasons, Downeast Wind Project.

BUSINESS CONFIDENTIAL

3.3 FLIGHT DIRECTION

The mean flight direction was 255° ± 66° in fall 2015, 68° ± 47° in spring 2016 and 252° ± 73° in fall 2016. Nightly mean flight direction varied among the nights (Figure 3-5; Appendix B Table 3).

BUSINESS CONFIDENTIAL

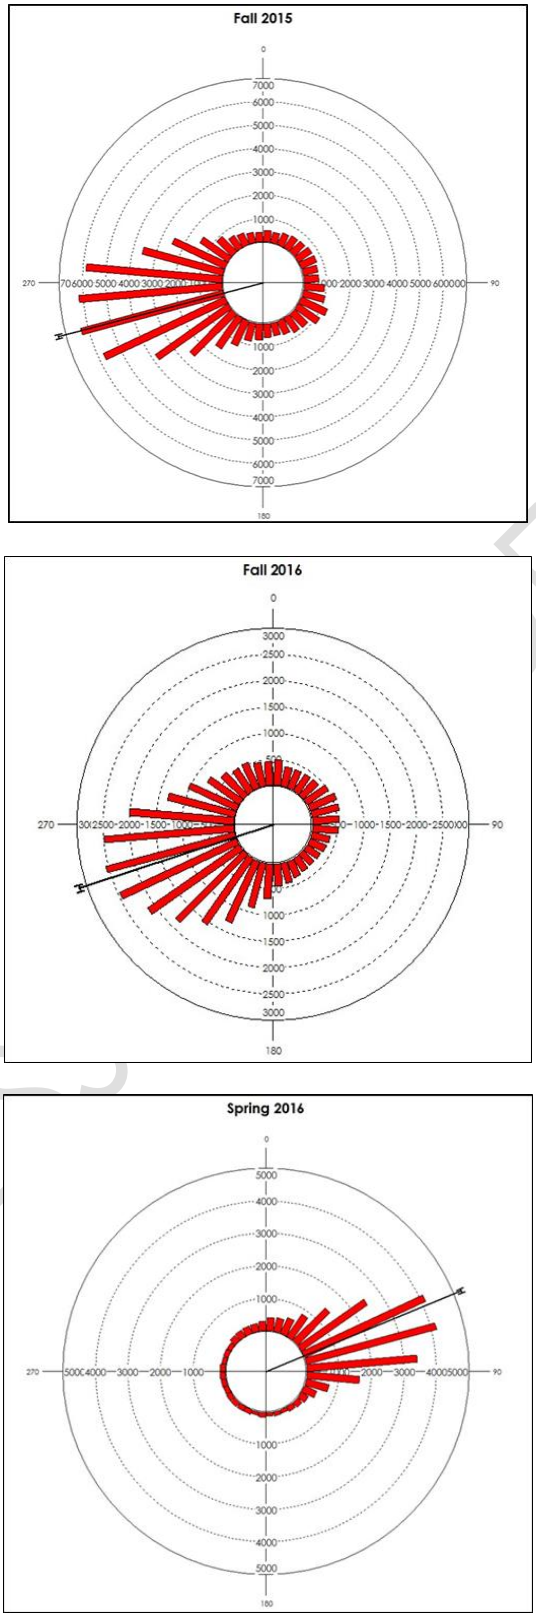

Figure 3-5. Mean flight direction in three radar seasons, Downeast Wind Project.

BUSINESS CONFIDENTIAL

3.4 FLIGHT HEIGHT

The mean flight height of targets was 428 ± 1 m (1,404 ft) in fall 2015, 384 ± 2 m (1,261 ft) in spring 2016, and 465 ± 1 m (1,526 ft) in fall 2016. The mean flight height of targets was greater in the fall seasons compared to the spring (Figure 3-6; Appendix B Table 4).

The percent of targets observed flying below 183 m was greatest during the spring 2016 season (20%, n = 4,040) and lowest during the fall 2016 season (13%, n = 4,349). The percentage of targets below 183 m in fall 2015 was 18% (n = 12,093).

BUSINESS CONFIDENTIAL

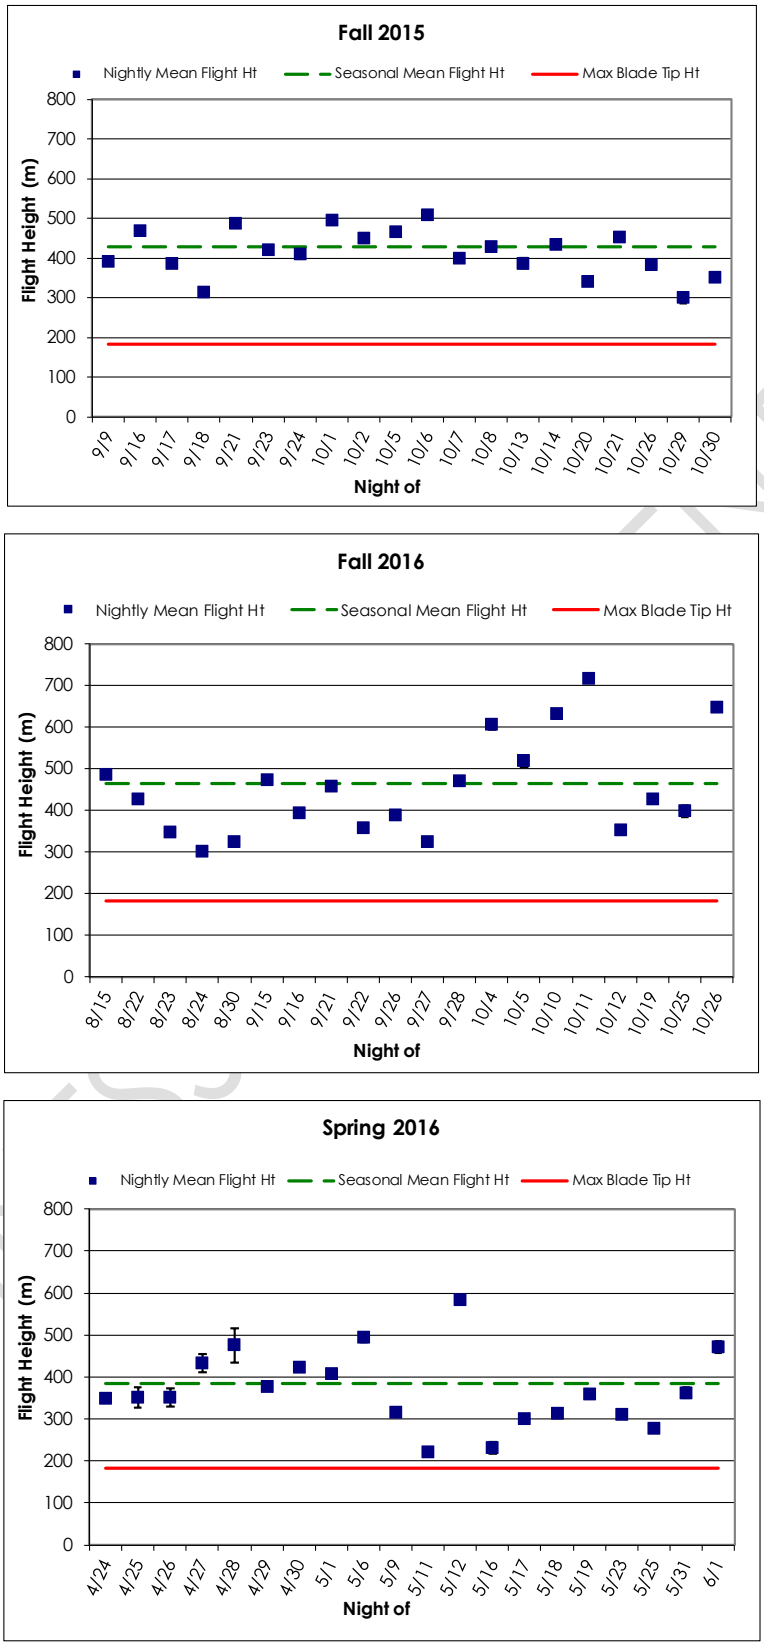

Figure 3-6. Mean nightly and seasonal flight heights for three radar seasons, Downeast Wind Project.

BUSINESS CONFIDENTIAL

Nightly variation in the percent of targets observed below maximum blade tip height was variable within seasons, ranging from 11% to 34% in fall 2015, 3% to 27% in fall 2016, and 7% to 53% in spring 2016 (Figure 3-7; Appendix B Table 4).

BUSINESS CONFIDENTIAL

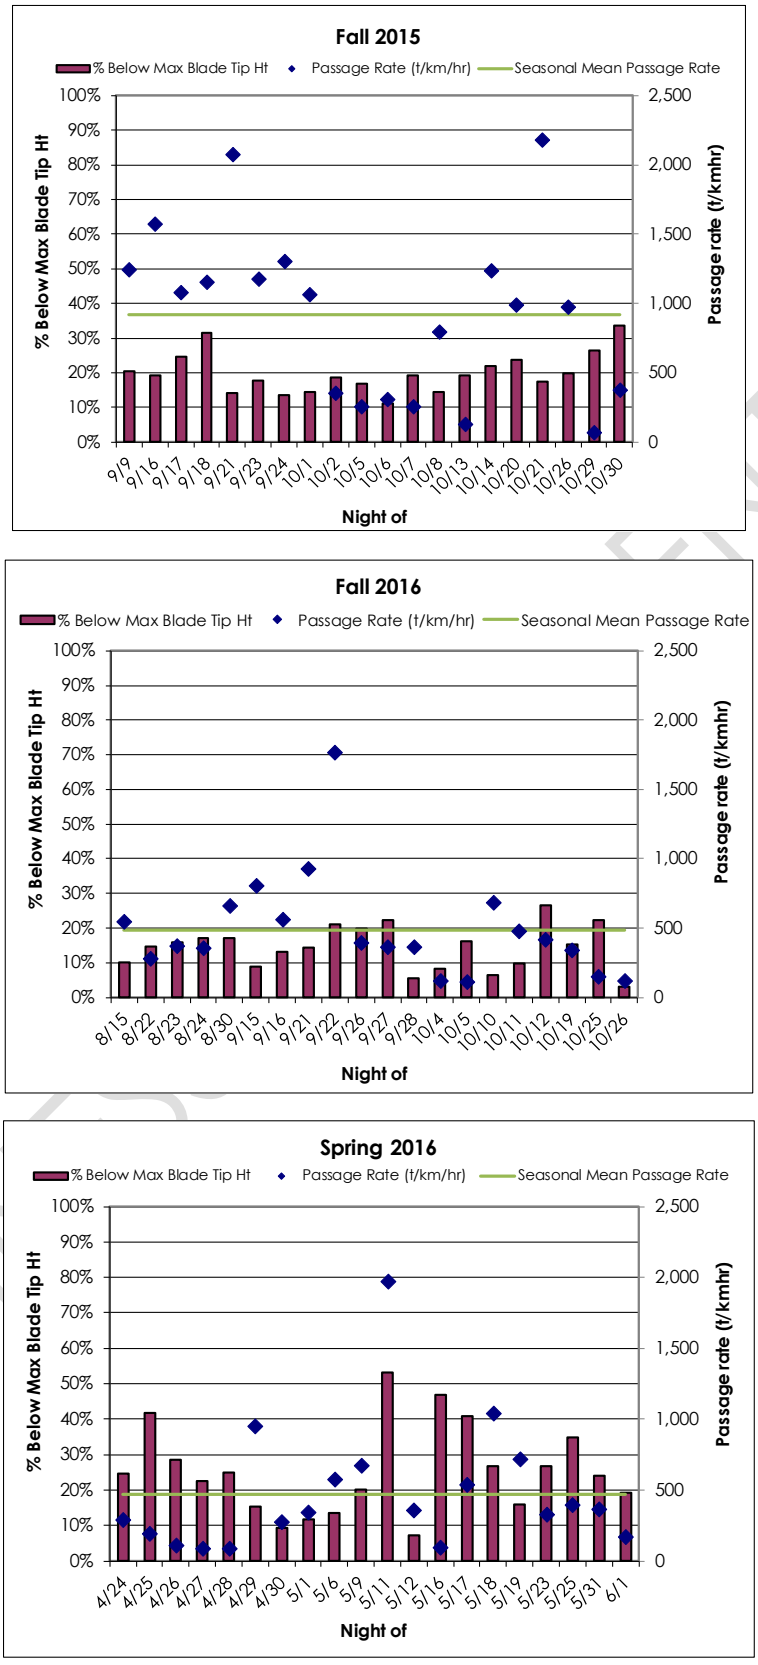

Figure 3-7. Percent of targets flying below maximum blade tip height in three radar seasons, Downeast Wind Project.

BUSINESS CONFIDENTIAL

Hourly mean and median flight heights varied between seasons and hours, showing slightly higher flight heights in the early night hours in fall 2015 and less pronounced patterns in spring and fall of 2016 (Figure 3-8). Hourly mean and median flight heights were consistently above maximum turbine blade tip height during all 3 seasons.

BUSINESS CONFIDENTIAL

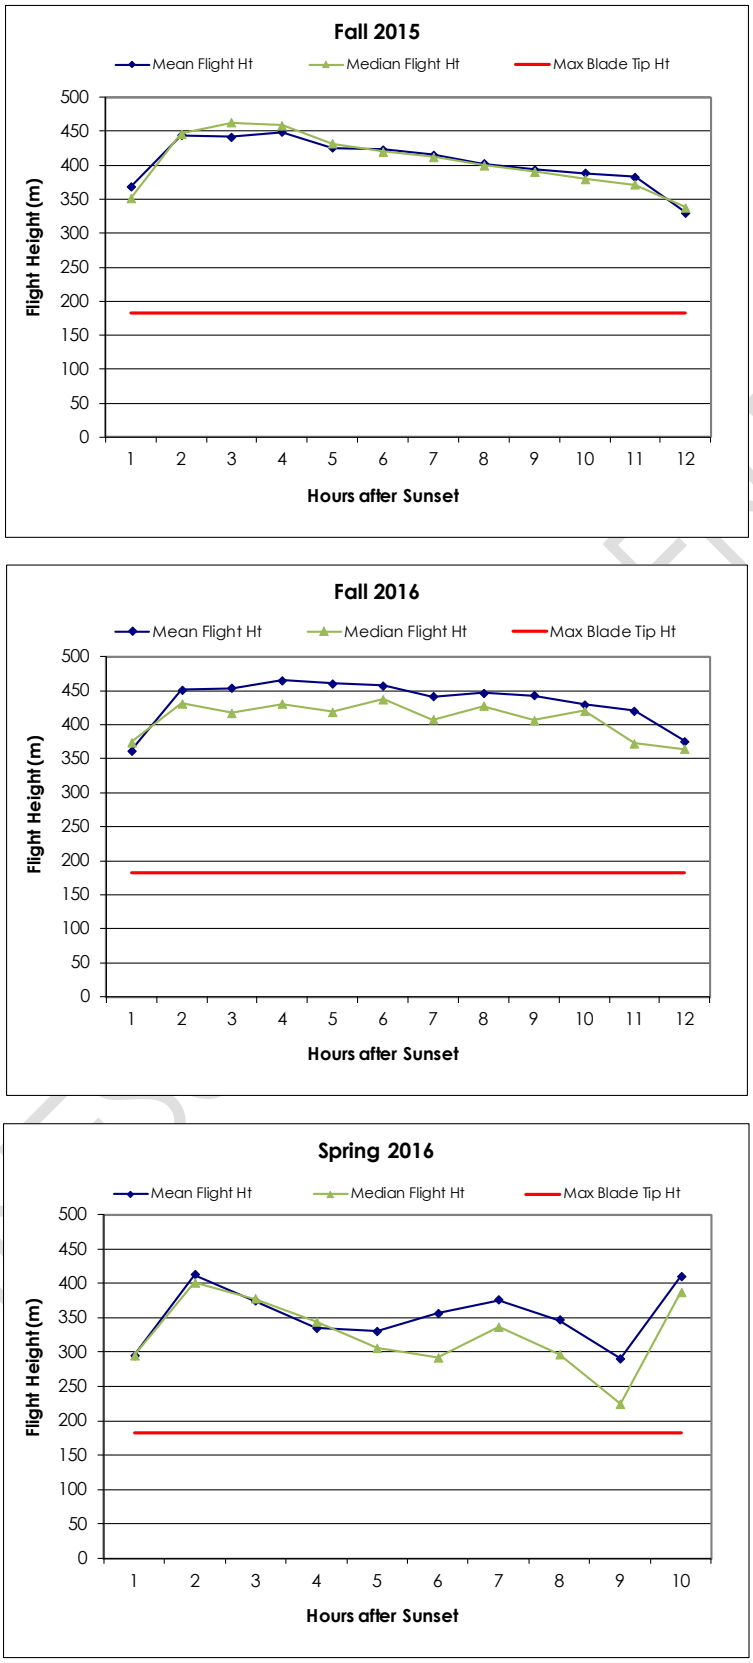

Figure 3-8. Hourly mean and median flight heights in three radar seasons, Downeast Wind Project,.

BUSINESS CONFIDENTIAL

Figure 3-9 shows the distribution of nightly flight heights of all targets relative to maximum turbine blade tip height. Boxes depict the middle 50% of targets. Error bars depict the upper and lower 25% of targets. Horizontal lines within boxes represent nightly median flight height.

BUSINESS CONFIDENTIAL

BUSINESS CONFIDENTIAL

3.5 ACTIVITY AND WEATHER RELATIONSHIPS

3.5.1 Passage Rate

3.5.1.1 Fall

On nights with the lowest mean passage rates in each fall season, mean wind direction was consistently against the direction of travel, indicating lower migration activity during nights with headwinds. For example, the difference between mean wind direction and mean flight direction was 169° on 15 September 2016 (i.e., headwinds), the night with the second highest mean passage rate. Despite this relationship, an anomaly was detected on the fall nights with the highest passage rates (21 October 2015 and 22 September 2016). On 21 October 2015, mean flight direction was from the west and mean wind direction was from the south, and on 22 September 2016, mean flight direction was northward while mean wind direction was from the west. The hourly variability in wind direction on these nights may have influenced the relatively high variability in hourly passage rates (i.e., standard deviation in nightly mean passage rates were highest on these nights relative to other within-season nights). Mean temperature was relatively low on 21 October 2015 (4°C) and relatively high on 22 September 2016 (15°C). On both nights, mean wind speed was moderate (6 m/s), and conditions were clear in the overnight hours but turned overcast in the early morning hours (with precipitation on 22 September 2016). Mean flight height on 21 October 2015 was relatively high (453 m) and on 22 September 2016 was moderate (357 m); percent below on both nights was approximately 20%. On both nights, mean passage rates were highest in the6th and 7th hrs after sunset, declining thereafter towards sunrise (Appendix A Tables 4 and 5).

On nights with the lowest passage rates in fall (29 October 2015 and 5 October 2016), mean flight direction was southward, and winds were predominantly from the south (against the direction of flight). Mean nightly wind speed was relatively high on 29 October 2015 (9 m/s) and moderate on 5 October 2016 (6 m/s). Both nights had periods of clear conditions and overcast or cloudy conditions. On 29 October 2015, rain occurred during that day and ended just before sunset, but the night remained overcast with gusty winds from the south. Mean flight height on 29 October 2015 was the lowest of all fall 2015 survey nights (299 m), and mean flight height on 5 October 2016 was among the highest of all fall 2016 survey nights (518 m).

On the single night with fog occurrence (4 October 2016), mean passage rate was the second lowest of all fall 2016 survey nights (115 t/km/hr), and mean flight height was the fourth highest of all fall 2016 survey nights (605 m). Eight percent of targets on this night flew below the maximum blade tip height. This night had mostly clear skies in the evening hours but turned overcast in the morning. Average wind speed was low (3 m/s) and wind direction was from the southwest.

3.5.1.2 Spring

On nights with the lowest mean passage rates in spring, mean wind direction was consistently against the direction of travel, indicating lower migration activity during nights with headwinds. For example, the difference between mean wind direction and mean flight direction was 163° on 18 May 2016 (i.e., headwinds), the night with the second highest mean passage rate. On the night with the highest passage rate in spring (11 May), mean flight direction was seasonally

BUSINESS CONFIDENTIAL

typical, toward the northeast. Mean wind direction on this night was from the west, somewhat conducive to northeasterly flight. Mean temperature was moderate (8°C), mean wind speed was moderate (5 m/s), and conditions were clear. Mean flight height on this night was the lowest of all nights in this survey season (222 m), and 53% of targets (n = 630) were below maximum blade tip height.

On the night with the lowest passage rate in spring (28 April), mean flight direction was from the northeast, but migrants faced a moderate headwind. The mean nightly temperature was relatively cold (-2°C), mean wind speed was moderate (5 m/s) and conditions were clear. Mean flight height on this night was relatively high (476 m).

BUSINESS CONFIDENTIAL

Table 3-2. Weather summary comparison and corresponding flight height and percent below maximum turbine blade tip height values for nights with the highest and lowest passage rates with, Downeast Wind Project, fall 2015, fall 2016, and spring 2016.

3.5.2 Flight Height

On nights with the highest nightly mean flight heights in all 3 seasons (6 October in fall 2015, 11 October in fall 2016, and 12 May in spring 2016), nightly mean wind speed was moderate (5-6 m/s) and skies were clear (Table 3-3). Only the night with the highest mean flight height in spring 2016 had a mean wind direction typical for seasonal migration (from the south). Mean wind direction on 6 October 2015 was from the west and on 11 October 2016 was from the east. Passage rates on these nights were below the seasonal mean.

The night with the lowest mean flight height in fall 2015 (29 October) was also the night with the lowest mean nightly passage rate during that season. Conversely, the night with the lowest mean flight height in spring 2016 (11 May) was the night with the highest mean passage rate during that season.

Table 3-3. Weather summary comparison for nights with the highest and lowest flight heights, Downeast Wind Project, fall 2015, fall 2016, and spring 2016.

Season	Night	Nightly Mean Flight Height (m)	Seasonal Low or High	Nightly Mean Passage Rate (t/km/hr)	Nightly Mean Temperature (°C)[1]	Nightly Mean Wind Speed (m/s)[1]	Nightly Mean Wind Direction (degrees)[1]	Overall Visibility[2]	Fog Possible (Y/N)[3]	Fog Occurred (Y/N)[2]
Fall 2015	10/29	299	Low	66	9	9	142	overcast PM, clear AM	N	N
	10/6	509	High	301	7	6	252	clear	Y	N

4.0 DISCUSSION

4.1 PASSAGE RATES

During both falls, median and mean passage rates peaked in mid- to late September in both years and a later pulse was detected in mid to late October in 2016. The timing of these peak migration nights is consistent with other fall radar surveys in Maine. The seasonal median and mean passage rates in fall 2015 were nearly double that in fall 2016, indicating yearly variation in levels of nocturnal migration at DOW, but both rates were within the range of results at wind projects in Maine and the eastern U.S. (Appendix A Table 13).

During spring, mean passage rates peaked in early May. The timing of the peak migration recorded in spring 2016 is consistent with other spring radar surveys in Maine and the seasonal

BUSINESS CONFIDENTIAL

mean passage rate is within the range of results at wind projects in Maine and the eastern U.S. (Appendix A Table 14).

Statistical analysis of 19 publicly available pre-construction radar survey passage rates with post-construction bird mortality for 8 wind projects in Maine (Figure 4-1) shows no significant relationship (R^2 = -0.04, P = 0.59) between passage rate and annual estimates of bird mortality; the correlation is very low, with no significant trend. This finding suggests that passage rate is not a good indicator of nocturnal migrant collision risk.

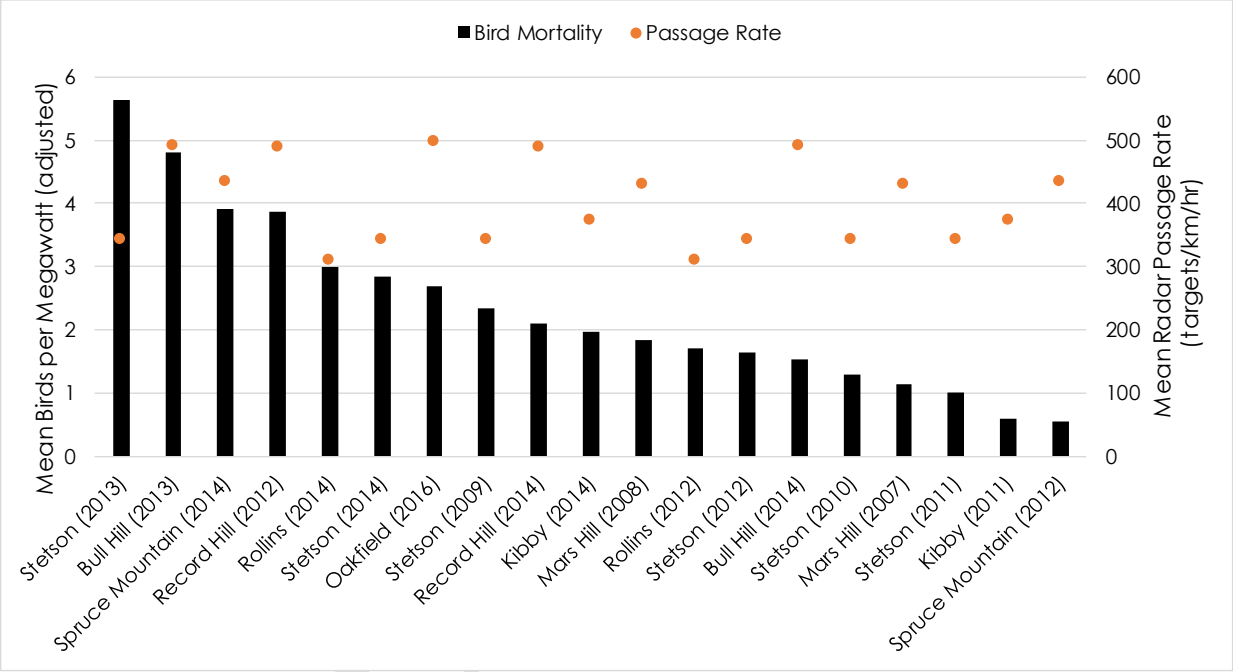

Figure 4-1. Estimated annual bird mortality rates (black columns) and radar passage rate (orange dots) for commercial wind projects in Maine.

4.2 FLIGHT HEIGHTS

The increasing number of publicly available radar surveys at proposed wind projects show a relatively consistent pattern in flight altitude, with most targets appearing to fly at altitudes of 200 m or more above the ground, regardless of local topography. Seasonal mean flight heights in fall 2015 and fall 2016 at DOW were higher than the range of results documented at wind project sites in Maine and the eastern U.S. Seasonal mean flight height in spring 2016 was within this range. Seasonal mean and median flight heights documented at DOW in all 3 seasons were well above the maximum blade-tip height of the proposed turbines. Percent of targets below maximum turbine blade tip height for all seasons was within the range of results at wind projects in Maine and the eastern U.S. (Appendix A Tables 14, 15).

4.3 DATA RELATIONSHIPS

4.3.1 Passage Rate, Flight Height and Weather

Nightly mean and median passage rates and flight heights were variable, and the level of variation was consistent with that documented at other projects in Maine.

On nights with the highest passage rates and flight heights in all 3 seasons, mean wind speeds were moderate and sky conditions were clear for the majority of nighttime hours. Wind direction and flight direction were variable on nights with the highest passage rates and highest flight heights.

4.3.2 Passage Rate and Flight Height

Typically, radar survey results have indicated that nights with relatively high mean passage rates have relatively high mean flight heights. This was true at the Project during the fall seasons, but during spring a peak nightly mean passage rate was recorded in early to mid-May on the night of the lowest mean and median flight height. Further assessment of the data on this night indicates this resulted from a large movement of birds migrating at lower altitudes consistently throughout the night. This night consisted of clear skies, above average temperatures, and episodic, strong wind gusts from the west.

4.3.3 Wind Direction and Flight Direction

On nights with the lowest mean passage rates in each season, mean wind direction was consistently against the direction of travel, indicating lower migration activity during nights with headwinds. On nights when the difference between mean wind direction and mean flight direction was nearest to 180° (i.e., nearly parallel) (169°–174° on fall survey nights, 163°–176° on spring survey nights), flight direction was seasonally typical (10/5 in fall 2015; 9/15, 9/27 and 9/28 in fall 2016; 5/11, 5/17, and 5/18 in spring 2016; Appendix A Tables 7, 8, 9). The difference between mean wind direction and mean flight direction was 164° on May 11, the night with the highest mean passage rate in spring 2016 (Appendix A Table 9). The difference between mean wind direction and mean flight direction was 169° on 15 September 2016 and 163° on 18 May 2016, nights with the second highest mean passage rates.

The seasonal mean flight direction at the Project in both fall seasons (west-southwest) is comparable to that documented at the Bull Hill Wind Project (west-south-west in fall 2009 and west-northwest in fall 2011; Stantec 2011) and the Weaver Wind Project (west-southwest in fall 2014; Stantec 2014). Both sites are approximately 10 miles northwest of the Project. Pooled flight direction results at Maine projects indicate that mean flight direction in fall is southwest and in spring is northeast (Appendix A Tables 13, 14).

BUSINESS CONFIDENTIAL

4.4 CONCLUSIONS

This radar survey effectively characterized the levels and timing of nocturnal migratory activity over DOW during spring (1 year) and fall (2 years). Higher passage rates were documented during fall than spring, rates were variable throughout each season with moderate peaks documented, and a relatively small percentage of targets were documented at heights below the maximum blade-tip height.

Although the relationship between passage rates and collision risk is not established based on extensive review of existing radar data at operational facilities, passage rates for all seasons evaluated at the Project were within the range of previously studied projects that have been proposed in Maine (Appendix A Tables 13, 14). As at other projects in Maine and in the eastern U.S., passerines are expected to make up the majority of fatalities (Loss et al. 2013, Stantec, pre-construction data, Taucher et al. 2012), and fatalities are expected to be greatest during the spring and fall migration periods (Stantec, pre-construction data). However, no significant population-level impact to any one migrating species is expected, largely because nocturnal migrant passerines most at risk of collision are regionally abundant (NRC 2007, Johnson et al. 2002, Arnold and Zinc 2011).

Monitoring of collision mortality during migration periods is recommended to confirm this conclusion. Analysis of the conditions during which collisions are documented may add to the understanding and identification of conditions when nocturnal migrants are most at risk of collision.

Appendix A Table 13. Summary of publically available avian fall radar survey results conducted at proposed (pre-construction) US wind power facilities in eastern U.S. using X-band mobile radar systems (2005-2016 sorted by mean passage rate low to high).

Project Site	Season	Number of Survey Nights	Number of Survey Hours	Landscape	Mean Seasonal Passage Rate (t/km/hr)	Range in Nightly Passage Rates	Mean Seasonal Flight Direction	Mean Seasonal Flight Height (m)	(Turbine Ht) % Targets Below Turbine Height	Reference
Sheffield, Caledonia Cty, VT	Fall 2004	18	176	Forested ridge	91	19–320	200	566	(125 m) 1%	Woodlot Alternatives, Inc. 2005. A Fall 2004 Radar, Visual, and Acoustic Survey of Bird and Bat Migration at the Proposed Hardscrabble Mountain Wind Project in Sheffield, Vermont. Prepared for UPC Wind Management, LLC.
Antrim, Hillsborough Cty, NH	Fall 2011	30	327	Forested ridge	138	4–538	217	203	(150 m) 40%	Stantec Consulting Services Inc. 2011. Summer and Fall 2011 Radar and Acoustic Bat Survey Report for the Antrim Wind Energy Project in Antrim, New Hampshire. Prepared for Antrim Wind Energy, LLC.
Kibby, Franklin Cty, ME (Range 1)	Fall 2005	12	101	Forested ridge	201	12–783	196	352	(125 m) 12%	Woodlot Alternatives, Inc. 2006. A Fall 2005 Survey of Bird and Bat Migration at the Proposed Kibby Wind Power Project in Kibby and Skinner Townships, Maine. Prepared for TransCanada Maine.
Number Nine, Aroostock County, ME	Fall 2014	20	227	Forested ridge	247	47-806	218	354	(150 m) 21%	Stantec Consulting Services Inc. 2014. Fall 2014 Nocturnal Radar Survey Report. Prepared for number Nine Wind Farm, LLC.
Georgia Mountain, VT	Fall 2008	21	n/a	Forested ridge	326	56–700	230	371	(120 m) 7%	Stantec Consulting Services Inc. 2008. A Fall 2008 Survey of Bird Migration at the Georgia Mountain Wind Project, Vermont. Prepared for Georgia Mountain Community Wind.
Bowers, Washington Cty, ME	Fall 2009	22	249	Forested ridge	344	95–844	231	315	(119 m) 14%	Stantec Consulting Services Inc. 2010. Fall 2009 Avian and Bat Surveys for the Bowers Wind Project. Prepared for Champlain Wind Energy, LLC.
Kingdom Community, Lowell, VT	Fall 2008	20	230	Forested ridge	356	12–1,372	n/a	350	(125 m) 15%	Stantec Consulting. 2008. Fall 2008 Bird and Bat Migration Survey Report: Radar Surveys for the Kingdom Community Wind Project in Lowell, Vermont. Prepared for Vermont Environmental Research Associates.
Granite Reliable Power, Coos County, NH	Fall 2007	29	232	Forested ridge	366	54–1,234	223	343	(125 m) 15%	Stantec Consulting Services Inc. 2007. Fall 2007 Radar, Visual, and Acoustic Survey of Bird and Bat Migration at the Proposed Windpark in Coos County, New Hampshire by Granite Reliable Power, LLC. Prepared for Granite Reliable Power, LLC.
Rollins, Lincoln, Penobscot Cty, ME	Fall 2007	22	231	Forested ridge	368	82–953	284	343	(120 m) 13%	Woodlot Alternatives, Inc. 2008. A Fall 2007 Survey of Bird and Bat Migration at the Rollins Wind Project, Washington County, Maine. Prepared for Evergreen Wind, LLC.
Passadumkeag, Grand Falls Township, ME	Fall 2011	20	222	Forested ridge	394	65–1,281	251	325	(140 m) 22%	Stantec Consulting Services. 2011. Summer and Fall 2011 Avian and Bat Survey Report for the Passadumkeag Wind Project in Grand Falls Township, Maine. Prepared for Passadumkeag Windpark LLC.
Record Hill, Oxford Cty, ME	Fall 2007	20	220	Forested ridge	420	88–1,006	227	365	(130 m) 14%	Woodlot Alternatives, Inc. 2007. A Fall 2007 Survey of Bird and Bat Migration at the Record Hill Wind Project, Roxbury, Maine. Prepared for Roxbury Hill Wind LLC.
Bull Hill, Hancock Cty, ME	Fall 2011	10	112	Coastal	431	111–747	282	279	(145 m) 26%	Stantec Consulting Services Inc. 2011. Fall 2011 Radar Survey Results and Comparison to Fall 2009 Radar Results: Memo for the Bull Hill Wind Project. Prepared for Blue Sky East Wind, LLC.
Kibby, Franklin Cty, ME (Valley)	Fall 2005	5	13	Forested ridge	452	52–995	193	391	(125 m) 16%	Woodlot Alternatives, Inc. 2006. A Fall 2005 Survey of Bird and Bat Migration at the Proposed Kibby Wind Power Project in Kibby and Skinner Townships, Maine. Prepared for TransCanada Maine.
Sisk (Kibby Expansion) Franklin Cty, ME	Fall 2009	20	210	Forested ridge	458	44–1,067	206	287	(125 m) 23%	Stantec Consulting Services Inc. 2009. Fall 2009 Nocturnal Migration Survey Report. Prepared for TRC Engineers LLC.
Granite Reliable Power, Coos Cty, NH	Fall 2006	30	328	Forested ridge	469	22–1,098	223	455	(125 m) 1%	Stantec Consulting Services Inc. 2007. Fall 2006 Radar Surveys of Nighttime Migration Activity at the Proposed Windpark in Coos County, New Hampshire by Granite Reliable Power, LLC. Prepared for Granite Reliable Power, LLC.
Groton Wind, Grafton Cty, NH	Fall 2008	45	509	Forested ridge	470	94–1,174	260	342	(125 m) 13%	Stantec Consulting Services Inc. 2008. Fall 2008 Radar Survey Report for the Groton Wind Project. Prepared for Groton Wind, LLC.
Stetson, Washington Cty, ME	Fall 2006	12	77	Forested ridge	476	131–1,192	227	378	(125 m) 13%	Woodlot Alternatives, Inc. 2007. A Fall 2006 Survey of Bird and Bat Migration at the Stetson Wind Project, Washington County, Maine. Prepared for Evergreen Wind V, LLC.

Executive Summary

Stantec Consulting Services Inc. (Stantec) conducted acoustic bat (acoustic) surveys for the proposed Downeast Wind Project (DOW or Project) in Washington County, Maine. Acoustic surveys were completed as part of pre-construction planning efforts for DOW in accordance with the Maine Department of Inland Fisheries and Wildlife's (MDIFW) *Curtailment Policy and Wind Power Preconstruction Study Recommendations* (June 2015), the U.S. Fish and Wildlife Service's *Land-Based Wind Energy Guidelines* (March 2012), the Project Work Plan dated 17 March 2016, discussions held with MDIFW during a meeting with Apex and Stantec on 23 February 2016, and methods similar to those employed at other wind energy projects in Maine and the Northeast. The goal of the surveys was to characterize bat activity at DOW. The objectives were to document species composition, seasonal and nightly timing of bat activity, and relationships between bat activity and habitat and between bat activity and conditions, i.e., temperature and wind speed, near the rotor zone.

Acoustic surveys occurred during two periods: fall 2015 (10 September to 31 October) and spring, summer, fall 2016 (31 March to 31 October). "Ground detectors" were deployed 5 – 8 meters (m) above ground level (agl) and "elevated detectors" were deployed at 20 (Met Mid) and 40 m agl (Met High) on the on-site met tower during both survey periods. Ground detectors were Anabat© (Titley Electronics Pty Ltd.) detectors programmed to operate each night between 18:00 and 08:00. Elevated detectors were 2 microphones of a single SM3 (Wildlife Acoustics ©) detector programmed to operate each night between ½ hour before sunset until ½ hour after sunrise. Ambient temperature and wind speed were recorded as 10-minute averages by sensors on the on-site met tower at 3 m agl and 59 m agl respectively.

Acoustic data collected at ground and elevated detectors were analyzed using 2 automated identification programs (Kaleidoscope Pro [with classifier version 3.1.0; "KPro"] and BCID [version 2.7b; "BCID"]. Species presence was based on a maximum likelihood estimator (MLE) assigned by each automated program on a nightly basis. Automated analysis results were used to calculate the percent of detector nights with presence and the percent of nights with presence by species and month. For ground detectors, the percent of nights with presence by species and habitat was calculated.

In addition, Stantec visually vetted each call file that was identified by the programs as a state-listed species (small-footed bat [*Myotis leibii*], little brown bat [*Myotis lucifugus*], and northern long-eared bat [*Myotis septentrionalis*]) to vet the automated identifications. Based on vetted call files, the percent of nights with listed species presence and the percent of nights with listed species presence by month were calculated.

For elevated detectors, Stantec visually analyzed all call files to confirm that all bat passes were included in analysis of activity patterns. Based on results of the visual analysis, detection rates and species composition were calculated, seasonal, nightly, and hourly patterns in activity were

Business Confidential

summarized, and temperature and wind speed, measured at times when bat activity occurred at met tower detectors, was used to characterize conditions when bats were active in the rotor zone.

Operation of ground detectors resulted in 1,050 total detector nights. Based on KPro, hoary bat was detected most often followed by eastern red bat at ground detectors. Based on BCID, silver-haired bat was most common and was recorded at each ground detector, followed by big brown bat. After vetting, little brown bats were considered plausibly present during 1.6 – 24.4% (n = 4 – 61) of detector-nights among ground detectors, small-footed bat were plausibly present during 0 – 0.8% (n = 0 – 2) of detector-nights, and northern long-eared bat were plausibly present during 0 – 4.7% (n = 0 – 7) of detector-nights. At ground detectors, depending on species and analysis program, the proportion of detector nights with bat activity was greatest in July and August except for small-footed bat, for which the greatest proportion of detector nights with activity occurred in May according to KPro (August according to BCID) and tri-colored bat (*Perimyotis subflavus*) for which the greatest proportion of detector nights with activity occurred in September according to BCID (August according to KPro). Species composition at ground detectors varied by habitat and overall detection rates were lowest in the blueberry barren habitat. Of the state-listed species recorded, small-footed bat and little-brown bat were present on the greatest proportion of detector nights in the pond habitat; however, both were detected infrequently. Northern long-eared bat was present on the greatest proportion of detector nights in the hedgerow in blueberry barren habitat according to KPro and in the pond habitat according to BCID.

Operation of elevated detectors resulted in 473 detector nights. Based on visual analysis, elevated detectors combined recorded 1,065 bat passes resulting in an overall mean detection rate of 2.3 passes/detector-night at both detectors combined. Met High recorded fewer bat passes (n=364; 1.7 passes/detector-night) than Met Mid (n=701; 2.7 passes/detector-night). Based on KPro, of the species detected at elevated detectors, hoary bat was detected on the greatest proportion of nights at both Met High and Met Mid, followed by big brown bat at Met Mid. Based on BCID, hoary bat was detected on the greatest proportion of nights at Met High, and silver-haired bat was detected on the greatest proportion of nights at Met Mid. Based on visual analysis of the elevated detector calls, bats in the big brown bat/silver-haired bat group and the hoary bat group were most common. After vetting at Met Mid, little brown bats were considered plausibly present during 3.8% (n = 10) of detector-nights, small-footed bat and northern long-eared bat were each plausibly present during 0.4% (n = 1) of detector-nights.

Species composition differed between Met Mid and Met High in that neither KPro or BCID identified small-footed bat or northern long-eared bat at Met High. At elevated detectors, depending on species and analysis program, the month with the greatest proportion of nights with bat presence was August. After vetting, the proportion of nights with little-brown bat presence was greatest in August (8%). Small-footed bat had plausible presence during 1 detector-night in August at Met Mid and northern long-eared bat had plausible presence during 1 detector-night in September at Met Mid.

Business Confidential

For bat passes recorded at elevated detectors when wind speed and temperature data were available, 83% of bat passes occurred when mean wind speed was ≤ 6.9 m/s, 96% occurred when mean temperature was ≥ 10 degrees Celsius, and 80% occurred when both conditions were present. This combination of wind speed and temperature occurred most often in the months of July, August, and September. Species composition was relatively consistent regardless of wind speed and temperature.

As measured using acoustic detectors at DOW in two bat activity periods spanning two calendar years, bat detection rates, species composition, and activity patterns related to habitat and conditions are similar to what has been documented at other proposed and operational wind energy projects in Maine and in the Northeast. Because overall bat detection rates were lowest in blueberry barrens and very few listed bat species were recorded at raised detectors located in a blueberry barren, siting turbines away from trees may minimize overall risk to bats during some periods of bat activity. Bat fatality patterns such as seasonal timing and species composition of mortality at DOW are expected to be similar to those documented at operational wind energy projects in Maine and in the Northeast; however, operational adjustment during time periods and conditions when most bat activity occurs would minimize impacts to bats. Based on this site-specific acoustic dataset, it is reasonable to expect that operational adjustment during the periods of greatest bat activity: seasonal periods (July and August), time periods (within 6 hours of sunset), wind conditions (<6.9 m/s) and temperature conditions (>10 °C), would greatly reduce potential impacts to bats at the site. Standard monitoring of bat mortality during the first year of operations should be implemented to evaluate the effectiveness of such a measure if implemented.

1.0 INTRODUCTION

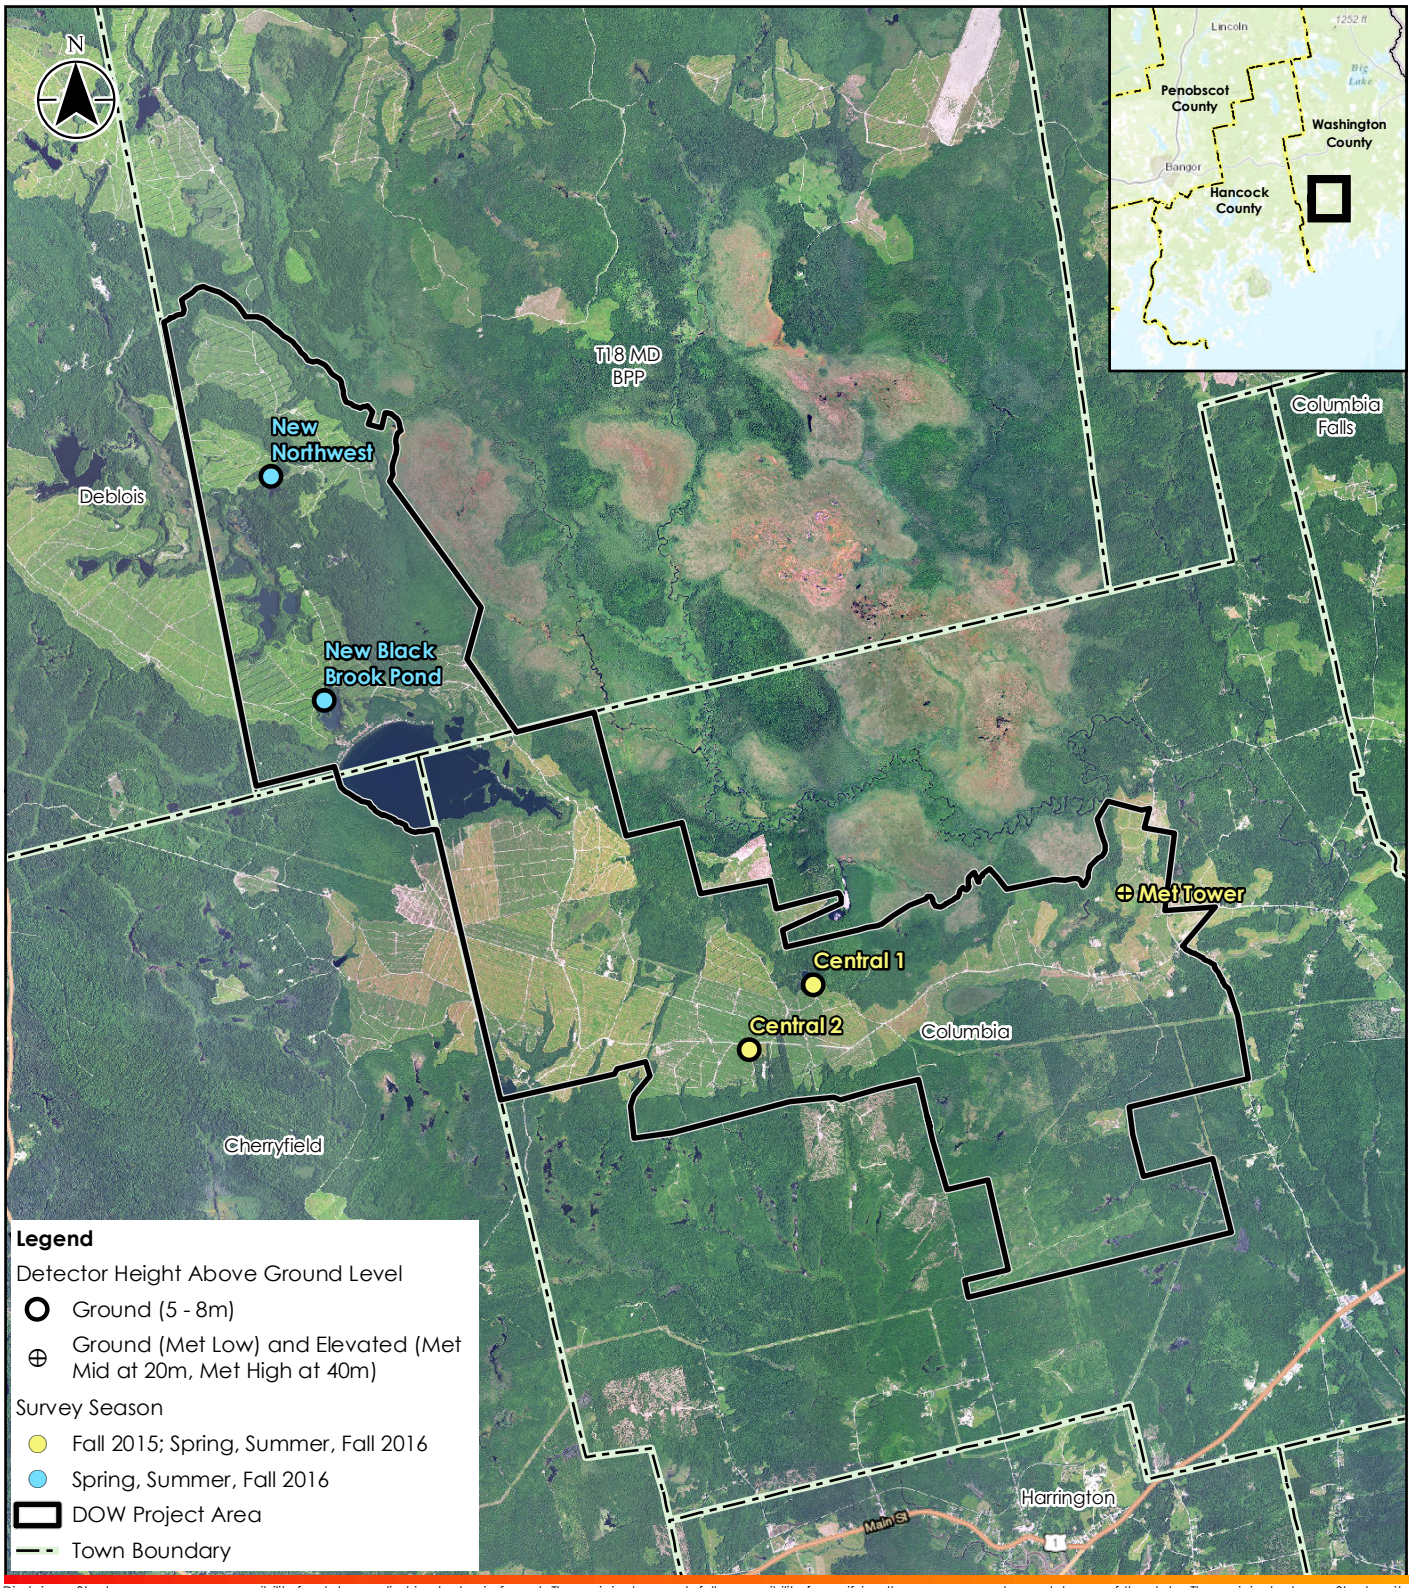
Stantec Consulting Services Inc. (Stantec) conducted acoustic bat (acoustic) surveys for the proposed Downeast Wind Project (DOW or Project) in Washington County, Maine. Acoustic surveys were completed as part of pre-construction planning efforts for DOW in accordance with the Maine Department of Inland Fisheries and Wildlife (MDIFW)'s *Curtailment Policy and Wind Power Preconstruction Study Recommendations* (June 2015), the US Fish and Wildlife Service's (USFWS) *Land-Based Wind Energy Guidelines* (March 2012), discussions held with MDIFW during a meeting with Apex and Stantec on 23 February 2016, and methods similar to those employed at other wind energy projects in Maine and the Northeast. The goal of the surveys was to characterize bat activity at DOW. The objectives were to document species composition, seasonal and nightly timing of bat activity, and relationships between bat activity and habitat and between bat activity and conditions i.e., temperature and wind speed, near the rotor zone.

1.1 BAT SPECIES IN MAINE

Table 1-1 shows the species of bats that occur in Maine and their current listing or conservation status (MDIFW 2015, MDIFW 2011).

Table 1-1. Species of bat that occur in Maine and corresponding species group.

Common Name	Scientific Name	Current Status	Species Acronym	Species Group
little brown bat	*Myotis lucifugus*	State endangered	MYLU	Myotis species (MYSP)
northern long-eared bat	*Myotis septentrionalis*	Federally threatened, state endangered	MYSE	
eastern small-footed bat	*Myotis leibii*	State threatened	MYLE	
big brown bat	*Eptesicus fuscus*	Not listed	EPFU	Big brown bat/silver-haired bat (BBSH)
silver-haired bat	*Lasionycteris noctivagans*	State species of special concern	LANO	
eastern red bat	*Lasiurus borealis*	State species of special concern	LABO	Eastern red bat/tri-colored bat (RBTB)
tri-colored bat	*Perimyotis subflavus*	State species of special concern	PESU	
hoary bat	*Lasiurus cinereus*	State species of special concern	LACI	Hoary bat (HB)



1.2 PROJECT AREA HABITAT

The Project area (Figure 1-1) is located within the Downeast Coast Ecoregion as defined in Maine's Comprehensive Wildlife Conservation Strategy (MDIFW 2005, Gawler & Cutko 2010). The

Downeast Maine Ecoregion extends from Ellsworth to Eastport and inland to north of State Route 9. This ecoregion is characterized by low acidic summits, blueberry barrens, coastal spruce-fir forests, and industrial timberlands.

Pineo Ridge and its associated glacial delta, esker, and moraine deposits predominates the Project area. This formation supports a landscape characterized by rolling hills and low-elevation broad ridges between approximately 200 and 400 ft in elevation. Habitats throughout the Project area consist primarily of commercially managed lowbush blueberry (*Vaccinium angustifolium*) barrens (managed lowbush Blueberry – Lichen barrens), small kettle ponds (Gawler & Cutko 2010, Maine Geologic Survey 2003), and various terrestrial forested upland. Terrestrial forested uplands are dominated by gray birch (Betula populifolia), red oak (*Quercus rubra*), white pine (*Pinus strobus*) balsam fir (*Abies balsamea*), and red maple (*Acer rubrum*); resulting in variations of red oak – white pine woodlands and early successional forests. Additional, terrestrial forested upland occurs as isolated jack pine (*Pinus banksiana*) and red pine (*Pinus resinosa*) wind hedgerows within the blueberry barrens. Large wetland and peatland complexes associated with the Narraguagus River and Pleasant River watersheds occur on the peripheries of the Project area. The Project area contains a network of unpaved roadways that intersect the blueberry barrens.

Title
Acoustic Bat Survey Locations, 2015-2016
3/22/2017

2.0 METHODS

2.1 DETECTOR PLACEMENT, SURVEY DATES, AND DATA COLLECTION

Acoustic surveys occurred during two periods: fall 2015 (10 September to 31 October) and spring, summer, fall 2016 (31 March to 31 October). Seven detectors were used for data collection; single detectors were deployed in 4 trees located throughout the Project area and 3 detectors were deployed on the single onsite meteorological (met) tower available at the time of surveys (Figure 1-1). Detectors in trees and one met detector (Met Low) were deployed 5 – 8 meters (m) above ground level (agl; "ground detectors"). The two other detectors were deployed on the met tower ("elevated detectors") at approximately 20 m agl (Met Mid) and 40 m agl (Met High). Ground detectors were Anabat© (Titley Electronics Pty Ltd.) detectors programmed to operate each night between 18:00 and 08:00. Elevated detectors consisted of a single SM3 (Wildlife Acoustics ©) detector with 2 microphones, programmed to operate each night between ½ hour before sunset until ½ hour after sunrise.

2.1.1 Ground Detectors

Ground detectors were deployed in a variety of habitats (Table 2-1). Photographs of ground detector setups are included in Appendix A.

Table 2-1. Operation dates and habitat at ground detector locations, 2015-2016.

Detector Name	Detector Height (m)	Operation Dates	Habitat (Habitat Category)
Met Low	5–8	2015 (9/10-10/31); 2016 (3/31-10/31)	Blueberry barren (Blueberry barren)
Central 1	5–8	2015 (9/10-10/31); 2016 (3/31-10/31)	Kettle pond shore/mixed forested edge (Pond)
Central 2	5–8	2015 (9/10-10/31); 2016 (3/31-10/31)	Deciduous hedgerow/forested edge (Hedgerow in barren)
New Black Brook Pond	5–8	2016 (3/31-10/31)	Kettle pond shore/deciduous forested edge/ blueberry barren (Pond)
New Northwest	5–8	2016 (3/31-10/31)	Coniferous hedgerow/ blueberry barren (Hedgerow in barren)

Each Anabat© was deployed in a waterproof housing enabling the detector to record while unattended for the duration of the survey. The housing suspended the Anabat© microphone downward to provide maximum protection from precipitation; to compensate for the downward position, a curved plastic joint was used to funnel sound to the microphone, allowing it to record bat calls within the airspace surrounding the detector.

Business Confidential

The audio sensitivity setting on Anabats© was set between 6 and 7 (on a scale of 1–10) to maximize sensitivity while limiting ambient background noise and interference. Anabat© detectors were powered by 12-volt batteries charged by solar panels. Stantec visited each detector at a maximum interval of every 3 weeks to download and store data and maintain equipment.

2.1.2 Elevated Detectors

One microphone from the SM3 (Wildlife Acoustics ©) detector on the meteorological (met) tower was coupled with an Anabat© detector which served as a source of backup data in the case that an SM3 microphone malfunctioned. Photographs of elevated detector setups are included in Appendix A.

Table 2-2. Operation dates and habitat at elevated detectors, 2015-2016.

Detector Name	Detector Height (m)	Operation Dates	Habitat (Habitat Category)
Met High	40	2016 (3/31-10/31)	Blueberry barren (Blueberry barren)
Met Mid	20	2015 (9/10-10/31); 2016 (3/31-10/31)	Blueberry barren (Blueberry barren)

The SM3 detector is waterproof and the microphones are designed for unattended monitoring. The SM3 detector was programmed to operate in "triggered .wav" mode using default trigger threshold settings as recommended by the manufacturer. The SM3 detector were powered by 12-volt batteries charged by solar panels. Stantec visited the detector at a maximum interval of every 3 weeks to download and store data and maintain equipment.

2.2 DATA ANALYSIS

For Anabat© units, potential call files were extracted from data files using CFCread® software using the software's default settings. For SM3 units, potential call files were converted to zero crossing format using Kaleidoscope Pro [with classifier version 3.1.0; "KPro"). Anabat and SM3 call files were analyzed in zero-crossing format.

2.2.1 Automated Analysis

Acoustic data from ground and elevated detectors were analyzed using 2 automated identification programs: KPro and BCID (version 2.7b; "BCID"), each approved by the USFWS for documenting northern long-eared bat species presence[1]. Results of these analyses were used to determine species presence for species that could be present at the Project. Species presence was determined based on a maximum likelihood estimator (MLE) assigned by each

[1] 2016 Range-wide Indiana Bat Summer Survey Guidelines (USFWS Guidelines) dated April 2016.

Business Confidential

automated program on a nightly basis. According to the USFWS Guidelines (2016) a nightly MLE of less than 0.05 indicates likely presence on that night at that sample location.

For ground detectors, automated analysis results were used to determine the percent of nights with species presence by month and by habitat. For simplification of analysis, detector sites where categorized into 3 habitats: blueberry barren, pond, and hedgerow in blueberry barren (Table 2-1).

For elevated detectors, automated analysis results were used to determine the percent of nights with species presence by month.

2.2.2 Vetting of Listed Species

It has been Stantec's experience that the automated programs sometimes misidentify call files or erroneously identify static as bat calls; therefore, Stantec visually vetted each call file identified as a listed species (Table 1-1) by either program to vet the identifications. If a call file identified as a listed species contained call characteristics that could belong to the suspected species, then the program's call identification was determined to be possible/probable, but if not, the call was assigned to the species or group with similar call characteristics. Vetted results were used to determine the plausibility of listed species presence and to determine the percent of nights with plausible presence of listed species by month.

2.2.3 Visual Analysis

Stantec visually analyzed all call files recorded by the elevated detectors to confirm that all bat passes were included in analysis of activity rates, seasonal patterns in activity, and activity versus conditions in the rotor zone. Call files containing less than two calls were eliminated from visual analysis, resulting in analysis of bat passes[2]. Results of visual analysis were used to determine species composition, detection rates, seasonal, nightly, and hourly activity levels, and to investigate relationships between activity and conditions, i.e., temperature and wind speed, in the rotor zone. Additionally, visual analysis allowed for comparability with previous acoustic work conducted in Maine.

To determine species composition, Bat passes were categorized to species when possible or to one of the following species groups[3]: MYSP, RBTB, BBSH, HB, Unknown[4] (UNKN), High Frequency

[2] Ultrasound recordings of bat echolocation may include a single call or a series of calls. A call is a single pulse of sound produced by a bat, while a bat pass is a combination of two or more pulses characteristic of normal flight or prey location ("search phase") and capture periods ("feeding buzzes").
[3] Each bat species is capable of expressing characteristic call patterns; however, overlap in certain call patterns is common among some species that call within the same frequency range. Additionally, call patterns from any species may lack sufficient detail needed for species level identification because of background noise, distance of the bat from the microphone, weather, or other environmental factors. To account for this, bat passes were characterized to species when possible, or to species group.
[4] Call sequences with less than 5 pulses, or sequences with indistinct call characteristics or overwhelming background static.

Business Confidential

Unknown[5] (HFUN) or Low Frequency Unknown[6] (LFUN; Table 1-1). Based on results of the visual analysis, detection rates (expressed as the number of bat passes per detector night per detector) and species composition were calculated, and seasonal, nightly, and hourly patterns in activity were summarized.

To investigate relationships between activity and conditions, i.e., temperature and wind speed, in the rotor zone, Stantec used ambient temperature and wind speed values recorded as 10-minute averages by the onsite Project met tower. Ambient temperature was recorded at a sensor 3 m agl and wind speed was recorded at a sensor 59 m agl. The timestamp of each bat pass recorded by the elevated detectors was rounded to the nearest 10 minutes to determine the corresponding temperature and wind speed conditions at the time of the bat pass.

3.0 RESULTS

3.1 GROUND DETECTORS

3.1.1 Automated Analysis

3.1.1.1 Bat Species Composition

According to KPro, LACI was detected most often (25.7% of detector-nights; n = 270) and at each detector, followed by LABO (11.4%; n = 120; Table 3-1). According to BCID, LANO was most common (16.3%; n = 171), followed by EPFU (11.3%; n = 119; Table 3-2).

3.1.1.2 Bat Activity Timing

Based on KPro, among months, MYLE was present on the greatest proportion of nights in May, EPFU, LACI, and MYLU were present on the greatest proportion of nights in July, and LANO, LABO, PESU, and MYSE were present on the greatest proportion of nights in August (Figure 3-1). Based on BCID, EPFU, LANO, LACI, and LABO were present on the greatest proportion of nights in July, MYLE, MYLU, and MYSE were present on the greatest proportion of nights in August, and PESU were present on the greatest proportion of nights in September (Figure 3-2). Based on both programs, the month with greatest proportion of detector nights with bat activity was July.

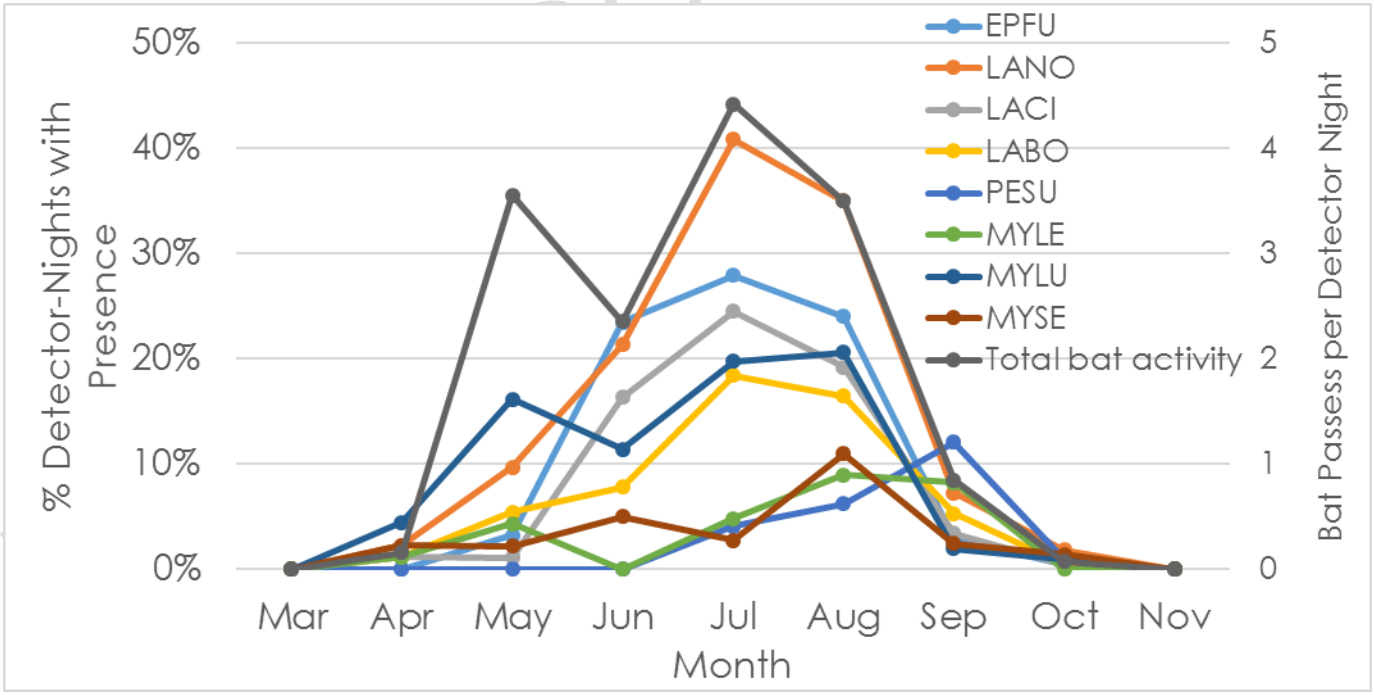

Figure 3-2. Activity timing at ground detectors by month based on the proportion of detector-nights with species presence as determined by BCID, 2015-2016.

3.1.1.3 Bat Activity and Habitat

According to KPro and BCID, the greatest proportion of detector-nights with bat species presence occurred in the pond habitat (72.2% of detector-nights sampled in pond habitat; n = 281 and 90.0%; n = 350, respectively), followed by the hedgerow in barren habitat (52.8%; n = 217 and 64.2%; n = 264, respectively). The lowest proportion of detector-nights with species presence occurred in the blueberry barren habitat (26.4%; n = 66 and 30.4%; n = 76, respectively). LACI was present on the greatest proportion of nights within all three habitats, followed by EPFU in the blueberry barren habitat and LABO in the hedgerow and pond habitats. Among habitats, based on KPro, the pond habitat had the highest species richness; based on BCID each species was present within each habitat (Table 3-3; Table 3-4).

MYLE and MYLU were present on the greatest proportion of detector nights in pond habitats according to both programs. MYSE was present on the greatest proportion of detector nights in hedgerow in barren habitat according to KPro and in pond habitat according to BCID (Table 3-3; Table 3-4).

3.1.2 Vetting of Listed Species

3.1.2.1 Listed Bat Species Composition

Vetting of ground detector call files identified as MYLE, MYLU, and MYSE generally confirmed the plausibility of presence of each species at multiple sites (Table 3-5). There were call files identified as a listed species by both programs that were determined to be a combination of noise or high frequency portions of non-listed species such as tri-colored bat or eastern red bat; however, there were call files identified by both programs that contained call characteristics consistent with identified listed species, indicating possible/probable presence of those species.

Table 3-5. Proportion of nights with listed species presence based on KPRO, BCID, and KPro or BCID plus vetting at ground detectors, 2015-2016 (highest propostions shaded).

Detector	Detector -Nights	MYLE			MYLU			MYSE		
		Kpro	BCID	KPRo or BCID + vetting	Kpro	BCID	KPRo or BCID + manual vetting	Kpro	BCID	KPRo or BCID + vetting
Met Low	250	0.8%	1.2%	0.0%	0.0%	1.6%	1.6%	0.8%	0.8%	0.0%
Central 1	250	2.0%	9.2%	0.0%	13.2%	24.0%	24.4%	0.0%	5.2%	0.0%
Central 2	262	0.0%	4.2%	0.8%	0.8%	2.3%	2.7%	0.8%	3.1%	0.4%
New Black Brook Pond	139	0.0%	0.7%	0.7%	3.6%	11.5%	11.5%	3.6%	5.0%	2.9%
New Northwest	149	0.7%	2.7%	0.7%	4.0%	9.4%	8.7%	4.0%	6.0%	4.7%
Total	**1,050**	**0.8%**	**4.0%**	**0.4%**	**4.5%**	**9.5%**	**9.6%**	**1.4%**	**3.7%**	**1.1%**

Of the three listed species, MYLU was detected most frequently at ground detectors, and after vetting was considered plausibly present during 1.6 – 24.4% (n = 4 – 61) of detector-nights. After vetting, MYLE were plausibly present during 0 – 0.8% (n = 0 – 2) of detector-nights and MYSE were plausibly present during 0 – 4.7% (n = 0 – 7) of detector-nights. Overall, the percent of detector-nights with possible/probable presence of listed species after vetting represents a small proportion of total detector-nights sampled (11.1%; n = 117), largely represented by MYLU presence (9.6%; n = 101; Table 3-5).

3.1.2.2 Listed Bat Species Activity Timing

For nights with listed species presence as determined by either KPro or BCID and vetting, seasonal patterns differed slightly among listed species. Relative to other months, MYLU were detected on the greatest proportion of detector nights in July and August. MYSE were detected on the greatest proportion of detector nights in August and MYLE were detected on the greatest proportion of detector nights in September (Figure 3-3). Of the nights with possible/probable MYSE, MYLE, and MYLU presence after vetting, 68% (n = 79) occurred during the peak activity months July – September.

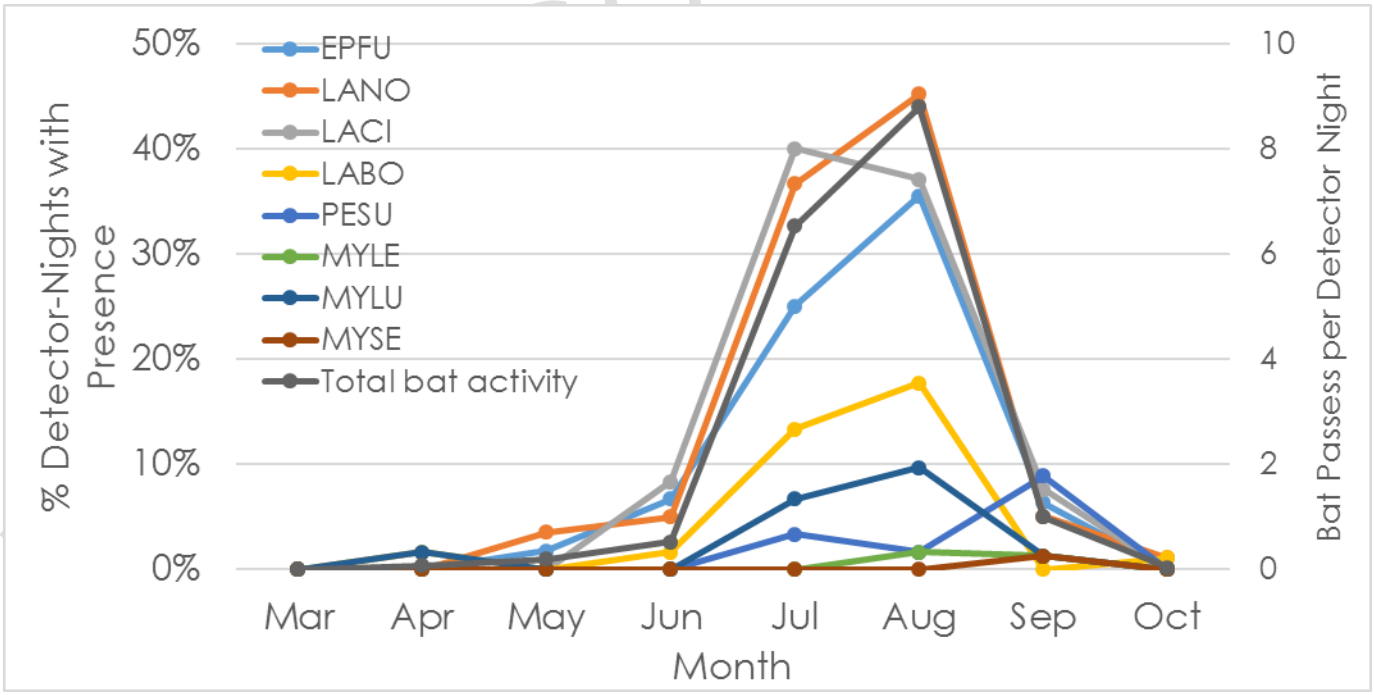

Figure 3-5. Activity timing by month at elevated detectors based on the proportion of detector-nights with species presence as determined by BCID, 2015-2016.

3.2.2 Vetting of Listed Species

3.2.2.1 Listed Bat Species Composition

Vetting of call files identified by either program as MYLE, MYLU, and MYSE generally confirmed the plausibility of presence of MYLU at low levels at both elevated detectors and of all 3 species at Met Mid (Table 3-8). Both programs identified some listed species call files that were determined to be a combination of noise or high frequency portions of non-listed species such as tri-colored bat or eastern red bat. However, both programs identified enough call files as a listed species that contained call characteristics that could belong to those species, indicating possible/probable presence of those species.

Of the three state-listed species, MYLU was detected most frequently, and after vetting was considered plausibly present during 0.5% (n = 1) of detector-nights sampled at Met High and 3.8% (n = 10) of detector-nights sampled at Met Mid. After vetting of KPro and BCID data, MYLE and MYSE were each plausibly present during 0.4% (n = 1) of detector-nights sampled at Met Mid, but not at Met High. Overall, the percent of detector-nights with possible/probable presence of listed species after vetting represents a small proportion of total detector-nights sampled (2.7%; n = 13 [2.3%; n = 11 represented by MYLU presence]; Table 3-8).

Table 3-8. Proportion of nights with listed species presence at elevated detectors based on KPRO, BCID, and KPro and/or BCID plus vetting, 2015-2016.

Detector	Detector-Nights	MYLE			MYLU			MYSE		
		Kpro	BCID	KPRo or BCID + vetting	Kpro	BCID	KPRo or BCID + manual vetting	Kpro	BCID	KPRo or BCID + vetting
Met High	213	0.0%	0.0%	0.0%	0.0%	0.5%	0.5%	0.0%	0.0%	0.0%
Met Mid	260	0.0%	0.8%	0.4%	0.0%	4.2%	3.8%	0.4%	0.4%	0.4%
Total	**473**	**0.0%**	**0.4%**	**0.2%**	**0.0%**	**2.5%**	**2.3%**	**0.2%**	**0.2%**	**0.2%**

Based on either KPro or BCID plus vetting, MYLE had plausible presence during 1 detector-night in August and MYSE had plausible presence during 1 detector-night in September. MYLU occurred on the greatest proportion of nights in August (8%; Figure 3-6). Of the nights with possible/probable MYLU presence, 82% (n = 9) occurred in July and August.

3.2.3 Visual analysis

3.2.3.1 Bat Species Composition

Most bat activity documented at the elevated detectors was represented by the BBSH species group (42.6%; n = 454), of which 79% (n =358) of passes were recorded at Met Mid. Bat passes identified to species included LACI (n = 305), EPFU (n = 147), LANO (n = 101), LABO (n = 33), and PESU (n = 3). The MYSP[7] species group represented 2.1% (n = 22) of bat passes recorded at elevated detectors. LFUN passes made up 91% of the UNKN passes recorded at elevated detectors (n = 217) and HFUN made up 9% (n = 21).

Table 3-9. Proportion of detections by species group at elevated detectors based on visual analysis, 2015-2016 (highest proportions shaded).

Detector	Species Group						Total
	BBSH	HB	MYSP	RBTB	HFUN	LFUN

Met Mid had proportionally higher monthly detection rates than Met High (Figure 3-7). At both detectors detection rates peaked in August (10.2 passes/detector night at Met Mid and 7.4 passes/detector night at Met High; Table 3-11). At both detectors, 88% (n = 937) of bat passes occurred during the peak activity months July and August (Table 3-11). The earliest recorded bat pass at elevated detectors occurred on 24 April 2016 and the latest occurred on 8 October 2016, and both were produced by MYSP. However, most MYSP and HFUN activity recorded at the elevated detectors (63%; n = 27) occurred during July and August (Appendix B Tables 1 and 2).

On a nightly basis, detection rates peaked 1 hour after sunset then declined until sunrise (Figure 3-8). Species group composition was relatively consistent regardless of hour past sunset. Seventy-two percent of the BBSH species group, 87% of the HB species group, and 77% of all bat passes occurred within the first 3 hours after sunset.

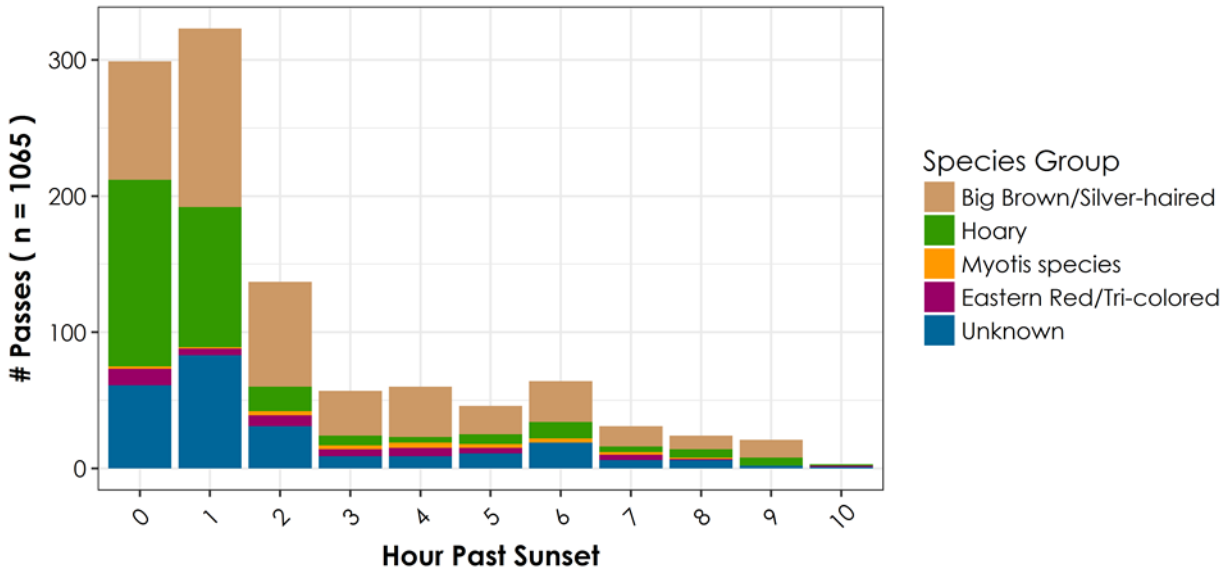

Figure 3-8. Bat passes at elevated detectors by species and hour after sunset based on visual analysis, 2015-2016.

3.2.3.3 Weather Data and Bat Activity Patterns

Ten-minute average wind speed and temperature data were available for 1,014 bat passes[8]. Eighty-three percent of bat passes (n = 839)occurred when mean wind speed was ≤ 6.9 m/s (Figure 3-9,) 96% (n = 975) occurred when mean temperature was ≥ 10 degrees Celsius (°C; Figure 3-10, Figure 3-11), and 80% occurred when both conditions were present. These conditions occurred during 40% (n = 6,544) of the total 10-minute increments, and most often in the months of July, August, and September (68%; n = 4,418). Mean temperature was >10 °C during 55% (n = 9,004) of the total 10-minute increments. Species composition was relatively consistent regardless of wind speed and temperature. MYSP was not recorded when mean wind speed was > 7.4 m/s.

Business Confic

[8] 10-minute average wind or temperature values were not available for 51 bat passes.

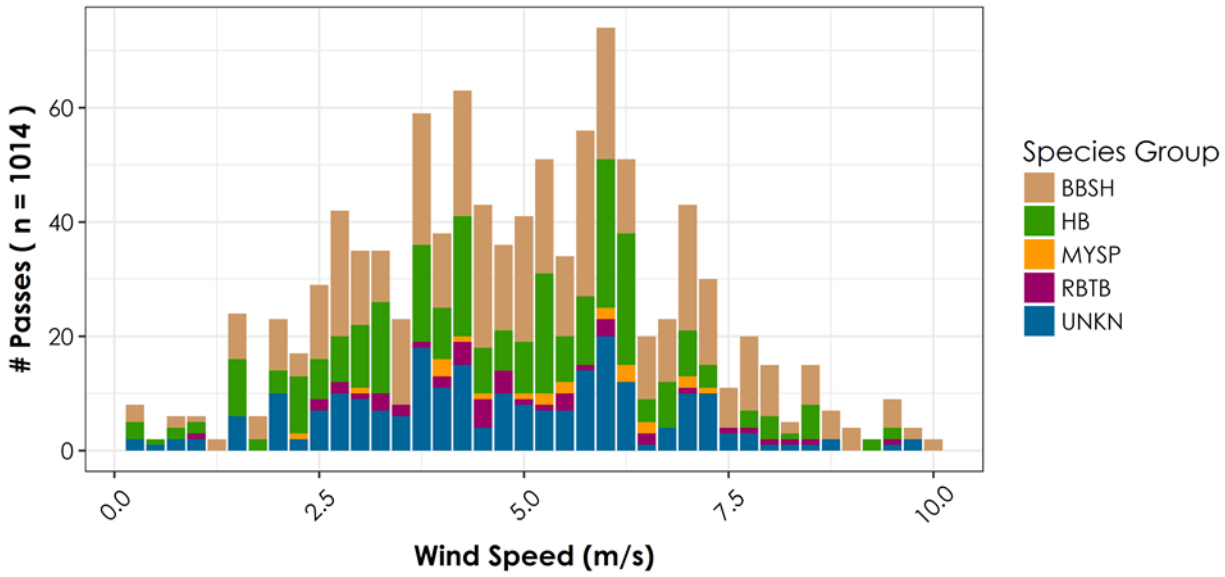

Figure 3-9. Number of bat passes per 10-minute average wind speed value at elevated detectors based on visual analysis, 2015-2016.

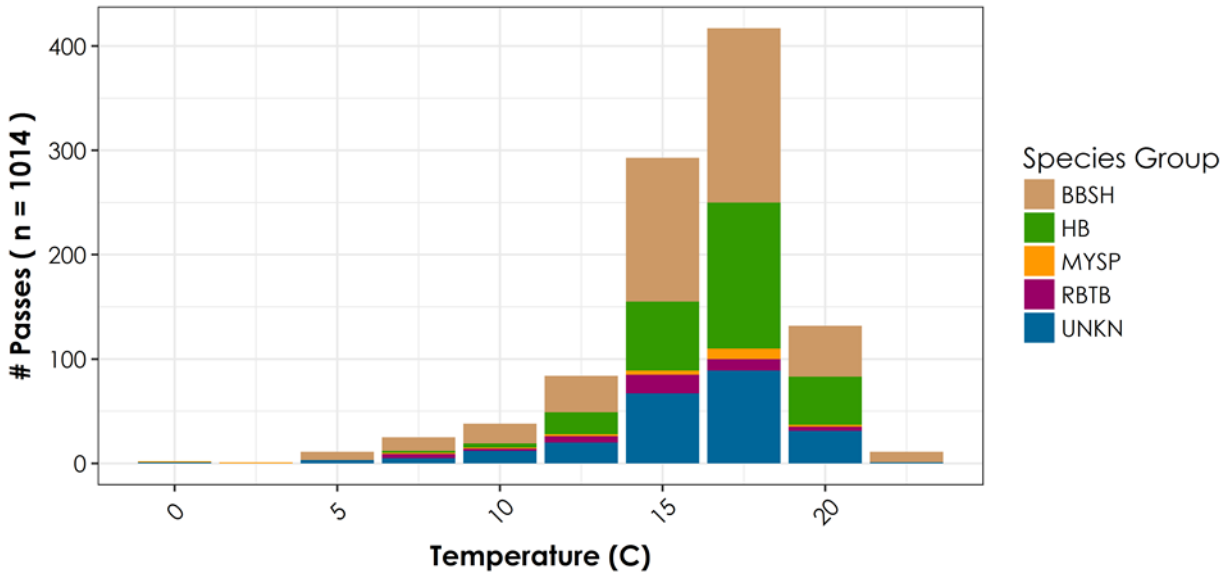

Figure 3-10. Number of bat passes per 10-minute average temperature value at elevated detectors based on visual analysis, 2015-2016.

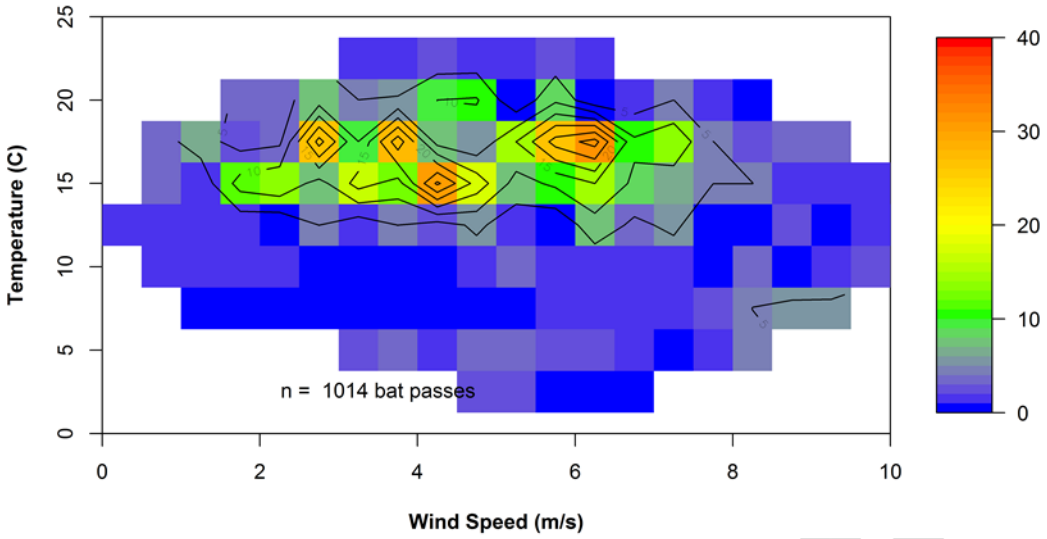

Figure 3-11. Heat map illustrating the number of recorded bat passes per 10-minute average temperature and wind speed at elevated detectors based on visual analysis, 2015-2016.

4.0 DISCUSSION

At ground detectors, detection rates of each bat species peaked in July and August, with the exception of small-footed bat, which also peaked in May according to KPro and August according to BCID, and PESU which peaked in September according to BCID. The greatest proportion of detector-nights with bat species presence occurred in the pond habitat, followed by the hedgerow in barren habitat. Of the three habitats, pond habitat had the highest species richness. The lowest proportion of detector-nights with species presence occurred in the blueberry barren habitat. Species composition varied by habitat, with LACI detected on the greatest proportion of nights within all three habitats.

Pre-White Nose Syndrome, Myotis bat activity dominated ground detector acoustic datasets in Maine (Peterson 2017). Post-WNS effects on Myotis bats, there is some evidence that other bat species including LACI are replacing the temporal or spatial niches of Myotis; for example, LACI have been shown to forage longer after sunset than during pre-WNS (Jachowski et al. 2014). Results at DOW indicated that LACI and bats in the BBSH group were most common, and foraged up to 9 hours after sunset. Myotis species were detected on low proportions of nights. Of the Myotis species, small-footed bat and little-brown bat were present on the greatest proportion of detector nights in the pond habitat. Northern long-eared bat was present on the greatest proportion of detector nights in the hedgerow in barren habitat according to KPro and in the pond habitat according to BCID. The presence of Myotis near water is consistent with the species' known behaviors.

Business Confid

Of the elevated detectors, overall detection rates were lower at Met High (34% of bat passes) than Med Mid (66% of bat passes), indicating that bat activity is lower within the rotor zone (40 m agl) than at or below 20 m agl. This is consistent with spatial activity patterns at other wind projects with detectors near tree canopy and rotor height. Detection rates at elevated detectors peaked in August, and most activity at the elevated detectors were from BBSH and HB groups, which is expected based on their migratory behavior and consistent with species composition documented with detectors near rotor height at other proposed and operational wind projects.

Temporal patterns in activity also were similar to those documented at other proposed and operational projects, with most bat activity occurring at the elevated detectors in July and August, and most Myotis activity occurring at elevated detectors during this timeframe. Within nights, 77% of activity by all bats occurred within 3 hours after sunset. As at other operational wind projects in Maine and in the East, the greatest proportion of fatalities at DOW would be expected to be represented by the long-distance migratory bats (LACI, LABO, and LANO). Myotis bat fatalities are expected to be low regardless, and implementation of avoidance measures may reduce these to a discountable level. To date, 18 Myotis fatalites have been documented at 6 operating wind projects in Maine (Normandeau 2010; Stantec 2008; Stantec 2010; Stantec 2012; Stantec 2014; and TetraTech 2015), with the most recent fatality in 2014 (TetraTech 2015). Most Myotis mortalities were MYLU found in July (n = 5) and August (n = 9), but some were also found in other months (April (n = 1), June (n = 1), and September (n = 2)). These 18 MYSP reflect 11.5% of total bats found all operational wind projects in Maine with publicly available fatality data. Since the occurrence of WNS in Maine in 2010 – 2011, 11 Myotis bat fatalities have been documented, representing 7.1% of total bats found. Operational adjustment during time periods and conditions when activity from these bats occurred should substantially minimize risk to state-listed bat species.

Bat activity patterns related to conditions were similar to those observed at other studies, i.e., bat activity was positively correlated with nightly mean temperatures and negatively correlated with average nightly wind speed (Fiedler 2004, Reynolds 2006). Bat activity was substantially reduced at very high wind speeds (> 6.5 m/s) and very low wind speeds (< 2 m/s) wind speeds. If a hypothetical curtailment regime was implemented to address periods of greatest bat activity during the 2015-2016 bat study at DOW, consisting of feathering turbines during the active periods of July and August, within 6 hours of sunset, when wind speed was < 6.9 m/s (the USFWS's current standard avoidance cut in speed), and temperature was >10 °C, 66% of bat passes at the elevated detectors would have been avoided and 45% of the state-listed bat passes would have been avoided. MDIFW currently recommends 6.0 m/s as a curtailment threshold from 20 April to 15 October but does not recommend a temperature or time of night threshold. Curtailing at 6.0 m/s from April to October would have avoided 67% of bat passes at the elevated detectors. These data suggest that further refinement of MDIFW's recommendations could greatly reduce bat impacts while maximizing electrical generation at the Project.

4.1 CONCLUSIONS

As measured using acoustic detectors at DOW in two bat activity periods spanning two calendar years, bat detection rates, species composition, and activity patterns related to habitat and conditions are similar to what has been documented at other proposed and operational wind energy projects in Maine and in the Northeast. Bat fatality patterns such as seasonal timing and species composition of mortality at DOW are expected to be similar to those documented at operational wind energy projects in Maine and in the Northeast with no avoidance measures implemented. Based on this fairly robust and site-specific acoustic dataset, it is reasonable to expect that operational adjustment during the periods of greatest bat activity: seasonal periods (July and August), time periods (within 6 hours of sunset), wind conditions (<6.9 m/s) and temperature conditions (>10 °C), would greatly reduce potential impacts to bats at the site. Standard monitoring of bat mortality during the first year of operations should be implemented to evaluate the effectiveness of such a measure if implemented.

APPENDIX A DATA TABLES

Executive Summary

Stantec Consulting Services Inc. (Stantec) conducted breeding bird surveys (BBS) for the proposed 30-turbine (90-megawatt) Downeast Wind Project (DOW or Project) in Washington County, Maine. BBS performed as part of pre-construction planning efforts for DOW were conducted in accordance with the Maine Department of Inland Fisheries and Wildlife's *Curtailment Policy and Wind Power Pre-construction Study Recommendations* (June 2015), the US Fish and Wildlife Service's *Land-based Wind Energy Guidelines* (March 2012), and methods that were similar to those employed at other wind energy projects in Maine and the Northeast. The objective of the BBS was to assess species composition, abundance, diversity, and distribution of songbirds relative to available habitat in the Project area during the breeding season.

Stantec conducted BBS at 28 survey points inside and outside the Project area. Survey points were grouped into 6 habitat categories based on dominant vegetation cover and general habitat characteristics: blueberry field, conifer forest, hardwood forest, mixed (hardwood and conifer) forest, man-made clearing (not blueberry field), and wetland. Data collected during the BBS were summarized to provide species and number of observations. The summarized data were used to calculate species richness, relative abundance, frequency, and Shannon Diversity Index (SDI). These indices were calculated for each habitat classification and for the entire survey area.

BBS were conducted in May and June 2016, and one, two, or three BBS were performed at each survey point. Stantec recorded 754 observations of 66 species at the survey points. Excluding flyovers and observations greater than 100 m from the observer, 507 observations of 53 species were recorded. A total of 234 observations (40 species) were recorded at the 10 points inside the Project area. A total of 273 observations (44 species) were recorded at the 18 points outside the Project area. Overall bird use (i.e., number/hour of observation) and species of birds observed was similar at points inside and outside.

Among habitat types in the Project area, survey points in wetland habitats had the highest relative abundance of birds, species richness, and diversity compared to points in blueberry fields and hardwood forest. Survey points in blueberry fields had the lowest overall relative abundance, species richness, and diversity. Bird abundance and species diversity values were similar within blueberry fields located inside and outside the Project area. Of the survey points outside the Project area, those in man-made clearings, which included gravel pits and borrow pits had the highest species richness and diversity.

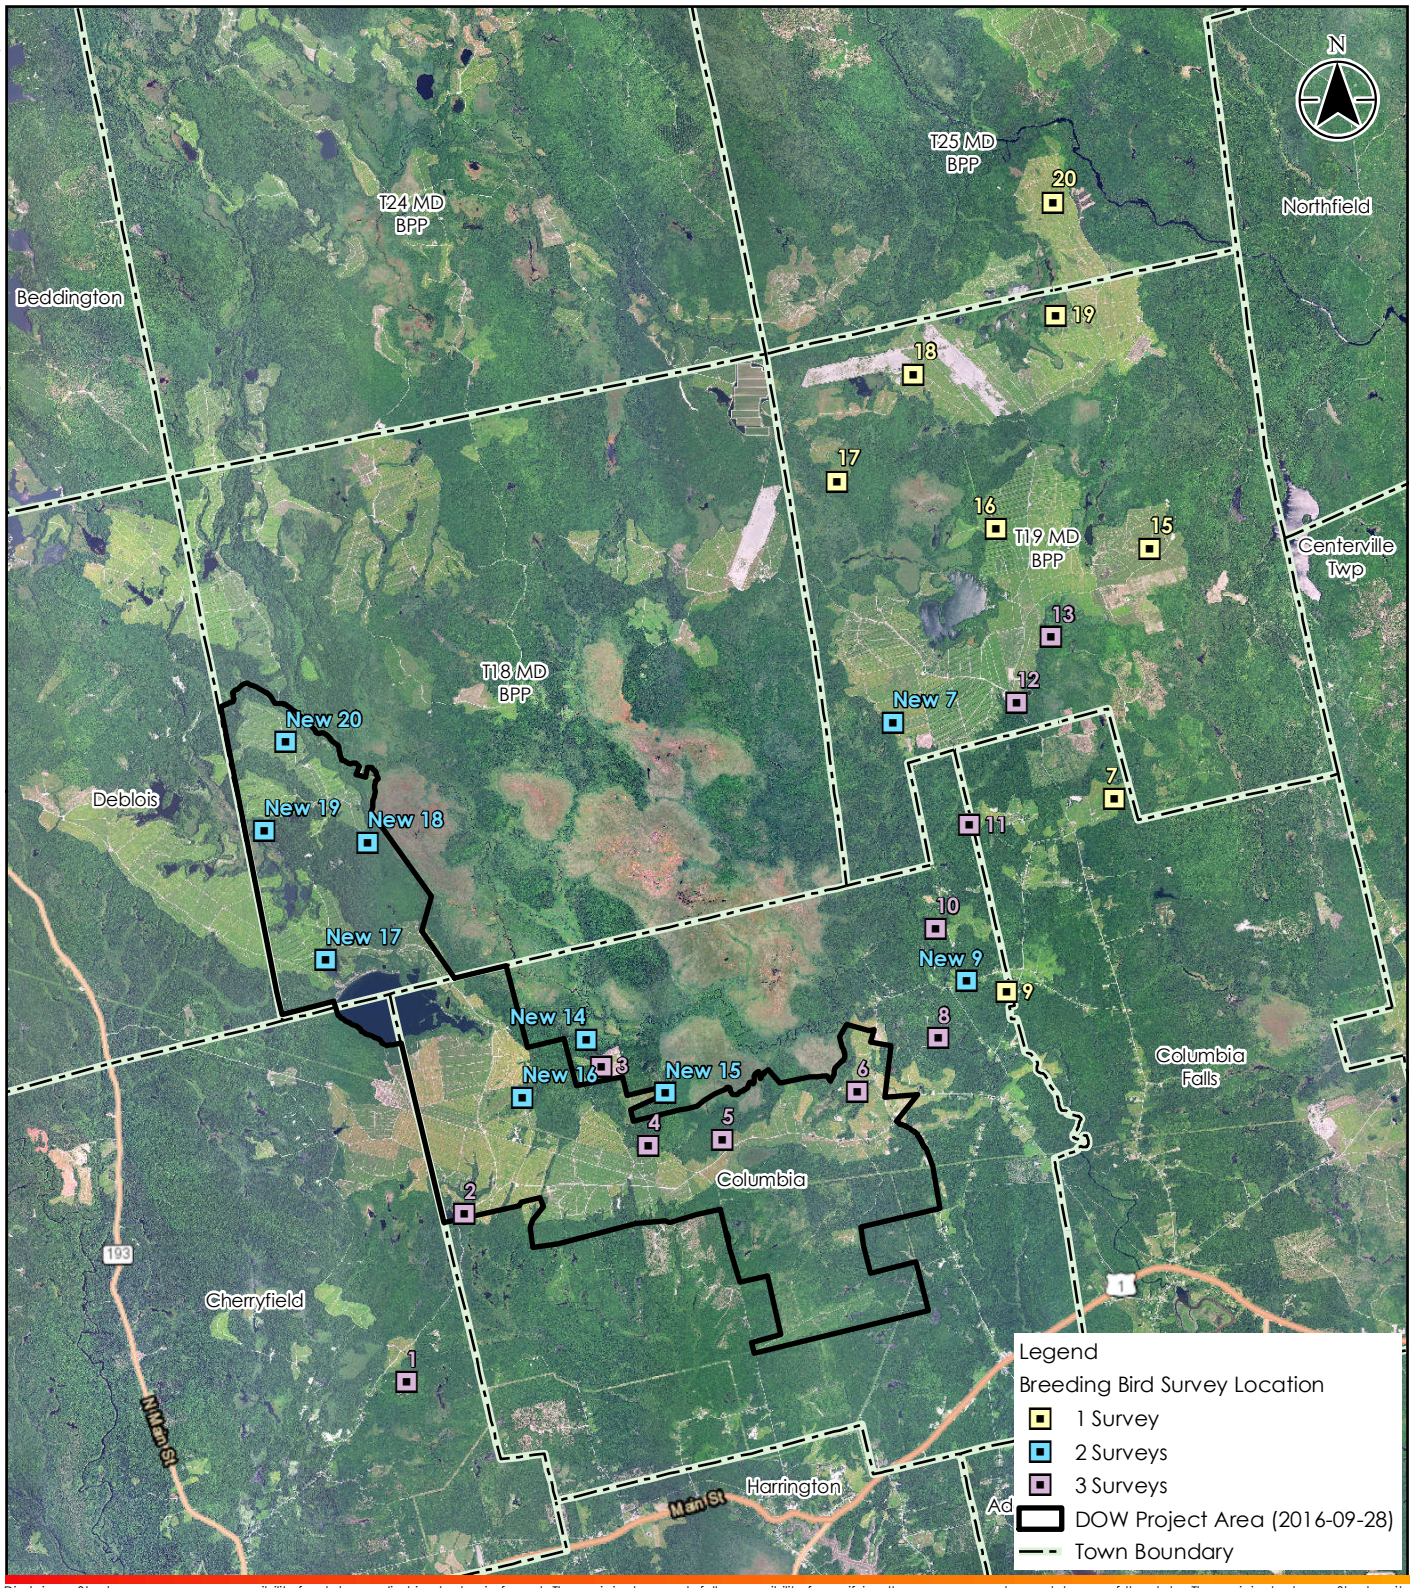
No federally or state-listed endangered or threatened species were detected. Ten species designated as special concern by MDIFW were detected within the Project area, and 4 additional special concern species were documented outside the Project area. Species

detected during BBS are generally common and typical of the habitats in which they were observed.

1.0 INTRODUCTION

Stantec Consulting Services Inc. (Stantec) completed breeding bird surveys (BBS) for the proposed 30-turbine (90-megawatt) Downeast Wind Project (DOW or Project) in Washington County, Maine. Surveys were completed as part of pre-construction planning efforts for DOW in accordance with the Maine Department of Inland Fisheries and Wildlife's *Curtailment Policy and Wind Power Pre-construction Study Recommendations* (June 2015), the US Fish and Wildlife Service's *Land-based Wind Energy Guidelines* (March 2012), and methods that were similar to those employed at other wind energy projects in Maine and the Northeast. The primary objectives of the BBS were to assess species composition, abundance, diversity, and distribution of songbirds relative to available habitat in the Project area during the breeding season. Secondary objectives of BBS were to provide baseline data of songbird species occurring and breeding within the specific habitat types in the Project area, to assess the likelihood that rare bird species occur in the Project area, and to compare the breeding bird community in the Project area to the typical breeding bird community of the region.

2.0 METHODS



This section describes the field survey and data analysis methods.

2.1 FIELD SURVEYS

Stantec conducted BBS at 28 total survey points, 10 points inside the area currently proposed for development (Project area) and 18 points proximal to but outside the Project area (Figure 1). Points outside the Project area were located in similar habitat as points inside the Project area, and included blueberry fields, conifer forest, man-made clearings, mixed forest and wetlands. Survey point locations were chosen using aerial Project photos and adjusted in the field to sample habitats representative of proposed turbine locations. BBS survey locations were limited to participating landowner parcels with access via roads and trails.

Survey points were grouped into 6 habitat categories based on dominant vegetation cover and general habitat characteristics: blueberry field, conifer forest, hardwood forest, mixed (hardwood and conifer) forest, man-made clearing (not blueberry field), and wetland.

BBS were conducted from sunrise until 11:30 AM targeting weather conditions conducive to hearing birdsong and seeing birds move about in vegetation and in flight. Weather information and general habitat conditions at each survey point were recorded during each survey.

Title

2016 Breeding Bird Survey Locations

12/9/2016

Birds that were identified by sight or sound, including soaring raptors, waterfowl, and other fly-overs, were recorded during a 10-minute session at each survey point. For each bird, the observer noted the time it was first observed and its approximate distance in 50-meter (m) increments from the observer.

Immediately after each 10-minute period at survey points in forested habitat, the observer broadcasted great horned owl (*Bubo virginianus*) and northern goshawk (*Accipiter gentilis*) calls, alternating between species calls, for 5 minutes to observe any approaching or territorial raptors, which may be indicative of potential breeding raptors proximal to the survey point.

2.2 DATA SUMMARY AND ANALYSIS

Data collected during the BBS were summarized to provide species and number of observations. Due to the potential for double-counting (in cases of adjacent points), and decreased detectability at distances greater than 100 m and, birds observed beyond approximately 100 m of the observer were recorded but excluded from quantitative assessments. Flyovers also were recorded but excluded since their breeding status and location could not be confirmed. The remaining data were used to calculate species richness, relative abundance, frequency, and Shannon Diversity Index (SDI). These indices were calculated by habitat separately for points inside the Project area and outside the Project area.

3.0 RESULTS

3.1 SURVEY EFFORT AND WEATHER SUMMARY

Table 1 presents the dates of survey and weather conditions per survey.

BBS were initiated on May 25 at 19 points[1]. Additional BBS were completed in June; however, revisions to the Project area boundary resulted in some points being surveyed one, two or three times.

The revised boundary eliminated some areas in the eastern portion of the original Project area and added some areas to the northwest of the original Project area (Figure 1). Following on the change in the Project area, 7 survey points (#14–#20) were relocated from the eastern to the northwestern areas of the Project area, and 2 survey points (#7 and #9) remained in the east but were shifted inside the new boundary. Survey points #7, #9, and #15–20 were surveyed once, and the relocated points ("New 7, 9, 14–20") were surveyed twice. The balance of the survey points were surveyed 3 times. Note that the relocated survey points were treated as new points during data analysis. The Project area was further revised post field efforts, resulting in 10 points

[1] Twenty survey points were planned to be surveyed in the May round; however, 1 point, #14, was overlooked by the field biologist. All 10 survey points in the Project area were surveyed during both June survey events.

remaining in the Project area. Points in the Project area that were surveyed 3 times include 2, 4, 5 and 6, and those that were surveyed two times include New 15 – New 20.

Daily average wind speeds ranged from 0 mph to 13–18 mph, and average daily temperatures ranged from 10–21°C during the BBS. Sky conditions ranged from clear to overcast, and periods of mist occurred on 25 May and 7 June (Table 1).

Table 1. Weather summary for breeding bird surveys, Downeast Wind Project, 2016.

Round	Date	Wind Speed[a]	Average Temperature (°C)	Sky Conditions
1	5/25/2016	0, 1	12	Clear to scattered clouds with periods of mist.
	5/26/2016	0, 2, 3	13	Clear to scattered clouds with periods of overcast skies.
2	6/7/2016	0, 3	10	Clear to scattered clouds with periods of mist.
	6/8/2016	0, 1, 2	14	Clear to scattered clouds.
	6/9/2016	2, 3, 4	12	Clear to scattered clouds.
3	6/22/2016	0, 1	21	Partly cloudy to scattered clouds.
	6/23/2016	1, 2	12	Clear to scattered clouds.
	6/24/2016	1, 2, 3	10	Clear skies.
[a] 0=<1 mph; 1=1-3 mph; 2=4-8 mph; 3=9-12 mph; 4=13-18 mph.				

3.2 OBSERVATIONS AND SPECIES OBSERVED

3.2.1 Points Inside the Project Area

Stantec detected 50 species (324 bird observations) at survey points inside the Project area, including flyovers and observations greater than 100 m from the observer. Appendix A Table 1 lists the observed species. Excluding flyovers and observations greater than 100 m from the observer, Stantec recorded 40 species (234 bird observations) (Appendix A Table 2).

At survey points in the Project area within 100 m of the observer and excluding flyovers, the species with the greatest number of observations were common yellowthroat (*Geothlypis trichas*) (n = 30), chestnut-sided warbler (*Setophaga pensylvanica*) (n = 27), and ovenbird (*Seiurus aurocapillus*) (n = 26).

3.2.2 Points Outside the Project Area

Stantec detected 56 species (430 bird observations) at survey points outside the Project area, including flyovers and observations greater than 100 m from the observer. Appendix A Table 1 lists the observed species. Excluding flyovers and observations greater than 100 m from the observer, Stantec recorded 44 species (273 bird observations) (Appendix A Table 2).

At survey points outside the Project area within 100 m of the observer and excluding flyovers, the species with the greatest number of observations were the same as those inside the Project area: common yellowthroat (n = 28), ovenbird (n = 27), and chestnut-sided warbler (n = 17).

3.2.3 Incidentally Observed Species

Species that were not documented during surveys but were observed incidentally to surveys inside and outside the Project area included American black duck (*Anas rubripes,* n = 1), broad-winged hawk (*Buteo platypterus,* n = 1), killdeer (*Charadrius vociferus,* n = 1), and merlin (*Falco columbarius,* n = 1).

Broadcasts of great horned owl and northern goshawk solicited no responses at points inside the Project area and solicited responses from a broad winged hawk (Point 7a), a red-shouldered hawk (*Buteo lineatus*, point 8), and a bald eagle (*Haliaeetus leucocephalus*, Point 20) outside the Project area. The broad-winged hawk was heard calling but was not visually observed. The red-shouldered hawk was observed flying from adjacent forest and perching in a snag. The bald eagle flew over the observer.

3.3 HABITAT RESULTS

The species with the greatest number of observations in common between points inside and outside the Project area (blueberry field, hardwood forest, and wetland) are shown below (Table 2).

Table 2. Species with greatest number of observations at habitats in common between points inside and outside the Project area, Downeast Wind Project, 2016 (bold text indicates species in common between points inside and outside the Project area).

		Blueberry Field		Hardwood Forest		Wetland	
Species	Scientific Name	In	Out	In	Out	In	Out
chestnut-sided warbler	*Setophaga pensylvanica*	4		11		**12**	**3**
common yellowthroat	*Geothlypis trichas*	**7**	**10**	10		**13**	**6**
ovenbird	*Seiurus aurocapilla*		14	**19**	**8**		
savannah sparrow	*Passerculus sandwichensis*	**7**	**14**				

Among habitat types in the Project area, survey points in wetland habitats had the highest relative abundance of birds, species richness, and diversity, and blueberry fields had the lowest overall relative abundance, species richness, and diversity. Bird abundance and species diversity values were similar within blueberry fields located inside and outside the Project area. Of points in blueberry fields, Point 12, outside the Project area, had the highest species richness (SR = 16, Appendix A Table 2). Of all points outside the Project area, those in man-made clearings, which included gravel pits and borrow pits, had the highest species richness and diversity (Table 3).

3.4 RARE, THREATENED AND ENDANGERED SPECIES

Stantec did not detect any federally or state-listed endangered or threatened species[2] in or outside the Project area. Ten state species of special concern were recorded in the Project and an additional 4 species were detected outside the Project area (Table 4).

[2] Maine Department of Fisheries and Wildlife (MDIFW). 2015. Endangered and threatened wildlife. <http://www.maine.gov/ifw/wildlife/endangered>. Accessed 13 July 2016.

4.0 DISCUSSION

BBS consisted of point count surveys designed to document birds present in the Project area during the breeding season and to provide baseline data of songbird species occurring and breeding within the specific habitat types in the Project area. The study allows assessment of the likelihood that rare bird species occur in the Project area and evaluation of the degree to which the breeding bird community in the Project area is typical of the region.

Species detected during this BBS included species that are generally common within the habitats surveyed. No federally or state-listed endangered or threatened species were recorded and few state species of special concern were recorded, most in low numbers. Birds observed were regionally abundant, with the possible exception of rusty blackbird, which is a species of special concern in Maine. Two rusty blackbird observations occurred at Point 4, which was in wetland habitat adjacent to a pond and both natural and man-made clearings. This is consistent with known habitat preference for this species.

The great horned owl and northern goshawk broadcasts solicited responses on 3 occasions of 3 different raptor species (broad-winged hawk, red-shouldered hawk, and bald eagle), but only at points outside the Project area. Though these 3 individuals either called or flew toward or near the observer, none of the 3 individuals exhibited aggressive, territorial behavior indicative of

nesting activity. Broad-winged hawks and red-shouldered hawks are common nesters in Maine in relatively continuous deciduous or mixed-deciduous forest near water. Red-shouldered hawks typically nest in older forest than broad-winged hawks. Due to the blueberry barrens, there is little contiguous forest habitat in the Project area.

Habitat impacts to resident birds in and near wind projects have not been well documented. The initial construction of a wind project results in a certain amount of habitat loss or habitat conversion for some species. Direct impacts associated with construction could occur if construction occurs during the breeding/nesting season. Potential indirect effects such as displacement could occur as a result of construction and operation of a project. The degree to which wind turbines deter resident birds from establishing territories nearby varies among bird species and habitats. Some resident birds may be at risk of colliding with turbines once operational, though seasonal timing and species composition of bird fatality in Maine suggest that collision fatality has been greatest during the spring and fall migration periods. Although this study suggests that most bird species potentially affected by the Project are common and windspread in the region, construction of the Project outside the breeding season, and utilization of existing roads and clearings as much as possible, would likely minimize impacts to breeding birds.

APPENDIX A. Revised Work Plan for 2016 Grassland Bird Surveys – Proposed Downeast Wind Project, 16 May 2016

Business Confidential

Executive Summary

Stantec conducted grassland bird surveys for the proposed Downeast Wind Project (DOW or Project) in Washington County, Maine. The Project area includes actively managed blueberry fields and hills that provide habitat for the state-threatened upland sandpiper (UPSA; *Bartramia longicauda*) (Weik 2000), as well as several other grassland bird species. At the request of the Maine Department of Inland Fisheries and Wildlife (MDIFW), a focused study of UPSA and other grassland species (northern harrier (*Circus cyaneus*), vesper sparrow (*Pooecetes gramineus*), eastern whip-poor-will (*Caprimulgus vociferus*) and whimbrel (*Numenius phaeopus*)) was completed. Study objectives included evaluating breeding period behavior and timing of courtship, estimating abundance of breeding UPSA, assessing relationships between UPSA abundance and habitat variables, documenting fall staging areas, and documenting presence of the other target species. The study comprised 2 time periods relevant to UPSA natural history: the breeding season (May and June) and the fall staging period (July, August, and September).

Breeding season surveys for UPSA and target species were conducted between 9 May and 23 June, 2016 at 40 survey sites, including 16 sites within the proposed Project area. UPSA were detected at 26 of 40 sites (65% occurrence). UPSA were detected a total of 79 times (mean = 2 detections/site; range = 0 – 4), 18 times inside the Project area and 61 times outside the Project area. Mean maximum detections/site estimated with the generalized linear Poisson model was 1.3 (95% CI = 1.0 – 1.7) for all sites, and 0.8 (95% CI = 0.4 – 1.3) for sites inside and 1.6 (95% CI = 1.2 – 2.2) for sites outside the Project area. Abundance estimates were calculated using hierarchical models that explicitly account for detection error (i.e., birds present but not detected) and survey effort at each site. Mean detection-adjusted abundance was 5.7 (95% CI = 2.9 – 11.0) for all sites, and 4.0 (95% CI = 1.2 – 12.9) for sites inside the Project area, and 8.6 (95% CI = 2.8 – 26.4) for sites outside the Project area. Given that each site was 48.5 acres (~20 hectares [ha]), the overall density estimate for DOW was 0.25 UPSA/ha.

UPSA courtship behaviors were observed on 6 occasions from May 10 to May 24, including 4 instances in the morning and 2 in the evening. Courtship was observed inside the Project area on 2 occasions at 1 site and outside the Project area at 4 sites. Heights of courtship displays ranged from < 20m to > 200m, and all were > 50m from forest edges.

Vegetation was sampled at 26 of the 40 survey sites (65%), including all 16 in the Project area, to assess relationships between UPSA abundance and vegetation structure. Model-averaged parameter estimates (β) indicated increased abundance with increasing grass height (β = 0.28, 85% UCI = 0.04 – 0.52) and grass cover (β = 0.37, 85% UCI = 0.11 – 0.62), while quadratic models suggested increasing and then decreasing abundance with increasing grass height and cover.

Fall staging surveys for UPSA were conducted between 24 July to 9 September at 26 survey sites, including all 16 sites in the Project area. UPSA were detected 8 times, all within the Project area, but staging behavior was not observed.

Within the Project area, 56 vesper sparrow, 6 eastern whip-poor-will, 3 northern harrier and 0 whimbrel observations were recorded.

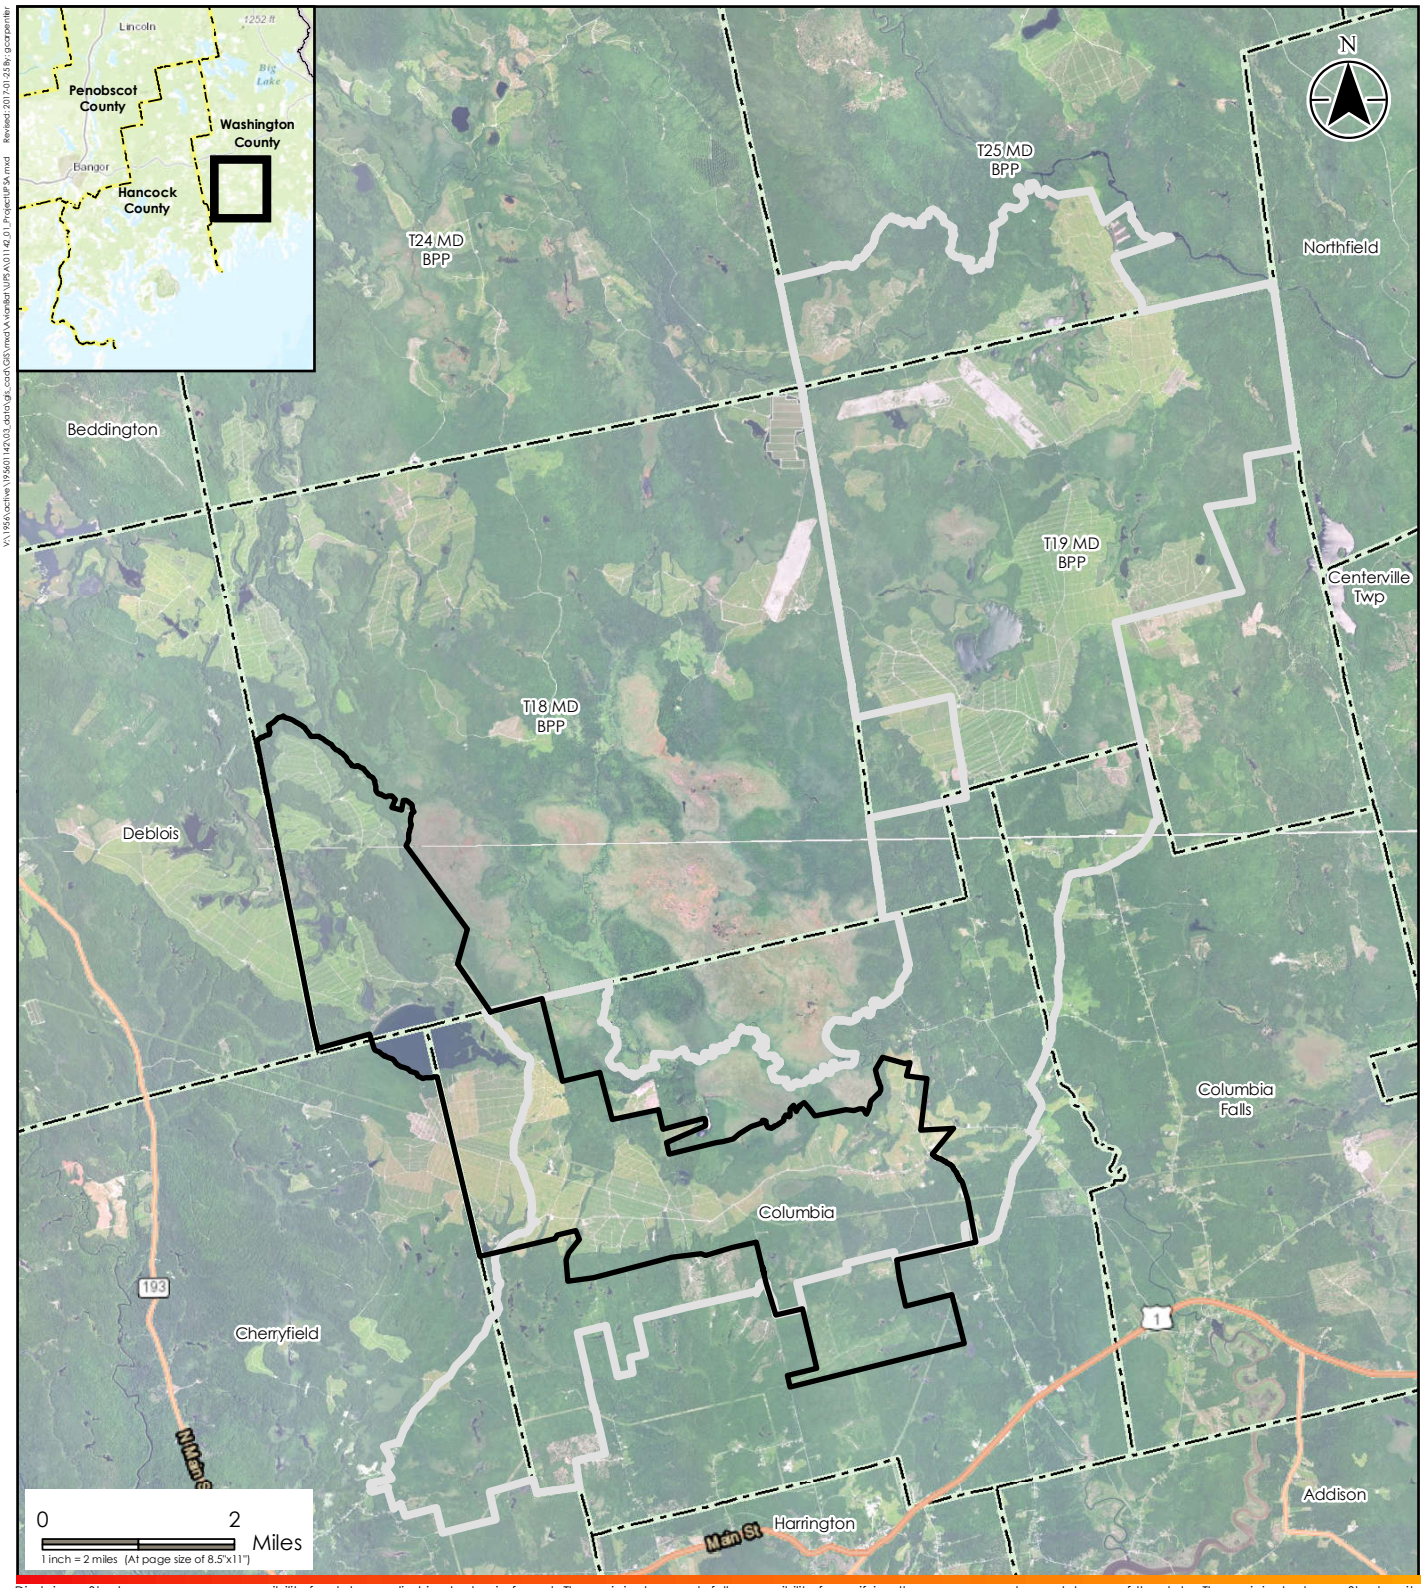
1.0 INTRODUCTION

Stantec conducted grassland bird surveys on land in and adjacent to the proposed Downeast Wind Project (DOW or Project) in Washington County, Maine (Figure 1). Project infrastructure is expected to include utility scale wind turbines, underground collector lines, a collection substation, an above ground transmission line, new and improved roads, an operations and maintenance building, and 2 or 3 permanent meteorological towers.

The Project area largely consists of actively managed blueberry fields and hills with mixed forest habitat. Blueberry cultivation in Maine provides habitat for the state-threatened upland sandpiper (UPSA; *Bartramia longicauda*) (Weik 2000), as well as several other grassland bird species. Region-wide surveys have indicated that the core of the UPSA range in New England and New York includes the blueberry barrens in Washington and Hancock counties (Weik 2000). The Maine Department of Inland Fisheries and Wildlife (MDIFW) has mapped suitable breeding habitat for UPSA throughout the state, including in the Project area. Mapping efforts resulted in GIS polygons depicting suitable habitat where UPSA was confirmed present at the time of mapping, and a 250-ft buffer around the suitable habitat. Since MDIFW's mapping efforts, Stantec is not aware of any studies that have systematically surveyed for presence or absence of the species in the area in and adjacent to the Project area, or quantitatively assessed microhabitat variables (i.e., habitat selection) where UPSA have been observed.



UPSA are potentially at risk at wind projects located in breeding habitat because the species' courtship behavior includes a flight display in which one or more males fly in a circular or elliptical path as high as approximately 200 m above the ground (Wiek 2000). Stantec is not aware of any studies in Maine that have collected data related to UPSA flight patterns during courtship.

Per request of MDIFW, observations of vesper sparrow (*Pooecetes gramineus*) and the following state Species of Special Concern were also recorded during the study: northern harrier (*Circus cyaneus*), eastern whip-poor-will (*Caprimulgus vociferus*) and whimbrel (*Numenius phaeopus*).

Objectives of the grassland bird study were to:

1. Document timing and flight characteristics of displaying UPSA
2. Model abundance of breeding UPSA
3. Model habitat relationships with UPSA abundance
4. Document UPSA staging areas during or preceding fall migration, if present
5. Document other target species, if present.
6. Use results to inform siting, construction, and operational protocols to minimize risk to the target species.

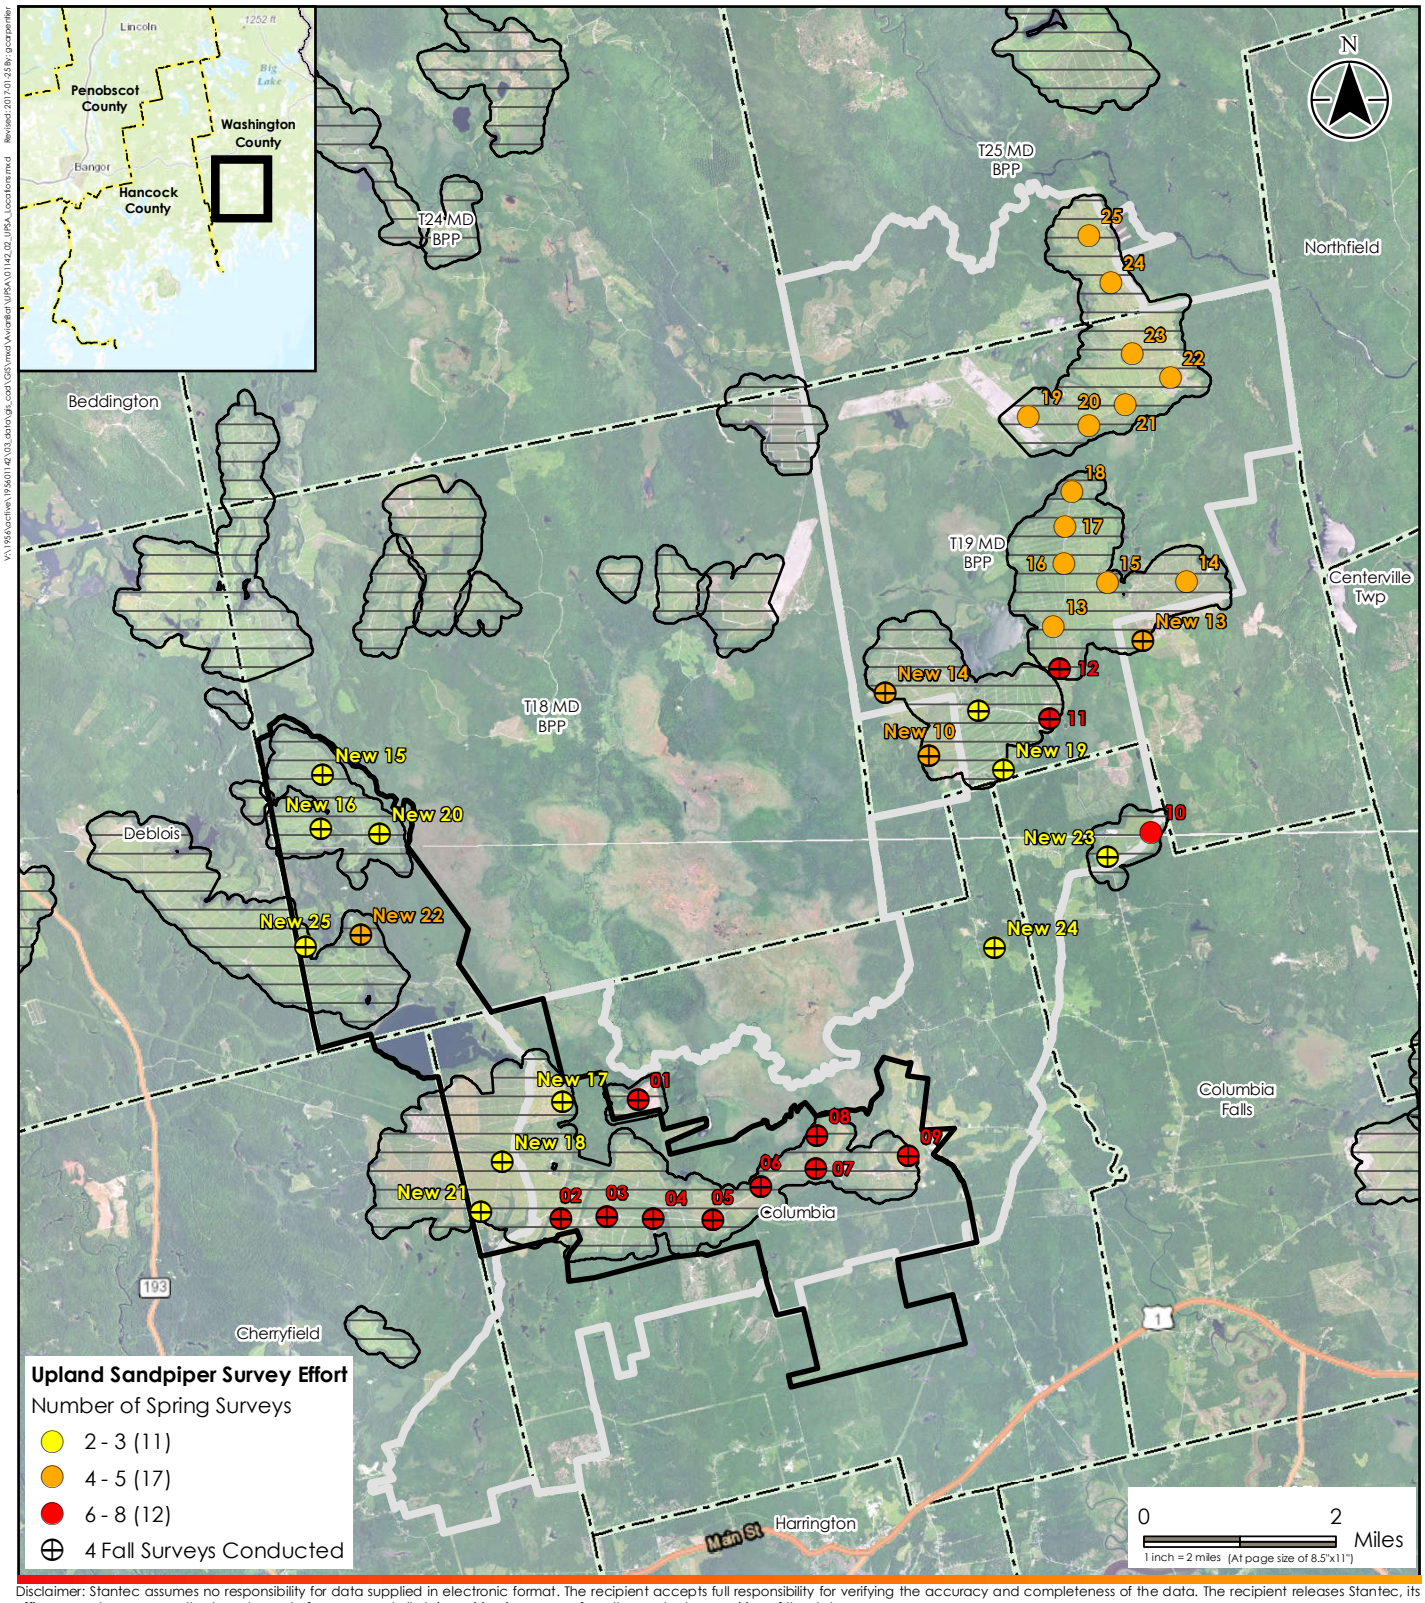
Objectives and methods were determined based on consultation with MDIFW and a third party expert, Dr. Kimberly Peters of DNV GL, an avian biologist with expertise on grassland birds including UPSA. A draft study plan was provided to MDIFW on 21 April 2016 and was revised based on comments received from the MDIFW on 29 April 29 2016 and technical input provided by Dr. Peters.

2.0 METHODS

This section describes the field survey and data analysis methods. Survey methods followed those described in the *Revised Work Plan for 2016 Grassland Bird Surveys – Proposed Downeast Wind Project* dated 16 May 2016 (Appendix A).

2.1 FIELD SURVEYS

Field surveys were conducted by Mark DiGirolamo whose past experience includes conducting presence/absence UPSA surveys in the late 1990s under the direction of Peter Vickery and Massachusetts Audubon and subsequently under Andrew Wiek and MDIFW.



Field surveys occurred from May through September 2016, which included the breeding season of the target species (May – June) and the UPSA fall staging period (late July – September).

Surveys were conducted at 40 sites within and in the vicinity of the Project area, 39 of which were located within MDIFW-mapped UPSA habitat (Figure 1). Sites were selected based on logistical access (i.e., landowner permission) and to provide adequate coverage of the MDIFW-mapped UPSA habitat. Sites consisted of circular plots with 250-m radii and were located far enough apart to be considered independent (minimum distance = 550 m), i.e., individuals were unlikely to be double-counted among sites.

Differing levels of survey effort were completed at each site due to Project area revisions[1] (Figure 2, Table 2-1). Reduction of the Project area resulted in a dataset that allows comparison between Project area and offsite data.

[1] On 7 June, the Project area was revised by removing a large area to the northeast and adding an area to the northwest. At this time surveys were discontinued at Sites 10 and 13–25, and on 8 June and 9 June, surveys were initiated at new Sites 27 and New 10–New 25. Sites 1–9 and Sites 11 and 12 remained within the revised Project area and were surveyed during each round in May through September. Since completion of surveys, on 26 September 2016, the Project area was again reduced to focus development in as small an area as possible and to minimize potential impacts to UPSA habitat in the blueberry barrens.

2.1.1 Breeding Season Surveys

Breeding season surveys were initiated on 9 May and continued through 23 June, coinciding with territory establishment, courtship, and nesting for UPSA (Vickery et al. 2010). Sites were surveyed in both morning and evening. Morning surveys occurred 0.5 hour before sunrise until 10:00 AM. Evening surveys occurred 1 hour before sunset until 1 hour after sunset. In early to mid-May, the courtship period, each site was surveyed up to 3 times in the morning and 2 times in the evening (Table 2-1). In late May and June, the nesting period, each site was surveyed up to 2 times in the morning and 1 time in the evening. Sites were surveyed systematically within morning or evening survey rounds based on geographic proximity; however each survey round was initiated at a different site than the previous round, resulting in broad temporal coverage of all sites. Surveys occurred in all weather conditions except for in heavy rain or high winds where visual or auditory detections would be impaired.

Visual surveys were conducted for 10 minutes, scanning 360° with binoculars and/or a spotting scope to search and listen for target species. The surveyor scanned fence posts, sign posts, utility wires, any other potential perches, and over fields. If UPSA were not detected during the initial 10 minutes, the surveyor broadcasted an UPSA call for 1 minute to attempt to elicit and detect territorial or response calls in the subsequent 4 minutes.

The locations of target species were indicated on maps within the 250-m radius circle. Data were recorded on Stantec datasheets. Other non-target bird species detected during grassland surveys were recorded as incidental observations.

Habitat and vegetation data were collected in June when most vegetation expected to be present would be mature, from sites that were surveyed in June, i.e., those sites that were considered inside the Project area at the time, which included Sites 1–12, 27, and New 10–New 25. At each survey site, a 1-m × 1-m quadrat was established 100-m in each cardinal direction from the site center, resulting in 4 total quadrats per site. If a quadrat occurred on or within 25 m of a road, the plot was moved 50 m into the grassland/blueberry field area perpendicularly from the road.

2.1.2 Fall Staging Season Surveys

Surveys were conducted during the fall staging period for UPSA from late 24 July to 9 September at sites that were considered inside the Project area at the time (i.e., Sites 1–9, Sites 11–12, Site 27, and Sites New 10–New 25). Each of these sites was surveyed up to 3 times in the morning: once in late July, once in mid-August, and once in early September (Table 2-1). In addition, each site was surveyed once in the evening. Methodology used in the fall was the same as in spring with the addition of categorizing observations as "staging" as appropriate. Staging behavior was considered any observation of multiple UPSA individuals in close proximity to one another (in a group) feeding or loafing during this time period.

Business Confidential

2.2 STATISTICAL ANALYSIS

A correlation matrix was used to assess multi-collinearity among vegetation variables because relatively high levels of correlation among predictor/independent variables ("covariates") in models can cause variance inflation, reduced statistical power, and biased parameter estimates (Graham 2003, Freckleton 2011). The correlation matrix was constructed by calculating Pearson correlation coefficients (r) for each pair of numeric vectors representing vegetation covariates and removed several covariates from subsequent analyses accordingly. Covariates were not excluded solely on exceeding an arbitrary value of r. Instead, covariate exclusion was based on quantitative evidence (i.e., r) and qualitative biological evidence (i.e., our understanding of the correlative or causative relationships of vegetation structure in the field) (Graham 2003).

Generalized linear Poisson models were fit to the maximum number of UPSA detected among repeated visits, and used to estimate mean abundance and 95% confidence intervals (CI). Primary model assumptions include 1) the likelihood of detecting UPSA was spatiotemporally independent among sites, and 2) detection errors (i.e., false-negative errors/not detecting UPSA that were present) were infrequent enough to cause negligible or no bias in abundance estimates.

The second assumption (i.e., negligible detection error) was addressed and relaxed by fitting hierarchical models of abundance to data representing site-specific detection histories of UPSA. That is, the multiple surveys per site over time represent temporally replicated sampling events that allow for estimation of detection probability and detection-adjusted abundance (Mackenzie et al. 2002, Royle 2004, Royle and Dorazio 2008). The "unmarked" package (Fiske and Chandler 2011) for R (R Development Core Team 2016) was used to fit hierarchical models and estimate detection probability and abundance. First, a set of 12 competing models were fit, containing variables that we hypothesized could influence the detection parameter, but only the *y*-intercept for the abundance parameter. The model set included 1) a null model (i.e., only the *y*-intercept for detection), 2) models containing single covariates representing time-of-day, Julian day, wind speed, and ambient temperature, 3) all models containing combinations of 2 additive covariates, and 4) a global model containing all 4 additive covariates. Influential detection variables were then included in a set of 11 hierarchical abundance models containing vegetation structure covariates. As a post hoc exploration, the following were fit: 1) hierarchical models containing quadratic forms of vegetation variables that appeared to influence abundance, and 2) the model containing site location as a categorical predictor variable to estimate and compare detection-adjusted abundance of sites on and off the Project area. The primary assumption for the hierarchical model is a closed population during the sampling period; i.e., births, deaths, immigration, and emigration were infrequent enough to have negligible or no influence on our abundance estimates and relationships with covariates.

Log likelihoods, Akaike's Information Criteria with second-order bias correction for small sample sizes (AICc), and proportional weights (*w*) were used to select and make inference from the most informative models of abundance (Burnham and Anderson 2002, Anderson 2008). Model coefficients/parameter estimates (β) and abundance (*N*) were model-averaged with the

Business Confidential

AICcmodavg package (Mazerolle 2016) for R (R Core Development Team 2016) to make multi-model inference if model-selection uncertainty was high (i.e., when *w* for the top-ranked model was not ≥ 0.90) (Burnham and Anderson 2002, Anderson 2008). β and *N* with 95% confidence intervals (CI), or 85% unconditional confidence intervals (UCI) for model-averaged estimates (Burnham and Anderson 2002, Arnold 2010) were reported. Covariates were considered to have positive or negative effects on *N* if CI or UCI for β did not overlap zero (Bolker 2008, Arnold 2010).

Results of the analyses provide: (1) an unbiased estimate of abundance, both inside and outside the Project area, and (2) identify habitat characteristics associated with UPSA abundance.

Hierarchical models of UPSA abundance make the most efficient and informative use of the data by providing 1) identification of factors influencing probability of detection (i.e., detection error), which facilitates optimization of future survey design, 2) abundance estimates with reduced bias via adjustment for detection error, 3) identification of vegetation variables influencing detection-adjusted abundance, and 4) comparison of detection-adjusted abundance estimates for survey sites inside and outside the Project area.

3.0 RESULTS

3.1 UPLAND SANDPIPER BREEDING SURVEYS

3.1.1 Occurrence and Unadjusted Abundance

Surveys for UPSA and target species occurred at a total of 40 sites between 9 May and 23 June, 2016 (mean = 5.0 surveys/site; range = 2 – 8), including 16 sites inside and 24 sites outside the Project area (Figure 2). UPSA were detected at 26 of the 40 sites (65% occurrence), and at 8 of 16 (50%) sites inside and 18 of 24 (75%) sites outside the Project area. UPSA were detected 79 times (mean detections/survey/site = 0.4; mean maximum detections/site = 1.3; mean total detections/site = 2.0), including 18 detections inside the Project area (mean detections/survey/site = 0.2; mean maximum detections/site = 0.8; mean total detections/site = 1.1) and 61 detections outside the Project area (mean detections/survey/site = 0.5; mean maximum detections/site = 1.6; mean total detections/site = 2.5).

Mean maximum detections/site estimated with the generalized linear Poisson model was 1.3 (95% CI = 1.0 – 1.7) for all sites, and 0.8 (95% CI = 0.4 – 1.3) for sites inside and 1.6 (95% CI = 1.2 – 2.2) for sites outside the Project area (β_{inside} = - 0.77, 95% CI = -1.42 – - 0.13, p = 0.019).

3.1.2 Courtship Behavior

UPSA courtship behaviors were observed on 6 occasions from May 10 to May 24, 4 in the morning and 2 in the evening (Table 3-1). Courtship was observed inside the Project area on 2 occasions at Site 2, and outside the Project area at 4 sites. Heights of courtship displays ranged from < 20m to > 200m, and all were > 50m from forest edges.

3.1.3 Detection-Adjusted Abundance

The hierarchical model with time-of-day and Julian day as detection covariates had the greatest proportional model weight (Table 3-2), so those detection covariates were included in the hierarchical models with vegetation covariates. Probability of detection decreased with increasing time-of-day (β = - 1.15; 95% CI = -2.13 – - 0.18) and Julian day (β = - 0.03; 95% CI = - 0.05 – - 0.02; Figure 3, Figure 4).

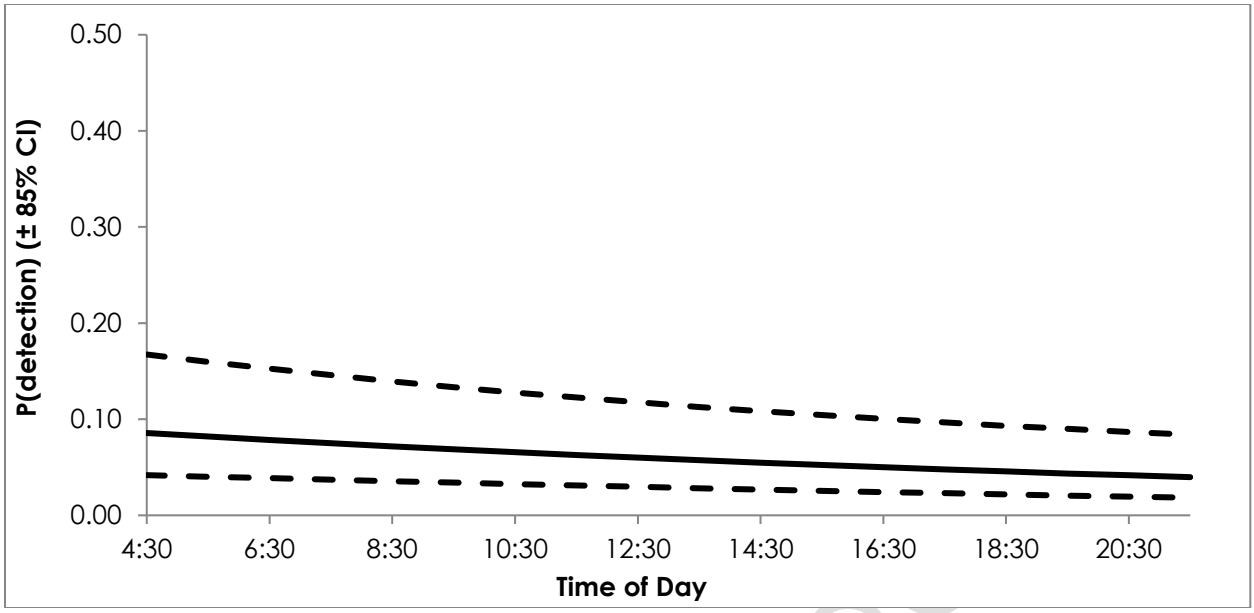

Figure 3. Upland sandpiper probability of detection (85% confidence interval) related to time of day, DOW, Maine, 2016.

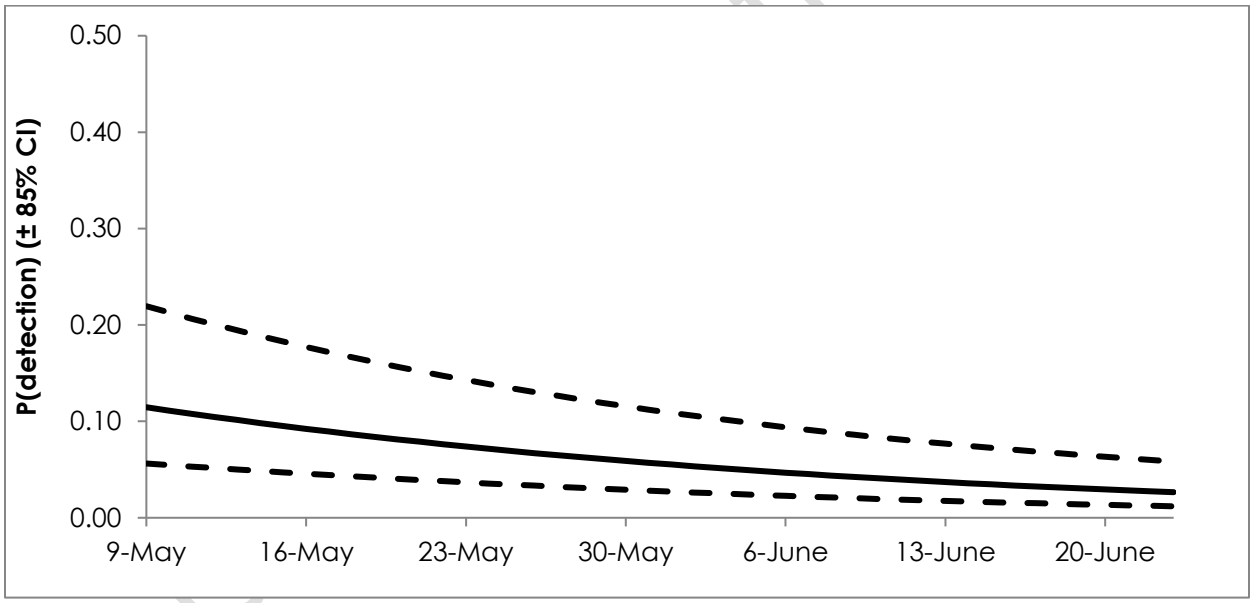

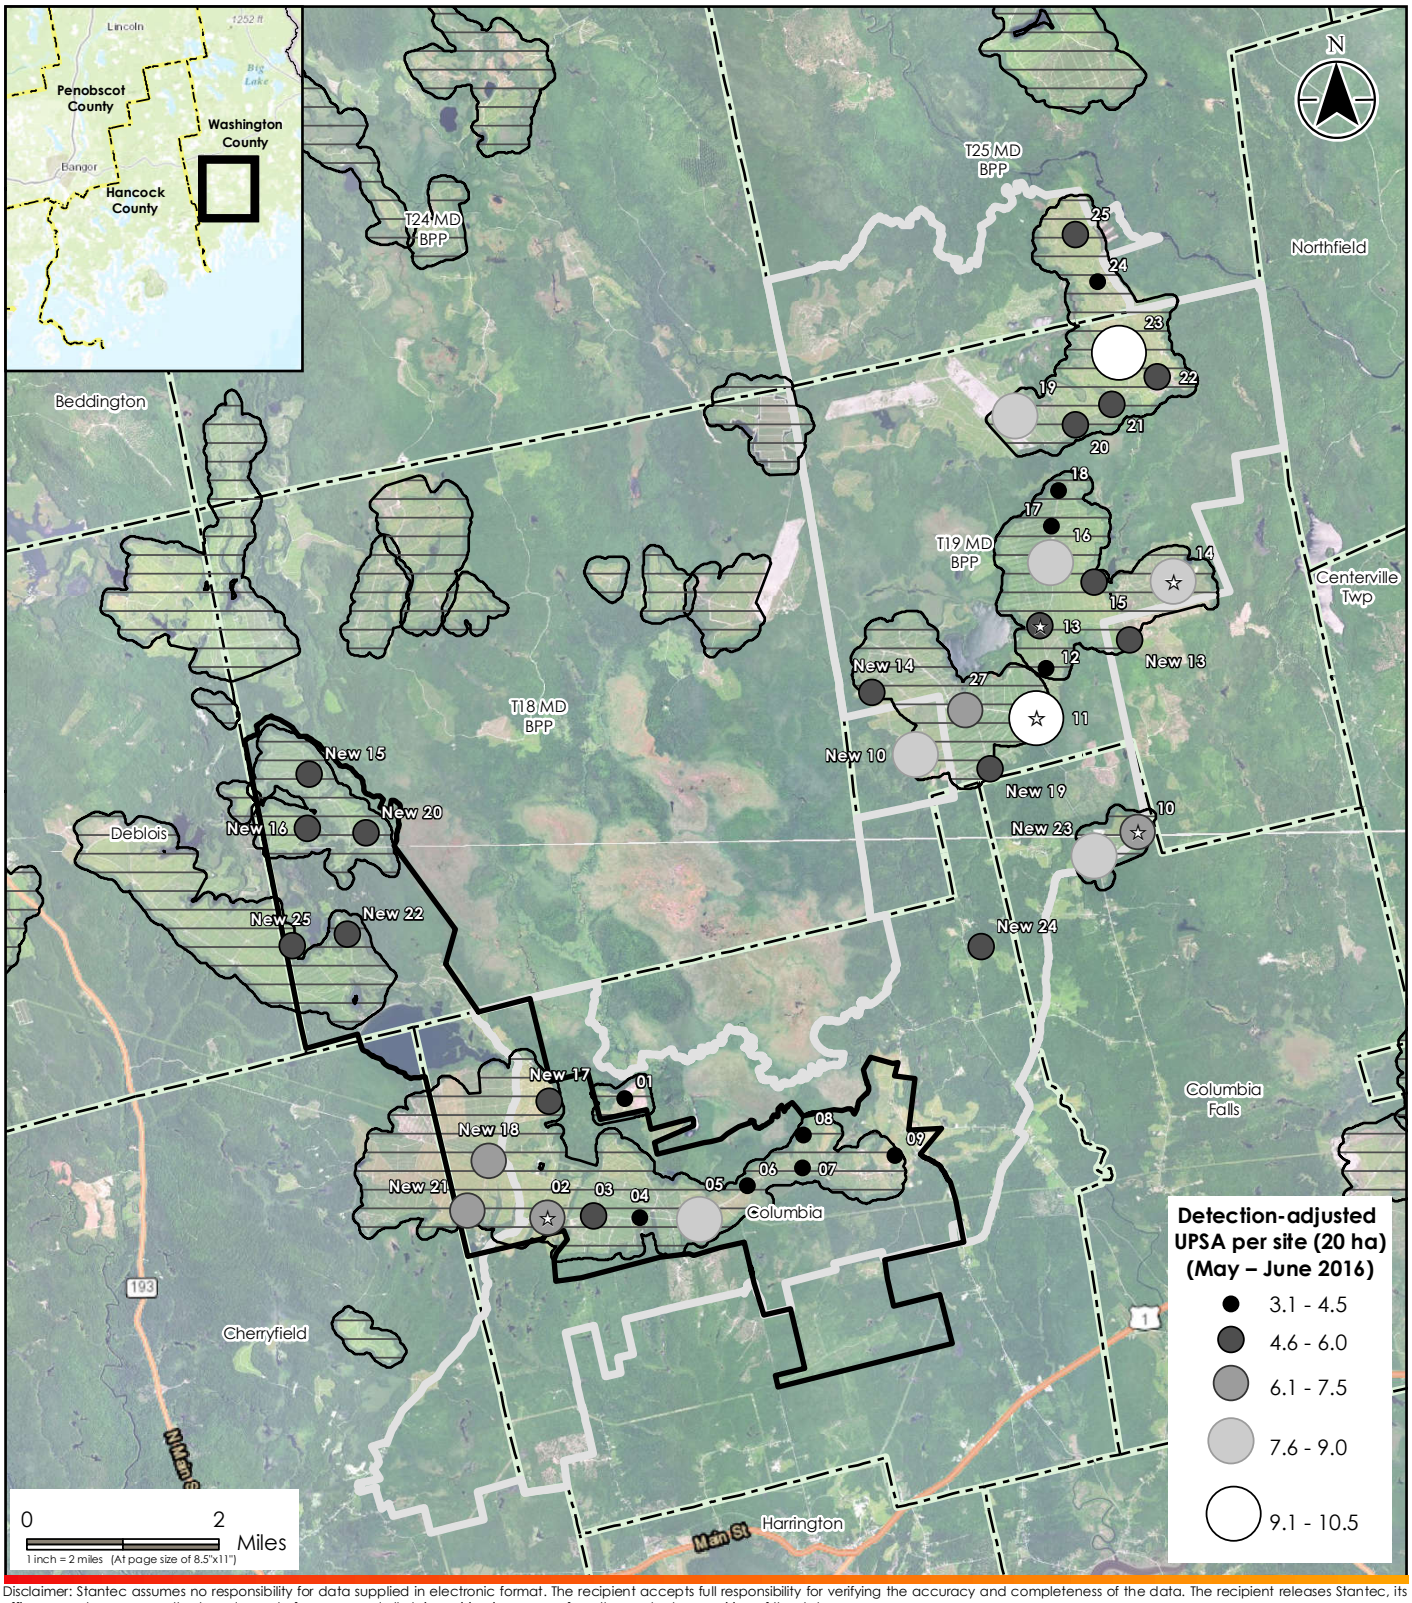

Figure 4. Upland sandpiper probability of detection (85% confidence interval) related to Julian day, DOW, Maine, 2016.

Mean detection-adjusted abundance (*N*) for the sample area was 5.7/site (95% CI = 2.9 – 11.0), and varied among sites (Figure 5). *N* at sites inside the Project area was 4.0 (95% CI = 1.2 – 12.9) and outside the Project area was 8.6 (95% CI = 2.8 – 26.4). Assuming a 1:1 sex ratio, the overall estimate of males was 114 (5.7 birds/site*40 sites = 228 birds*0.5). Given that each site was 48.5 acres (~20 hectares [ha]), the overall density estimate was 0.25 UPSA/ha.

Title

Detection-adjusted Upland Sandpiper (UPSA) Abundance

3.1.4 Vegetation Covariates

Vegetation was sampled at 26 of 40 sites (65%) on 22, 23, 24, 27, and 28 June, 2016. Grass, herbaceous, and shrub mean heights were strongly correlated with grass, herbaceous, and shrub maximum heights (Table 3-3), so maximum heights were excluded as model variables.

Table 3-3. Correlation values for vegetation variables sampled at sites for upland sandpiper surveys in Maine, 2016.

Model selection uncertainty was too high to base inference on a single model among competing hierarchical models with vegetation variables (Table 3-4). Model-averaged vegetation β indicated positive effects of grass cover (β = 0.37; 85% UCI = 0.11 – 0.62; Figure 6) and grass height (β = 0.28; 85% UCI = 0.04 – 0.52; Figure 7) on *N* (abundance; Table 3-5). Quadratic hierarchical models indicated that *N* initially increased and then decreased with increasing grass cover and height (Figure 8, Figure 9).

3.2 UPLAND SANDPIPER FALL STAGING SURVEYS

Fall staging surveys for UPSA were conducted between 24 July to 9 September at 26 survey sites, including all 16 inside and an additional 10 sites outside the Project area. UPSA were detected 8 times in the Project area at sites 4, 5, 6, 7, and 8, but staging behavior was not observed.

3.3 OTHER TARGET SPECIES

Three of the other target species were detected inside and all 4 species outside the Project area (Table 3-6), with vesper sparrow being the most frequent and widespread (56 recorded inside and 48 outside the Project area). Six whip-poor-will observations were recorded in the Project area (7 outside the Project area), all during spring evening counts. Three northern harrier observations were recorded in the Project area, 1during spring and 2 in fall, and 2 were recorded offsite. One whimbrel was detected offsite, flying near Site 21 in mid-August, and none were observed onsite.

Table 3-6. Summary of grassland bird species detected (other than upland sandpiper), at DOW, Maine, 2016.

Species	Total No. of Obs	No. of Obs Inside	No. of Obs Outside	Site	Dates of Observation	Behavior	Flight Height Range (m)

Whimbrel	1	0	1	21	8/18	flyover	< 25

4.0 DISCUSSION

4.1.1 UPSA Abundance

Survey sites in this study were located in large fields ranging from 50 ha to over 700 ha. Consistent with Vickery et al.'s findings (1994), in which UPSA were uncommon on sites with <50 ha of suitable habitat, UPSA were not detected at sites in the smallest fields (i.e., New 15 (85 ha), New 16 (56 ha), and New 20 (81 ha)), all located in the northwest portion of the Project area; however, it is important to note that these sites were added partway through surveys and were surveyed for fewer rounds than Sites 1–12, and on dates after 1 June. Surveys of these smaller

Business Confidential

patches during future breeding seasons are recommended to further evaluate presence and habitat suitability.

The adjusted density estimate form this study (0.25 UPSA/ha) is similar to the pair density estimate known for Maine in Kennebunk Plains in York County, which was estimated as 4-12 pairs/100 ha (0.08-0.24 UPSA/ha) (Vickery 1993 as cited in Weik 2000). It is important to note however, that the current study did not formally estimate the number of breeding pairs using the same methods as Vickery (1993), and the Vickery (1993) estimates did not account for incomplete detection and are therefore likely biased low. It is also important to note that the mobility and intermingling of courting UPSA causes difficulty for observers trying to accurately estimate numbers of breeding pairs (Weik 2000), as well as the fact that pairs likely move freely throughout feeding areas (Ailes 1976; MDIFW 2013). The detection-adjusted abundance estimates in the current study were more than double the unadjusted detection estimates. Unadjusted detections provided a mean estimate closer to 5 pairs/100 ha, which would place the Project area at the lower end of the density spectrum identified by Vickery (1993).

4.1.2 UPSA Habitat

The data and models used in this study indicate that UPSA abundance increased and then decreased with increasing grass height and cover. Although analyses conducted to date indicate that these relationships may be weak, findings imply that some habitats may be more desirable to UPSA. Additional data may improve the potential for these models to identify relationships between abundance and habitat characteristics.

Displacement of grassland birds as a result of the construction and operation of inland wind energy facilities has been documented (Pearce-Higgins et al. 2009, 2012). In Shaffer and Buhl's study of multiple species at 3 wind energy facilities (2015), they reported no significant change in UPSA nesting density at 1 wind facility, significant change within 100 m of turbines but no effect beyond that at another facility, and significant change beyond 300 m of turbines but no effect closer than that at another facility. Thus, for UPSA the observed extent of displacement (i.e., spatial) and the associated behavioral response (e.g., abandonment, change in nest density) has been inconsistent.

An example of an operating wind energy facility with UPSA presence is the Wolfe Island Wind Facility (Wolfe Island or facility) located in the Province of Ontario, in the northeast corner of Lake Ontario. This 86 turbine facility encompasses roughly 23,000 acres (9,000 ha), has high quality grassland habitat throughout the entire facility, and a high abundance and diversity of grassland breeding birds (Ontario Partners in Flight, 2006 as cited in Stantec 2011). Upland sandpipers are common breeders at the facility; pre-construction surveys resulted in calculated density estimates for UPSA of 3.10 pairs/10 ha in 2006 and 1.4 pairs/10 ha in 2007 (Stantec 2011). Consultants conducted post-construction fatality monitoring at Wolfe Island in 3 consecutive years: 2009, 2010, and 2011. In 2010, the second year of monitoring, consultants conducting post-construction fatality monitoring documented an UPSA nest on bare ground as close as 35 m from the nearest turbine (Stantec 2011). This nest was on the disturbed ground under a clump of weeds. During the same year the nest was found, Stantec conducted disturbance effects monitoring for multiple bird groups including grassland birds at Wolfe Island. Monitoring involved

Business Confidential

2 methods: pre/post construction point counts and paired point counts, which allowed for mapping bird occurrences in 100-m bands from the base of turbines. Results did not suggest avoidance of the most common grassland breeding birds, including upland sandpiper, around the wind turbines (Stantec 2011). Observed densities of upland sandpiper as measured by point counts decreased between year 1 and year 2 post-construction years, but the same trend was not observed during area searches. These data suggest that breeding UPSA may be insensitive to potential disturbance effects of operating wind turbines, but that intact habitat for courtship and nesting is likely important.

No other nesting data or displacement data are available for UPSA at operational wind projects; however displacement is not expected to be significant as a result of the Project. The Project area contains approximately 3,650 acres (1,477 ha) of blueberry barrens. Additional habitat is abundant in areas to the northeast, north, and west of the Project. The Project is not currently planning to eliminate or convert large portions of existing blueberry fields to disturbed or developed area; therefore, loss of habitat is expected to be minimal. Additionally, proximate suitable habitat exists for any birds that may be displaced by Project development. Because nesting may occur within suitable habitat at the Project, Project construction within suitable breeding habitat that occurs outside the May and June breeding season would eliminate risk of impact to nests. Clearance surveys could also be conducted in suitable habitat to allow construction in areas with confirmed absence.

4.1.3 UPSA Collision

The northward migratory route of the majority of UPSA in North America is known to occur over the American central flyway (https://migration.pwnet.org/pdf/Flyways.pdf), through the central portion of the US over Texas, Kansas, and Mississippi (Houston and Bowen 2001 as cited in Vickery et al 2010). They may migrate in greater numbers along the eastern coast of the US when flying south (Veit and Petersen 1993), though published evidence of this phenomenon is lacking.

There have been only 4 known, publicly available UPSA fatalities at operational wind facilities in North America to date. Three UPSA fatalities have been documented in 3 years of monitoring during the breeding season at Wolfe Island (Stantec 2010, 2011), and 1 fatality was documented at the Ainsworth Wind Facility (Ainsworth) in Brown County, Nebraska (Derby et al. 2007). Ainsworth is a 36-turbine facility encompassing approximately 8,300 acres (3,400 ha), the majority of which is native sandhills grassland used primarily for livestock grazing (Derby et al. 2007). Three of the 4 fatalities, including 2 fatalities at Wolfe Island and the single fatality in Nebraska, occurred during the breeding season in May and June. The fourth fatality occurred in August at Wolfe Island (Stantec 2010). These data suggest that UPSA are vulnerable to collision fatality, mostly during the breeding season, if impact avoidance measures are not implemented.

Two out of 6 courtship behaviors (33%) observed during this study occurred in the Project area at Site 2: one instance reached rotor-swept height, considered to be approximately 130 m to 180 m. The courtship display lasted for one minute and 15 seconds, and flights occurred at heights over 130 m for approximately 50 seconds. Collision during the breeding season at the Project is possible in areas where UPSA perform courtship displays; however, avoiding siting turbines in areas where UPSA are known to display is likely not necessary to reduce risk, so long as

Business Confidential

operational adjustments are implemented during this sensitive period in occupied courtship habitat. Based on this study, displays occurred twice as frequently in the morning hours than the evening hours, from 10 May to 24 May, suggesting that a time of day component may also be relevant to minimizing risk of impact to the species.

Of the 5 courtship displays documented during surveys (i.e., excluding the incidental observation on May 12), 3 (60%) occurred less than 50 m from the nearest perch and nearest road, and 4 (80%) occurred greater than 100 m from the nearest forest (these parameters are not mutually exclusive). These data suggest that UPSA are displaying in interior portions of fields, and not on forest edges; therefore, risk of collision or displacement impact may be further reduced by siting turbines near edges of the blueberry barrens. The number of courtship displays observed was too small to allow for statistical analysis, however with additional similar data, the significance of these parameters in predicting where displays are most likely to occur could inform siting and/or timing of potential turbine curtailment and limit the need for yearly site-specific studies. Based on the timing of this study, it is possible that UPSA could have been displaying prior to initiation of surveys in early May 2016; therefore, additional surveys are recommended to improve understanding of courtship.

Although UPSA presence in August was established, staging behavior was not observed. Staging areas are considered those areas used by shorebirds to feed and rest during only the migration season (MDIFW 2013). Shorebirds in Maine exhibit staging behavior, which is when individuals congregate in large groups in areas with high concentrations of food prior to the southward migration. For most shorebirds, areas with high concentrations of food are considered wetlands and coastal areas in the Gulf of Maine (MDIFW 2013). Since staging involving multiple individuals was not observed at this Project, and few UPSA detections occurred during the staging period, it is likely that only minor, if any, influx of migrant UPSA occurred during the 2016 staging period at the Project, and UPSA that bred in the Project area staged in areas outside the Project. Additional surveys are recommended to confirm absence or document potential annual variation in UPSA, or other target species, fall staging at the site.

5.0 CONCLUSIONS

Analyses of data collected during this study indicate the following:

1. UPSA occurred in the majority of MDIFW-identified suitable habitat within the Project area and offsite during the breeding season.

2. Courtship behavior was observed at 1 site in the Project area in 2016 within a relatively large area of suitable habitat.

3. Courtship behavior documented in and near the Project was most concentrated during the morning hours, which may have application in defining operational adjustment of turbines near suitable habitat if deemed appropriate.

4. Staging behavior was not evident at DOW or offsite study sites in 2016.

Business Confidential

5. Replicating and improving this study in 2017 (e.g., maximizing detection probability of UPSA based on 2016 results, augmenting the vegetation dataset, and investigating landscape-level parameters such as patch size) is appropriate to evaluate annual variation in UPSA use and augment the data collected in this study (i.e., increase sample size and statistical power), which may improve the ability to evaluate habitat and abundance relationships.

Appendix A. Field Survey Data Sheets

1.0 INTRODUCTION

Apex Clean Energy, Inc. (Apex) is developing the Downeast Wind Project (Project) in Washington County, Maine in the towns of Cherryfield, Columbia, Columbia Falls, Township T19 MD BPP, and Township T25 MD BPP (Figure 1). At this time, the Project is expected to generate up to approximately 90 megawatts of power and include up to 30 turbines. Turbines are expected to have a total height of approximately 183 meters (600 ft). Project infrastructure is expected to include underground collector lines, a generator lead transmission line, new and improved roads, a collection substation, an operations and maintenance building, and 2 or 3 permanent meteorological towers.

The Project area consists of actively managed blueberry fields and hills with mixed forest habitat. The western and central portions of the Project area have little topography and contain a network of dirt roads that intersect the blueberry fields. Other habitats in these portions include hedgerows, and small ponds. The northern and eastern portion of the Project area is more topographically variable, developed with residences, farms, fallow fields, paved roads, and mixed forest.

The upland sandpiper (UPSA; *Bartramia longicauda*) breeding population is listed as threatened in the state of Maine. Region-wide surveys have indicated that the core of the UPSA's range in New England and New York includes the blueberry barrens in Washington and Hancock counties (Weik 2000). MDIFW has mapped suitable breeding habitat for UPSA throughout the state, and 7 polygons are located within the Project area. While a few of these polygons are relatively small, 4 areas—In Township T19 and Columbia—are large. Overall, there are approximately 7,000 acres of mapped UPSA habitat within the Project area.

The blueberry fields in the Project area potentially provide suitable habitat for state threatened UPSA as well as four other species including northern harrier (*Circus cyaneus*), vesper sparrow (*Pooecetes gramineus*), eastern whip-poor-will (*Caprimulgus vociferus*)and whimbrel (*Numenius phaeopus*). Northern harrier, whimbrel, and eastern whip-poor will are state species of special concern. The vesper sparrow is not a state listed threatened, endangered, or species of special concern but was an additional species MDIFW expressed interest in. Apex has retained Stantec and Dr. Kimberly Peters to assess potential risk of impact to these species as a result of the Project and inform potential siting or operational considerations to avoid or minimize risk. Dr. Peters will oversee the development of the study design, implementation of field studies, and data analyses.

A previous study plan was provided to MDIFW on April 21, 2016. This study plan has been revised based on comments received from the MDIFW on April 29, 2016 and technical input provided by Dr. Kimberly Peters, an avian biologist with expertise on grassland birds, including UPSA.

Specifically, this study plan has been revised to:

- Clarify that a grassland bird expert will provide technical oversight of the study design, implementation, and data analyses;
- Clarify that other grassland bird species of concern including northern harrier, vesper sparrow, whimbrel, and eastern whip-poor-will will be surveyed during the field studies;
- Clarify the habitat data that will be collected at each point count location;
- Include refined mapping of potential grassland habitat;
- Include four additional potential survey point locations;
- Clarify survey timeframes and playback protocols; and
- Include an additional field survey in early September during the staging period

The survey methodology outlined in this work plan is based on protocols for 1) assessing UPSA presence from the Wisconsin Department of Natural Resources and Pennsylvania Game Commission, 2) modeling habitat suitability from the Pennsylvania Game Commission, 3) feedback from the MDIFW, and 4) expert consultation with Dr. Peters.

2.0 UPLAND SANDPIPER BACKGROUND

An estimate of UPSA in Maine in the 1990s was approximately 160 pairs (Weik 2000). UPSA inhabit grasslands including hay fields, lightly grazed pastures (Ailes 1976, Bowen 1976, Bowen and Kruse 1993 as cited in Weik 2000), agriculture fields, grass portions of airfields (Osborne and Peterson 1984, Vickery et al. 1994 as cited in Weik 2000), large peatlands (Weik and Purtell 2000 as cited in Weik 2000), and shrub-dominated sites such as lowbush blueberry barrens (Weik 2000). In Maine, particularly in grassland and large commercial blueberry barrens, upland sandpipers are uncommon on sites < 50 hectares (124 acres) and have a 50% incidence rate on sites roughly 200 hectares (494 acres) (Vickery et al. 1994 as cited in Weik 2000). In Washington County, UPSA lay eggs between mid-May and mid-June, and eggs hatch between mid-June and mid-July (Weik, unpublished data, as cited in Weik 2000).

The courtship behavior of UPSA poses potential risk to siting and operation of wind projects. During courtship displays, male sandpipers fly with short bursts of alternating rapid flight and long gliding in circular or elliptical patterns as high as 200 m (656 ft) above the ground (Weik 2000). These vertical displays can reach heights within the rotor-swept zone of turbines. To date, there have been 4 publicly-known UPSA fatalities at wind facilities, 1 in Nebraska (Derby et al. 2007) and 3 at an island wind project in Ontario (Stantec 2010, 2011). Three of the 4 fatalities, including 2 fatalities in Ontario and the single fatality in Nebraska, occurred during the breeding season in May and June. The fourth fatality occurred in August. In the same year that the August fatality

was documented at a wind project in Ontario (2009), an UPSA nested on the bare ground as close as 35 m from the nearest turbine (Stantec 2010).

3.0 2016 FIELD SURVEY OBJECTIVES

Objectives of the 2016 grassland bird surveys are to:

- document and locate occurrences of sensitive grassland bird species in the Project area including UPSA, northern harrier, vesper sparrow, eastern whip-poor-will, and whimbrel;
- characterize the associated habitat through quantitative assessments of vegetation;
- refine currently mapped UPSA habitat polygons based on field studies and observations;
- estimate the approximate number of displaying males;
- document the timing and characteristics of flight displays (i.e., flight heights, percent within the rotor-swept zone (RSZ), and time spent in the RSZ);
- document locations of upland sandpiper and whimbrel staging areas for fall migration and, if present, their general behavior during staging; and
- assess potential risk of impact to the species as a result of the Project and inform potential siting or operational considerations to avoid or minimize risk.

Depending on the presence of UPSAs, two secondary objectives may be to

- model abundance via an occupancy model (Royle and Nichols 2003, Royle 2004); and
- model habitat suitability.

4.0 2016 FIELD SURVEY METHODS

Field surveys will be completed at least once per month from May through September. Surveys will occur during the breeding season including the period of territory establishment and courtship as well as the nesting period. Surveys will also occur during the late summer staging period.

4.1 BREEDING SEASON SURVEYS

Surveys will occur during the 2016 breeding season from early May before egg-laying to late June when birds are on eggs or eggs hatch. Each point will be surveyed during three survey events in May and two survey events in June by a Stantec bird biologist with experience and expertise in grassland bird species: 2 survey events will occur in May targeting territory establishment and displaying periods, 1 survey event will occur in late May targeting nesting, and 2 survey events will occur in June targeting nesting. Morning and evening surveys will be conducted during each survey event. The two survey events conducted during the territory establishment and courtship period will result in each point being surveyed twice in the morning and once in the evening. The three survey events conducted during the nesting period will result in each point being surveyed three times in the morning and once in the evening. The temporal

distribution of the surveys will be randomly assigned. Surveys will occur in all weather conditions except for in heavy rain or high winds where visual or auditory detections would be impaired.

Surveys will occur at 29 points with a 250-meter (m) radius. Points generally will be centered on existing roads (Figure 1). Survey points were identified based on logistical (e.g., road access) and landowner accessibility as well as adequate coverage of MDIFW mapped UPSA habitat. Four of the 29 survey point locations are potential survey point locations as landowner permission is pending for access to this potential habitat area. These points will be included in the 2016 survey area if landowner permission is obtained. In the absence of survey data for these locations, and if project infrastructure is proposed within this area, potential UPSA use will be extrapolated for this area based on an analysis of utilization and distribution data obtained elsewhere in the project area with similar habitat conditions. UPSAs may be assumed to be present if necessary.

Morning surveys will occur one-half hour before sunrise until 10:00 AM. Evening surveys will be completed one hour before sunset until one hour after sunset.

At each point, a Stantec biologist will conduct a visual survey for 10 minutes, scanning 360° around the survey point with binoculars and/or a spotting scope to search and listen for UPSA and other sensitive grassland bird species. The biologist will scan fence posts, sign posts, utility wires, and any other potential perches and over fields. If no UPSAs are documented after the visual and auditory survey, the Stantec biologist will broadcast an UPSA call over a 1-minute period to attempt to elicit a territorial call or response call indicative of breeding individuals. After the call broadcast period, Stantec will listen for an additional 4 minutes for a response.

In order to minimize the potential for duplicating or influencing bird counts during call broadcasts, point locations that abut each other will not be surveyed consecutively if the biologist determines that call broadcasts could potentially be heard in the adjacent survey point area.

Locations of UPSAs and other target grassland bird observations will be mapped within the 250-m radius point circle. Data will be recorded on the Grassland Bird Survey Field Data Form (Appendix A). Other non-target bird species observed during grassland surveys will be recorded as incidental observations.

Habitat data will be collected from each of the survey points in June. At each survey point, a 1-m × 1-m quadrat will be established 100-m in each cardinal direction from the center of the survey point location (i.e., 4 total quadrats per point). If a quadrat occurs on or within 25 m of a road, the plot will be moved 50 m into the grassland/blueberry field area perpendicularly from the road. Data for each observation will be recorded on the Grassland Brid Survey Habitat Data Form (Appendix A). Size of contiguous field will be estimated using desktop GIS analysis. Other landscape characteristics will also be estimated using GIS as available and appropriate (e.g. distance from tree line).

Observations of UPSA and other sensitive grassland bird species made while conducting other on-going field surveys such as eagle point counts, diurnal raptor surveys, breeding bird surveys, or other site visits will also be documented using the Grassland Bird Survey Field Data Form and the location of the observation will be sketched onto field maps.

4.2 FALL STAGING SEASON SURVEYS

Surveys will occur during the 2016 fall staging period from late July to early-September at the same points as spring surveys. Each point will be surveyed three times in the morning, once in late July, once in mid-August, and once in early September. Evening surveys will be completed once at each survey point during the fall staging period. Methodology at points will be the same as in spring.

Observations of UPSA and other sensitive grassland bird species made while conducting on-going field surveys such as eagle point counts, diurnal raptor surveys, and site visits will be documented using the Grassland Bird Survey Field Data Form and the location of the observation will be sketched onto field maps.

5.0 DATA ANALYSIS AND REPORTING

Data will be summarized in a single report to include an introduction, methods, results, and discussion sections. Photographs and figures will be included as appropriate. Maps of the Project area showing display sites and staging areas will be included as appropriate.

Stantec will use occupancy modelling methods to estimate grassland bird abundance for target grassland species as appropriate based on sample size (Royle and Nichols 2003, Royle 2004). Habitat and survey timing (i.e., morning vs. evening) parameters will be included as covariates in occupancy models as appropriate, and all model results will report potential biases (MacKenzie 2005). Stantec will perform density mapping to identify areas with the greatest concentration of UPSA abundance, UPSA activity, and other sensitive grassland bird observations. UPSA habitat suitability will be assessed and mapped based on relevant landscape parameters using kernel or other resource utilization function methods (Hegel et al. 2010). If appropriate, utilization distribution modeling (e.g., Keating and Cherry 2009) will be completed to evaluate suitability of proposed development areas in potential grassland bird habitat that may have been inaccessible at the time of the field studies (e.g., landowner permission not obtained prior to conducting surveys).

The report will assess risk of impact to the species as a result of Project construction and operation based on qualitative and quantitative results, and will provide considerations to avoid or minimize risk. The final report will be provided to the MDIFW along with appropriate data, maps, and photographs.

LIST OF APPENDICES

APPENDIX A DRAFT WORK PLAN FOR 2017 GRASSLAND BIRD SURVEYS – PROPOSED DOWNEAST WIND PROJECT A.1

APPENDIX B COURTSHIP DATA TABLES B.1

Business Confidential

Executive Summary

Stantec completed a grassland bird study for the proposed Downeast Wind Project (DOW or Project) in Washington County, Maine, during the spring breeding and fall staging seasons in 2016 and 2017.The spring surveys were completed in morning and evening hours of the courtship and nesting seasons (May and June). The fall surveys were completed in the morning and evening hours of the fall staging period (July–October). The target species of the surveys was upland sandpiper (*Bartramia longicauda;* UPSA) and, per request of the Maine Department of Inland Fisheries and Wildlife (MDIFW), also included vesper sparrow (*Pooecetes gramineus*) and the following state Species of Special Concern: northern harrier (*Circus cyaneus*), eastern whip-poor-will (*Caprimulgus vociferus*), and whimbrel (*Numenius phaeopus*). The main purposes of the surveys were to document and locate occurrences of these species in and in the vicinity of the Project area, to characterize UPSA flight displays, to model the characteristics of occupied UPSA habitat, and to inform potential siting or operational strategies to avoid or minimize risk to UPSA and target species.

Point counts for UPSA and target species were completed at a total of 69 sites between May 9 and June 23, 2016, and April 24 and June 16, 2017 (mean = 6.3, SE = 0.3, surveys/site; range = 2 – 9). UPSA were detected at 43 of 69 sites (62% occurrence) during the 2 seasons of surveys, including at 17 of 36 (47%) sites inside and 26 of 33 (79%) sites outside of the Project area. UPSA were detected 155 times (mean detections/survey/site = 0.4; mean maximum detections/site = 1.4; mean total detections/site = 2.2). Abundance estimates were calculated using hierarchical models that explicitly accounted for detection error (i.e., birds present but not detected) and effort at each site. Assuming a 1:1 sex ratio, the overall 2016-2017 estimate of breeding pairs was 81 ((4.7 birds/site*69 sites)/2 years) = 162 birds*0.5 females). Given that each site was 48.5 acres (~20 hectares [ha]), the overall density estimate was 0.24 UPSA/ha/year.

In spring 2016 and spring 2017, UPSA courtship behaviors were observed on 16 occasions from May 3 to June 16. Courtship was observed inside the Project area on 4 occasions at 4 sites and outside the Project area on 12 occasions at 7 sites. Maximum height of courtship displays ranged from < 25 m to > 500 m, and all were > 50 m from forest edges.

In spring and fall 2017, within the Project area, 148 vesper sparrow, 2 eastern whip-poor-will, 5 northern harrier, and 0 whimbrel observations were recorded. In spring and fall 2016, within the Project area, 56 vesper sparrow, 6 eastern whip-poor-will, 3 northern harrier, and 0 whimbrel observations were recorded.

The 2016-2017 dataset indicated the following key findings:

1. UPSA were documented during the breeding season within MDIFW-mapped suitable habitat polygons.
2. Density and abundance of UPSA during the breeding season was significantly higher in areas outside the Project area than onsite in both years (44 UPSA detections inside the Project area [mean detections/survey/site = 0.2; mean maximum detections/site = 0.8;

Business Confidential

mean total detections/site = 1.2]; and 111 UPSA detections outside the Project area [mean detections/survey/site = 0.6; mean maximum detections/site = 2.1; mean total detections/site = 3.4]).

3. UPSA abundance was higher at sites in and near the Project area within larger fields ($\beta_{field.size}$ = 0.31; 85% unconditional confidence intervals [UCI] = 0.10 – 0.52), and no UPSA were documented in fields < ~90 acres (35 ha) at onsite or offsite locations.
4. UPSA abundance was lower at sites inside the Project area containing greater proportions of tree cover within a 250-m radius (i.e., average forest in each site plot; β_{forest} = - 0.23; 85% UCI = - 0.44 – - 0.02).
5. The probability of courtship behavior in and near the Project decreased as the hour of the day increased (β_{hour} = - 0.77, 95% confidence intervals [CI] = - 1.49 – - 0.06, p = 0.035); with 70% of morning courtship instances occurring between 5:30 and 7:30 AM.
6. The probability of courtship behavior in and near the Project increased with decreasing cloud cover (β_{cloud} = - 0.92, 95% CI = - 1.54 – - 0.30, p = 0.004).
7. 98.8% of UPSA detections and 100% of UPSA courtship displays documented in and near the Project occurred > 50 m from the nearest forest edge.
8. Target species, including UPSA, did not exhibit staging behavior in the Project area.

Results of this study indicate that siting turbines away from interior areas where courtship occurs or adjusting operations during higher risk periods is likely to reduce risk of collision mortality. Based on the 2016-2017 study, to minimize the risk of potential collision of UPSA with operational turbines, turbines should be limited near Sites 11, 12, 15, and 19 and be sited as close to forest edges as possible, or operational curtailment should be implemented under the following conditions: May 1–June 20, from sunrise to 10:00 AM, on days with clear to partly cloudy skies.

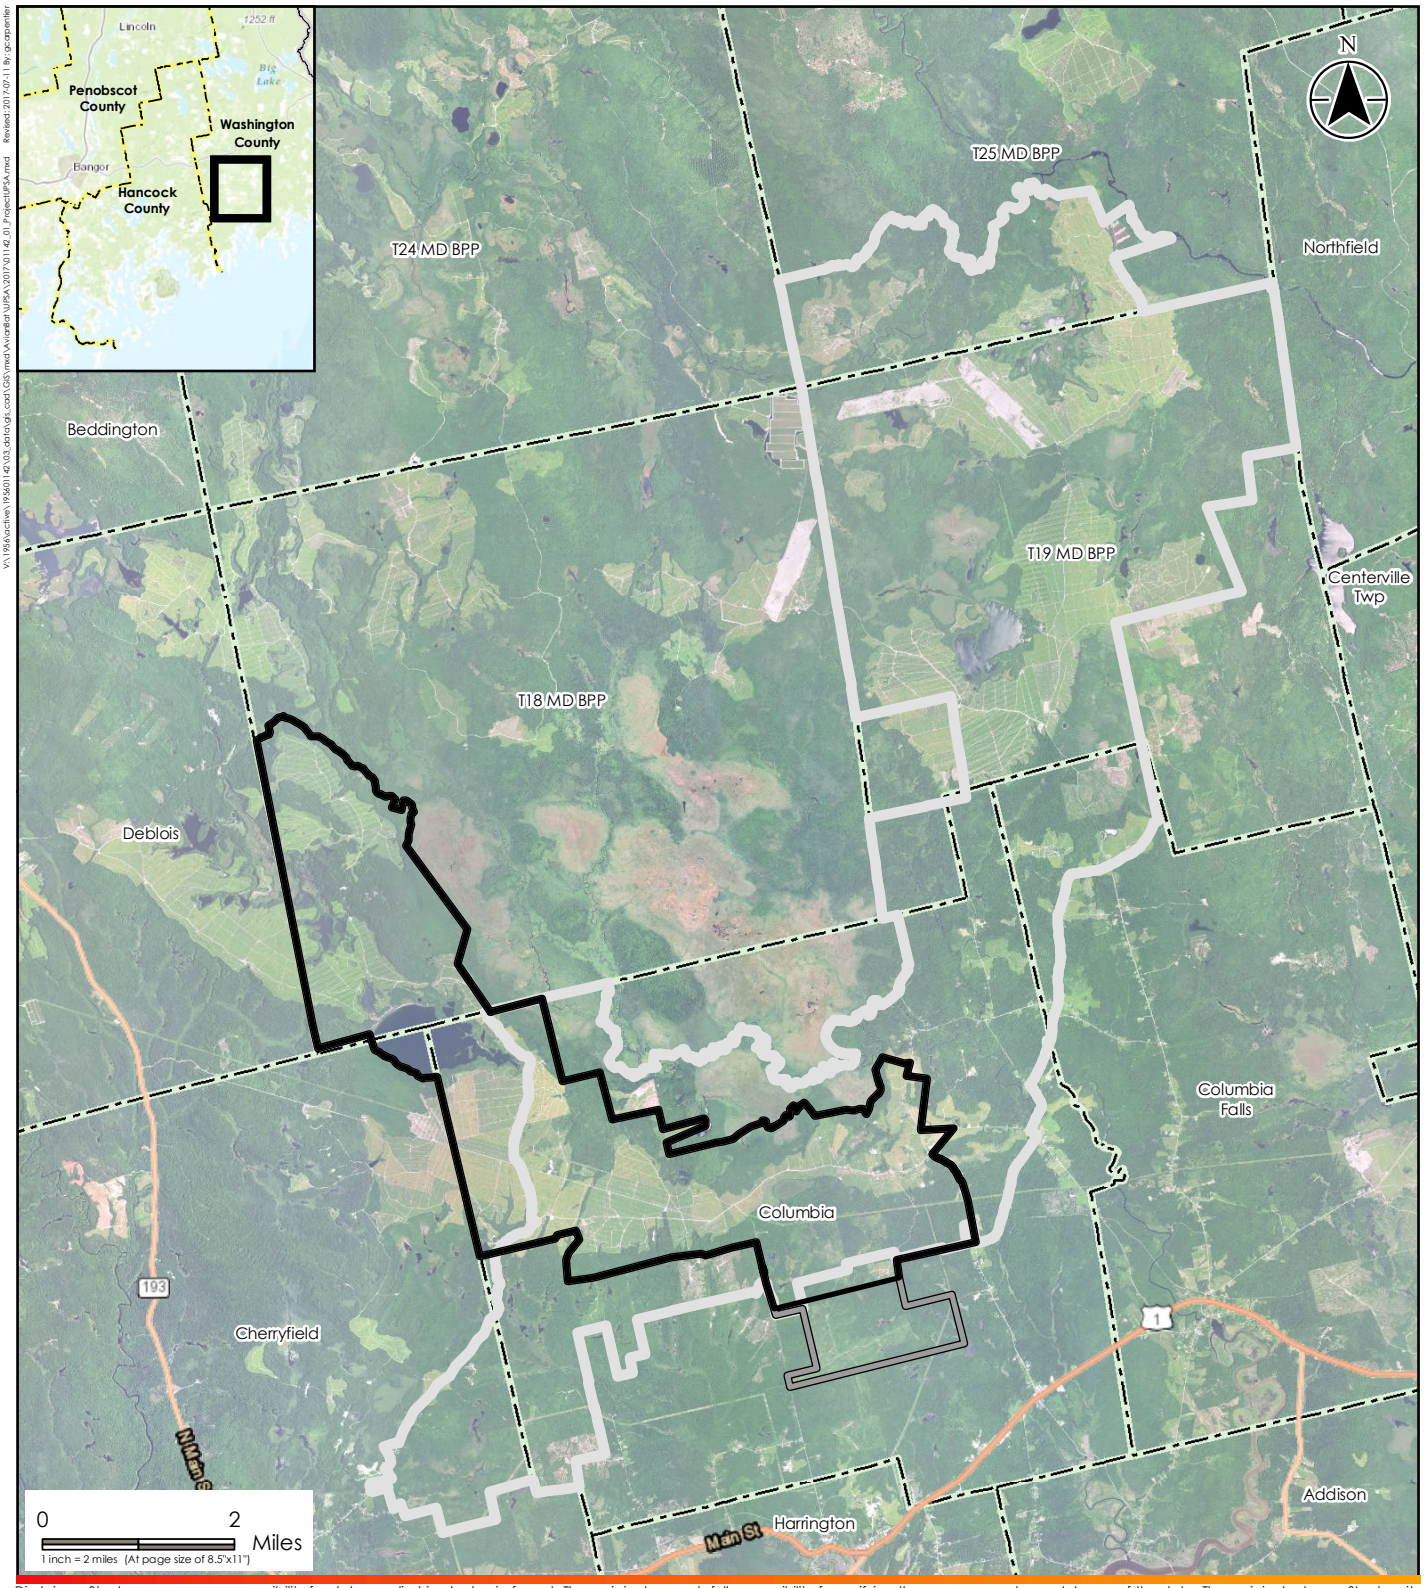
1.0 INTRODUCTION

Stantec completed a grassland bird study on land in and adjacent to the proposed Downeast Wind Project (DOW or Project) in Washington County, Maine, during 2016 and 2017 (Figure 1-1). Results of the 2016 survey are summarized in Grassland Bird Surveys Downeast Wind Project – May to September 2016 (2016 Grassland Bird Report; Stantec 2017). Results and analyses presented in this report represent combined data collected during the 2016 and 2017 surveys.

The target species of the grassland bird survey was upland sandpiper (*Bartramia longicauda*; UPSA) and, per request of the Maine Department of Inland Fisheries and Wildlife (MDIFW), also included vesper sparrow (*Pooecetes gramineus*) and the following state Species of Special Concern: northern harrier (*Circus cyaneus*), eastern whip-poor-will (*Caprimulgus vociferus*) and whimbrel (*Numenius phaeopus*).

Objectives of the grassland bird study were to:

1. Document and locate occurrences of sensitive grassland bird species in the Project area.
2. Estimate UPSA arrival dates.
3. Estimate the number of displaying UPSA males and breeding UPSA.
4. Document the timing and characteristics of flight displays (i.e., flight heights, percent within the rotor-swept zone, and time spent in the rotor-swept zone).
5. Document locations of UPSA and whimbrel staging areas for fall migration and, if present, their general behavior during staging.
6. Model the characteristics of occupied breeding habitat through quantitative assessments of vegetation and landscape features.
7. Refine currently mapped UPSA habitat polygons based on field studies and observations.
8. Assess potential risk of impact (collision and/or displacement) to UPSA as a result of the Project and inform potential siting or operational strategies to avoid or minimize risk.



The 2016 and 2017 study objectives and methods were determined in coordination with MDIFW. The timeline for communication with MDIFW is as follows:

- The 2016 draft study plan was provided to MDIFW on April 21, 2016.
- MDIFW commented on April 29, 2016, and the draft study plan was revised on May 16, 2016, to incorporate MDIFW's comments.
- Dr. Kimberly Peters of DNV GL, an avian biologist with expertise on grassland birds including UPSA, joined the Project team.

BUSINESS CONFIDENTIAL

- Meeting with MDIFW on January 19, 2017, to review results of the 2016 study. MDIFW requested that the 2017 study be initiated earlier by 1 week and extend later by 1 week than the 2016 study.
- The draft 2017 study plan was provided to MDIFW on February 10, 2017. It incorporated MDIFW's request to extend the study period.
- Meeting with MDIFW on March 2, 2017, to further discuss the 2016 grassland bird study results. MDIFW verbally approved the 2017 draft study plan.
- Meeting with MDIFW on May 31, 2017, to preliminarily discuss an Incidental Take Permit.
- Meeting with MDIFW on July 13, 2017, to discuss the 2017 study results and potential mitigation options.

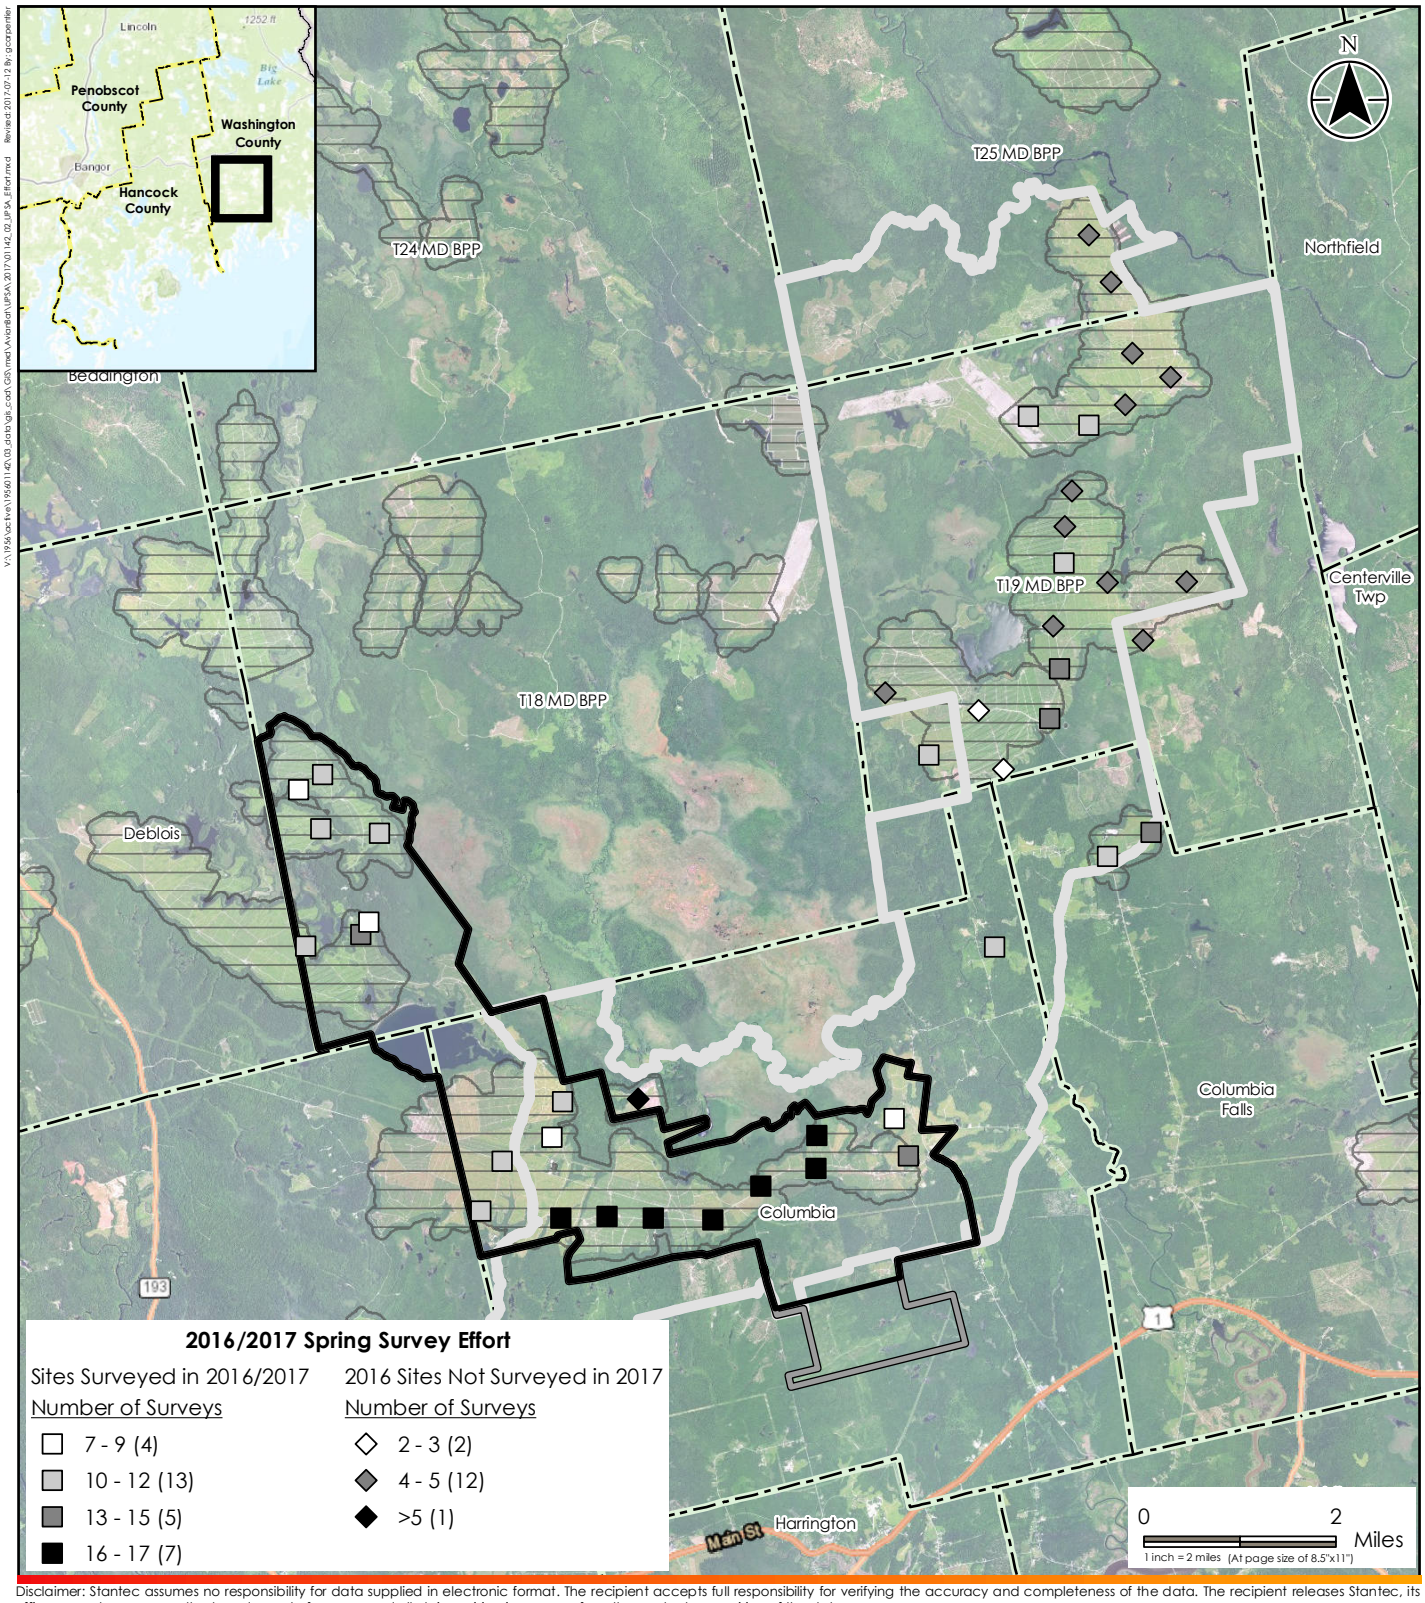
2.0 METHODS

This section describes the field survey and data analysis methods. Survey methods followed those described in the *Draft Work Plan for 2017 Grassland Bird Surveys – Proposed Downeast Wind Project* (Appendix A).

2.1 FIELD SURVEY

The 2016 and 2017 field surveys were completed by Mark DiGirolamo, whose past experience includes conducting presence/absence UPSA surveys in Maine and other states in the region in the late 1990s under the direction of Peter Vickery and Massachusetts Audubon and subsequently under Andrew Wiek and MDIFW.



Each year of field surveys comprised 2 periods: the courtship/nesting period and the fall staging period. The courtship/nesting surveys occurred from May 9 to June 23, 2016, and from April 24 through June 16, 2017. The fall staging period occurred from July 24 through September 9, 2016, and from August 7 to October 5, 2017.

The 2017 survey consisted of point counts completed at 29 sites within and in the vicinity of the Project area including:

1. All 2016 sites (n = 16) within or directly adjacent to the current Project boundary (Figure 2-1; see Stantec 2017 for 2016 site locations).
2. An additional 4 sites centered at the bases of 4 meteorological (met) towers installed in 2016.
3. Nine sites located outside of the Project that were surveyed in 2016. Sites were selected to provide representation of all offsite grassland patches.

A full description of the 2016 field survey effort is provided in Stantec 2017 and the combined 2016-2017 effort is summarized in Figure 2-1 and Table 2-1.

Each point count site was centered on a circular plot with a 250-m radius. Sites were visited in both morning and evening. Morning point counts occurred 0.5 hour before sunrise until 10:00 AM. Evening point counts occurred 1 hour before sunset until 1 hour after sunset. In 2017 during the courtship period, each site was visited 3 times in the morning and up to 3 times in the evening; during the nesting period, each site was visited 2 times in the morning and 1 time in the evening; and during the fall staging period, each site was visited 3 times in the morning and 1 time in the evening. Similar schedules were followed in 2016, although Project modifications required the addition of several new survey points mid-season that were consequently not sampled during courtship (Stantec 2017). Sites were visited systematically within morning or evening survey rounds based on geographic proximity; however, each survey round was initiated at a different site than the previous round, resulting in broad temporal coverage of all sites. Point counts occurred in all weather conditions except in heavy rain or high winds where visual or auditory detections would be impaired. Weather variables were recorded by the observer from ground level immediately prior to the start of each point count.

Passive visual counts were completed for 10 minutes, scanning 360° with binoculars and/or a spotting scope to search and listen for target species. The observer scanned fence posts, sign posts, utility wires, and any other potential perches and over fields. In 2017, the passive count was followed by a 5-minute active count, during which the observer broadcasted an UPSA call for 1 minute to attempt to elicit and detect territorial or response calls over the subsequent 4 minutes of the count. In 2016, the 5-minute active count was completed only if UPSA were not detected during the passive count.

The locations of target species were recorded on maps depicting site plots for reference. Data were recorded on Stantec datasheets. Other, non-target bird species detected during point counts were recorded as incidental observations.

Habitat and vegetation data were collected in June when most vegetation expected to be present would be mature. At each site, a 1-m × 1-m quadrat was established 100-m in each cardinal direction from the site center, resulting in 4 total quadrats per site. If a quadrat occurred on or within 25 m of a road, the plot was moved 50 m into the grassland/blueberry field area perpendicularly from the road.

2.2 STATISTICAL ANALYSIS

2.2.1 Courtship Flight Models

Generalized linear binomial models ("logistic regressions") were fit in R (R Development Core Team 2016) to explore relationships between probability of courtship flight occurrence and weather variables. A set of 8 competing models were fit, including a null model; models parameterized with variables representing temporal effects (hour and Julian day) and weather effects (ambient temperature, wind speed, wind direction, and cloud cover); and a global model containing all variables. Selection and inference were made from the most informative model(s) by ranking model Log likelihoods, Akaike's Information Criteria with second-order bias correction for small sample sizes (AICc), and proportional weights (*w*; Burnham and Anderson 2002, Anderson 2008). Coefficient/parameter (β) and abundance (*N*) estimates were reported with 95% confidence intervals (CI) or 85% unconditional confidence intervals (UCI) as appropriate. Covariates were considered to have positive or negative relationships with *N* if CI or UCI for β did not overlap zero (Bolker 2008, Arnold 2010).

2.2.2 Abundance Models

Hierarchical models of abundance were fit to data representing site-specific detection histories of UPSA. That is, the repeated counts per site over time represent temporally replicated sampling events that allow for estimation of detection probability and detection-adjusted abundance (Mackenzie et al. 2002, Royle 2004, Royle and Dorazio 2008). The primary assumption for the hierarchical model of abundance is that the population is closed during the sampling period, i.e., births, deaths, immigration, and emigration were infrequent enough to have negligible or no influence on the accuracy and precision of our estimates of abundance and covariate parameters.

Prior to selecting model parameters, multi-collinearity among vegetation variables was assessed because relatively high levels of correlation among covariates in models can inflate variance, reduce statistical power, and bias parameter estimates (Graham 2003, Freckleton 2011). A correlation matrix was used to calculate Pearson correlation coefficients (*r*) for each pair of numeric vectors representing the vegetation covariates included in the abundance models. Covariates were not excluded solely on exceeding an arbitrary value of r. Instead, covariate exclusion was based on quantitative evidence (i.e., r) and qualitative biological evidence (i.e., our understanding of the correlative or causative relationships of vegetation structure in the field) (Graham 2003). Typically, one covariate of an associated pair was retained for analysis.

Hierarchical models were fit to estimate detection probability, abundance, and relationships between abundance and covariates using the "unmarked" package (Fiske and Chandler 2011) for R (R Development Core Team 2016). First a set of 12 competing models parameterized with variables that we hypothesized could influence detection probability were fit, while abundance was parameterized with only the *y*-intercept. The model set included 1) a null model (i.e., only the *y*-intercept for detection); 2) models containing single covariates representing time-of-day,

BUSINESS CONFIDENTIAL

Julian day, wind speed, and ambient temperature; 3) 6 models containing all combinations of 2 additive covariates; and 4) a global model containing all 4 additive covariates.

Next, the influential detection variables were included in multiple sets of hierarchical abundance models to determine factors associated with UPSA abundance, including:

1. Models comparing mean abundance among sampling years (2016 vs. 2017).
2. Models comparing mean abundance among sites on and off the project area (onsite vs. offsite).
3. Models comparing mean abundance among sites with presence/absence of met towers.
4. Models parameterized with vegetation structure covariates; covariates included horizontal cover of bare ground and horizontal cover and mean height of grass, shrubs (including lowbush blueberry [Vaccinium angustifolium]), and herbaceous plants.
5. Models parameterized with landscape composition (mean area per land class) covariates. 2015 National Agriculture Imagery Program (NAIP) digital orthophotos and 2010 Microsoft Digital Globe aerial photos available through ESRI's World Imagery web mapping service were used in ArcGIS 10.4.1 to calculate mean area per land class within the 250-m radius plots. Landscape-based abundance models were parameterized with variables representing mean area for the 3 most dominant land classes, including shrub/scrub, representing primarily the blueberry crops used by UPSA as nesting habitat, and mixed forest (merged with forested windrows) and developed areas (e.g., roads and structures), representing landscape features fragmenting nesting habitat. Field size (hectares [ha]), distance to nearest forest edge, and distance to nearest hedgerow were added as additional parameters. Field size was coarsely determined based on the criteria that only "main" roads (i.e., Schoodic Pond Road, Schoodic Road, Baseline Road, Montegail Road) were considered field boundaries, in addition to forests or ponds. These criteria are consistent with findings that most species grassland birds do not appear to avoid or alter their behavior proximal to low-traffic roads (Lituma and Buehler 2016; Sliwinski and Koper 2012).Values were standardized by centering (subtracting variable means) and scaling (dividing by standard deviation) to enable comparison of model coefficients for variables with different units (e.g., field area measured in ha versus distances measured in m) and optimize convergence on maximum likelihood estimates prior to model fitting.
6. Models parameterized with the quadratic forms of vegetation covariates.

The most informative models were selected by ranking model Log likelihoods, AICc, and *w*, and β and *N* estimates were model-averaged with the AICcmodavg package (Mazerolle 2017) for R (R Core Development Team 2016) to make multi-model inferences when model-selection uncertainty was high (i.e., when *w* for the top-ranked model was < 0.90) (Burnham and Anderson 2002, Anderson 2008). β and *N* were reported with 95% CI or 85% UCI for model-averaged estimates (Burnham and Anderson 2002, Arnold 2010). Covariates were considered to have positive or negative relationships with *N* if CI or UCI for β did not overlap zero (Bolker 2008, Arnold 2010).

BUSINESS CONFIDENTIAL

3.0 RESULTS

3.1 UPLAND SANDPIPER COURTSHIP FLIGHTS

Surveys for UPSA occurred at a total of 69 sites between May 9 and June 23, 2016, and April 24 and June 16, 2017 (mean = 6.3, SE = 0.3, surveys/site; range = 2 – 9), including 36 sites inside and 33 sites outside of the Project area (Figure 2-1). In 2016, 5 courtship flights were observed, and in 2017, 11 courtship flights were observed, for a total of 16 flights out of 436 sampling events (4% occurrence; Table 3-1). Models were fit to the pooled 2016 and 2017 flight occurrence (1/0 binary) data, with flight duration, maximum flight height, flight duration at heights > 130 m, and weather variables including ambient temperature, wind speed, and percent cloud cover as predictor variables. Models indicated cloud cover was the most influential variable, such that probability of flight occurrence increased with decreasing cloud cover (β_{cloud} = - 0.92, 95% CI = - 1.54 – - 0.30, p = 0.004; Table 3-2, Figure 3-1.). The second most probable model, parameterized with hour, indicated a declining likelihood of observing courtship flights as the hour of the day increased (β_{hour} = - 0.77, 95% CI = - 1.49 – - 0.06, p = 0.035; Table 3-2, Figure 3-2).

Table 3-1. Upland sandpiper courtship flights observed per survey; courtship flight duration (total seconds), maximum height (m), and duration (seconds) at greater than 130 m height; and ambient temperature (°C), wind speed level (0=<2 kilometers per hour [kph]); 1=2–5 kph; 2=6–12 kph; 3=13–19 kph; 4=20–29 kph), and cloud cover (%) associated with courtship flights at DOW, Maine, 2016 – 2017.

BUSINESS CONFIDENTIAL

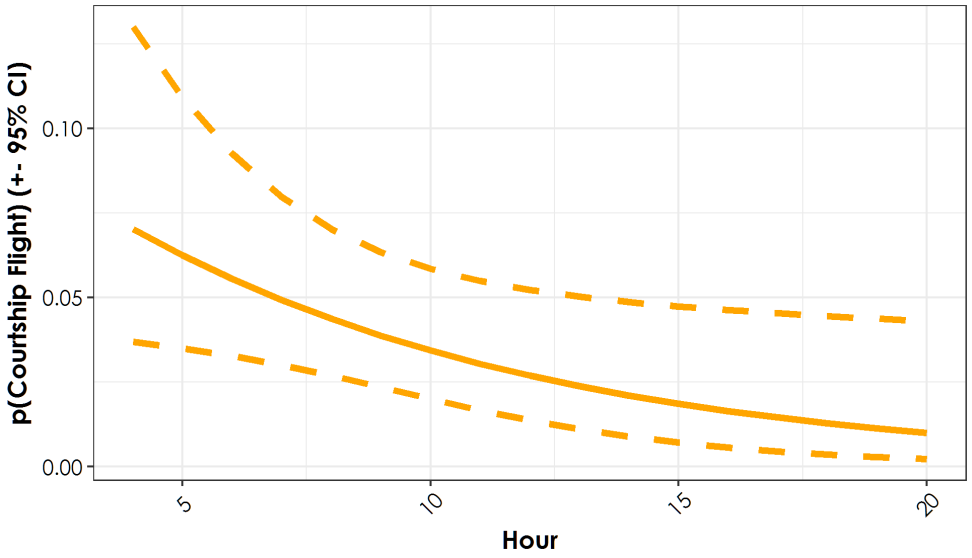

Figure 3-2. Probability of courtship flight occurrence (± 95% confidence intervals) versus hour, DOW, Maine, 2016 – 2017.

Courtship was observed inside the Project area at Sites 11, 12, 15, and 19 and outside the Project area at 7 sites. Of the 9 courtship displays documented in 2017 that had accompanying perch data, 2 (18%) occurred from perches, 5 (45%) occurred < 100 m from perches, and 2 occurred > 100 m from perches. Similarly, in 2016, 60% of courtship instances (n = 3) occurred less than 50 m from the nearest perch. Of the 11 courtship displays observed during surveys in 2017, 2 (18%) occurred 50–100 m from the nearest forest edge, and 9 (82%) occurred over 100 m from the nearest forest edge. In 2016, 1 courtship display occurred 50-100 m from the nearest forest edge, and 4 displays occurred greater than 100 m from forest edge. These data suggest that UPSA are displaying in interior portions of fields with perch sites and not near forest edges (Appendix B Table 1, Table 2).

Of the 4 courtship displays observed in the Project area in 2017, 1 reached rotor-swept height, estimated as approximately 130 m to 180 m above ground level for approximately 180 seconds. In 2016, of the 2 courtship displays in the Project area, 1 reached rotor-swept height for approximately 50 seconds.

3.2 UPLAND SANDPIPER DETECTIONS

UPSA were detected in blueberry barrens contained within MDIFW-mapped suitable habitat polygons (MDIFW 2017). UPSA were observed exhibiting the following behaviors in addition to courtship: territorial displays, perching, and feeding. On some occasions UPSA were detected auditorily but were not seen. UPSA were detected at 43 of 69 sites (62% occurrence); 17 of 36 (47%) sites were inside and 26 of 33 (79%) sites were outside of the Project area. UPSA were

detected 155 times (mean detections/survey/site = 0.4; mean maximum detections/site = 1.4; mean total detections/site = 2.2), including 44 detections inside the Project area (mean detections/survey/site = 0.2; mean maximum detections/site = 0.8; mean total detections/site = 1.2) and 111 detections outside the Project area (mean detections/survey/site = 0.6; mean maximum detections/site = 2.1; mean total detections/site = 3.4).

3.3 UPLAND SANDPIPER DETECTION PROBABILITY AND OVERALL ABUNDANCE

The hierarchical model with time-of-day ("time") and wind speed as detection covariates had the greatest proportional model weight (Table 3-3); however, the 5 top-ranked models all included time and accounted for nearly 100% of the model weight, while CI for all other covariate β overlapped zero, indicating "pretender variables" (Arnold 2010). Therefore, time was included as the only detection variable in all subsequent hierarchical models of abundance. Probability of detection decreased with increasing time-of-day (β_{time} = - 0.51; 95% CI = -0.72 – -0.30). Estimated from the null model (time as a detection covariate but only the *y*-intercept for abundance), detection-adjusted mean abundance per site (*N*) for the overall sampling area was 4.7 (95% CI = 3.2 – 7.0).

Assuming a 1:1 sex ratio, the overall 2016-2017 estimate of breeding pairs was 81 ((4.7 birds/site*69 sites)/2 years) = 162 birds*0.5 females). Given that each site was 48.5 acres (~20 ha), the overall density estimate was 0.24 UPSA/ha/year.

Table 3-3. Probability of detection variables, parameters (*K*), Akaike's Information Criterion (AICc), proportional weight (*w*), and log likelihood (LL) for hierarchical models of detection-adjusted abundance for upland sandpipers at DOW, Maine, 2016 – 2017.

	K	AICc	ΔAICc	*w*	LL
Time + Wind	4	735.1	0.0	0.34	-363.2

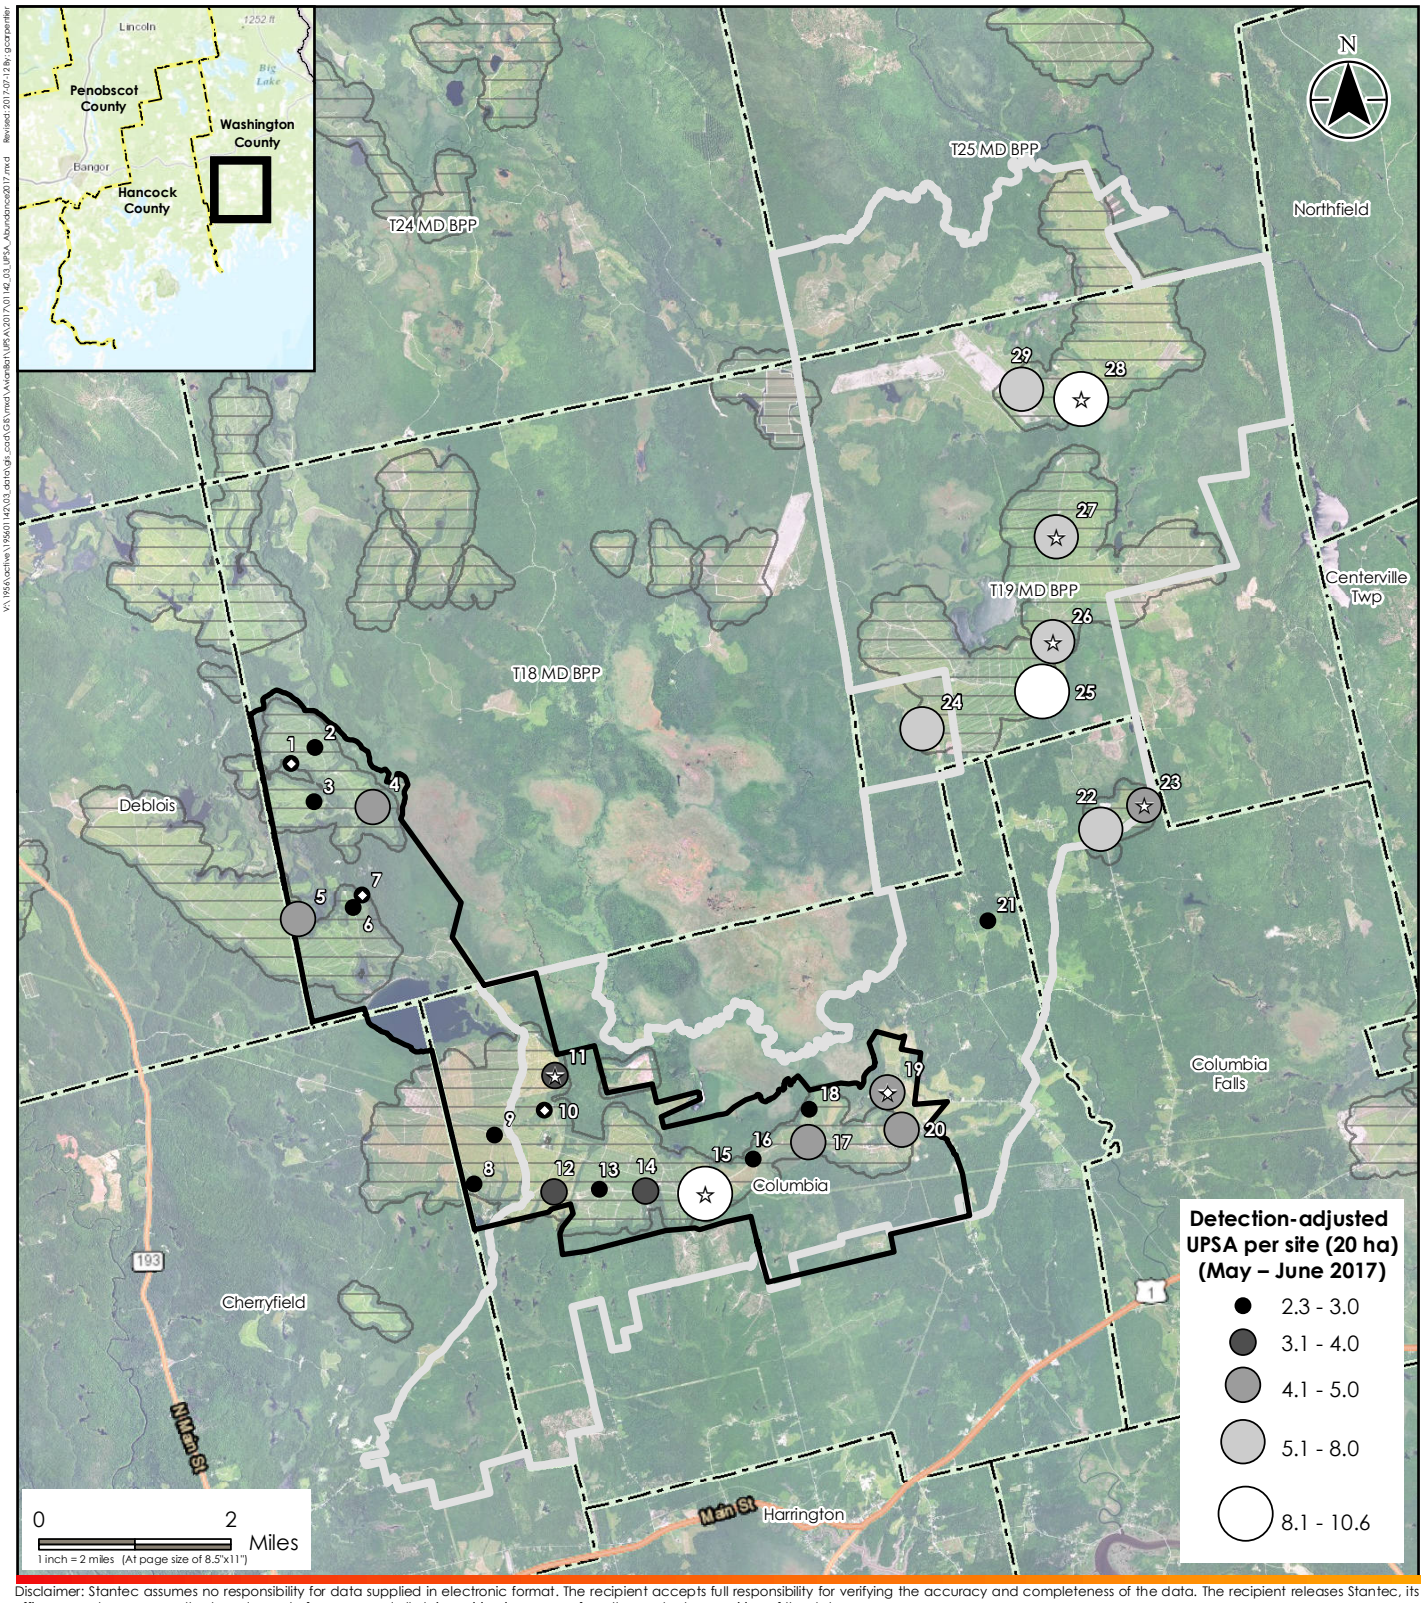
3.3.1 Effects of Year and Site Location



The model parameterized with "year" (2016 vs. 2017) as the sole abundance variable indicated that *N* did not vary significantly among years (N_{2016} = 5.2, 95% CI = 2.9 – 9.3; N_{2017} = 4.5, 95% CI = 2.5 – 7.9; β_{2017} = - 0.15; 95% CI = -0.51 – 0.22, p = 0.44; $AICc_{null}$ = 761.8, $AICc_{year}$ = 737.2). The model parameterized with sampling site "location" (inside vs. outside Project area) as the sole abundance variable indicated that *N* was significantly greater at outside sites (N_{out} = 13.0, 95% CI = 5.8 – 29.3; N_{in} = 3.5, 95% CI = 1.5 – 8.1; β_{in} = - 1.32; 95% CI = -1.72 – - 0.92, $p < 0.005$; $AICc_{null}$ = 761.8, $AICc_{location}$ = 690.9). The model parameterized with "year" and "location" as additive variables indicated *N* was greater at outside sites for both years ($N_{out2016}$ =11.6, 95% CI = 5.1 – 26.4; N_{in2016} = 2.9, 95% CI = 1.2 – 7.1; $N_{out2017}$ =14.5, 95% CI = 6.5 – 32.5; N_{in2017} = 3.6, 95% CI = 1.6 – 8.3;; $AICc_{null}$ = 761.8, $AICc_{year + location}$ = 691.5; Figure 3-3, Figure 3-4).

Note that the 2016 Grassland Bird Report (Stantec 2017) contains slightly different estimates of *N* for sites overall (N_{2016} = 5.7, 95% CI = 2.3 – 13.9), inside (N_{in2016} = 4.0, 95% CI = 1.2 – 12.9) and outside ($N_{out2016}$ = 8.6, 95% CI = 2.8 – 26.4) the Project area, than are reported for 2016 here. The updated estimates in this report are based on a model fit to data from both years and parameterized with a categorical predictor variable for "year" (which allows calculation of year-specific N) but only "time" for a detection covariate, whereas the 2016 model detection probability was parameterized with "time" and "Julian day" for detection. The differences between 2016 estimates is slight, however, all respective CI broadly overlap, and the updated 2016 estimates, based on the 2016 – 2017 model, have increased precision.

3.3.2 Effects of Meteorological Towers

N did not significantly vary at sites inside the Project area with and without met towers (N_{absent} = 1.7, 95% CI = 0.7 – 3.8; $N_{present}$ = 0.8, 95% CI = 0.2 – 3.6; $\beta_{present}$ = - 0.71; 95% CI = -2.20 – 0.77, p = 0.347).

Title

Detection-adjusted Upland Sandpiper (UPSA) Abundance, 2016

3.3.3 Effects of Vegetation Structure

Multi-collinearity among vegetation covariates was relatively low (e.g., $r = -0.76$ for shrub cover and herbaceous cover was the strongest correlation coefficient), so no variables were excluded. Model selection uncertainty was too high to base inference on a single model (Table 3-4) so covariate β was model averaged. Model-averaged β indicated negative effects of herbaceous cover (β = - 0.59; 85% UCI = - 0.93 – - 0.25) and positive effects of grass height (β = 0.20; 85% UCI = 0.01 – 0.40; Table 3-5) on abundance. Sample size limitations prevented model convergence on maximum likelihood estimates for models parameterized with quadratic herbaceous cover and grass height variables. Raw mean and range vegetation values for sites with and without UPSA detections are shown in Table 3-6.

Table 3-4. Vegetation variables, number of model parameters (*K; including intercept*), Akaike's Information Criterion (AICc), proportional weight (*w*), and log likelihood (LL) for hierarchical models of detection-adjusted abundance for upland sandpipers at DOW, Maine, 2016 – 2017.

3.3.4 Effects of Landscape Composition

Sites in this study were located in shrub habitat largely comprising cultivated lowbush blueberry fields ranging from 35 ha to over 700 ha, with interspersed hedgerows planted as windbreaks. No UPSA were documented in fields < ~90 acres (35 ha) at both on and offsite locations, which included Sites 2016-1, 2017-6, 2017-7, and 2017-21. Multi-collinearity among mean areas for land class covariates available for 2017 results was relatively low (e.g., r =0.53 for distance to hedge and forest area was the strongest correlation coefficient), so no variables were excluded. Model selection uncertainty was too high to base inference on a single model (Table 3-7), so we model averaged covariate β. Model-averaged β indicated a positive effect of field size ($\beta_{field.size}$ = 0.31; 85% UCI = 0.10 – 0.52; Table 3-8) on abundance. Location was also identified as a significant effect, with abundance lower at points within the Project boundary than at those outside of the Project boundary (β_{in} = - 1.26; 85% CI = -1.92 – - 0.60; Table 3-8). Otherwise, confidence intervals surrounding model-averaged β ranged from negative to positive, indicating uncertain effects of variables. Raw mean and range landscape composition values for sites with and without UPSA detections are show in Table 3-9.

3.4 FALL STAGING SURVEYS

UPSA staging behavior was not observed in 2016 or 2017. In 2016 during staging surveys between July 24 and September 9, UPSA were detected 8 times in the Project area at Sites 2016-4 (2017-14), 2016-5 (2017-15), 2016-6 (2017-16), 2016-7 (2017-17), and 2016-8 (2017-18). In 2017 during staging surveys between August 7 and October 5, UPSA were detected 5 times in the Project area at Sites 15 and 16 and 4 times outside the Project area at Sites 24, 25, and 27. UPSAs were observed feeding, as flyovers, and in one instance on August 10, 2017, outside the Project area at Site 25 exhibiting a territorial display. This display lasted for 4 total minutes and the duration of the flight at heights > 130 m was 3 minutes. The maximum flight height during this display was 250 m.

3.5 OTHER TARGET SPECIES

Three of the other target species, northern harrier, eastern whip-poor-will, and vesper sparrow, were detected inside the Project area and 3 species, northern harrier, vesper sparrow, and whimbrel, were detected outside the Project area (Table 3-10). Of the target species, vesper sparrow observations were most frequent and widespread (148 recorded inside and 25 outside the Project area).

No whimbrels were detected during grassland bird surveys. A group of approximately 50 whimbrels was observed on July 24, 2017, in a large, open area outside the Project area in Deblois, incidental to other on-site monitoring. Individuals were on the ground but took flight toward the northeast when the observer drove by. Sky condition on this day was overcast with 100% cloud cover, winds were light (0.4–1.3 m/s [1–3 mph]) and direction was variable, and the temperature was 20° C (68° F). Two follow up surveys to search for whimbrels in the Project area were completed on July 26 and 27, 2017. Lindsay Tutor of MDIFW accompanied Stantec's observer on July 27. These surveys consisted of driving meander surveys for 4 total hours: 2 hours before high tide and 2 hours after high tide. The observers stopped at open fields and scanned them using binoculars to search for whimbrels. No whimbrels were observed in the Project area.

BUSINESS CONFIDENTIAL

Table 3-10. Summary of grassland bird species detected (excluding upland sandpiper), at DOW, Maine, spring and fall 2017.

Species	Total No. of Obs	No. of Obs Inside	No. of Obs Outside	Site	Dates of Observation	Behavior	Flight Height Maximum (m)
Northern Harrier	8	5	3	5, 10, 11, 13, 24, 26, 27	4/30, 5/3, 5/5, 5/18, 9/9, 10/4, 10/5	flyover, feeding	< 25–50
Vesper Sparrow	173	148	25	All sites except 21, 23, 28	Multiple dates in Apr, May, Jun, Aug, Sep, Oct	flyover, feeding, perched, vocalizing	0–25
Eastern Whip-Poor-Will	2	2	0	2, 6	5/19, 9/5	vocalizing	na
Whimbrel	~50*	0	~50*	outside	7/24	perched, flyover	0–50

*Observed incidental to surveys.

In spring and fall 2016, 56 vesper sparrows, 6 eastern whip-poor-will, 3 northern harrier, and 0 whimbrel observations were recorded within the Project area (Table 3-11).

Table 3-11. Summary of grassland bird species detected (other than upland sandpiper), at DOW, Maine, spring and fall 2016.

Species	Total No. of Obs	No. of Obs Inside	No. of Obs Outside	Site	Dates of Observation	Behavior	Flight Height Range (m)
Northern Harrier	5	3	2	13, 16, 28, 2016-23, 6	5/10, 5/24, 6/8, 7/25, 8/17	hunting, flyover	< 25-100
Vesper Sparrow	104	56	48	All sites except 11, 17, 21, 27, 28 (nd for 1, 7, 10, 19)	5/9-5/11, 5/12, 5/16-5/19, 5/23-5/26, 6/7-6/9, 6/20-6/22, 7/24-7/27, 8/16	perched, vocalizing, foraging	< 25
Eastern Whip-Poor-Will	13	6	7	2016-1, 12, 13, 15, 17, 26, 2016-13, 8	5/23-5/25, 6/6, 6/19, 6/20, 7/24, 8/16	perched, vocalizing	na
Whimbrel	1	0	1	2016-21	8/18	flyover	< 25

4.0 DISCUSSION

4.1.1 Upland Sandpiper Abundance

The adjusted density estimate for the study area from the 2016-2017 study (0.24 UPSA/ha) is similar to the density estimate known for Maine in Kennebunk Plains in York County, which was

BUSINESS CONFIDENTIAL

estimated as 4–12 pairs/100 ha (0.08-0.24 UPSA/ha) (Vickery 1993 as cited in Weik 2000). It is important to note, however, that the current study did not formally estimate the number of breeding pairs using the same methods as Vickery (1993), and the Vickery (1993) estimates did not account for incomplete detection; therefore, Vickery's estimates are likely biased low. The detection-adjusted abundance estimates in the current study were more than double the unadjusted detection estimates. Unadjusted detections provided a mean estimate closer to 5 pairs/100 ha, which would place the study area at the lower end of the density spectrum identified by Vickery (1993). It is also important to note that the mobility and intermingling of courting UPSA causes difficulty for observers trying to accurately estimate numbers of breeding pairs (Weik 2000), as well as the fact that pairs likely move freely throughout feeding areas (Ailes 1976; MDIFW 2013).

Consistent with Vickery et al.'s findings (1994), in which UPSA were uncommon on sites with < 50 ha of suitable habitat, UPSA were not detected at sites in the smallest fields (i.e., those < 35 ha) UPSA abundance was higher at sites in and near the Project area within larger fields; however, determining field size was challenging due to the homogeneity of shrub habitat at the Project and the lack of data related to how UPSA use habitat and what constitutes a habitat barrier for UPSA (e.g., narrow dirt roads, hedgerows).

4.1.2 Upland Sandpiper Habitat

UPSA abundance was not different at sites with met towers compared to sites without met towers within the Project area in 2017. Model averaged coefficient/parameter estimates used in this study showed negative effects of herbaceous cover and positive effects of grass height on abundance, though these relationships were weak. On a landscape scale, models used in this study indicated negative effects of forest mean area and location, suggesting that UPSA abundance was lower at sites inside the Project area containing greater proportions of tree cover within a 250-m radius. Negative relationships between UPSA presence and the presence of trees, forest, and tall vegetation edges have been observed in UPSA home ranges and proximal to nest sites (White 1983; Miller et al. 2014). In general, treelines have been identified as having a negative influence on the distribution of many grassland birds (Walk and Warner 1999), in part because nest predation risk increases with increasing proximity to forest edge (Johnson and Temple 1990) whereas visual openness decreases near forest edges (Keyel et al. 2013).

The Project is not currently planning to eliminate or convert large portions of existing blueberry fields to disturbed or developed area; therefore, loss of habitat is expected to be minimal. Because nesting may occur within suitable habitat at the Project, Project construction within suitable breeding habitat that occurs outside the May and June breeding season would eliminate risk of impact to nests. Clearance surveys could also be completed in suitable habitat to allow construction in areas with confirmed absence.

BUSINESS CONFIDENTIAL

4.1.3 Upland Sandpiper Courtship

Though point counts were initiated on April 24, 2017, no courtship displays were observed until the morning of May 3. This indicates that the 2017 survey was initiated at the appropriate time to capture the beginning of the UPSA courtship period. In 2016, point counts were initiated on May 9, and the first courtship display was observed on May 10, suggesting that courtship may have already begun at the onset of 2016 surveys. Courtship displays appeared to end by May 24 in 2016 and by June 16 in 2017, suggesting that the end of the courtship period may vary annually. UPSA displayed in interior portions of fields (with the majority of displays > 100 m from the nearest forest edge) with perch sites.

Results of this study indicate that siting turbines away from areas where courtship occurs or adjusting operations during higher risk periods is likely to reduce risk of collision mortality. Based on the 2016-2017 study, to minimize the risk of potential collision of UPSA with operational turbines, turbines should be limited near Sites 11, 12, 15, and 19 and be sited as close to forest edges as possible, or operational curtailment should be implemented under the following conditions: May 1–Jun 20, from sunrise to 10:00 AM, on days with clear to partly cloudy skies.

5.0 CONCLUSIONS

The 2016-2017 dataset indicated the following key findings:

1. UPSA were documented during the breeding season within MDIFW-mapped suitable habitat polygons.
2. Density and abundance of UPSA during the breeding season was significantly higher in areas outside the Project area than onsite in both years.
3. UPSA abundance was higher at sites in and near the Project area within larger fields, and no UPSA were documented in fields < ~90 acres (35 ha) at onsite or offsite locations.
4. UPSA abundance was lower at sites inside the Project area containing greater proportions of tree cover within a 250-m radius.
5. The probability of courtship behavior in and near the Project decreased as the hour of the day increased, with 70% of morning courtship instances occurring between 5:30 and 7:30.
6. The probability of courtship behavior in and near the Project increased with decreasing cloud cover.
7. 98.8% of UPSA detections and 100% of UPSA courtship displays documented in and near the Project occurred >50 m from the nearest forest edge.
8. Target species, including UPSA, did not exhibit staging behavior in the Project area.

Findings from this study provide valuable information regarding upland sandpiper site use, habitat selection, and activity behavior and can have important management implications for the siting and operation of wind projects in areas where occupied upland sandpiper habitat is

BUSINESS CONFIDENTIAL

present. Informed avoidance and minimization measures such as siting turbines away from interior portions of larger fields, or curtailing operations of turbines in areas of higher risk and during periods of higher risk (seasons and times of day), will reduce risk to individuals and minimize potential impacts to the species.

Draft Work Plan for 2017 Grassland Bird Surveys – Proposed Downeast Wind Project

1 INTRODUCTION

In 2016, a three-season grassland bird survey was completed as part of an assessment of the potential risk posed to grassland birds by the proposed Downeast Wind Project (Project) in Washington County, Maine [1][1]. Species of interest include: upland sandpiper (UPSA; *Bartramia longicauda*), vesper sparrow (*Pooecetes gramineus*), eastern whip-poor-will (*Caprimulgus vociferus*), northern harrier (*Circus cyaneus*) and whimbrel (*Numenius phaeopus*). Based on results from the 2016 survey and consultation with Maine Department of Inland Fisheries & Wildlife (MDIFW) on January 19, 2017, it was determined that a second year of grassland bird surveys would be conducted, with the study design, protocol, and analysis modified to address the revised project boundary. The goal of the study is to inform siting, impact assessment and potential permitting and mitigation for the proposed project.

2 FIELD SURVEY OBJECTIVES

Objectives of the 2017 grassland bird surveys are:

1. Document and locate occurrences of sensitive grassland bird species in the Project area including UPSA, northern harrier, vesper sparrow, eastern whip-poor-will, and whimbrel;
2. Estimate UPSA arrival dates;
3. Estimate the number of displaying UPSA males and breeding UPSA using hierarchical modelling methods [3][4][5];
4. Document the timing and characteristics of flight displays (i.e., flight heights, percent within the rotor-swept zone [RSZ], and time spent in the RSZ);
5. Document locations of upland sandpiper and whimbrel staging areas for fall migration and, if present, their general behaviour during staging;
6. Model the characteristics of occupied breeding habitat through quantitative assessments of vegetation and landscape features;
7. Refine currently mapped UPSA habitat polygons based on field studies and observations;
8. Assess potential risk of impact (collision and/or displacement) to the species as a result of the Project and inform potential siting or operational considerations to avoid or minimize risk.

3 FIELD SURVEY METHODS

Field survey methods will be similar to those described for 2016 [1][2] with minor modification as summarized below.

3.1 SURVEY SCHEDULE

In 2016, grassland bird breeding surveys were initiated on 9 May and continued through 23 June. Fall surveys were conducted from 24 July – 9 September. The first UPSA detection in 2016 was

made on 9 May and the first observation of courtship behavior was on 10 May; therefore. it is difficult to estimate arrival dates and start of courtship for UPSA based on data collected thus far. In Massachusetts, UPSA arrivals to breeding territories have been documented to be as early as 21 April, with approximately 25% of nests starting incubation between 1 and 10 May, and 45% of nests starting incubation between 11 and 20 May (K. Peters, *unpublished data*). Although the Maine breeding season likely begins slightly later than in Massachusetts, it is recommended that the 2017 sampling design be expanded to capture early arrivals and potentially estimate mean arrival dates, as presented in Table 3-1.

Table 3-1. Proposed 2017 Grassland Bird Survey Schedule, Downeast Project.

Period	Dates	Time of Day	All Survey Points
Courtship	Apr 21-May 5	Morning	3
		Evening	2
Nesting	May 8-Jun 23	Morning	2
		Evening	1
Fall Staging	July 17- Oct 6	Morning	3
		Evening	1

It is proposed that all other survey protocols implemented in 2016 be continued in 2017, including point-count timing, playback schedules, and recording of behavior, but that the survey periods be standardized to a total of 15 minutes (passive surveying for 10 mins, followed by call broadcasting and surveying the subsequent 5 mins). In 2016, the additional 5 minute survey was only completed if UPSA were not detected in the prior 10 minutes. Standardizatioin in 2017 will limit potential bias among sites and visits per site resulting from increased sampling at sites where no detections occurred the first 10 minutes.

3.2 SURVEY SITES

On 7 June and 28 June 2016, Apex modified and reduced the Project boundary to consolidate the Project, reduce the Project footprint, and minimize potential impact to grassland birds. This resulted in an unbalanced 2016 data set because some sites were sampled early in the breeding season only, some sites were sampled mid-late breeding season and fall only, and some sites were sampled throughout the entire survey. The hierarchical methods used to estimate UPSA abundance are generally robust to unbalanced data; however, modeling of the 2016 breeding season data indicated that detection probability was greatest earlier in the season and decreased later in the season [1]. Surveys conducted at sites within the new Project boundaries that were added after the boundaries modifications, therefore, were less likely to result in UPSA detections when UPSA were present.

For the 2017 season, the following design is recommended and presented in Figure 1 (Total= 29 survey sites):

1. Onsite surveys –

a. Survey all 2016 sites (n=16) within or directly adjacent to the new Project boundary.
b. Add an additional 4 survey points, centered at the bases of four meteorological (Met) towers installed in 2016 (**Error! Reference source not found.**).

2. Offsite surveys-
   a. Survey a subset of sites evaluated in 2016 (n=9). Sites were systematically identified based on 2016 sampling intensity, accessibility (i.e., can be accessed within a single survey period), and to represent all offsite grassland patches surveyed in 2016.

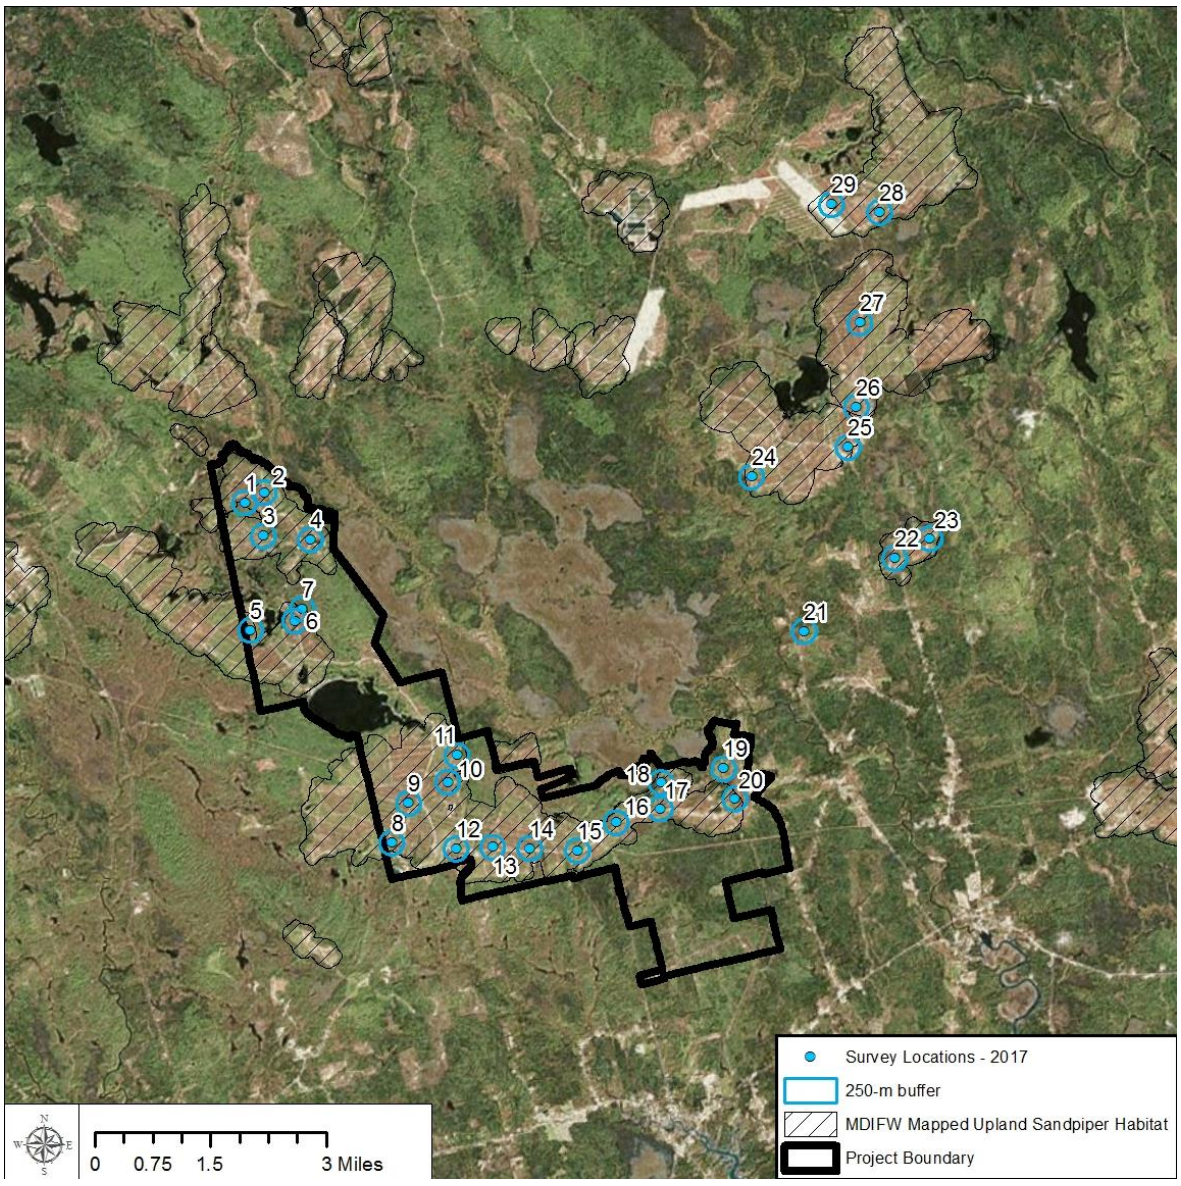

Figure 1. Proposed 2017 grassland bird survey locations.

This proposed design will provide baseline characterization of both on and offsite use by UPSA and other grassland birds, allow landscape-level analyses and may provide insight into potential UPSA avoidance behaviors around tall structures (i.e., points located at temporary met towers).

4 DATA ANALYSIS

To address the objectives listed in Section 2, the following analytical approaches will be taken:

1. Similar to 2016, hierarchical models that account for imperfect detection will be used to estimate UPSA abundance during the breeding season (i.e., courtship + nesting). Assumptions will be similar to those acknowledged in 2016 (e.g., closed population, independent observations);
2. Similar to 2016, hierarchical models that account for imperfect detection will be used to identify microhabitat structure factors associated with UPSA abundance. A "year" parameter will be added to the models, point-level characteristics (e.g., distance to edge, tree, road, etc.), and habitat associations will be presented based on AIC model-weighted parameter estimates;
3. A second set of hierarchical models incorporating landscape-scale parameters will be explored. Detection parameters in the models will be those identified in Approach 1, above. Landscape parameters will consist of a subset of characteristics identified *a priori* as potentially influencing UPSA habitat selection, and may include various patch (e.g., patch area, patch shape) and class (e.g., edge density) metrics calculated in a Geographic Information System (GIS) [8]. Independence of survey sites will be considered at each scale and survey sites pooled or treated as pseudoreplicates as appropriate [9];
4. A fourth analysis will explore the relationship between UPSA presence and temporary met towers (i.e., surrogates for tall human-made structures like wind turbines). It is acknowledged that this exploratory analysis is limited by sample size because there are only 4 met towers installed in the Project area. Contingent on the data acquired, models incorporating a binary predictor variable (i.e., 'met' vs 'non met') may be developed. Response variables may include abundance (hierarchical model based on best model identified in Approaches 1 and 2) or distance from observer (ANOVA).; and
5. Descriptive statistics (e.g., mean, variance) will be provided for all behavioral data, including time spent in RSZ, fall staging surveys, and survey results for non-UPSA target species.

2015-2016 BALD EAGLE USE AND BALD EAGLE NEST AND HERON ROOKERY SURVEYS FOR THE DOWNEAST WIND PROJECT

November 10, 2016

Executive Summary

Stantec Consulting Services Inc. (Stantec) conducted bald eagle (*Haliaeetus leucocephalus*) surveys for the proposed 30-turbine (90-megawatt) Downeast Wind Project (DOW or Project) in Washington County, Maine. Bald eagle surveys included an aerial bald eagle nest survey in spring 2016 and bald eagle use surveys from September 2015 to September 2016. The objective of the aerial nest survey was to locate bald eagle nests and great blue heron (*Ardea herodias*) within 4 miles of the area proposed for development (Project area). The objective of bald eagle use surveys was to characterize seasonal and spatial use of the Project area by bald eagles to evaluate risk and inform siting Surveys followed methods described in the Project Work Plan developed in coordination with U.S. Fish and Wildlife Service (USFWS) and Maine Department of Inland Fisheries and Wildlife's (MDIFW) and were consistent with the USFWS April 2013 *Eagle Conservation Plan Guidance* (ECPG) and MDIFW's June 2015 *Curtailment Policy and Wind Power Preconstruction Study Recommendations* (MDIFW Recommendations) dated June 2015.

Aerial Nest Survey

Survey flights were completed on 13 April 2016 and 19 May 2016. Bald eagle nests, great blue heron rookeries, incidental observations of bald eagles, great blue heron and osprey (*Pandion haliaetus*) were recorded if observed. Two occupied and 5 unoccupied bald eagle nests were located within the survey area. The nearest occupied nest was located 3.3 miles southeast of the Project area boundary. The nearest unoccupied nest was within the Project area. One active great blue heron rookery was documented during the second flight in southern Deblois, approximately 2.2 miles west of the Project area. Seven nests containing 5 adult great blue herons were observed at this location. One new unoccupied nest was located during the second flight: the nest was composed of sticks and in a location and of a size that suggested it was either a great blue heron or osprey nest. This nest is located just outside and west of the Project area. One osprey was observed on the transmission line south of Schoodic Lake. No other incidental bald eagle or great blue heron observations were made during either survey flight.

Bald Eagle Use Surveys

Bald eagle use point count surveys were conducted from September 2015 to September 2016. Point count surveys consisted of 1-hour visual surveys at 31 locations within and adjacent to the Project area. Each location surveyed an area of 2 km^2 (800-m radius circle). Stantec surveyed approximately once every 3 weeks and completed 18 rounds of survey totaling 310 survey hours. Nine bald eagles were recorded at points inside the Project area, for a total of 21 eagle minutes recorded in 133 hrs of survey within the Project area. During 9 of those minutes, bald eagles flew at heights 200 m or less agl. Twenty two eagle observations were recorded outside but near the Project area in a total of 177 hrs of study. A single territorial display between 2 individuals was observed in the Project area in March 2016. All other observed behaviors in the Project area

Business Confidential

were soaring or gliding, or perching. For all points, bald eagle use was concentrated in the winter and spring months of January through May. The rate of bald eagle occurrence was highest in the month of March at points inside and outside the Project area. No eagles were observed in the months of June, July, October, and December. These data suggest that the area proposed for development presents low risk to the species.

Business Confidential

1.0 INTRODUCTION

Stantec Consulting Services Inc. (Stantec) conducted bald eagle (*Haliaeetus leucocephalus*) surveys on land in and adjacent to the 30-turbine (90-megawatt) Downeast Wind Project (DOW or Project) in Washington County, Maine. Bald eagle surveys included an aerial bald eagle nest in spring 2016 and bald eagle use surveys from September 2015 to September 2016. The objective of the aerial nest survey was to locate bald eagle nests and great blue heron (*Ardea herodias*) rookeries to evaluate risk and inform siting. The objective of bald eagle use surveys was to evaluate the seasonal and spatial patterns of bald eagle activity to evaluate risk and inform siting.

Surveys were conducted to comply with the U.S. Fish and Wildlife Service's (USFWS) *Eagle Conservation Plan Guidance* (ECPG) dated April 2013 and the Maine Department of Inland Fisheries and Wildlife's (MDIFW) *Curtailment Policy and Wind Power Preconstruction Study Recommendations* (MDIFW Recommendations) dated June 2015. Surveys followed methods described in the Project Work Plan submitted to MDIFW on 19 February 2016. The Work Plan was discussed with MDIFW at a meeting on 23 February 2016, and was revised on 17 March 2016 based on feedback from MDIFW (Appendix A). Revisions to the Work Plan were related to the aerial nest survey, and included the following: using a transect-based search approach within 4 miles of the Project; and timing the second aerial flight in early to mid-May to concurrently assess the status of the bald eagle nests identified in the first flight and to assess the status of known or new great blue heron rookeries.

2.0 2016 AERIAL BALD EAGLE NEST, GREAT BLUE HERON ROOKERY, AND LARGE RAPTOR NEST SURVEY

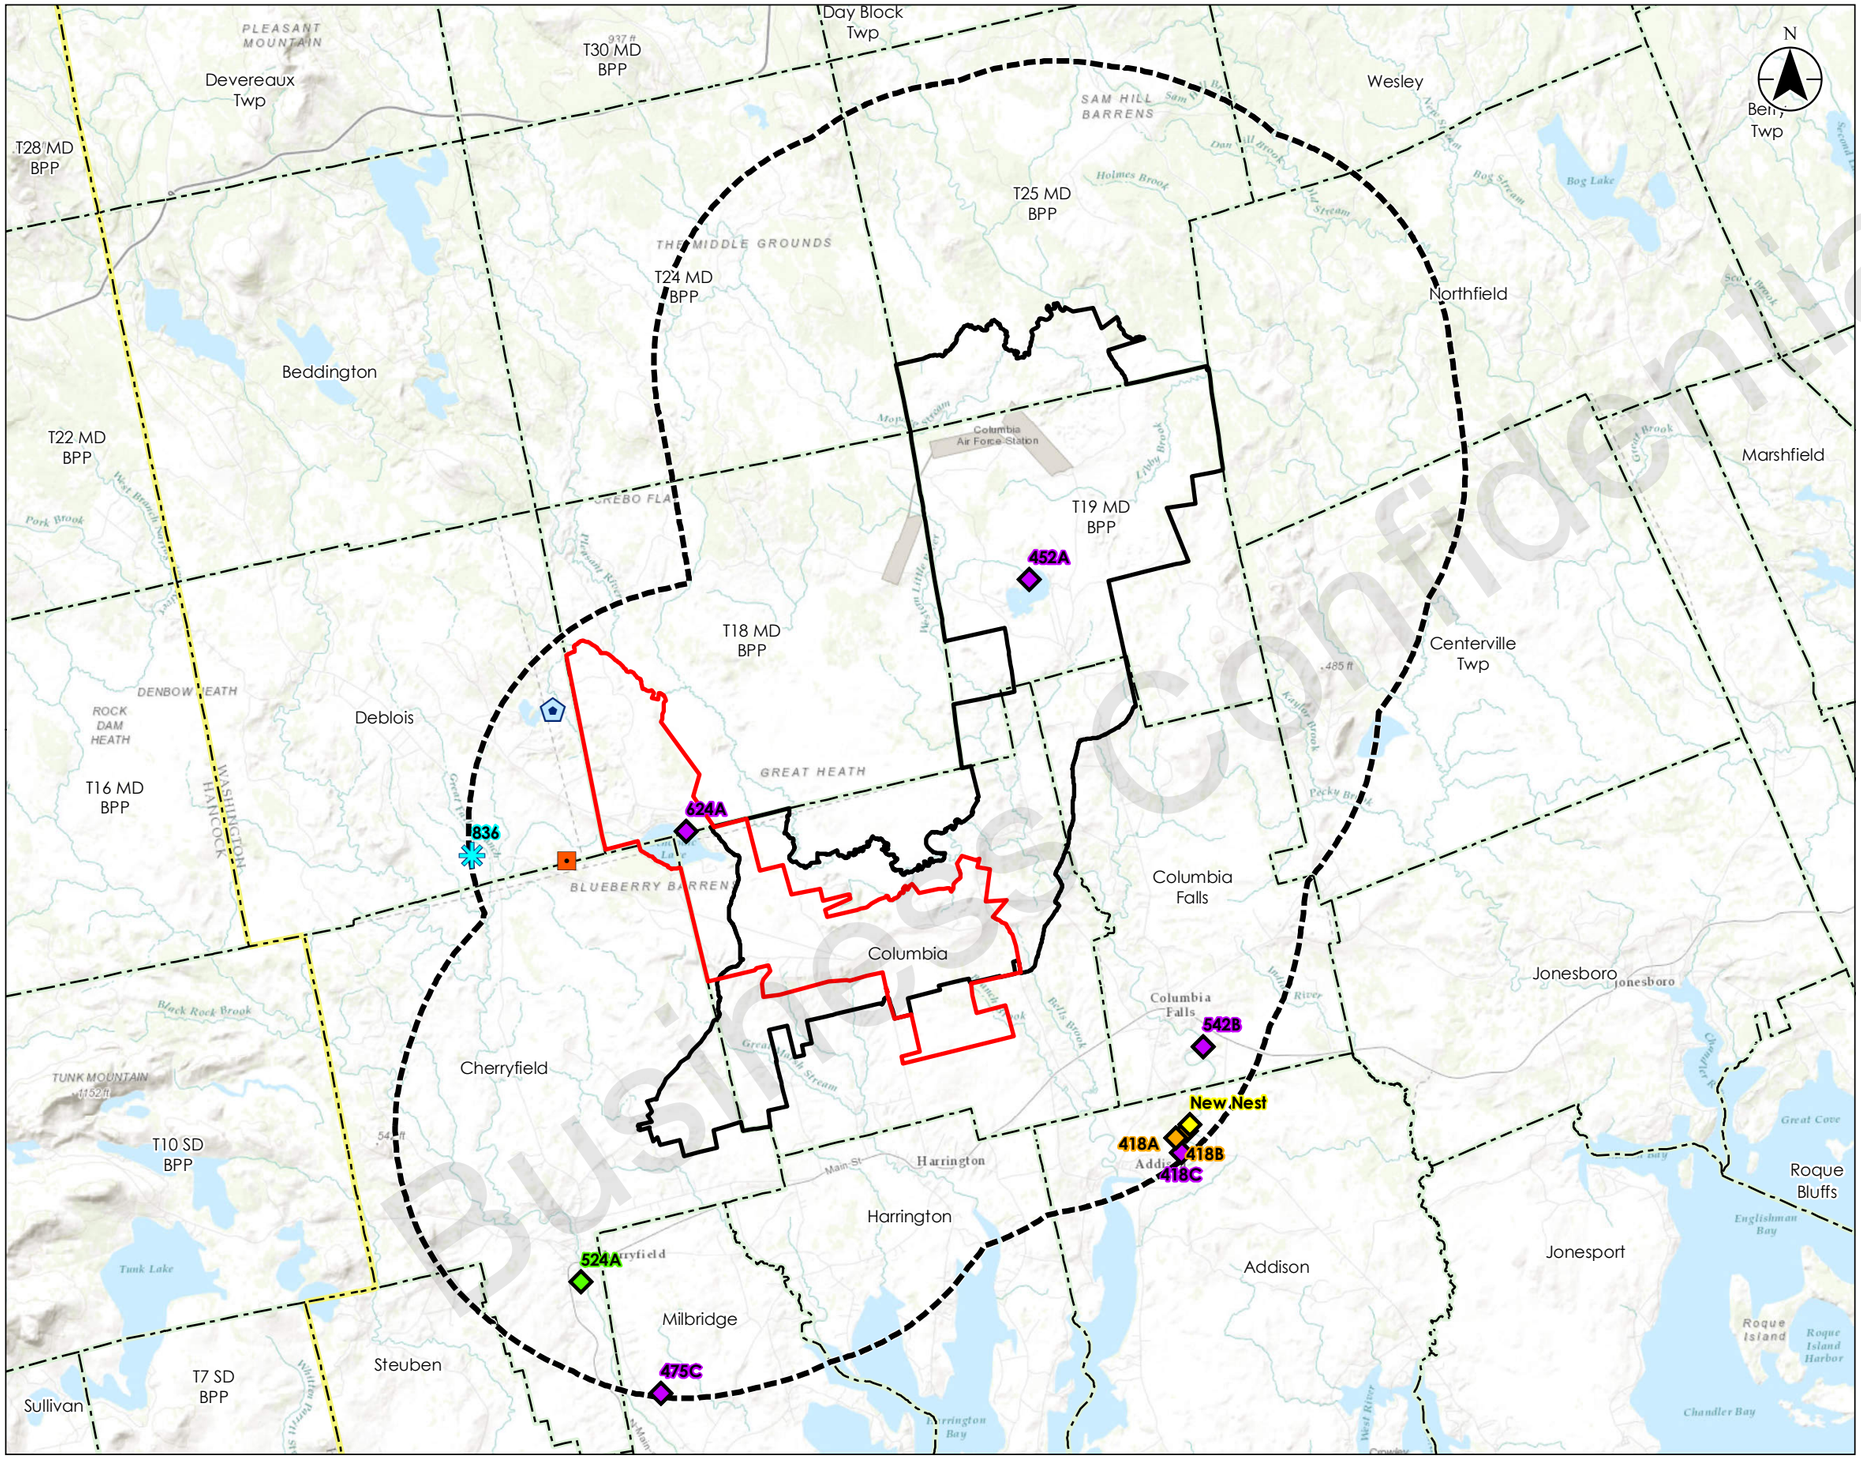
2.1 METHODS

Prior to the surveys, Stantec reviewed information provided by MDIFW regarding known active and historic bald eagle nest and great blue heron rookery locations in the vicinity of the Project. Following protocol previously established by the USFWS (2007)[1], Stantec notified Mark McCollough of the USFWS Maine Field Office on 4 April 2016 that flights were being conducted in the area and that Stantec was coordinating with MDIFW on the timing and methods of the flights.

Stantec conducted 2 aerial surveys in the spring of 2016. A revised Project area was provided to Stantec after surveys on 28 September 2016. Figure 1 depicts the initially proposed Project area and associated survey area, which fully encompasses the current Project area.

[1] U.S. Fish and Wildlife Service. 2007. *National Bald Eagle Management Guidelines*. U.S. Fish and Wildlife Service, Washington, DC.

Business Confidential



The aerial surveys were conducted in a Cessna fixed-wing aircraft piloted by Mr. Jim Strang (first flight) and Mr. Jeremy Harmon (second flight) of Penobscot Island Air. The first flight was conducted on 13 April 2016 and was focused on surveying for bald eagle nests. The timing of the first flight was chosen to correspond with the time period when bald eagles are actively incubating eggs in the nests. The purpose of the first flight was to survey the mapped bald eagle nests and to search potential nesting habitat for new bald eagle nests within 4 miles of the initial Project area (Figure 1). The survey included inland waterbodies and portions of Narraguagus River and Bay, Harrington Bay and other bays and inlets on the Atlantic Ocean. We also performed low level flights along the shoreline of rivers, lakes, the ocean, and major wetland systems to target preferred potential bald eagle nesting habitat. During this flight observers also surveyed for great blue heron nests.

The second flight conducted on 19 May 2016 focused on surveying for great blue heron rookeries, continued to survey for new bald eagle nests, and also surveyed known bald eagle nests for eggs and/or occupancy. The timing of the second flight was chosen to correspond with the time period when great blue herons are actively incubating eggs or brooding chicks in the nests. The surveys consisted of low altitude passes, approximately 300–500 feet above ground level (agl), along transects within 4 miles of the initiall Project area. The planned transect spacing was ½ mile; however during desktop field map preparation, it was apparent that viewsheds would overlap significantly, so transects were widened to approximately ¾ mile[2]. In addition to the transects, the survey investigated large wetland complexes (marshes, bogs, etc.) and the adjacent upland habitat. The survey also included investigation of mapped rookeries within 4 miles of the initial Project area.

During the 2 flights, incidental observations of bald eagles, osprey (*Pandion haliaetus*), and great blue heron were recorded if these species were observed, and large stick nests were recorded if observed.

2.2 RESULTS

Stantec identified 7 total bald eagle nests within the survey area: 2 occupied and 5 unoccupied. As detailed in the ECPG, the occurrence of a pair of adult bald eagles at or near a nest during the normal incubation time period constitutes the nest being considered "occupied." One occupied nest was a new nest (does not have a MDIFW identification number), although this new nest was likely an alternate nest for the nests that were either not located (418A & 418B) or were unoccupied (418C). This new, occupied nest was located 3.3 miles to the southeast of the current Project area (Table 1). The other occupied nest, nest 524A, was located 5.4 miles from the current Project area. Both occupied nests had adults in the nest during the second flight. The adult bald eagle in the new nest obscured the view into the nest so we were unable to determine definitively if there were eggs or nestlings present. Two additional historic bald eagle nest sites were not located (Table 1, Figure 1).

Table 1. Results for bald eagle nests during the aerial nest survey, Downeast Wind Project, 2016.

MDIFW Nest #	Location	Flight 1 Nest Status	Flight 2 Nest Status	Distance to Current Project Area (mi)
524A	Narraguagus River-West	Not Located	Occupied	5.4
475C	Narraguagus River-East	Unoccupied	Unoccupied	6.7
418C	Pleasant River-West	Unoccupied	Unoccupied	3.4
418B	Pleasant River-West	Not Located	Not Located	3.3
418A	Pleasant River-West	Not Located	Not Located	3.2

Business Confidential

Stantec surveyed known great blue heron rookery 836 in southern Deblois, which was occupied with 7 nests containing 5 adult great blue herons. This rookery is located 2.2 miles from the current Project area. One new, unoccupied nest was located during the second flight. The nest was composed of sticks and in a location and of a size that suggested it was either a great blue heron or osprey nest. This was a single nest in a wetland north of Pineo Pond and south of Dorr Meadow Brook in Deblois. This nest is located just outside and west of the current Project area (Figure 1).

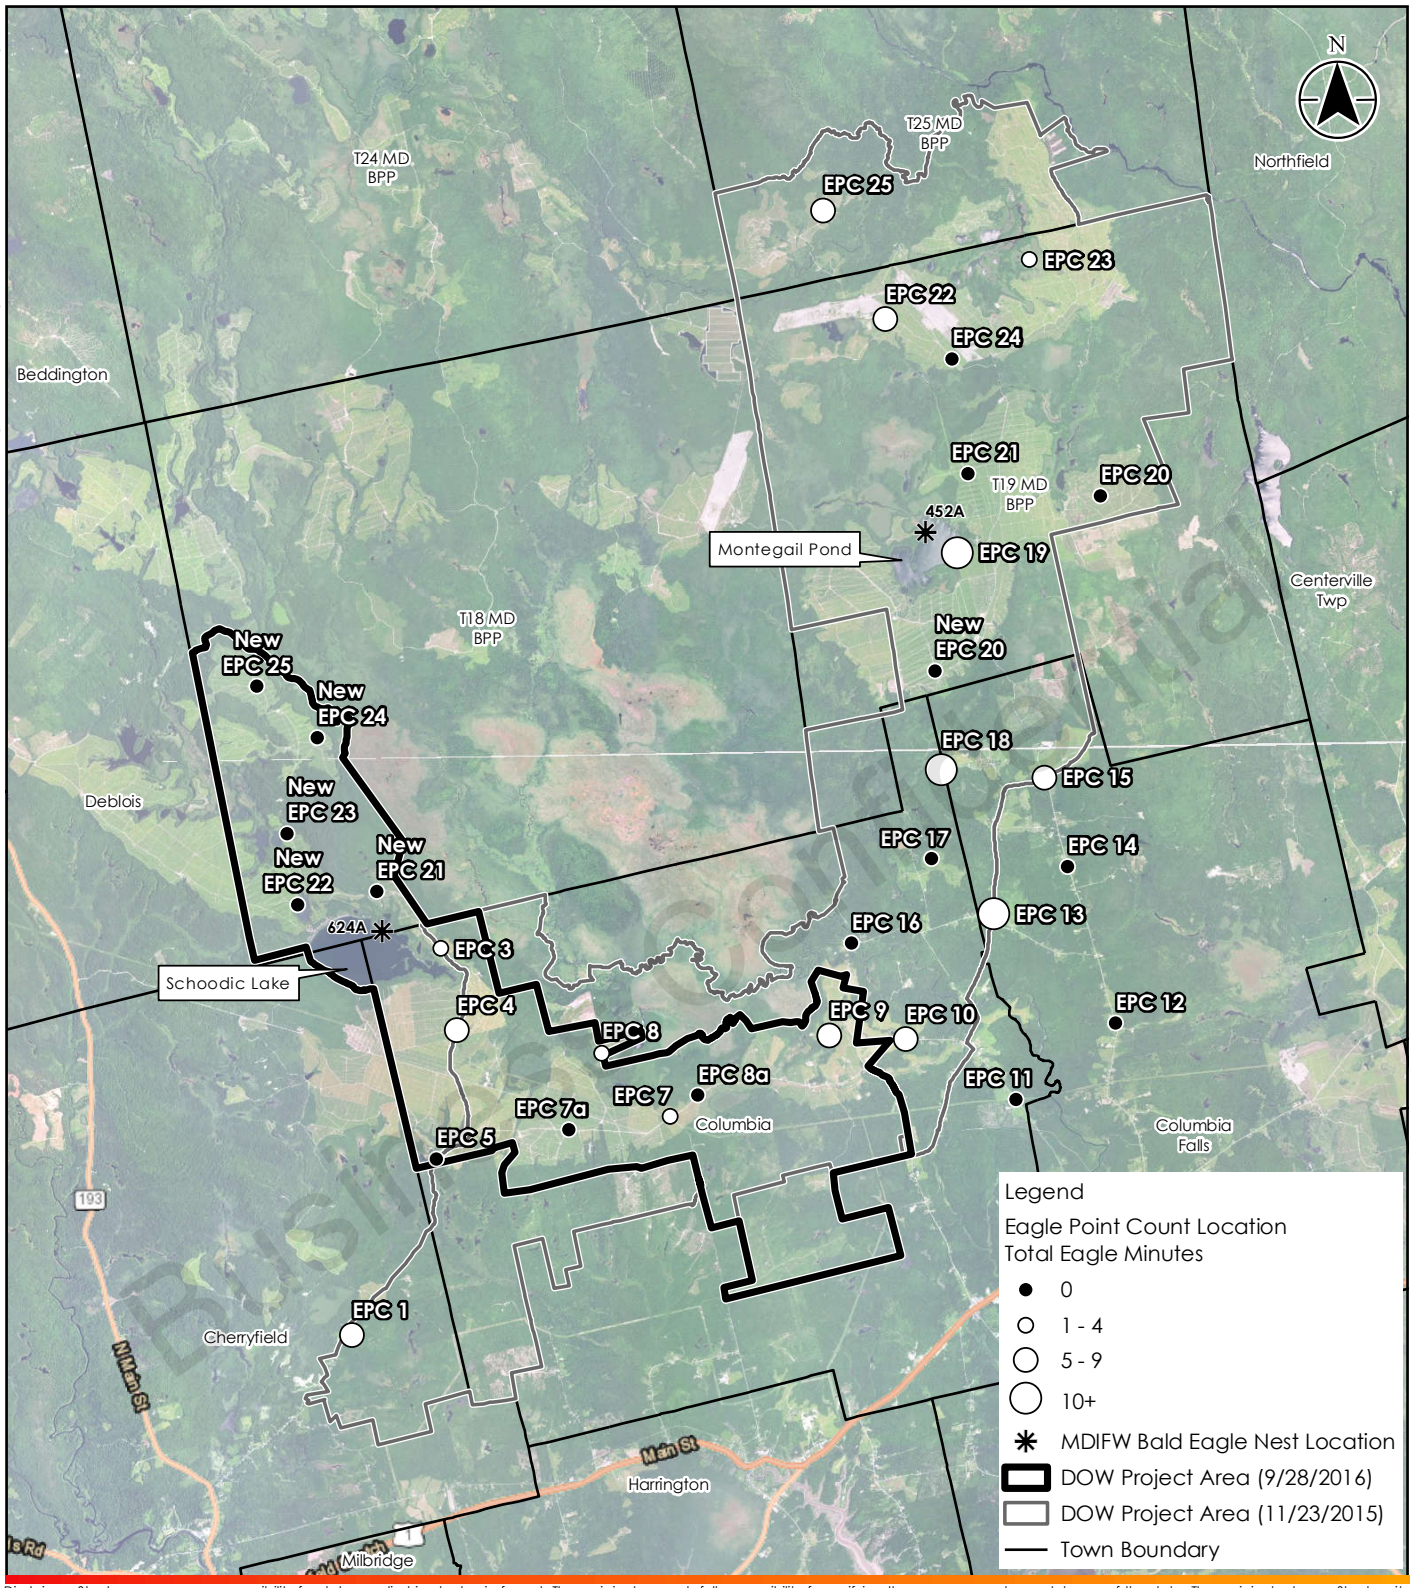
During the first flight, Stantec observed an osprey nest on the transmission line south of Schoodic Lake but no adult ospreys were observed around the nest. No other incidental bald eagle, great blue heron or osprey observations were made during either survey flight.

3.0 2015-2016 BALD EAGLE USE SURVEY

3.1 METHODS

3.1.1 Bald Eagle Use Point Count Surveys

Stantec conducted point count surveys for bald eagles for 1 full year consistent with the ECPG. Point count surveys consisted of 1-hour visual surveys at a total of 31 locations[3] within and adjacent to the Project area (Figure 2), each with an 800-meter radius and covering an area of 2 km^2. Surveys were conducted once approximately every 3 weeks resulting in 18 rounds.



Surveys occurred in all weather conditions except when visibility was poor, and occurred within the full range of daylight hours. The starting point count location changed each survey round to enable sampling of each point during a range of daylight hours. Though bald eagles were the target species, Stantec biologists recorded all birds observed during bald eagle point count surveys. Stantec also recorded any incidental observations of bald eagles observed outside of survey hours such as while traveling between survey points or while conducting other surveys.

3.1.2 Bald Eagle Use Data Analysis

Bald eagle data were summarized by point, including behavior, total observation minutes, and exposure minutes, which are minutes that eagles spent flying within 800 meters of the point count location and at heights below 200 meters agl. Exposure minutes were expressed as a percentage of total survey minutes.

Business Confidential

[3] At the time surveys were initiated, per the ECP Guidance, the number of point count locations was determined by calculating the entire estimated turbine area including a 1-km buffer around proposed turbines, calculating 30% of the area, and dividing by 2 (to account for the 2 km^2 plots). Since initiating surveys, the Project area has been revised and survey points have been relocated.

3.2 RESULTS

3.2.1 Survey Effort

Stantec conducted 310 hours of survey at 31 locations between 16 September 2015 and 7 September 2016. Thirteen of the points were located within the Project area; however, survey effort varied across these points due to the revision of the Project area on 28 September 2016 resulting in some points being added and some being relocated. Of the 310 survey hours, 133 occurred in the current Project area and 177 occurred adjacent to the Project area. Skies ranged from clear to overcast. Short periods of drizzle occurred during 2 survey rounds; no other precipitation occurred during surveys (Table 2).

3.2.2 Results Inside the Project Area

A total of 31 bald eagle observations were recorded, 9 of which were within the Project area. Twenty-one eagle bald eagle minutes were recorded inside the Project area and 9 total bald eagle exposure minutes. Total exposure minutes ranged from 0 –4 minutes per point (Table 3). The greatest number of flying bald eagle minutes per survey hour within the Project area occurred at Point 9 (n = 0.50 flying bald eagle minutes/survey hour; 43% of total flying bald eagle minutes within the Project area. Point 9 is in the eastern portion of the Project area, and most minutes occurred when the 2 bald eagles exhibited undulating, territorial flight on 22 March. The greatest number of bald eagle exposure minutes also occurred at this Point (n = 0.22 exposure minutes/survey hour; 44% total exposure minutes in the Project area). Of the 13 Points inside the Project area, no bald eagles were observed at Points 5, 7a, 8a, New 21, New 22, New 23, New 24, and New 25.

[1] Minutes that an bald eagle was observed perched are not included.

Observations occurred between 7:20 AM and 4:50 PM (Table 4). Bald eagles observed were adults, except for 1 bald eagle whose age could not be classified due to its distance from the observer. Most bald eagle observations exhibited soaring or gliding behavior.

Business Confidential

Point 19 had the greatest bald eagle occurrence rate outside the Project area (Table 6). Point 19 is nearest to Montegail Pond, which has a historic bald eagle nest on its northern shore. Points 22 and 18 had similar occurrence rates. Point 22 was located in the far north near the abandoned radar station. Point 18 is approximately 2 miles south of Point 19. Montegail Pond, Point 18, Point 19, and Point 22 are outside the current Project area. Stantec found the Montegail Pond nest to be unoccupied during 2016 aerial nest surveys.

Mean use by bald eagles within the Project area (0.16 eagle minutes/hr of observation) was lower than observed at points outside the Project area (0.49 eagle minutes/hr of observation). Excluding point 9, overall mean use within the Project was very low (0.10 eagle minutes/hr of observation).

Table 6. Bald eagle minutes at points outside the Project area, Downeast Wind Project, 2015–2016.

3.2.4 Seasonal Eagle Use

For all points, bald eagle use was concentrated in the winter and spring months of January through May (Figure 3). The rate of bald eagle occurrence was highest in the month of March at points inside and outside the Project area. No eagles were observed in the months of June, July, October, and December.

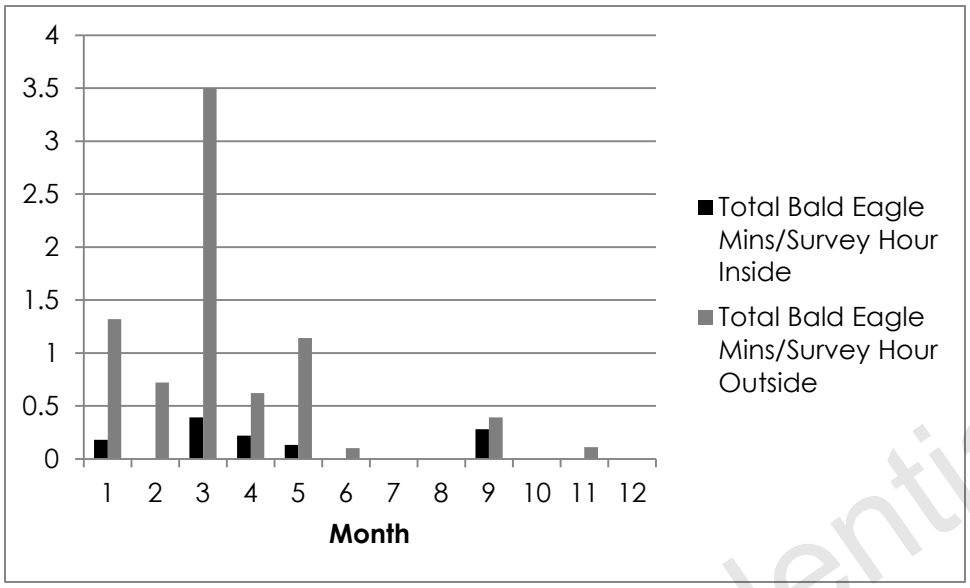

Figure 3. Bald eagle Occurrence Rates at All Survey Points by Month, Downeast Wind Project, 2015–2016.

3.2.5 Incidental Species

3.2.5.1 Non-bald eagle species

Bird species observed incidentally during bald eagle use surveys are listed in Appendix C Table 1. No federally listed species were observed, 1 state-listed threatened species: upland sandpiper (*Bartramia longicauda*) was recorded at Points 23 and 24 which are outside of the current Project area, and 5 state species of special concern were recorded, 2 outside the project area (black-and-white warbler (*Mniotilta varia*), chestnut-sided warbler (*Setophaga pensylvanica*)) and 3 within the project area (great blue heron (*Ardea herodias*), northern harrier (*Circus cyaneus*), and white-throated sparrow (*Zonotrichia albicollis*)). The single great blue heron was observed flying north between 50 and 100 m agl near Point 5 on 16 September 2015.

Stantec also observed a flock of approximately 200 shorebirds, the majority of which were semipalmated plovers (*Charadrius semipalmatus*), adjacent to Point 5 on 6 September 2016. The flock was present for the entire hour of survey, and individuals were loafing and feeding. The biologist returned to the site on 7 September and documented that the flock was no longer there. No other shorebirds (aside from upland sandpiper) were observed during bald eagle point count surveys.

4.0 DISCUSSION

One bald eagle nest, Nest 624A on the northeastern shore of Schoodic Lake, is within the Project area. The other bald eagle nests are over 3 miles from the current Project area.

Business Confidential

Nest 624A was found to be unoccupied during 2016 aerial nest flights. Bald eagle activity in the vicinity of this nest as assessed during bald eagle use surveys was low; in 18 survey hours, only 1 bald eagle was observed at Point Count 3, approximately 0.25 miles to the east of the lake. No bald eagles were observed at Point New 21, 0.25 miles north of the lake, and Point New 22, 0.25 miles northwest of the lake. These 2 points were surveyed 5 times.

The majority of bald eagle observations recorded outside the Project area occurred around Montegail Pond. Despite the fact that this nest was found to be unoccupied in 2016, relative to results from other survey points adjacent to the Project area, bald eagle activity was highest in the vicinity of this nest. Nonetheless, this nest is located outside the area currently proposed for development.

Mean use by bald eagles within the Project area was lower than observed at points outside the Project area. Excluding point 9, overall mean use within the Project was very low. At all points, bald eagle use was concentrated in the winter and spring months of January through May, which corresponds with the period when eagles migrate or make local movements to breeding grounds, create or repair nest sites, perform courtship displays, and lay and incubate eggs. Activity at points inside and outside the Project area peaked in March, when eagles construct nests and some individuals lay eggs. The time period of egg laying in Maine is broad, from late February to early May[4]. Eagle use of the Project area was observed to be extremely low or non-existent in months between May and December, when fledging occurs, juveniles and adults make localized movements between feeding areas, and some eagles migrate southward.

Behaviors thought to be associated with greater collision risk at wind projects include courtship displays, territorial displays, and foraging (USFWS 2013[5]). Young birds practicing flying during their first summer may be at increased risk of collision. However in 12 months of survey, only 1 territorial display occurred between 2 individuals in the Project area (in March), and no juvenile bald eagles were observed during the post-fledging period. The lack of observations in June or July may have been due to the fact that the nest on Schoodic Lake was inactive in 2016.

To date, there is no documented correlation between pre-construction bald eagle occurrence data and post-construction bald eagle mortality. In Maine, bald eagle use at wind projects has been documented during both pre- and post-construction surveys[6]. Stantec has assessed bald eagle use during project operation at 2 projects with active bald eagle nests within 2 miles of turbines (Stantec 2012a,b; Stantec 2015 b,c). At those projects, eagles continued to use the airspace in the vicinity of turbines, but did not collide with them. Despite a large and growing bald eagle population in Maine[7], no bald eagle fatalities have been recorded at operational wind projects in Maine or New England. This may in part be because bald eagles exhibit a high

Business Confidential

rate of avoidance at wind projects (Sharp et al. 2010; Stantec 2012 a,b; Stantec 2015 b,c). This, combined with the fact that no active nests occur within 4 miles of the Project, and that the majority of behaviors observed were not behaviors that are thought to be associated with greater collision risk at wind projects (courtship, territorial displays, or foraging), indicates that risk of collision and disturbance as a result of the Project likely is very low.

1.0 INTRODUCTION

Apex Clean Energy, Inc. (Apex) is the process of developing the Downeast Wind Project (Project) in Washington County, Maine in the towns of Cherryfield, Columbia, Columbia Falls, Township T19 MD BPP, and Township T25 MD BPP (Figure 1). At this time, the Project is expected to generate up to approximately 180 megawatts of power and include up to 60 turbines, and may be built in 2 phases. Turbines are expected to have a total height of approximately 183 meters (600 ft). Project infrastructure is expected to include underground collector lines, a generator lead transmission line, new and improved roads, a collection substation, an operations and maintenance building, and 2 or 3 permanent meteorological towers.

The Project area consists of actively managed blueberry fields and hills with mixed forest habitat. The western and central portions of the Project area have little topography and contain a network of dirt roads that intersect the blueberry fields. Other habitats in these portions include hedgerows, and a few lakes and ponds. The northern and eastern portion of the Project area is more topographically variable, developed with residences, farms, fallow fields, paved roads, and mixed forest.

In fall 2015, Stantec Consulting (Stantec) initiated eagle use surveys at the Project to assess eagle activity/presence consistent with the US Fish and Wildlife Service's (USFWS) *Eagle Conservation Plan Guidance* (ECPG; 2013), and bird and bat surveys following the Maine Department of Inland Fisheries and Wildlife's (MDIFW) *Curtailment Policy and Wind Power Preconstruction Study Recommendations* (MDIFW Recommendations; June 2015). This work plan outlines the bird and bat studies completed in 2015 and planned for completion in 2016.

- Eagle Activity Surveys (fall 2015 to fall 2016)
- Aerial Bald Eagle Nest and Great Blue Heron Rookery Survey (spring 2016)
- Nocturnal Migration Radar Surveys (fall 2015 and spring 2016)
- Diurnal Raptor Migration Surveys (fall 2015 and spring 2016)
- Breeding Bird Surveys and Upland Sandpiper Surveys (late spring/summer 2016)
- Acoustic Bat Monitoring (fall 2015, and spring/summer/fall 2016)

It is our intention to reconvene with MDIFW following completion of spring surveys to determine what studies should be conducted at the Project in fall 2016.

2.0 BIRD AND BAT SURVEYS

2.1 EAGLE ACTIVITY SURVEYS

The objective of eagle activity surveys is to provide input data for modeling to predict risk to eagles at the Project and inform siting decisions. Eagle point count surveys were initiated in mid-September 2015, and are planned to continue for at least 1 year throughout the Project area.

Business Confidential

Surveys consist of 1 hour point counts, with each point surveyed at approximately 3 week intervals. In fall 2015, 14 points[1] were surveyed in the southern and western portions of the Project area. In spring 2016, 6 additional points were added in the northern and eastern portions of the Project area, for a total of 20 points. An 800-meter radius plot is evaluated at each point, covering 2 square kilometers. Points are positioned to optimize the view shed of the Project area. Due to the low, flat cleared landscape throughout much of the Project area, most points in the southern and eastern portions have a nearly 360-degree view of the surrounding landscape.

Surveys will occur in all weather conditions except when visibility is poor, such as during heavy fog or rain events, and will be distributed throughout the daylight period. The order of surveys will be altered to provide representative spatial and temporal sampling throughout the Project. Surveys will end in mid-September 2016, resulting in 18 rounds of surveys.

Surveyors will also document any other raptors observed during eagle activity surveys. Data collected will include species, age, and sex, as possible, flight behavior, flight height, flight time, and weather conditions. Flight locations will be drawn on maps of the Project area.

A report summarizing the eagle use data will be provided after 1 year of data collection is complete. The analyses will evaluate seasonal and spatial use of the Project by eagles using standard metrics to inform siting decisions. The report will also include a list of other raptor observations in the project area including species, date observed, and minimum height inside the Project area. GIS shapefiles of the survey locations and eagle observations and flightpaths will be provided with the survey report.

2.2 AERIAL BALD EAGLE NEST, GREAT BLUE HERON ROOKERY, AND RAPTOR NEST SURVEYS

The objective of the aerial bald eagle nest, great blue heron rookery, and raptor nest surveys is to evaluate siting options and assess impacts to nesting eagles, great blue heron, and raptors at the Project.

In spring 2016, Stantec will conduct 1 aerial bald eagle nest and great blue heron rookery flight. The survey will occur in early to mid-May, before leaf out conditions, to document the status of existing bald eagle nests and great blue heron rookeries and to search for new nests and rookeries within 4 miles of the Project.

Prior to the survey, Stantec will review results of previous flights in the vicinity of the Project area and any information provided by MDIFW regarding known active and historic eagle nest locations near the Project. Stantec will notify USFWS before the flights are conducted in accordance with USFWS Bald Eagle Management Guidelines (USFWS 2007).

[1] The final locations of the 14 eagle point counts were determined prior to the third survey round and were based on landowner access permissions and reconnaissance survey for view shed. Some points surveyed during rounds 1 and 2 were moved or eliminated.

Business Confidential

The survey will use a transect based approach to identify suitable nesting/rookery habitat within 4 miles. Transects will be spaced approximately 0.25 miles apart, with 2 observers searching opposite sides of the plane. Flight paths will deviate from the transects to assess identified suitable habitat, nests, or rookeries more closely. Additionally, low altitude passes, approximately 500 to 1,000 ft above ground level will be completed around the shorelines of major rivers, lakes, ponds, and flowages. Data on new and previously identified nest and rookery locations will be documented during the flight. Incidental observations of adult bald eagles and other visible raptor nests (e.g. osprey nests) will also be recorded. Stantec will also survey the known eagle nest on Montegail Pond. If the nest is not detected during the aerial survey, it will be ground evaluated to determine if the nest is still intact and/or active.

After completion of the survey, we will summarize methods and results in a memo report which also will include data collected during the eagle activity surveys (Section 2.1). The report will include a map showing the locations of nests and rookeries identified (or those confirmed as no longer intact if applicable). GIS shapefiles of track log, survey area and nest/rookery locations will be provided with the survey report.

2.3 NOCTURNAL RADAR MIGRATION SURVEYS

The objective of the nocturnal radar migration surveys is to document patterns of nocturnal migrants at the Project. This information has been used by MDIFW to assess mortality risk. However, Stantec and others in the industry have recognized that reliance on pre-construction radar surveys as an indicator of post-construction mortality risk is challenging as they have not proven to accurately predict turbine-related bird and bat fatality patterns[2]. Evaluation of pre-construction surveys and post-construction mortality estimates at operating projects in Maine and New England has shown that there is no statistical correlation between pre-construction survey results (radar passage rates) and post-construction bird fatality estimates (Stantec unpublished data).

In order to follow MDIFW Recommendations at the Project, Stantec initiated radar surveys in early fall 2015 and will conduct radar surveys in spring 2016. Surveys utilize an X-band marine radar unit to document the abundance, timing, and flight altitudes of night-migrating species. The fall survey site was located in the west-central portion of the Project area. At this location, topography and surrounding tree height provide a nearly unobstructed view with less than 30% ground clutter, as called for in the MDIFW Recommendations. In spring 2016, Stantec will move the radar further north to an area that is central to the entire Project area as depicted in Figure 1. Stantec conducted 20 survey nights in fall 2015 between 9 September and 30 October and will conduct 20 nights at the new location in spring 2016, between 15 April and 1 June. Surveys will be conducted on nights with generally clear weather without long periods of substantial

[2] Ferrer, M., M. de Lucas, G.F.E. Janss, E. Casado, A.R. Muñoz, M.J. Bechard, and C.P. Calabuig. 2012. Weak relationship between risk assessment studies and recorded fatality at wind farms. Journal of Applied Ecology 49:38–46.

Business Confidential

precipitation. On nights when periodic showers are forecasted, surveys will occur between showers to collect information on migration activity during inclement weather.

Radar surveys will include up to 12 hours of data collection per night alternating every 10 minutes between vertical and horizontal mode. In horizontal mode, the antenna spins horizontally to survey the airspace around the radar and detects the number of targets and their flight direction as they pass through the Project site. By analyzing the echo trail, the flight direction and flight speed of targets can be determined. In vertical mode, the radar unit is tilted 90° to survey the airspace above the radar. In vertical mode, target echoes do not provide directional data, but do provide information on the altitude of targets passing through a vertical radar beam with a 20° angle of view. Horizontal data will be used to calculate passage rates and flight direction; vertical data will be used to calculate flight heights and percent of migrants flying below proposed turbine height.

Radar data will be post-processed using analysis software and methods developed by Stantec. Digital image data will be converted to numerical data for the calculation of migration statistics. Insect data will be separated from other target data (i.e., birds and bats) based on target flight speed. Stantec will calculate and report the average hourly and nightly passage rate (targets/kilometer/hour), seasonal passage rate, nightly and seasonal flight direction, and nightly and seasonal flight height. The percentage of targets flying below the height of the proposed turbines will be calculated on a nightly basis. Data will be compiled into a radar migration report after radar migration surveys are completed.

2.4 DIURNAL RAPTOR MIGRATION SURVEYS

The objective of the diurnal raptor migration surveys is to document species composition, timing, and flight patterns of migrating raptors at the Project to assist in evaluating siting decisions. It should be noted that while pre-construction data provides a snap-shot of raptor activity in an area at the time it was sampled, pre-construction data do not predict levels of post-construction mortality in raptors. For example, the Pennsylvania Game Commission prepares annuals reports in the form of a Cooperative Agreement that summarize results of pre and post-construction bird and bat surveys conducted at all Pennsylvania projects in an effort to assess the impacts of operational wind projects on local and migrant bird and bat populations. In 2012, Taucher et al.[3] reported that despite the volumes of pre-construction and post-construction data (45 sites) included in these assessments, they have not been able to develop a model that predicts the extent of bird or bat mortality.

Stantec completed raptor migration surveys in fall 2015, and will do so again in spring 2015. From 9 September to 25 November 2015, 24 survey days were completed from the raptor migration survey location shown in Figure 1. The survey site in fall 2015 was located a quarter mile from the

[3] Taucher, J., T. Librandi Mumma, W. Capouillez. 2012. Pennsylvania Game Commission Wind Energy Voluntary Cooperation Agreement Third Summary Report. Available online at: http://www.pccd.state.pa.us/portal/server.pt/document/1378280/pgc_3rd_wind_energy_summary_report_2012_pdf

Business Confidential

radar site. It was on flat ground and had an extensive view. In spring 2016, Stantec will move the raptor location northward to a location that is central and prominent to the Project area (Figure 1). Spring surveys will be conducted between 1 March and 15 June at a rate of 2 surveys every 7 days, pending suitable weather conditions. Surveys will occur on days with optimal migration weather, which typically include fair days with thermal development and winds generally from a southerly direction. Raptor surveys will be conducted from 9 am to approximately 2 hours before sunset. Binoculars will be used to aid in identification. In addition to raptors, incidental observations of songbirds and migrating flocks or individuals of large birds such as waterfowl, wading birds, and shorebirds will be documented.

Data for raptors will be documented on Stantec raptor datasheets and include species, age, and sex, as possible, flight behavior, flight height, flight time, flight locations, flight paths, and weather conditions. Data will be analyzed and summarized by hour, day, and for the season. Data will be compiled and results discussed in a raptor migration report.

2.5 BREEDING BIRD SURVEYS

The objective of the breeding bird surveys is to assess species composition, abundance, diversity, and distribution of songbirds relative to available habitat in the Project area during the breeding season to assist in evaluating siting decisions, in accordance with MDIFW Recommendations.

Breeding bird surveys will consist of point count surveys designed to document singing male birds and responses of territorial raptors breeding in the Project area. Stantec will conduct breeding bird surveys at 20 point count locations in the various habitat types present throughout the Project area. Due to the homogenous nature of the habitat in the southern and western portions of the Project, 20 point count locations is expected to sufficiently capture the breeding bird composition of the Project area. A GPS point will be taken at each location.

Surveys will occur in 3 rounds: 1 in May and 2 in June. Surveys will be scheduled to target fair-weather days. During each round, each point will be visited and birds seen or heard will be documented during a 10-minute sampling period. Immediately after each 10-minute period for points located in forested habitat, the observer will broadcast a great horned owl (*Bubo virginianus*) call and northern goshawk (*Accipiter gentilis*) call, alternating between species, for 5 minutes to attempt to observe any approaching or territorial raptors, indicative of potential breeders, proximal to the point.

A separate survey report will describe the habitat at each point count location, methods, and results, and will include a discussion section. Data will be analyzed and summarized to determine species richness, relative abundance, species frequency, and community diversity for each type of habitat available in the Project area and for the survey as a whole.

Business Confidential

2.6 ACOUSTIC BAT MONITORING

The objectives of the acoustic bat monitoring survey are to assess frequency of rare species presence at the Project, document seasonal patterns in bat activity and species presence, and to characterize conditions during which bats are present near the rotor zone.

Acoustic surveys began in fall 2015, when Stantec deployed 2 bat detectors in the single Project meteorological (met) tower (at ~5 m and ~20 m in height) and at 4 additional sites in the Project area in trees at ~5–8 m in height (the shore of the southern pond of Myer's Ponds, a hedgerow near the radar and raptor survey locations, and 2 forest edges in the southwest portion of the Project). Year 2016 acoustic surveys will expand on previous efforts and include a total of 11 detectors deployed from 1 April 2016 until 31 October 2016. This survey window is longer than suggested in MDIFW Recommendations, but was recommended by MDIFW during a meeting on 23 February 2016 between MDIFW, APEX, and Stantec. The 2016 survey period will encompass the spring migration, summer residency, and fall migration seasons for bats. In addition to the 6 detector locations used in fall 2015, Stantec will deploy an additional detector on the onsite met tower at ~40 m in height. Stantec will also deploy an additional 4 detectors in trees at ~5–8 m in new locations in the northern portion of the Project area, resulting in 11 detectors total. If a second met tower is deployed in the Project area, we will also deploy detectors at heights of ~40 m and ~20 m on the tower, for a total of 13 detectors.

A combination of SM3 (Wildlife Acoustics ©) and Anabat (Titley Electronics Pty Ltd.) detectors will be used for data collection. Specifically, we will use SM3 detectors in the met tower at heights of ~40 m and ~20 m. Detectors will sample from approximately ½ hour before sunset until ½ hour after sunrise on a nightly basis throughout the survey periods. Stantec will visit each detector at a maximum interval of every 3 weeks to download and store data and maintain equipment.

Acoustic data will be analyzed using Kaleidoscope (classifier version 3.1.0) and BCID (version 2.7b), approved USFWS automated analysis programs. Stantec will then visually examine any calls identified as a state or federally listed species. Additionally, automated programs calculate a nightly maximum likelihood estimator (MLE) to assess the likelihood that individual species are present at a given location on a single night. According to the USFWS *2015 Range-Wide Indiana Bat Summer Survey Guidelines* (April 2015) a MLE of less than 0.05 indicates likely presence. Stantec will compare file-level identification results for each automated program and manual vetting as well as nightly MLE values to evaluate patterns in rare species detection such as seasonality, frequency, and distribution across habitats.

Because automated analysis programs sometimes filter out poor quality bat passes, Stantec will also visually analyze all files recorded by the detectors deployed near the rotor zone in the met tower (detectors at ~20 and ~40 m in height) to ensure that all bat passes are included in analysis of activity versus conditions in the rotor zone, and to allow better comparability with results of similar studies at other Projects. Stantec will determine the temperature (hourly average) and wind speed (10-minute average) at which each bat pass occurred to quantify the conditions during which bats were active near the rotor zone. Stantec will also evaluate

Business Confidential

seasonal and temporal patterns in bat activity near the rotor zone based on acoustic data from the detectors deployed at ~20 and ~40 m. Methods, results, and a discussion will be included in an acoustic bat report after the completion of the survey.

APPENDIX B INCIDENTAL SPECIES

Business Confidential

Appendix B Table 1. Bird species observed incidentally during bald eagle use surveys, Downeast Wind Project, 2015–2016.

Species Common Name	Species Scientific Name	No. Observations	Point Locations
American black duck	*Anas rubripes*	1	9
American crow	*Corvus brachyrhynchos*	117	1, 5, 7, 8, 9, 10, 13, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, New 21, New 22, New 23, New 24
American goldfinch	*Spinus tristis*	5	10, 13, 16
American kestrel	*Falco sparverius*	18	1, 3, 4, 5, 7, 9, 10, 13, 15, 21, 7a, New 25
American robin	*Turdus migratorius*	61	1, 3, 4, 5, 7, 8, 9, 10, 13, 15, 16, 17, 18, 19, 20, 22, 23, 25, New 21, New 24, New 25
bald eagle	*Haliaeetus leucocephalus*	3	1, 5
belted kingfisher	*Megaceryle alcyon*	2	9, New 22
black-and-white warbler	*Mniotilta varia*	1	19
black-capped chickadee	*Poecile atricapillus*	42	1, 3, 4, 5, 7, 8, 9, 10, 11, 13, 15, 16, 17, 18, 19, 20, 24, New 21
blue jay	*Cyanocitta cristata*	38	1, 3, 4, 5, 8, 9, 10, 11, 13, 14, 15, 17, 18, 20, 22, 24, New 22, New 24
blue-headed vireo	*Vireo solitarius*	3	15, 16, 19
broad-winged hawk	Buteo platypterus	20	3, 4, 5, 7, 9, 11, 12, 13, 14, 17, New 25
brown thrasher	*Toxostoma rufum*	4	17, 22, 23
Canada goose	*Branta canadensis*	31	5, 9, 10, 22
cedar waxwing	*Bombycilla cedrorum*	16	1, 3, 7, 11, 13, 15, 18, New 24, New 25
chestnut-sided warbler	*Setophaga pensylvanica*	2	11, 17
chipping sparrow	*Spizella passerina*	12	13, 15, 16, 19, 21, New 21, New 22
cliff swallow	*Petrochelidon pyrrhonota*	3	7, 9, 10
common grackle	*Quiscalus quiscula*	12	16, 19, New 22
common loon	*Gavia immer*	5	17, 19, New 20
common nighthawk	*Chordeiles minor*	1	17
common raven	*Corvus corax*	176	All points besides 6 and 8a
common yellowthroat	*Geothlypis trichas*	3	10, 16, New 21
Cooper's hawk	Accipiter cooperii	2	10, 13
dark-eyed junco	*Junco hyemalis*	7	3, 10, 13, 15, 16, 18
double-crested cormorant	*Phalacrocorax auritus*	1	19
downy woodpecker	*Picoides pubescens*	1	16
eastern phoebe	*Sayornis phoebe*	2	13, 16
European starling	*Sturnus vulgaris*	2	13, 22
great blue heron	*Ardea herodias*	3	5, 7
hermit thrush	*Catharus guttatus*	2	16, 23
killdeer	*Charadrius vociferus*	1	9
mallard	*Anas platyrhynchos*	2	5
merlin	Falco columbarius	1	New 23
mourning dove	*Zenaida macroura*	16	1, 4, 5, 10, 13, 16, 18, 19, 21, 25
northern cardinal	*Cardinalis cardinalis*	2	1, 18
northern flicker	*Colaptes auratus*	6	7, 15, 18, 19, 21, 22
northern harrier	*Circus cyaneus*	20	1, 3, 4, 7, 8, 15, 16, 20, 21, 7a
northern parula	*Setophaga americana*	2	16, 19
osprey	Pandion haliaetus	5	19, 22, New 21
palm warbler	*Setophaga palmarum*	4	New 22

2017 BALD EAGLE NEST AND HERON ROOKERY SURVEYS FOR THE DOWNEAST WIND PROJECT

June 28, 2017

Executive Summary

Stantec Consulting Services Inc. conducted an aerial nest survey for the proposed 30-turbine (90-megawatt) Downeast Wind Project (DOW or Project) in Washington County, Maine. This survey represented the second year of aerial nest surveys conducted at DOW. The objective of the survey was to locate bald eagle (*Haliaeetus leucocephalus*) nests and great blue heron (*Ardea herodias*) rookeries within 4 miles of the area proposed for development. Surveys followed methods described in the Project Work Plan developed in coordination with U.S. Fish and Wildlife Service (USFWS) and Maine Department of Inland Fisheries and Wildlife (MDIFW) and were consistent with the USFWS final eagle rule (81 FR 91494, USFWS 2016) and MDIFW's June 2015 *Curtailment Policy and Wind Power Preconstruction Study Recommendations* (MDIFW Recommendations) dated June 2015.

Survey flights were completed on April 10 and May 24, 2017. Bald eagle nests and great blue heron rookeries were recorded, and incidental observations of bald eagles, great blue heron, osprey (*Pandion haliaetus*) and osprey nests were recorded if observed.

Three occupied bald eagle nests were located: 1 within the Project area on Schoodic Lake, 1 located 2.6 miles southeast of the Project area on the Pleasant River in Columbia Falls, and 1 located 3.3 miles southeast of the Project area on the Pleasant River in Addison. One active great blue heron rookery was documented in southern Deblois, approximately 2.2 miles west of the Project area, with 6 to 8 nests containing several adult great blue herons. This rookery was found to be occupied during the 2016 flights, and the number of nests seen were similar between years. In addition, 4 active osprey nests were observed within the survey area approximately 1 to 4 miles west and northwest of the Project area. No other nests, rookeries or incidental observations were made during the survey.

2017 BALD EAGLE NEST AND HERON ROOKERY SURVEYS FOR THE DOWNEAST WIND PROJECT

June 28, 2017

1.0 INTRODUCTION

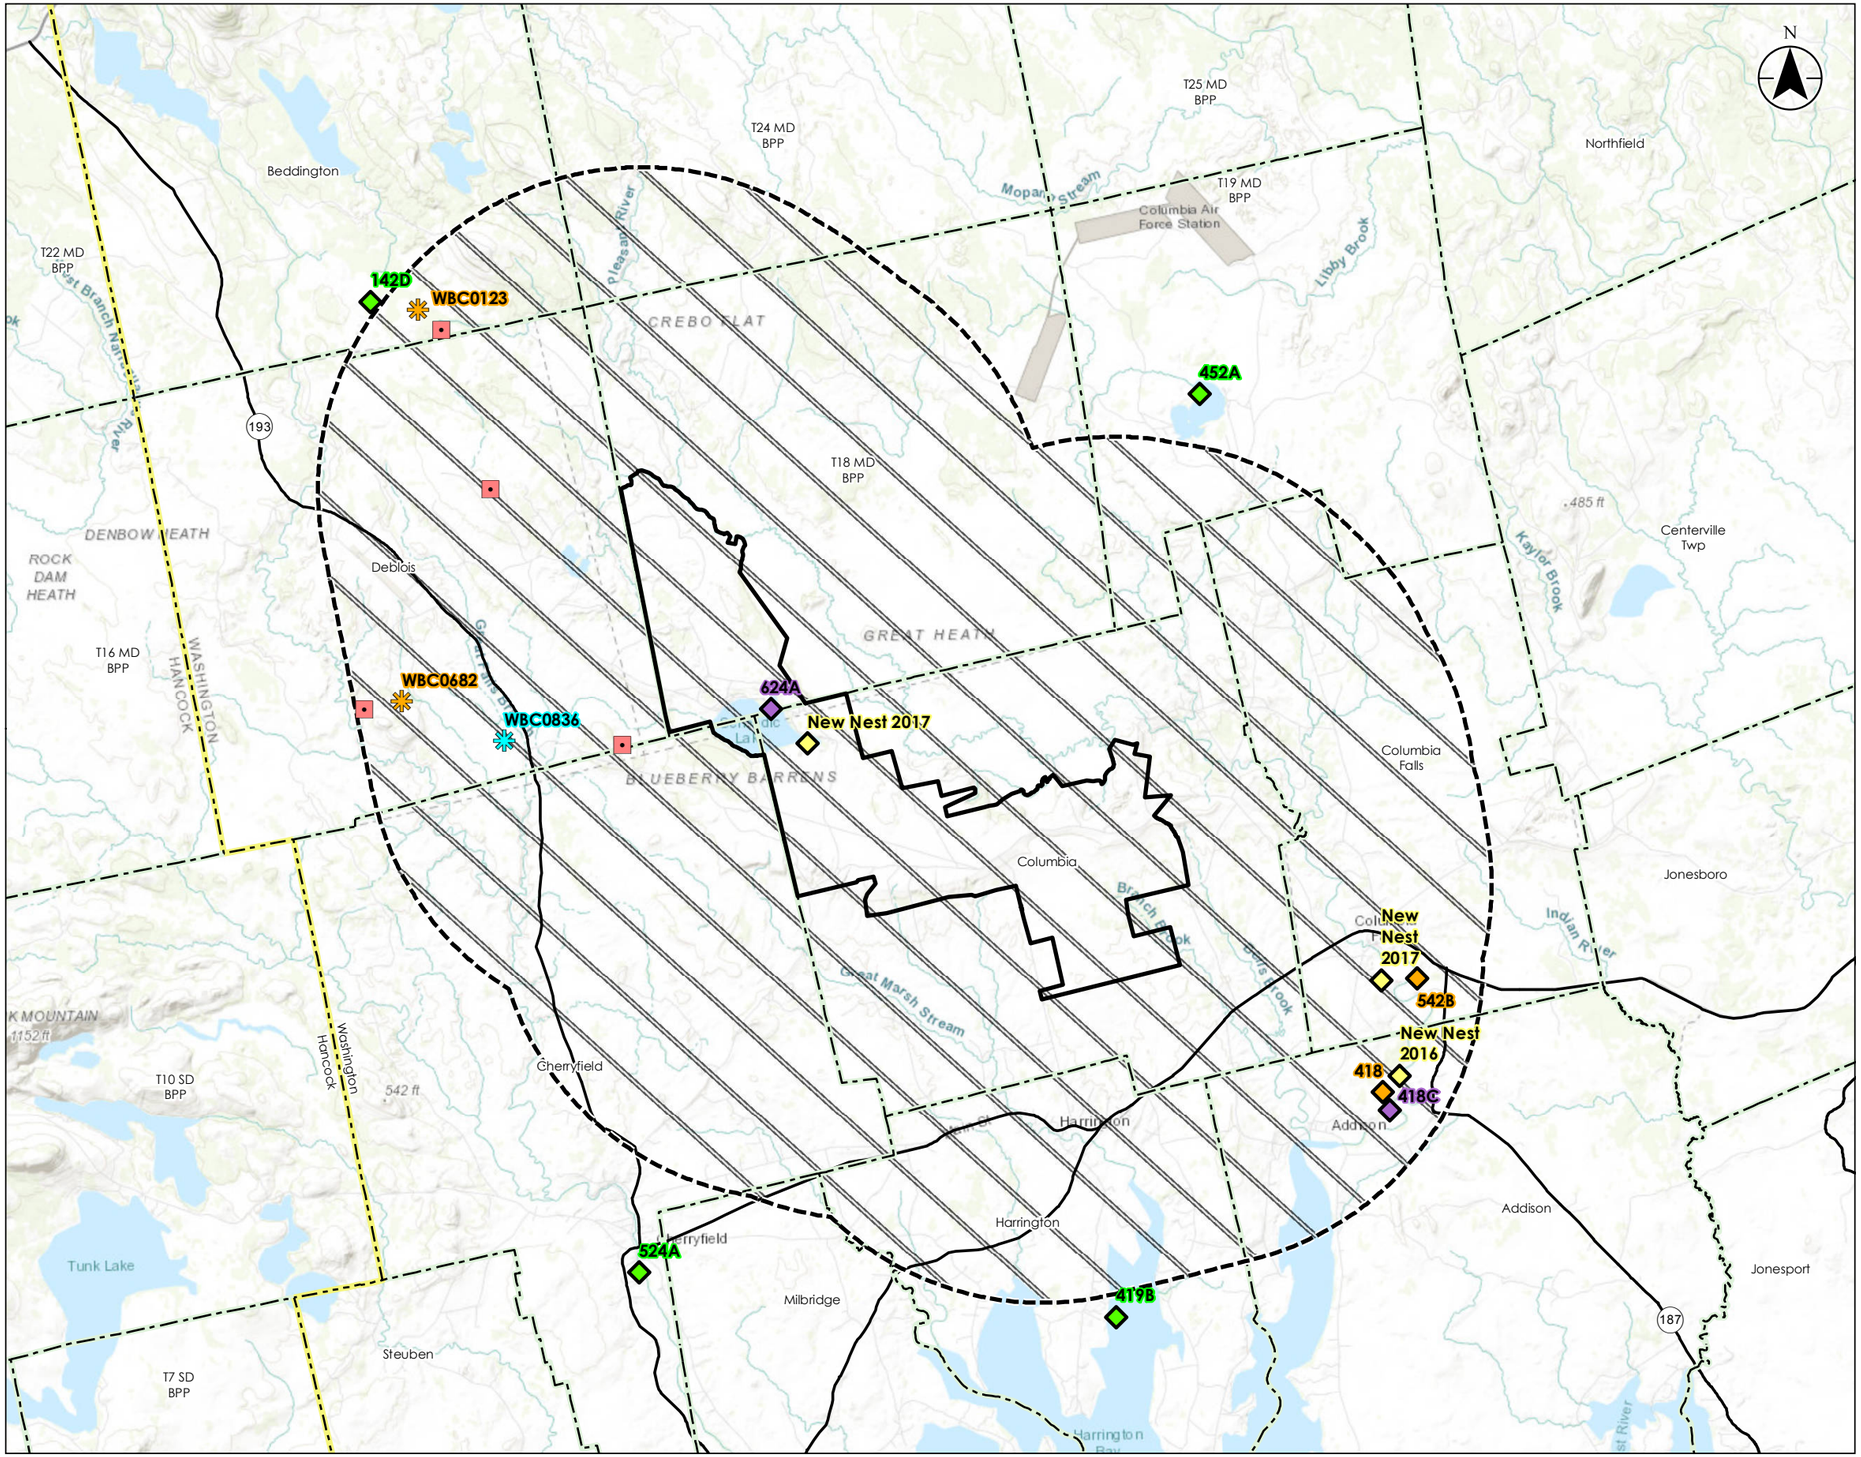
Stantec Consulting Services Inc. (Stantec) conducted an aerial bald eagle nest and heron rookery survey in and adjacent to the 30-turbine (90-megawatt) Downeast Wind Project (DOW or Project) in Washington County, Maine, in spring 2017. This survey represented the second year of aerial nest surveys conducted at DOW. Results of the first year of aerial nest surveys were included in the *2015-2016 Bald Eagle Use and Bald Eagle Nest and Heron Rookery Surveys for the Downeast Wind Project* (Stantec 2016).

The objective of the survey was to locate bald eagle (*Haliaeetus leucocephalus*) nests and great blue heron (*Ardea herodias*) rookeries within 4 miles of the Project. The survey was conducted to comply with the U.S. Fish and Wildlife Service's (USFWS) final eagle rule (81 FR 91494, USFWS 2016) and the Maine Department of Inland Fisheries and Wildlife's (MDIFW) *Curtailment Policy and Wind Power Preconstruction Study Recommendations* (MDIFW Recommendations) dated June 2015. Surveys followed methods described in the Project Work Plan submitted to MDIFW on February 19, 2016 and as discussed in a March 2, 2017 coordination meeting.

2.0 METHODS

Stantec conducted 2 aerial flights in the spring of 2017. Prior to flights, Stantec reviewed information provided by MDIFW regarding known occupied and historic bald eagle nest and great blue heron rookery locations in the vicinity of the Project, as well as the results of aerial surveys conducted in spring 2016. Following protocol previously established by the USFWS (2007)[1], Stantec notified Mark McCollough of the USFWS Maine Field Office on April 3, 2017 that flights were being conducted in the area and that Stantec was coordinating with MDIFW on the timing and methods of the flights.

The survey was conducted in a Cessna fixed-wing aircraft piloted by Mr. Scott Story (first flight) and Mr. Shawn Michaud (second flight) of Penobscot Island Air. Charlie Todd, Endangered & Threatened Species Coordinator for MDIFW, was an observer on the first flight. The survey consisted of low altitude passes, approximately 300–500 feet above ground level (agl), along transects spaced ¾ miles apart within 4 miles of the Project area.



The first flight was conducted on April 10, 2017 and focused on surveying for bald eagle nests. The timing of the first flight was chosen to correspond with the time period when bald eagles are actively incubating eggs in the nests. The purpose of the first flight was to survey the previously mapped bald eagle nests and to search potential nesting habitat for new bald eagle nests within 4 miles of the Project area (Figure 1). Stantec also surveyed 4 mapped bald eagle nests

[1] U.S. Fish and Wildlife Service. 2007. *National Bald Eagle Management Guidelines*. U.S. Fish and Wildlife Service, Washington, DC.

located just outside of the 4-mile search area. The survey area included inland waterbodies and portions of Narraguagus River, Harrington Bay, and other bays and inlets on the Atlantic Ocean. The survey also included the shoreline of rivers and lakes, the ocean, and major wetland systems to target preferred potential bald eagle nesting habitat. Consistent with the final eagle rule, bald eagle nests were considered occupied if a pair of adult bald eagles were observed at or near a nest during the normal incubation time period.During this flight, observers also surveyed for great blue heron nests and recorded other large bird nests if observed.

The second flight was conducted on May 24, 2017 and focused on surveying for great blue heron rookeries by surveying a transect pattern as described above, and large wetland complexes (marshes, bogs, etc.) and the adjacent upland habitat out to a distance of 4 miles from the Project area. The survey also included investigation of known rookeries or bald eagle nests within 4 miles of the Project area, for eggs and/or occupancy. Any newly discovered bald eagle nets were also recorded. The timing of the second flight was chosen to correspond with the time period when great blue herons are actively incubating eggs or brooding chicks in the nests.

During the 2 flights, incidental observations of bald eagles, osprey (*Pandion haliaetus*), and great blue heron were recorded if these species were observed.

3.0 RESULTS

3.1 EAGLES

Stantec identified 5 bald eagle nests within the survey area: 3 occupied and 2 unoccupied (Figure 1, Table 1). Four additional occupied nests were identified just outside the survey area and are also shown in Figure 1 and Table 1. The historic MDIFW mapped nest on Schoodic Lake (#624) in the Project area was not occupied in 2016 or 2017. However, a new nest was discovered in the southeast corner of the lake during the second flight. Two adult bald eagles were observed perched on the shoreline near the nest location. The view into this nest was obscured by branches and therefore it could not be determined if eggs or young were present.

Table 1. Results for bald eagle nests during the 2017 aerial nest survey, Downeast Wind Project.

MDIFW Nest #	Location	Flight 1 Nest Status	Flight 2 Nest Status	Distance to Current Project Area (mi)
New Nest 2017	Schoodic Lake	Not Located	Occupied	Inside Project Area
624A	Schoodic Lake	Unoccupied	Unoccupied	Inside Project Area
New Nest 2017	Pleasant River-North	Occupied	Occupied	2.6
542B	Pleasant River-North	Not Located	Not Located	3.1
New Nest 2016	Pleasant River-South	Occupied	Occupied	3.3
418C	Pleasant River-South	Unoccupied	Unoccupied	3.3
418A&B	Pleasant River-South	Not Located	Not Located	3.4
142D	Bog Brook Flowage	Occupied	Unoccupied	4.1
419B	Harrington Bay	Occupied	Occupied	4.3
452A	Montegail Pond	Occupied	Occupied	4.7
524A	Narraguagus River	Occupied	Occupied	5.4

Two additional occupied nests were identified within the survey area that are presumed to be alternate nests for previous MDIFW-mapped locations (542B and 418). One of the new occupied nests is located on the Pleasant River near Route 1 in Columbia Falls, 2.6 miles east of the Project area. This location is presumed to be an alternate nest for the MDIFW nest 542B. That nest was mapped 0.5 miles to the east of the new nest, but nest 542B was not found during the 2017 flights. The other occupied nest was a new location identified in 2016 and a presumed alternate for MDIFW nests 418A,B,C. The new occupied nest location is on the Pleasant River in Addison, an estimated 3.4 miles southeast of the Project area.

The 4 occupied nests located just beyond the survey limits were previously identified by MDIFW (142D, 452A, 419B, and 524A). Adult eagles were observed on or near these nests during both flights, except for nest 142D on Bog Brook Flowage, where no adults were observed during the second flight. It could not be determined if eggs or nestlings were present in any of these occupied nests due to obscured views by the adult or overhanging branches.

3.2 HERONS

No new heron rookeries were detected during the 2017 survey (Figure 1). Rookery 836 was occupied with 6 to 8 nests containing several adult herons. This rookery is located an estimated 2.2 miles west of the current Project area (Figure 1). Rookeries 682 (in Southern Deblois) and 123 in Beddington were not located. No other great blue heron nests were observed in previously mapped locations or other wetland complexes within the survey area during either survey flight.

3.3 OSPREY

During the first flight, Stantec observed 2 osprey nests on the transmission line in Deblois (Figure 1). During the second flight, 2 additional osprey nests were located, 1 on a cell tower in eastern Deblois and 1 in a large dead tree in Bog Brook Flowage in Beddington. Adult ospreys were observed on or near all 4 nests during the second flight.

3.4 OTHER SPECIES

No large bird nests or incidental observations of other raptors occurred during the survey.

4.0 DISCUSSION

One bald eagle nest, a new occupied nest on the southeastern shore of Schoodic Lake, is within the Project area. This is a new nest location and is presumed to have replaced 624A on Schoodic Lake, which was located but found to be unoccupied in both 2016 and 2017. All other bald eagle nests are over 2.5 miles from the current Project area and over 4 miles from proposed turbine locations. The active great blue heron rookery is approximately 2.3 miles from proposed turbine locations. This rookery was occupied with a similar number of nests during the 2016 flights.

One of the osprey nests found in 2017 in Deblois was also documented in 2016. All 4 osprey nests found in 2017 are located outside of the Project area.

Reference: Downeast Wind Project – 2019 Aerial Nest Survey

INTRODUCTION

Stantec Consulting Services Inc. (Stantec) conducted an aerial survey for great blue heron (*Ardea herodias*) rookeries in the vicinity of the proposed Downeast Wind Project (Project) in Washington County, Maine (Figure 1). A survey for great blue heron rookeries was recommended by the Maine Department of Inland Fisheries and Wildlife (MDIFW) during agency consultation for the Project. Concurrent with the great blue heron survey Stantec surveyed for bald eagle (*Haliaeetus leucocephalus*) nests consistent with previous surveys conducted at the Project to provide current data on eagle nest status in the area surrounding the Project.

Prior to the survey, Stantec reviewed information provided by the MDIFW regarding known active and historic heron rookery and bald eagle nest locations in the vicinity of the Project. Eagle nest locations were recently updated by the MDIFW following their own aerial surveys for the entire state of Maine in 2018. Following eagle survey protocol previously established by the United States Fish and Wildlife Service (USFWS) (2007)[1], Stantec notified Mark McCollough of the USFWS Maine Field Office on May 20, 2019, that a flight was being conducted in the area.

METHODS

Stantec conducted the aerial nest survey on May 22, 2019, in a Cessna fixed-wing aircraft piloted by Jeremy Harmon of Penobscot Island Air and accompanied by two Stantec observers, Tom Tetreau and Derek Benedix. The timing of the flight was chosen to correspond with the period when great blue herons are actively incubating eggs or brooding chicks in the nests. The survey covered the area within four miles of the currently proposed Project turbine locations. The survey targeted mapped heron rookeries and surveyed large wetland complexes (marshes, bogs, etc.) and the adjacent upland habitat. The survey consisted of low altitude passes, approximately 300–500 feet above ground level, at the large wetland complexes. New nest locations were located using a tablet equipped with a global positioning system receiver. In addition, known bald eagle nests were surveyed, and the shorelines of rivers and lakes within four miles of the proposed turbines, including Spruce Mountain Lake, Southwest Pond, Pleasant River Lake, Mopang Stream, and Pleasant River, were surveyed for new bald eagle nests. Incidental observations of great blue herons, bald eagles, osprey (*Pandion haliaetus*) and other raptors were also recorded. Results are described below and in Table 1.

RESULTS

Stantec surveyed five historic great blue heron rookery locations. No nests were observed at three of these locations. Stantec observed great blue heron nesting activity at WBC0836, where two stick nests and one adult great blue heron were observed in the standing dead trees within the wetland complex. Great blue heron nesting activity was observed at another, previously undocumented location approximately 1.7 miles east of WBC0836. Four stick nests were observed in the standing dead trees in this wetland complex. No adult birds were observed.

[1] U.S. Fish and Wildlife Service, 2007. *National Bald Eagle Management Guidelines*. U.S. Fish and Wildlife Service, Washington, DC.

Stantec surveyed the three known bald eagle nest locations (142D, 624B, and 452A) within four miles of the proposed turbines. Adult eagles were observed on the nests at 624B and 452A. No eagles were observed at 142D No new bald eagle nests were observed.

Three osprey nests were observed on transmission line poles and a cell tower in Deblois and Beddington, east of the Project, during the flight. Incidental raptor observations included flying adult bald eagles and turkey vultures (*Cathartes aura*).

Table 1. 2019 Results of Aerial Nest Survey within 4 miles of proposed turbines at the Downeast Wind Project.

Nest/Rookery ID	Location	MDIFW 2018 Eagle Flight Status	Stantec 2019 Flight Status	Distance to Nearest Proposed Turbine (mi)
New Rookery 2019	Unnamed wetland, Deblois/Cherryfield	N/A – heron rookery	4 nests, no adults observed	1.7
WBC0836	Unnamed wetland, Deblois	N/A – heron rookery	Occupied, 2 nests with 1 adult	2.6

EXECUTIVE SUMMARY

Downeast Wind, LLC is developing the Downeast Wind Project (Project) in Washington County, Maine. TRC conducted nest monitoring at the Schoodic Lake bald eagle nest, which is the only known active eagle nest within four miles of the Project area. Surveys were completed from March 5, 2019 to September 6, 2019 to determine the extent and map the spatial use and any patterns the nesting eagle pair and any fledged juveniles exhibited to inform Project planning and design. Methods were developed with United States Fish and Wildlife Service (USFWS) during a consultation meeting held on February 22, 2019.

Four-hour monitoring events were conducted bi-weekly in March and April, when the eagles were expected to begin using the nest, then completed every week from May until the juveniles were confirmed to have fledged in early September, for a total of 92 hours of monitoring. Surveyors recorded all observations of the nesting pair and juveniles during each monitoring event, including estimated flight height, flight path, and age class of the individual. In addition, any federally and/or state listed species were recorded if observed incidentally within the Project area at any time during the surveys.

Two adult eagles were first observed on the nest at Schoodic Lake on April 12, 2019. Over the season the pair successfully fledged two juvenile eagles. The juvenile eagles were last observed on August 30. The adult pair were generally observed leaving the nest flying to the west, down the lake and returning from the same direction. The eagles were recorded within 263 meters of the nest on average and the maximum recorded distance from the nest was 854 m. The nearest proposed turbine to the nest is at least 1,600 m from this nest, and therefore risk to nesting eagles is anticipated to be low. Northern harrier, a State of Maine Species of Special Concern, was observed incidentally once during the Schoodic Lake nest monitoring. This was the only other state or federally listed species observed.

1.0 INTRODUCTION

1.1 PROJECT AREA

Downeast Wind, LLC is developing the Downeast Wind Project (Project), a proposed 126 MW wind generating facility, in Washington County, Maine (Figure 1). The Project area is comprised of commercial agriculture in the form of blueberry barrens and forestry land. There are several ponds and lakes within the Project area, the largest being Schoodic Lake, which is approximately 385 acres.

1.2 PURPOSE AND OBJECTIVES

TRC conducted eagle nest monitoring at the only known active nest occurring within four miles of the Project area (nest located on Schoodic Lake). The primary objective of this survey was to determine the extent of spatial use and map any spatial patterns the nesting eagle pair and fledged juvenile eagles exhibited to inform Project planning and design. Methods were developed through consultation with the United States Fish and Wildlife Service (USFWS). In addition, any federally and/or state listed species were recorded if observed incidentally within the Project area at any time during the surveys.

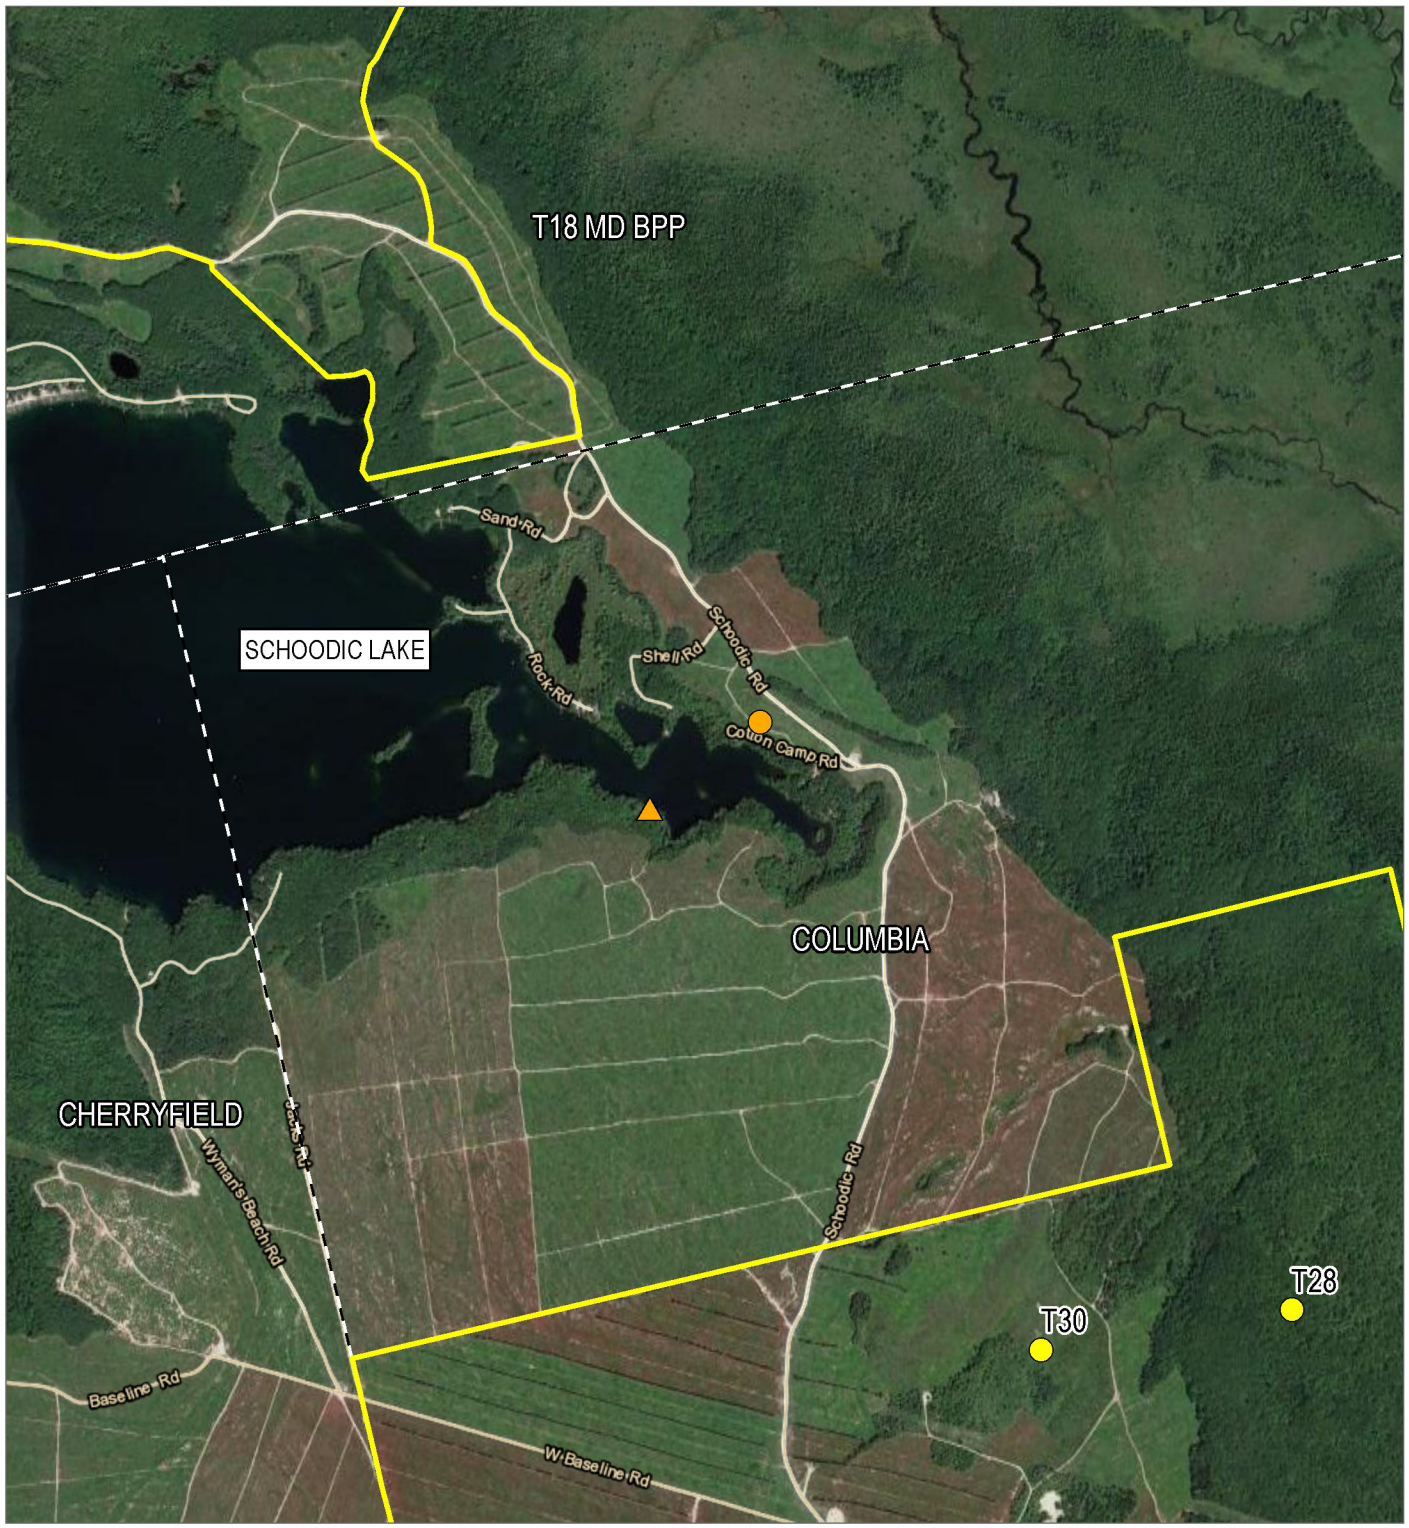
2.0 MONITORING PROTOCOL

2.1 MONITORING DESIGN

2.1.1 Nest Monitoring



The Schoodic Lake bald eagle nest was identified during aerial nest surveys at the Project in 2017 and 2019. Observers monitored the bald eagle nest from one survey point located at the north shore of Schoodic Lake approximately 1,100 ft from the nest (Figure 2). The nest was monitored bi-weekly during the months of March and April, when eagles were expected to begin using the nest, and then weekly through the beginning of September, or when the juveniles were confirmed to have fledged (i.e., not observed for an entire survey). Monitoring periods lasted for four hours during daylight hours and took place during all weather conditions, however observers targeted good weather days, or days with good potential visibility. An additional survey by canoe was undertaken on September 6, 2019 to determine if the eagles and / or juvenile(s) were still active on or near the nest.

2.2 DATA COLLECTION

Flight paths and locations for observed eagles were digitized over aerial maps of the Project and appended to data sheets. Detailed bird and weather observation data was collected during the nest monitoring survey on digital data sheets accessed by smart phone or tablet. Data forms were developed based on the Hawk Migration Association of North America (HMANA) data forms for raptor migration.

2.2.1 Data QA/QC, Entry and Summary

Data sheets were reviewed for completeness and accuracy prior to leaving the survey point. Any errors or inconsistencies noted were rectified at that time. Data was further reviewed and verified by survey management staff following each survey event. Data was analyzed concurrently with ongoing field work to ensure Project objectives were being met by the types and method of data being collected. Data was uploaded to the survey database. Survey Data Sheets are provided as Appendix A. Summaries of temporal and spatial distributions of eagles and listed species (if observed) were generated.

3.0 RESULTS

3.1 SCHOODIC LAKE NEST MONITORING

A total of 23 monitoring events for a total of 92 survey hours were completed at the Schoodic Lake bald eagle nest. The observation of one adult perched near the nest site occurred on March 5, 2019 and represented the first recorded eagle activity of the survey. Adult eagles were observed incubating the eggs on the nest on April 12, 2019, and eggs likely hatched around mid-May 2019. Two juveniles were confirmed in the nest on June 5, 2019. The juvenile eagles were first observed in flight on July 24, 2019. The last observation of eagles near the nest was recorded on August 30, 2019. An additional survey by canoe was undertaken on September 6, 2019 to determine if the eagles and / or juvenile(s) were still using the lake. No eagles were observed during this canoe survey and therefore no additional nest monitoring surveys were completed after this confirmation.

Adults were typically seen leaving the nest to forage, flying to the west along the lake away from areas where turbine locations are proposed. They would return from the west or from the south, which is generally in the direction of Schoodic Lake or the barrens to the south. The average distance of observed flights was approximately 263 m from the nest, with the furthest observed flight approximately 854 m from the nest. The adult and fledged juvenile eagles were only observed flying from the nest in the general direction of the proposed turbine areas once out of a total of 56 flight observations. The recorded distance of this flight path was 215 meters, which is less than the distance of proposed turbines from the nest. Figure 3 outlines the estimated flight paths of eagles observed during the survey flying to and from the nest. One Northern harrier, a State of Maine Species of Special Concern, was observed once, incidentally, during the survey. This was the only other state or federally listed species observed.

4.0 DISCUSSION AND CONCLUSIONS

The eagles were rarely observed flying in the direction of any of the proposed turbine locations and generally stayed within the vicinity of Schoodic Lake. Of the 56 observations recorded, 52 occurred over Schoodic Lake. The eagles were recorded within 263 meters of the nest on average and the maximum recorded distance from the nest was 854 m. The nearest proposed turbine to the nest is at least 1,600 m and, therefore, risk to nesting eagles is expected to be low. In general, flight paths of eagles observed were greater than 0.7 miles from a proposed turbine location. The nest establishment near Schoodic Lake allows for abundant and proximal foraging opportunities within the lake area. Eagles were rarely observed outside of this area or near any of the proposed turbine locations.

High-risk behaviors such as territorial behavior, kiting, and foraging can increase the mortality rate from turbine collision (Smallwood et al 2009). It is thought that these behaviors increase mortality because birds lose their spatial awareness of the turbine locations. Foraging by the adults was often observed; however, this was observed only over the lake and never within the Project area where turbines are proposed. There were three observations of territorial behavior. The territorial behavior took place over the lake and in the vicinity of the nest. There were no high-risk behaviors observed in the Project area near proposed turbine locations. Rather, most high-risk behavior observations occurred near or over the lake. Based on the results of the survey and the flight information recorded, it does not appear that the nesting pair or fledged eagle(s) frequently entered the areas with proposed turbines. Therefore, the eagles associated with the nest site would not be at higher risk of mortality due to turbine collision.

Survey Site	Schoodic Nest

Survey Overview

Survey Start Time	09:00
Survey End Time	13:00
Duration of survey (minutes)	240
Count of eagles observed	1
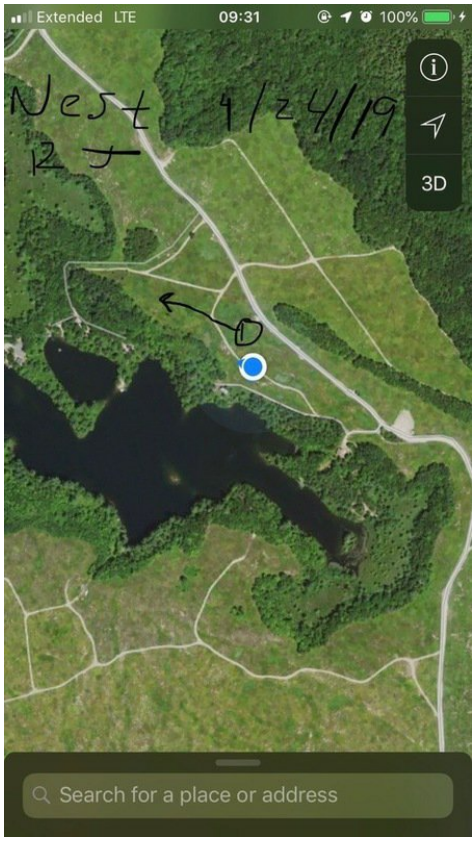
Count of raptors observed	2



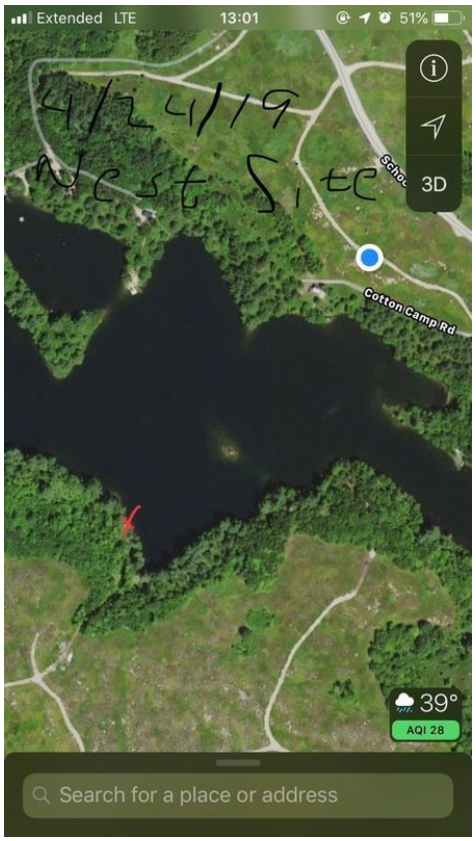
Weather Summary

Wind Speed	1 - Light air
Wind Direction	W
Temperature (F)	39
Relative Humidity	97
Barametric Pressure (inches)	29.75
Cloud Cover (percent)	100
Visibility	5km
Precipitation	1 - Haze or Fog

Northern Harrier, 1

Raptor Site	Schoodic Nest
Raptor Date	4/24/19
Species	Northern Harrier
Raptor observation number	1
Count of individuals in group	1
Time first observed	08:57
Time last observed	08:58
Duration of observation (minutes)	1
Age	Adult
Sex	Male
Behavior	Hunting, Flapping
General Flight Direction	W
Flight Height	1 - below rotor swept area
Horizontal Position Code	D - flight path over a valley
Notes	Incidental observation: First spotted while driving into the eagle nest survey site. Spotted flying in from the east low over the blueberry barrens. Flew down towards the field and landed.

Map of Flight Path



Weather during observation

Wind Speed	1 - Light air
Wind Direction	W
Temperature (F)	39
Relative Humidity	97
Barametric Pressure (inches)	29.97
Cloud Cover (percent)	100
Visibility	5km
Precipitation	1 - Haze or Fog

Bald Eagle, 2

Raptor Site	Schoodic Nest
Raptor Date	4/24/19
Species	Bald Eagle
Raptor observation number	2
Count of individuals in group	1
number of eagles observed	1
Time first observed	08:57
Time last observed	13:02
Duration of observation (minutes)	245
Age	Adult
Sex	Female
Behavior	Sitting on nest

General Flight Direction	S
Flight Height	1 - below rotor swept area
Notes	First spotted sitting on the nest. At 9:46 individual on the nest re-arranged sticks in the nest. Re-arranged sticks for about 15 min. Around 10:30 the individual shifted and shuffled in the nest. Individual remained in the nest throughout the duration of the survey.
Map of Flight Path	

Weather during observation

Wind Speed	1 - Light air
Wind Direction	W
Temperature (F)	39
Relative Humidity	97
Barametric Pressure (inches)	29.97
Cloud Cover (percent)	100
Visibility	5km
Precipitation	1 - Haze or Fog

Survey Interval	April
Date	2019-04-30
Survey Site	Schoodic Nest

Survey Overview

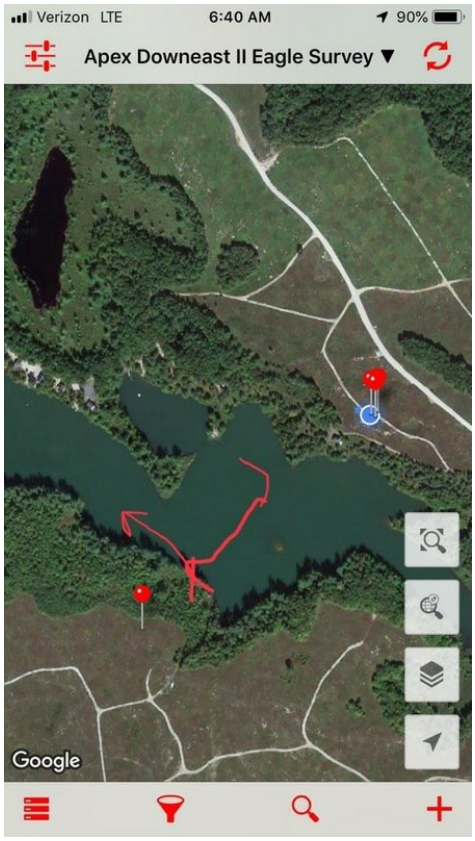
Survey Start Time	05:16
Survey End Time	09:16
Duration of survey (minutes)	240
Count of eagles observed	6
Count of raptors observed	7

Weather Summary

Wind Speed	0 - Calm
Temperature (F)	35
Relative Humidity	85
Barametric Pressure (inches)	30.26
Cloud Cover (percent)	100
Visibility	10km
Precipitation	0 - none

Bald Eagle, 1

Raptor Site	Schoodic Nest
Raptor Date	4/30/19
Species	Bald Eagle
Raptor observation number	1
Count of individuals in group	1
number of eagles observed	1
Time first observed	05:21
Time last observed	06:32
Duration of observation (minutes)	71
Duration within survey boundary	71
Age	Adult
Sex	Female
Behavior	Flapping, Perching, Sitting on nest
General Flight Direction	NW
Horizontal Position Code	Over lake
Notes	One individual (a) observed on nest until 6:23 when second parent returns flying low over the lake. Swap incubation and the first individual perches in near by white pine for about 9 minutes grooming till it flys down lake at tree height and out of site. Second individual (b) remains on nest.



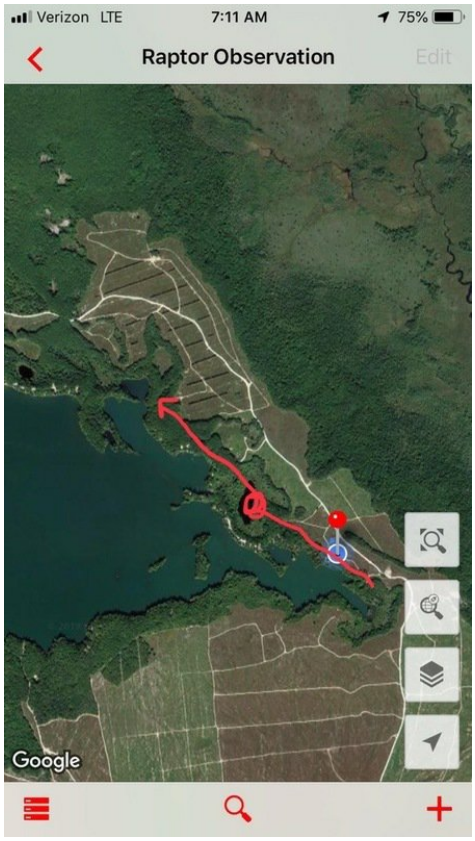
Weather during observation

Wind Speed	0 - Calm
Temperature (F)	33
Relative Humidity	84
Barametric Pressure (inches)	30.26
Cloud Cover (percent)	100
Visibility	10km
Precipitation	0 - none

Bald Eagle, 2

Raptor Site	Schoodic Nest
Raptor Date	4/30/19
Species	Bald Eagle
Raptor observation number	2
Count of individuals in group	1
number of eagles observed	1
Time first observed	06:23
Time last observed	07:16
Duration of observation (minutes)	53
Duration within survey boundary	53
Age	Adult
Sex	Male
Behavior	Flapping, On nest
General Flight Direction	S
Flight Height	0 - outside of turbine array area
Notes	Flys up to nest and swaps incubation with eagle a. Came from western end of lake, flying low over lake as it was not seen till it flew up to nest site. Leaves at 7:16.

Map of Flight Path

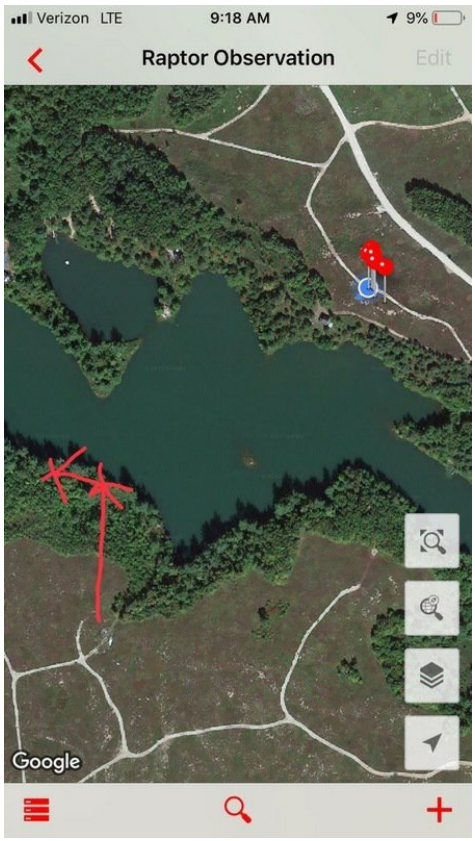


Weather during observation

Wind Speed	0 - Calm
Temperature (F)	33
Relative Humidity	84
Barametric Pressure (inches)	30.26
Cloud Cover (percent)	100
Visibility	10km
Precipitation	0 - none

Turkey Vulture, 3

Raptor Site	Schoodic Nest
Raptor Date	4/30/19
Species	Turkey Vulture
Raptor observation number	3
Count of individuals in group	1
Time first observed	07:04
Time last observed	07:06
Duration of observation (minutes)	2
Age	Adult
Sex	Unknown
Behavior	Flapping, Gliding
General Flight Direction	NW
Flight Height	1 - below rotor swept area, 2 - within rotor swept area



Horizontal Position Code	Over barren
Notes	One TUVU glides along souther edge of barren, circling over trees gaining altitude and then continuing west
Map of Flight Path	

Weather during observation

Wind Speed	1 - Light air
Wind Direction	NW
Temperature (F)	36
Relative Humidity	84
Barametric Pressure (inches)	30.26
Cloud Cover (percent)	100
Visibility	10km
Precipitation	0 - none

Bald Eagle, 4

Raptor Site	Schoodic Nest
Raptor Date	4/30/19
Species	Bald Eagle
Raptor observation number	4
Count of individuals in group	1
number of eagles observed	1
Time first observed	07:16
Time last observed	09:17
Duration of observation (minutes)	121

Duration within survey boundary	121
Age	Adult
Sex	Female
Behavior	Flapping, Sitting on nest
Notes	Flys in from south side of nest and swaps incubation with male. Flys off nest at 8:25 and swaps incubation with male. Perches in nearby tree. In tree till end of survey
Map of Flight Path	

Bald Eagle, 5

Raptor Site	Schoodic Nest
Raptor Date	4/30/19
Species	Bald Eagle
Raptor observation number	5
Count of individuals in group	1
number of eagles observed	1
Time first observed	07:20
Time last observed	07:21
Duration of observation (minutes)	1
Duration within survey boundary	1
Age	Adult
Sex	Male
Behavior	Hunting, Flapping
General Flight Direction	NW
Notes	Returns to nest with fish and immediately leaves.

Map of Flight Path

Bald Eagle, 6

Raptor Site	Schoodic Nest
Raptor Date	4/30/19
Species	Bald Eagle
Raptor observation number	6
Count of individuals in group	2
number of eagles observed	2
Time first observed	08:11
Time last observed	09:18
Duration of observation (minutes)	67
Duration within survey boundary	67
Age	Adult
Sex	Male
Behavior	Perching
Notes	Male returns and perches in tree. Moves to nest at 8:15 and swaps incubation at 8:23. On nest till end of survey

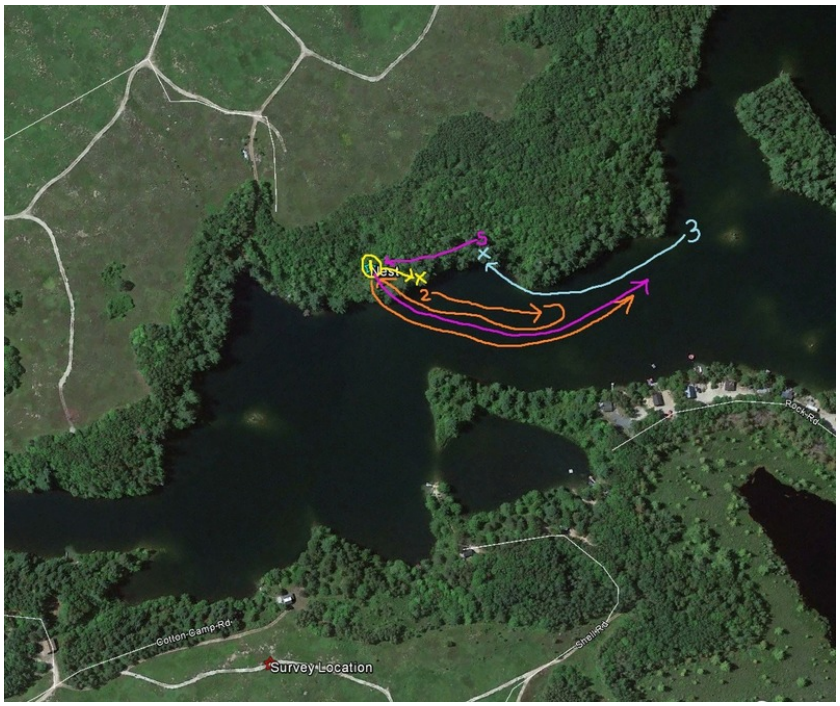
Survey Interval	May
Date	2019-05-10
Survey Site	Schoodic Nest

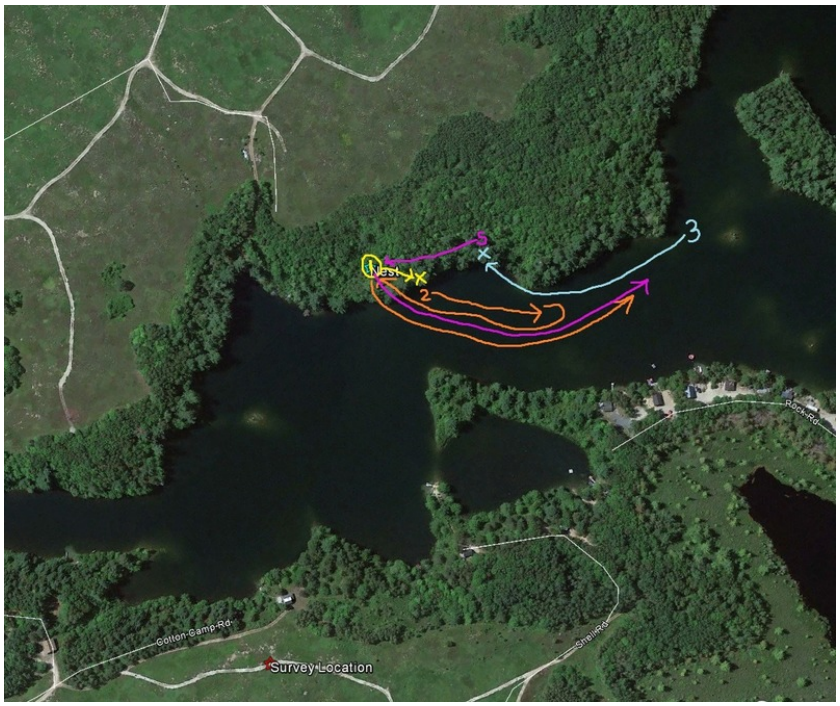
Survey Overview



Survey Start Time	11:47
Survey End Time	15:47
Duration of survey (minutes)	240
Count of eagles observed	7
Count of raptors observed	8
Survey Summary Comments	Two resident adult balds. Rain was steady most of survey period. Visibility not hindered. Based on past surveys and notes, guess would be mid/late May for hatch. Both adults observed upon arrival but only one on departure after nest switch.

Weather Summary

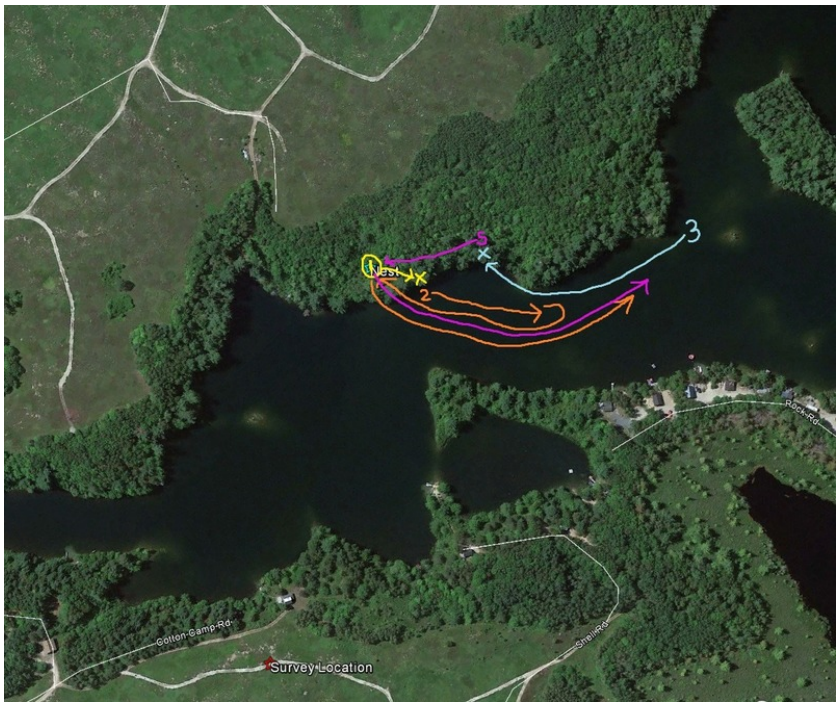
Wind Speed	3 - Gentle breeze
Wind Direction	SSE
Temperature (F)	42
Relative Humidity	99
Barametric Pressure (inches)	30.22
Cloud Cover (percent)	100
Visibility	6.4
Precipitation	3 - Rain
Weather Comment	Rain did not let up entire survey period.



Bald Eagle, 1

Raptor Site	Schoodic Nest
Raptor Date	5/10/19
Species	Bald Eagle
Raptor observation number	1
Count of individuals in group	2
number of eagles observed	2
Time first observed	11:47
Time last observed	11:49
Duration of observation (minutes)	2
Duration within survey boundary	0
Age	Adult
Sex	Female, Male
Behavior	Flapping, Perching
General Flight Direction	NW
Flight Height	0 - outside of turbine array area

Turbine Pad Utilized (WTG)	N/A
Horizontal Position Code	Over Lake
Notes	Upon arrival to site, both adults on nest. One incubating, the second adult perched on edge of nest. Bird on edge defecates off front of nest then takes off NW ~200ft away to perch in nearby low, dead snag along same side of shoreline.
Map of Flight Path	 



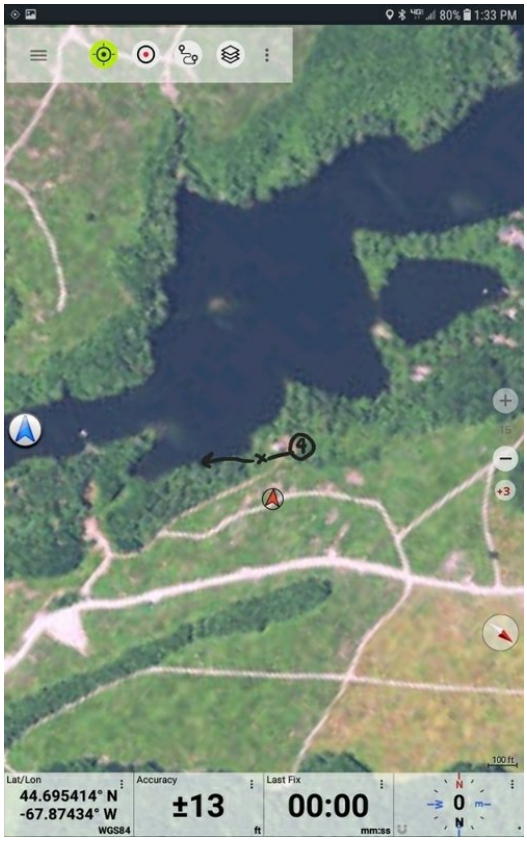
Bald Eagle, 2

Raptor Site	Schoodic Nest
Raptor Date	5/10/19
Species	Bald Eagle
Raptor observation number	2
Count of individuals in group	2

number of eagles observed	2
Time first observed	12:05
Time last observed	12:07
Duration of observation (minutes)	2
Duration within survey boundary	0
Age	Adult
Sex	Female, Male
Behavior	Flapping, Perching
General Flight Direction	NW
Flight Height	0 - outside of turbine array area
Turbine Pad Utilized (WTG)	N/A
Horizontal Position Code	Over Lake
Notes	Adult perched in nearby snag leaves briefly and brings a fish back to nest to other adult incubating. Lots of vocalization. This individual then leaves the nest again NW over the lake out of sight.
Map of Flight Path	

Bald Eagle, 3

Raptor Site	Schoodic Nest
Raptor Date	5/10/19
Species	Bald Eagle
Raptor observation number	3
Count of individuals in group	1
number of eagles observed	1
Time first observed	13:09
Time last observed	15:47
Duration of observation (minutes)	158
Duration within survey boundary	0

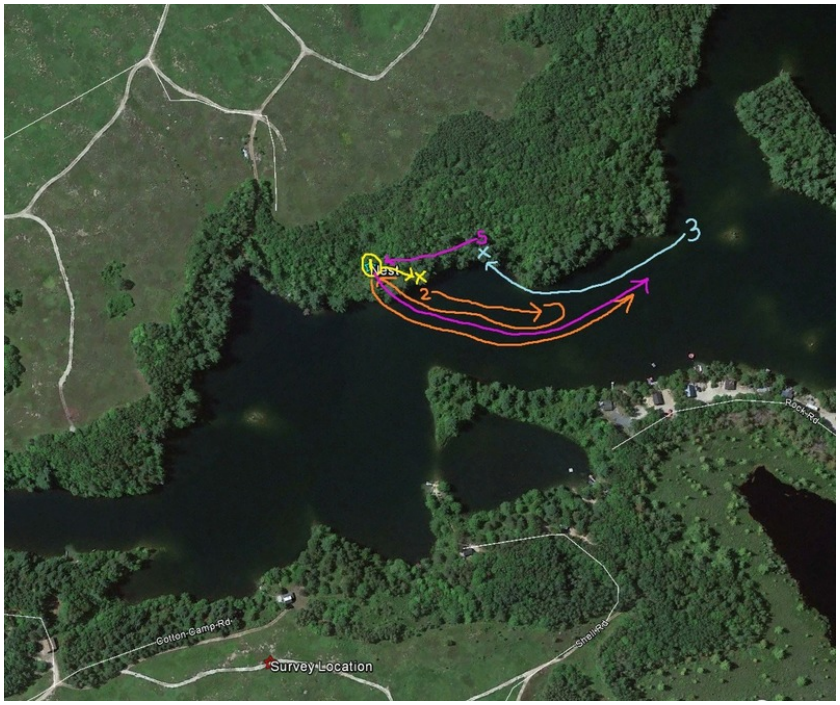


Age	Adult
Sex	Unknown
Behavior	Perching
General Flight Direction	SE
Flight Height	0 - outside of turbine array area
Turbine Pad Utilized (WTG)	N/A
Horizontal Position Code	Over Lake
Notes	Mate returns from NW direction over lake, flying SE. Perches in nearby tree, very top of tree, about the 5th tallest pine tree to the right, looking at current nesting tree along same shoreline.
Map of Flight Path	

Kestrel, 4

Raptor Site	Schoodic Nest
Raptor Date	5/10/19
Species	Kestrel
Raptor observation number	4
Count of individuals in group	1
Time first observed	13:22
Time last observed	13:23
Duration of observation (minutes)	1
Duration within survey boundary	0
Age	Adult
Sex	Female
Behavior	Flapping, Perching
General Flight Direction	SE
Flight Height	0 - outside of turbine array area
Turbine Pad Utilized (WTG)	N/A
Horizontal Position Code	Eastern lake shoreline by camp
Notes	Bird emerges from woods slightly north of camp. Perches in tree next to camp, south side, along driveway for a few moments. Takes off SE along Eastern shoreline of lake behind trees in view of foreground.

Map of Flight Path



Weather during observation

Precipitation	3 - Rain

Bald Eagle, 5

Raptor Site	Schoodic Nest
Raptor Date	5/10/19
Species	Bald Eagle
Raptor observation number	5
Count of individuals in group	2
number of eagles observed	2
Time first observed	15:05
Time last observed	15:07
Duration of observation (minutes)	2
Duration within survey boundary	0
Age	Adult
Sex	Female, Male
Behavior	Flapping, Perching, Soaring
General Flight Direction	NW
Flight Height	0 - outside of turbine array area
Turbine Pad Utilized (WTG)	N/A
Horizontal Position Code	Over lake

Notes	Rain turns to drizzle around 3pm and mate perched high in nearby tree visits nest. The two adults do a nest switch. Adult that has been sitting on nest entire time leaves nest and flies NW out over lake out of sight. Did not see this adult return before survey ended. Other adult sat on nest after a few mins on edge.
Map of Flight Path	

Weather during observation

Wind Speed	3 - Gentle breeze
Wind Direction	SE
Temperature (F)	46
Relative Humidity	93
Barametric Pressure (inches)	30.1
Cloud Cover (percent)	100
Visibility	6.4
Precipitation	2 - Drizzle

15:00

Time of weather observation	15:00
Wind Speed	3 - Gentle breeze
Wind Direction	SE
Temperature (F)	46
Relative Humidity	93
Barametric Pressure (inches)	30.1
Cloud Cover (percent)	100
Visibility	6.4
Precipitation	2 - Drizzle
Weather Comment	Update only to note rain turns to drizzle, finally letting up.

12:01

Time of observation	12:01
Describe observation	A gull flies by over lake heading SE.

15:05

Time of observation	15:05
Describe observation	Visited by two men in a dark blue truck working for Cherryfield Foods. Came to chat to see if okay and why here. Mentioned doing bird surveys in area. He knew there were nesting eagles there. The camp right here is his brother in law's and he has two other camps on lake. He asked what he can do to attract more eagles. Starting going off about wind and Apex, he brought up, not I. Kept things vauge. Very much opposes anything wind related and upset with doing away with so much hydro. Pleasant fellow otherwise.

Survey Site	Schoodic Nest

Survey Overview

Survey Start Time	09:45
Survey End Time	13:35
Duration of survey (minutes)	230
Count of eagles observed	7
Count of raptors observed	10
Survey Summary Comments	Both eagles active in nest today. Raw, chilly, windy day. Recent AM rain, passing drizzle surrounding area otherwise clear viewing. Survey ended a tiny bit early due to employee needing to leave to seek immediate medical attention.

Weather Summary

Wind Speed	3 - Gentle breeze
Wind Direction	N
Temperature (F)	40
Relative Humidity	85
Barametric Pressure (inches)	29.68
Cloud Cover (percent)	100
Visibility	8
Precipitation	0 - none
Weather Comment	Clear at survey location over lake & @nest; light fog towards east.

Bald Eagle, 1

Raptor Site	Schoodic Nest
Raptor Date	5/15/19
Species	Bald Eagle
Raptor observation number	1
Count of individuals in group	1
number of eagles observed	1
Time first observed	09:45
Time last observed	12:26
Duration of observation (minutes)	161
Duration within survey boundary	240
Age	Adult
Sex	Unknown
Behavior	Perching
Flight Height	0 - outside of turbine array area
Turbine Pad Utilized (WTG)	N/A

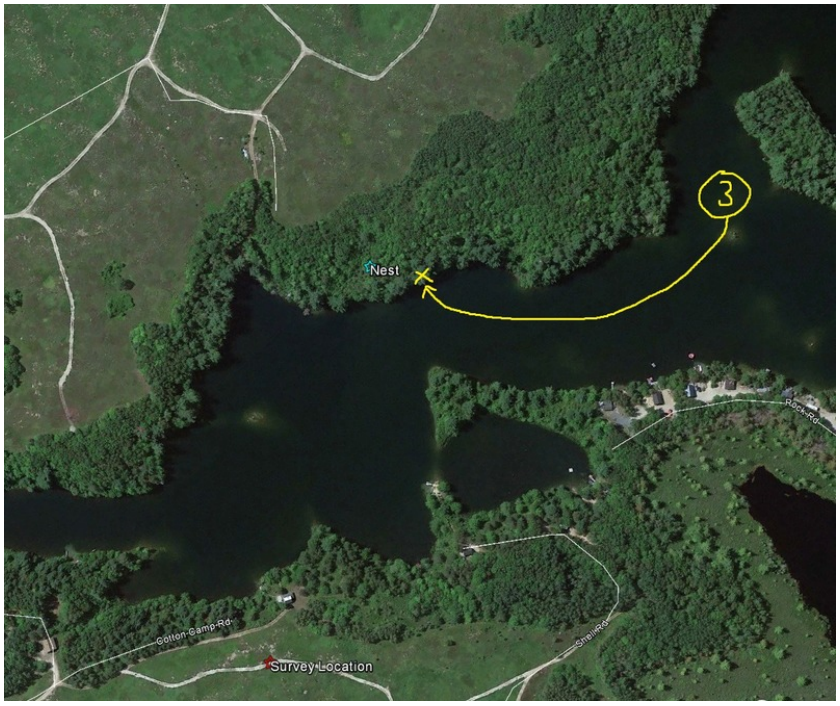
Horizontal Position Code	@Nest
Notes	One adult BAEA on nest upon arrival. Second adult not around.
Map of Flight Path	
	

Weather during observation

Wind Speed	3 - Gentle breeze
Wind Direction	N
Temperature (F)	40
Visibility	8
Precipitation	0 - none

Kestrel, 2

Raptor Site	Schoodic Nest



Raptor Date	5/15/19
Species	Kestrel
Raptor observation number	2
Count of individuals in group	1
Time first observed	10:05
Time last observed	10:07
Duration of observation (minutes)	2
Duration within survey boundary	2
Age	Adult
Sex	Male
Behavior	Flapping, Perching
General Flight Direction	E
Flight Height	0 - outside of turbine array area
Turbine Pad Utilized (WTG)	N/A
Horizontal Position Code	D - flight path over a valley
Notes	Bird flies out of woods from west and lands on a rock, roadside to north of survey location approximately 300ft away towards lone tree in Blueberry field. Birds sits on ground for a few before taking off out of sight to the east low above fields and roads.
Map of Flight Path	

Weather during observation

Wind Speed	3 - Gentle breeze
Wind Direction	N
Temperature (F)	40
Cloud Cover (percent)	100

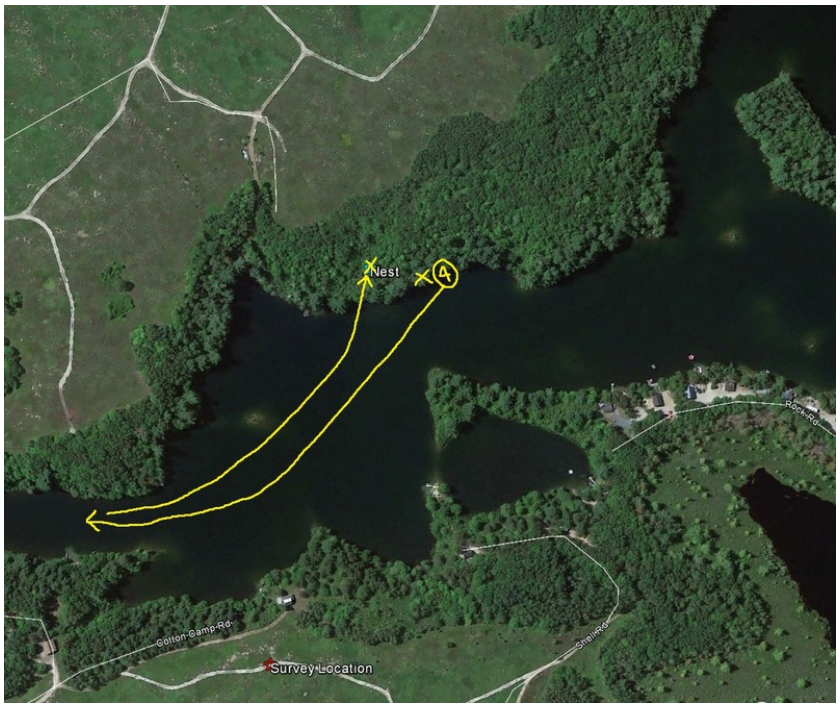
Bald Eagle, 3



Raptor Site	Schoodic Nest
Raptor Date	5/15/19
Species	Bald Eagle
Raptor observation number	3
Count of individuals in group	1
number of eagles observed	1
Time first observed	10:22
Time last observed	11:25
Duration of observation (minutes)	63
Duration within survey boundary	203
Age	Adult
Sex	Unknown
Behavior	Flapping, Perching
General Flight Direction	SE
Flight Height	0 - outside of turbine array area
Turbine Pad Utilized (WTG)	N/A
Horizontal Position Code	Over Lake
Notes	Mate arrives in area. Flies in from NW over lake and perches in nearby snag slightly north of nest along same shoreline. Other adult still in nest.
Map of Flight Path	

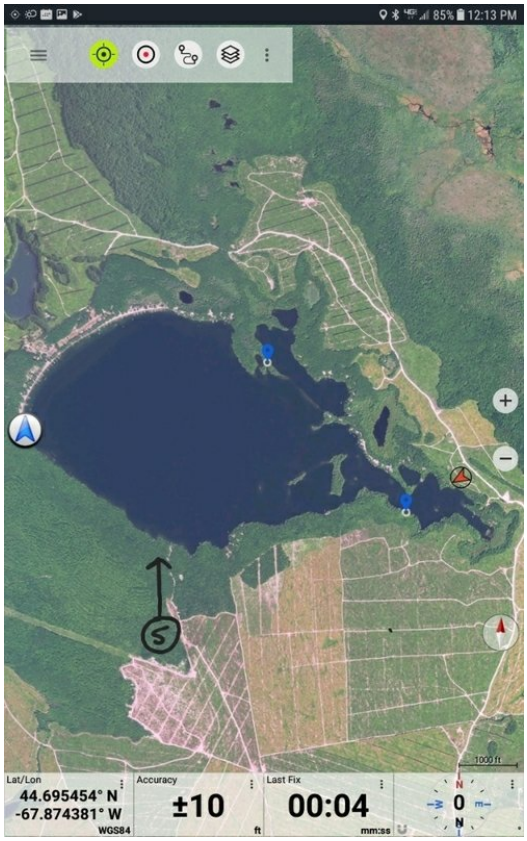
Weather during observation

Wind Speed	3 - Gentle breeze
Wind Direction	N

Temperature (F)	40
Cloud Cover (percent)	100
Visibility	8
Precipitation	2 - Drizzle

Bald Eagle, 4

Raptor Site	Schoodic Nest
Raptor Date	5/15/19
Species	Bald Eagle
Raptor observation number	4
Count of individuals in group	1
number of eagles observed	1
Time first observed	11:25
Time last observed	12:25
Duration of observation (minutes)	60
Duration within survey boundary	140
Age	Adult
Sex	Unknown
Behavior	Flapping, Hunting, Perching
General Flight Direction	SE to NW
Flight Height	0 - outside of turbine array area
Turbine Pad Utilized (WTG)	N/A
Horizontal Position Code	Over lake
Notes	Adult leaves snag, flying over lake SE out of sight to southern cove for a few minutes. Adult returns to nest with fish and sits with mate.
Map of Flight Path	



Weather during observation

Wind Speed	4 - Moderate breeze
Wind Direction	N
Cloud Cover (percent)	100
Visibility	8
Precipitation	0 - none

Turkey Vulture, 5

Raptor Site	Schoodic Nest
Raptor Date	5/15/19
Species	Turkey Vulture
Raptor observation number	5
Count of individuals in group	2
Time first observed	11:33
Time last observed	11:35
Duration of observation (minutes)	2
Duration within survey boundary	0
Age	Unknown
Sex	Unknown
Behavior	Soaring
General Flight Direction	N
Flight Height	0 - outside of turbine array area
Turbine Pad Utilized (WTG)	N/A
Horizontal Position Code	D - flight path over a valley
Notes	Two TUVU far beyond lake to west, soaring skies above fields in distance headed north until out of sight behind trees in foreground.

Map of Flight Path

Weather during observation

Wind Speed	4 - Moderate breeze
Wind Direction	NNW
Temperature (F)	43
Relative Humidity	77
Barametric Pressure (inches)	29.68
Cloud Cover (percent)	100
Visibility	8

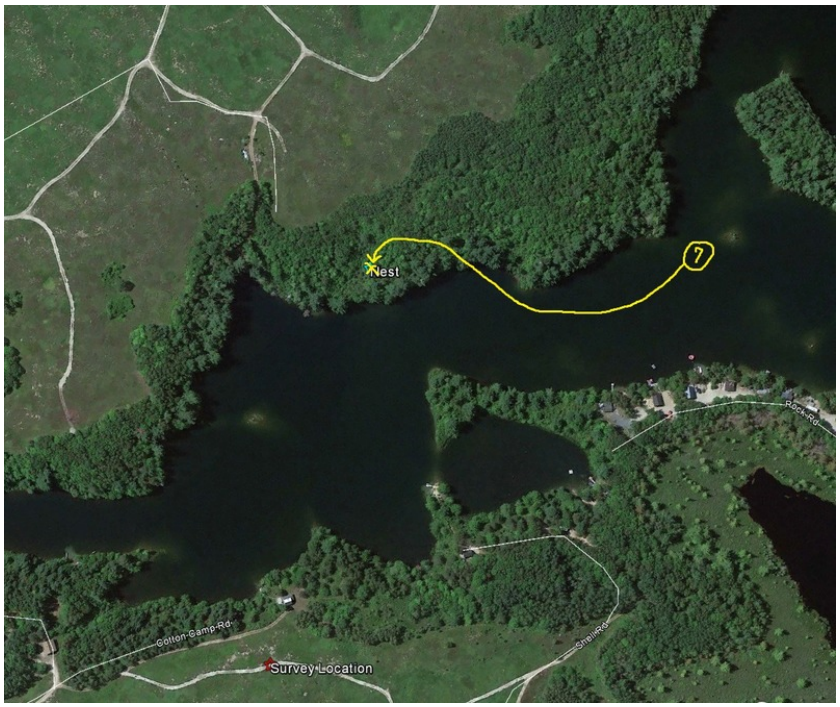
Bald Eagle, 6

Raptor Site	Schoodic Nest
Raptor Date	5/15/19
Species	Bald Eagle
Raptor observation number	6
Count of individuals in group	2
number of eagles observed	2
Time first observed	12:25
Time last observed	12:26
Duration of observation (minutes)	1
Duration within survey boundary	0
Age	Adult
Sex	Female, Male



Behavior	Flapping, Perching, Soaring
General Flight Direction	NW
Flight Height	0 - outside of turbine array area
Turbine Pad Utilized (WTG)	N/A
Horizontal Position Code	Over lake
Notes	Nest switch. Mate that brought fish, takes over incubating and original adult on nest (since arrival to survey location) leaves NW over lake out of sight.
Map of Flight Path	

Weather during observation

Wind Speed	3 - Gentle breeze
Wind Direction	NNW
Temperature (F)	43
Cloud Cover (percent)	100
Visibility	8
Precipitation	0 - none

Bald Eagle, 7

Raptor Site	Schoodic Nest
Raptor Date	5/15/19
Species	Bald Eagle
Raptor observation number	7
Count of individuals in group	1
number of eagles observed	1
Time first observed	12:44
Time last observed	12:54
Duration of observation (minutes)	10
Duration within survey boundary	0

Age	Adult
Sex	Unknown
Behavior	Flapping, Perching
General Flight Direction	SE
Flight Height	0 - outside of turbine array area
Turbine Pad Utilized (WTG)	N/A
Horizontal Position Code	Over lake
Notes	Mate returns to nest over lake from NW direction. Swoops behind nest and accesses from SW side. Jumps up a couple branches from nest after initial landing.
Map of Flight Path	

Weather during observation

Wind Speed	3 - Gentle breeze
Wind Direction	NNW
Temperature (F)	44
Cloud Cover (percent)	100
Visibility	8
Precipitation	0 - none

Bald Eagle, 8

Raptor Site	Schoodic Nest
Raptor Date	5/15/19
Species	Bald Eagle
Raptor observation number	8
Count of individuals in group	1
number of eagles observed	1
Time first observed	12:54
Time last observed	13:35

Duration of observation (minutes)	41
Duration within survey boundary	0
Age	Adult
Sex	Unknown
Behavior	Flapping, Soaring
General Flight Direction	NW
Flight Height	0 - outside of turbine array area
Turbine Pad Utilized (WTG)	N/A
Horizontal Position Code	Over lake
Notes	Adult that was perched in branches just above nest leaves area again. Flies NW over lake out of sight. Mate continues to incubate. The adult that leaves is not seen again for duration of survey period.
Map of Flight Path	

Weather during observation

Wind Speed	3 - Gentle breeze
Wind Direction	NNW
Temperature (F)	44
Cloud Cover (percent)	100
Visibility	8
Precipitation	0 - none

10:20

Time of weather observation	10:20
Wind Speed	3 - Gentle breeze
Wind Direction	N
Temperature (F)	40
Cloud Cover (percent)	100
Visibility	8

Precipitation	2 - Drizzle
Weather Comment	Update only to note drizzle begins. Lasts maybe 15 mins.

10:30

Time of observation	10:30
Describe observation	Swallows, Robin's & Blue Jays around.

11:05

Time of observation	11:05
Describe observation	One adult common loon flies over lake from SE to NW out of sight.

12:31

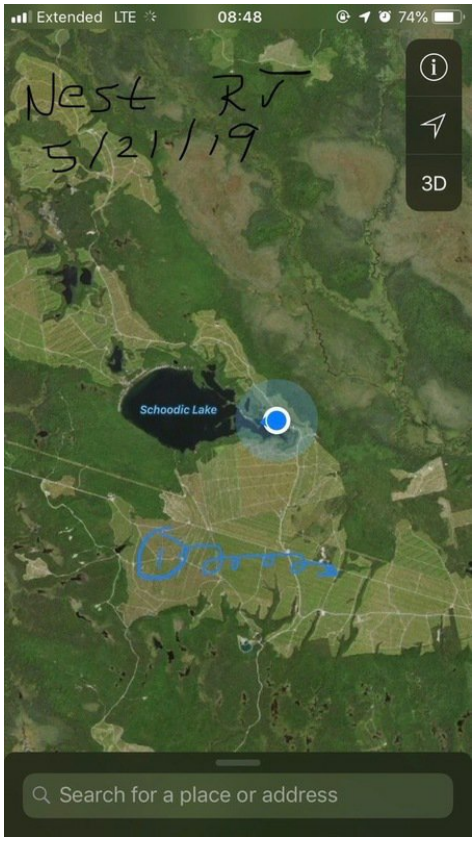
Time of observation	12:31
Describe observation	One male and one female Common Merganser preening out on shallows, rock pile on lake.

Schoodic Nest, 2019-05-21

Created	2019-05-21 12:47:19 UTC by Randi Jackson
Updated	2019-12-17 17:57:31 UTC by Meg Stevenson
Location	44.6954892297, -67.8743738495
Lead Observer	Randi Jackson
Survey Interval	May
Date	2019-05-21
Survey Site	Schoodic Nest

Survey Overview

Survey Start Time	08:02
Survey End Time	12:04
Duration of survey (minutes)	242
Count of eagles observed	6
Count of raptors observed	15



Weather Summary

Wind Speed	6 - Strong breeze
Wind Direction	W
Temperature (F)	56
Relative Humidity	67
Barametric Pressure (inches)	29.59
Cloud Cover (percent)	95
Visibility	Unlimited
Precipitation	0 - none

Turkey Vulture, 1

Raptor Site	AD-10
Raptor Date	5/21/19
Species	Turkey Vulture
Raptor observation number	1
Count of individuals in group	3
Time first observed	08:29
Time last observed	08:32
Duration of observation (minutes)	3
Age	Unknown
Sex	Unknown
Behavior	Circling
General Flight Direction	E
Flight Height	2 - within rotor swept area
Horizontal Position Code	A1 - Over ridge, parallel
Notes	Spotted three TUVU circling together in the south. All three circled together making their way east out of site.

Map of Flight Path

Bald Eagle, 2

Raptor Site	AD-10
Raptor Date	5/21/19
Species	Bald Eagle
Raptor observation number	2
Count of individuals in group	1
number of eagles observed	1
Time first observed	08:34
Time last observed	12:04
Duration of observation (minutes)	210
Duration within survey boundary	210
Age	Adult
Sex	Female
Behavior	Flapping, Gliding, Perching
General Flight Direction	S
Flight Height	1 - below rotor swept area
Horizontal Position Code	D - flight path over a valley
Notes	First spotted the female BAEA flying low over the lake coming in from the narrow channel in the east. The eagle glided low over the lake heading south towards the nest where she then flew up to and landed on a branch in the tree. She perched for a few minutes then hoped over and sat on the nest at 8:37. Female remained on the nest for the rest of the survey duration.

Map of Flight Path

Bald Eagle, 3

Raptor Site	AD-10
Raptor Date	5/21/19
Species	Bald Eagle
Raptor observation number	3
Count of individuals in group	1
number of eagles observed	1
Time first observed	08:51
Time last observed	08:53
Duration of observation (minutes)	2
Duration within survey boundary	2
Age	Adult
Sex	Unknown
Behavior	Gliding, Flapping
General Flight Direction	E
Flight Height	2 - within rotor swept area
Horizontal Position Code	A1 - Over ridge, parallel
Notes	First spotted the BAEA in the south gliding making its way east. Lost site of the individual in the east.

Map of Flight Path

Bald Eagle, 4

Raptor Site	Schoodic Nest
Raptor Date	5/21/19
Species	Bald Eagle
Raptor observation number	4
Count of individuals in group	1
number of eagles observed	1
Time first observed	09:02
Time last observed	09:31
Duration of observation (minutes)	29
Duration within survey boundary	29
Age	Adult
Sex	Male
Behavior	Flapping, Perching, Gliding
General Flight Direction	S
Flight Height	2 - within rotor swept area, 1 - below rotor swept area
Horizontal Position Code	D - flight path over a valley
Notes	First spotted a male BAEA flying in from the south heading north. Once closer and over the lake I noticed the individual had a rodent in its talon. The individual made a lap around the northern to eastern edge of the lake then continued to fly over the lake and land in the nest tree. The male then looked to be feeding fledglings in nest (hard to see from this distance clearly). The male then took off from the nest at 9:22 and flapped, glided, and circled its way around the lake numerous times. At 9:30 the male began gliding making its way south over the tree line and out of site.

Map of Flight Path

Turkey Vulture, 5

Raptor Site	AD-10
Raptor Date	5/21/19
Species	Turkey Vulture
Raptor observation number	5
Count of individuals in group	1
Time first observed	09:36
Time last observed	09:37
Duration of observation (minutes)	1
Age	Unknown
Sex	Unknown
Behavior	Gliding
General Flight Direction	SW
Flight Height	2 - within rotor swept area
Horizontal Position Code	A1 - Over ridge, parallel
Notes	First spotted gliding in from the south east. Continued gliding making its way south west.

Map of Flight Path

Bald Eagle, 6

Raptor Site	AD-10
Raptor Date	5/21/19
Species	Bald Eagle
Raptor observation number	6
Count of individuals in group	1
number of eagles observed	1
Time first observed	09:38
Time last observed	09:42
Duration of observation (minutes)	4
Duration within survey boundary	4
Age	Adult
Sex	Unknown
Behavior	Flapping, Gliding, Circling
General Flight Direction	NE
Flight Height	4 - No predominant height
Horizontal Position Code	A2 - Over ridge, perpendicular
Notes	First spotted gliding in from the west. Circled flapped and glided over the fields to the north of the lake for a few minutes. Then took off and continued gliding north east out of site.

Map of Flight Path

Turkey Vulture, 7

Raptor Site	AD-10
Raptor Date	5/21/19
Species	Turkey Vulture
Raptor observation number	7
Count of individuals in group	2
Time first observed	09:44
Time last observed	09:45
Duration of observation (minutes)	1
Age	Adult
Sex	Unknown
Behavior	Gliding
General Flight Direction	S
Flight Height	1 - below rotor swept area
Horizontal Position Code	A3 - Over ridge, saddle
Notes	First spotted gliding in from the west low over the tree line. Continued gliding south over the tree line and out of site.

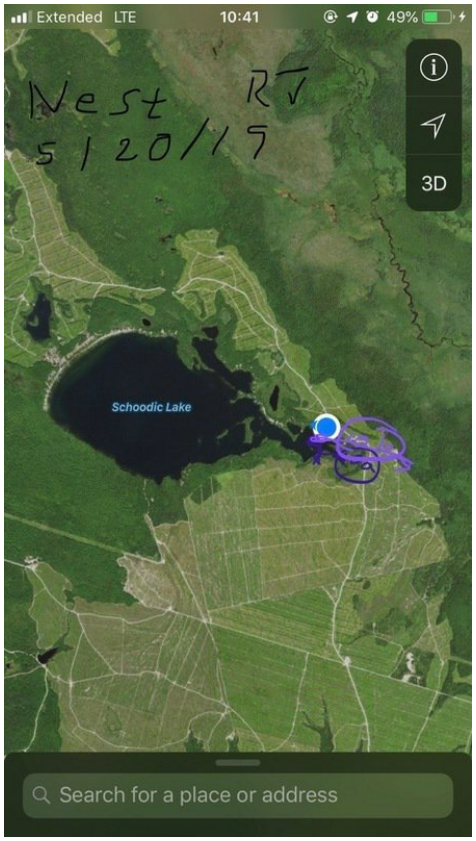
Map of Flight Path

Turkey Vulture, 8

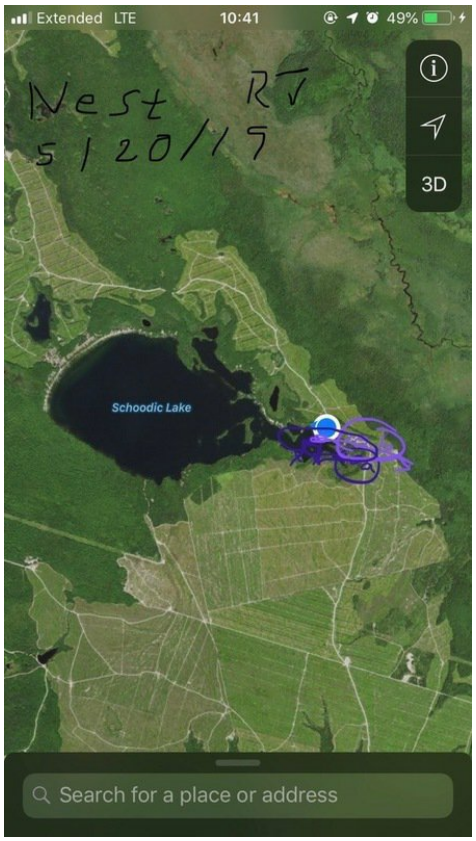
Raptor Site	AD-10
Raptor Date	5/21/19
Species	Turkey Vulture
Raptor observation number	8
Count of individuals in group	2
Time first observed	09:59
Time last observed	10:01
Duration of observation (minutes)	2
Duration within survey boundary	2
Age	Unknown
Sex	Unknown
Behavior	Circling
General Flight Direction	N
Flight Height	1 - below rotor swept area
Horizontal Position Code	A3 - Over ridge, saddle
Notes	First spotted circling in the north. Circled for a few minutes heading north over the tree line and out of site.

Map of Flight Path

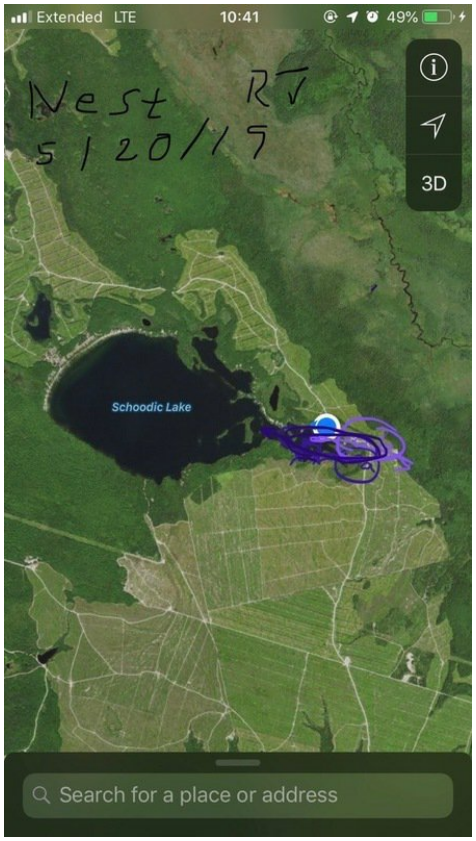
Broad-winged Hawk, 9



Raptor Site	AD-10
Raptor Date	5/21/19
Species	Broad-winged Hawk
Raptor observation number	9
Count of individuals in group	1
Time first observed	10:04
Time last observed	10:05
Duration of observation (minutes)	1
Duration within survey boundary	1
Age	Juvenile
Sex	Unknown
Behavior	Gliding
General Flight Direction	NE
Flight Height	1 - below rotor swept area
Horizontal Position Code	A3 - Over ridge, saddle
Notes	First spotted gliding in from the east heading west. Turned and continued gliding north east.



Map of Flight Path



Bald Eagle, 10

Raptor Site	AD-10
Raptor Date	5/21/19
Species	Bald Eagle
Raptor observation number	10
Count of individuals in group	2
number of eagles observed	2
Time first observed	10:08
Time last observed	12:59
Duration of observation (minutes)	171
Duration within survey boundary	171
Age	Adult
Sex	Male, Unknown
Behavior	Flapping, Circling, Gliding
General Flight Direction	W
Flight Height	2 - within rotor swept area
Horizontal Position Code	D - flight path over a valley

Notes	First spotted the male BAEA (10a) flying in from the eastern narrows of the lake. The male then landed in a tree along the south eastern side of the lake. Around 10:12 another adult BAEA (10b) flew in from the east over the lake. The male bald eagle flew out of the tree and locked talons with the second eagle. They fought with each other for about a minute until the second bald eagle took off and glided back east. The male then landed in the same tree as before and perched. At 10:44 the perching male then took off low over the lake and landed on a log in the water. The male then flew low over the lake and pulled a fish out of the water and flew up to the nest tree with it. The male and female are both tending to the fledgeling. At 11:20 the male took off out of the nest tree and made a lap around the lake. The male then landed in the same tree it was originally perching in on the south east side of the lake. At 11:37 the male then took off over the lake and landed in the nest tree and perched. The male took off at 11:56 and made a few laps around the lake before taking off heading west over the lake out of site.

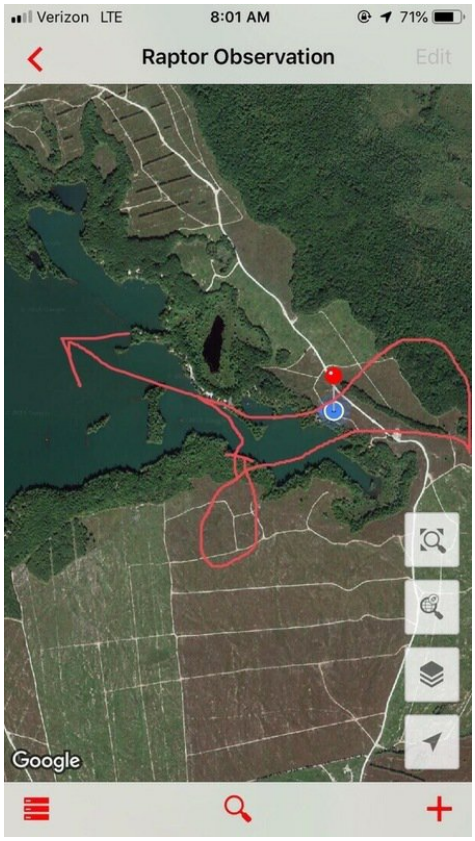
Schoodic Nest, 2019-05-31

Created	2019-05-31 10:20:41 UTC by Meg Stevenson
Updated	2019-12-19 21:15:53 UTC by Meg Stevenson
Location	44.6954396088, -67.8743124102
Lead Observer	Meg Dood
Survey Interval	May
Date	2019-05-31
Survey Site	Schoodic Nest

Survey Overview

Survey Start Time	06:20
Survey End Time	10:20
Duration of survey (minutes)	240
Count of eagles observed	2
Count of raptors observed	2

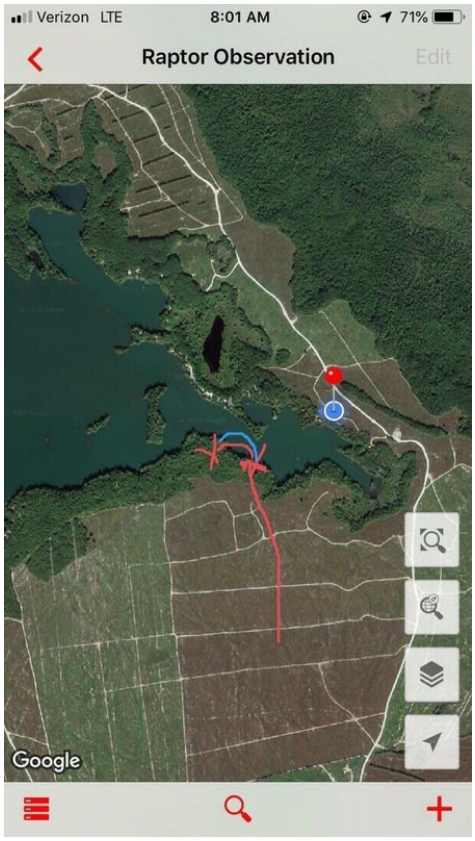


Weather Summary

Wind Speed	0 - Calm
Visibility	2km
Precipitation	1 - Haze or Fog
Weather Comment	Nest visible

Bald Eagle, 1

Raptor Site	Schoodic Nest
Raptor Date	5/31/19
Species	Bald Eagle
Raptor observation number	1
Count of individuals in group	1
number of eagles observed	1
Time first observed	08:00
Time last observed	08:18
Duration of observation (minutes)	18
Duration within survey boundary	18
Age	Adult
Sex	Unknown
Behavior	Flapping, Perching
General Flight Direction	NW
Flight Height	1 - below rotor swept area, 2 - within rotor swept area
Notes	One BAEA flew up from west and perched on tree. 8:14 two crows fly toward eagle, eagle chases them off to NE, loops back flapping to the NW and down the lake out of site. Flys at or below tree height over lake, approx 100-50 ft over ground



Map of Flight Path

Bald Eagle, 2

Raptor Site	Schoodic Nest
Raptor Date	5/31/19
Species	Bald Eagle
Raptor observation number	2
Count of individuals in group	1
number of eagles observed	1
Time first observed	09:05
Time last observed	10:20
Duration of observation (minutes)	75
Duration within survey boundary	75
Age	Adult
Sex	Unknown
Behavior	Flapping, On Nest
General Flight Direction	N
Flight Height	1 - below rotor swept area
Notes	One individual flys into nest, feeds chick. At least one chick visible, able to stand, grey down. Adult perches in tree 8:21. Flys down out of site for moment, returns to nest to feed chick 9:30. Stays in nest

Schoodic Nest, 2019-06-05

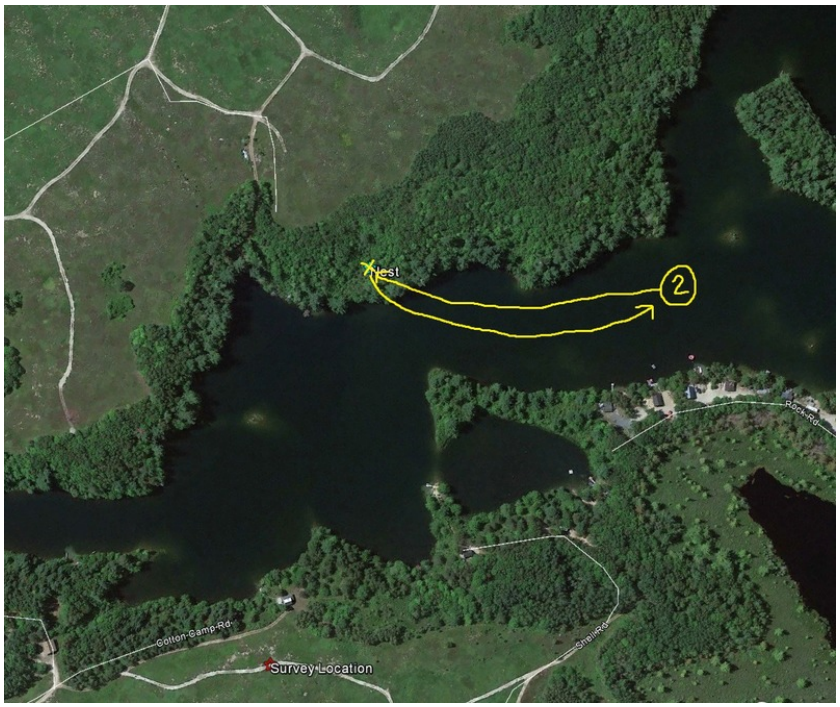
Created	2019-06-05 17:36:19 UTC by Karla Fortier
Updated	2020-02-05 19:16:37 UTC by Karla Fortier
Location	44.6954644, -67.8743507
Lead Observer	Karla Fortier
Survey Interval	June
Date	2019-06-05
Survey Site	Schoodic Nest

Survey Overview

Survey Start Time	13:20
Survey End Time	17:20
Duration of survey (minutes)	240
Count of eagles observed	5
Count of raptors observed	5
Survey Summary Comments	Gorgeous afternoon & evening. Wind kicks up around 5pm. Only one adult in area during entire survey period. 90% sure, two chicks approximately 5-6weeks old in nest. Based on color of body and wing span when stretching/preening.

Weather Summary

Wind Speed	2 - Light breeze
Wind Direction	SW
Temperature (F)	67
Relative Humidity	52
Barametric Pressure (inches)	29.81
Cloud Cover (percent)	30
Visibility	16
Precipitation	0 - none
Weather Comment	Clear, sunny, plenty of blue skies.



Bald Eagle, 1

Raptor Site	Schoodic Nest
Raptor Date	6/5/19
Species	Bald Eagle
Raptor observation number	1
Count of individuals in group	1
number of eagles observed	1
Time first observed	13:20
Time last observed	17:20
Duration of observation (minutes)	240
Duration within survey boundary	0
Age	Juvenile
Sex	Unknown
Behavior	Sitting on nest
General Flight Direction	N/A
Flight Height	0 - outside of turbine array area

Turbine Pad Utilized (WTG)	N/A
Horizontal Position Code	Over Lake
Notes	One confirmed juvenile BAEA, maybe a second one but hard to tell. The first appears to be dark not a lot of down, maybe 5 weeks old. Lots of movement in nest, active. No adults in area.
Map of Flight Path	 

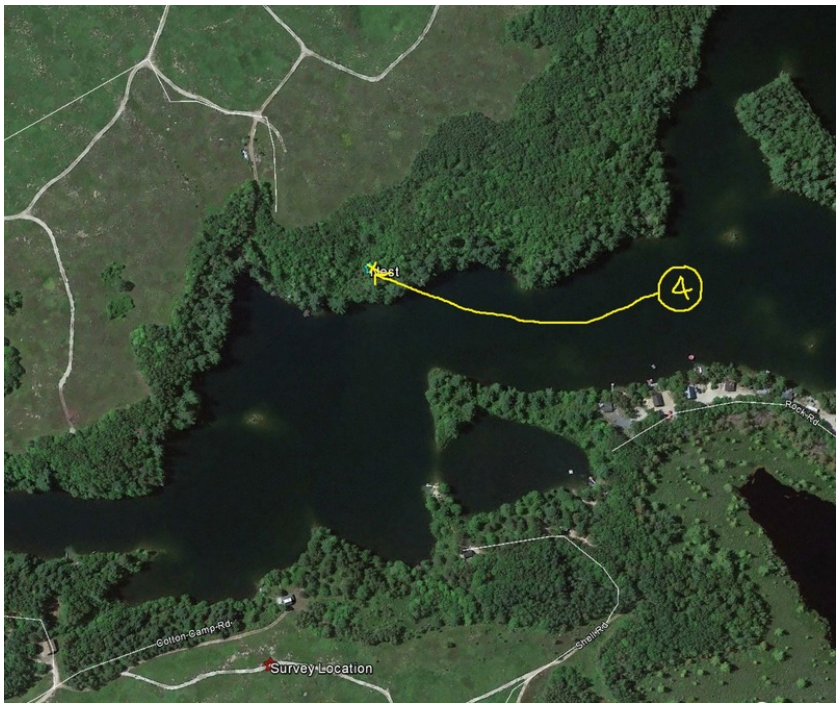
Bald Eagle, 2

Raptor Site	Schoodic Nest
Raptor Date	6/5/19
Species	Bald Eagle
Raptor observation number	2
Count of individuals in group	1

number of eagles observed	1
Time first observed	13:50
Time last observed	15:27
Duration of observation (minutes)	97
Duration within survey boundary	0
Age	Adult
Sex	Unknown
Behavior	Flapping, Perching, Soaring
General Flight Direction	SE
Flight Height	0 - outside of turbine array area
Turbine Pad Utilized (WTG)	N/A
Horizontal Position Code	Over lake
Notes	Adult comes in over lake from NW. Brings a fish to nest. Sits for a while before taking off NW back down lake.
Map of Flight Path	

Bald Eagle, 3

Raptor Site	Schoodic Nest
Raptor Date	6/5/19
Species	Bald Eagle
Raptor observation number	3
Count of individuals in group	2
number of eagles observed	2
Time first observed	16:55
Time last observed	17:20
Duration of observation (minutes)	25
Duration within survey boundary	0
Age	Juvenile



Sex	Unknown
Behavior	Flapping, Perching
General Flight Direction	N/A
Flight Height	0 - outside of turbine array area
Turbine Pad Utilized (WTG)	N/A
Horizontal Position Code	In Nest
Notes	Big gusts of wind kicks up. One chick moves and opens/flaps wings a few times. Looked like it was about to blow off nest. A second body seems to be in nest as well, moved over just enough, still hard to see, but opens wings up as well and flaps a couple times while wind blows. 90% sure there are two chicks in nest. ~5-6weeks old based on color and size of wing span.
Map of Flight Path	

Weather during observation

Wind Speed	4 - Moderate breeze
Wind Direction	SW
Temperature (F)	65
Relative Humidity	40
Barametric Pressure (inches)	29.68
Cloud Cover (percent)	30
Visibility	16
Precipitation	0 - none

Bald Eagle, 4

Raptor Site	Schoodic Nest
Raptor Date	6/5/19
Species	Bald Eagle
Raptor observation number	4
Count of individuals in group	1

number of eagles observed	1
Time first observed	17:08
Time last observed	17:20
Duration of observation (minutes)	12
Duration within survey boundary	0
Age	Adult
Sex	Unknown
Behavior	Flapping, Perching
General Flight Direction	SE
Flight Height	0 - outside of turbine array area
Turbine Pad Utilized (WTG)	N/A
Horizontal Position Code	Over Lake, on Nest
Notes	One adult returns to nest from NW direction over lake, no fish this time. Sits on edge of nest through end of survey, still there upon departure.
Map of Flight Path	

Weather during observation

Wind Speed	4 - Moderate breeze
Wind Direction	SW
Temperature (F)	65
Relative Humidity	40
Barametric Pressure (inches)	29.68
Cloud Cover (percent)	30
Visibility	16
Precipitation	0 - none

17:00

Time of weather observation	17:00

Wind Speed	4 - Moderate breeze
Wind Direction	SW
Temperature (F)	65
Relative Humidity	40
Barametric Pressure (inches)	29.68
Cloud Cover (percent)	30
Visibility	16
Precipitation	0 - none
Weather Comment	Update to note wind kicks up a lot.

Schoodic Nest, 2019-06-12

Created	2019-06-12 10:53:52 UTC by Karla Fortier
Updated	2020-02-05 19:29:12 UTC by Karla Fortier
Location	44.6954418, -67.8743913
Lead Observer	Karla Fortier
Survey Interval	June
Date	2019-06-12
Survey Site	Schoodic Nest

Survey Overview

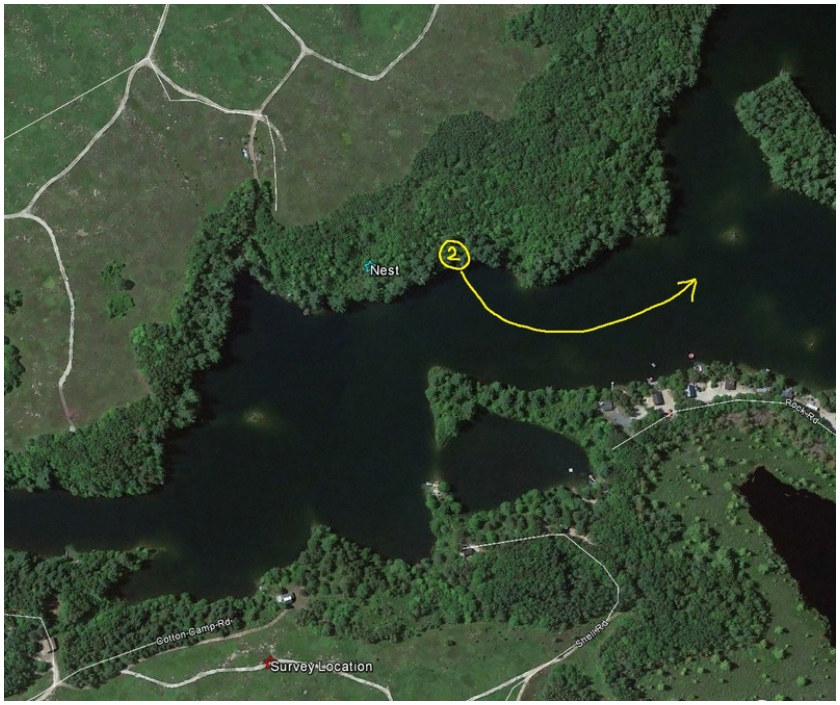
Survey Start Time	06:00
Survey End Time	10:00
Duration of survey (minutes)	240
Count of eagles observed	6
Count of raptors observed	6
Survey Summary Comments	Clear, crisp AM. Constant wind to keep black flies off. Two juvinile BAEAs in nest confirmed. Only one adult in & out/around at a time during survey period.

Weather Summary

Wind Speed	3 - Gentle breeze
Wind Direction	NW
Temperature (F)	50
Relative Humidity	77
Barametric Pressure (inches)	30.04
Cloud Cover (percent)	0
Visibility	16+
Precipitation	0 - none
Weather Comment	Beautiful morning.

Bald Eagle, 1

Raptor Site	Schoodic Nest
Raptor Date	6/12/19
Species	Bald Eagle
Raptor observation number	1
Count of individuals in group	2
number of eagles observed	2
Time first observed	06:00
Time last observed	10:00
Duration of observation (minutes)	240
Duration within survey boundary	0
Age	Juvenile, Adult
Sex	Unknown
Behavior	Perching
General Flight Direction	N/A
Flight Height	0 - outside of turbine array area



Turbine Pad Utilized (WTG)	N/A
Horizontal Position Code	On nest & over lake
Notes	Upon arrival at least one chick confirmed in nest. Shadows make it difficult to see alot of detail in nest this AM. One adult nearby in treetop slightly NW of nest ~200ft away along shoreline.
Map of Flight Path	 

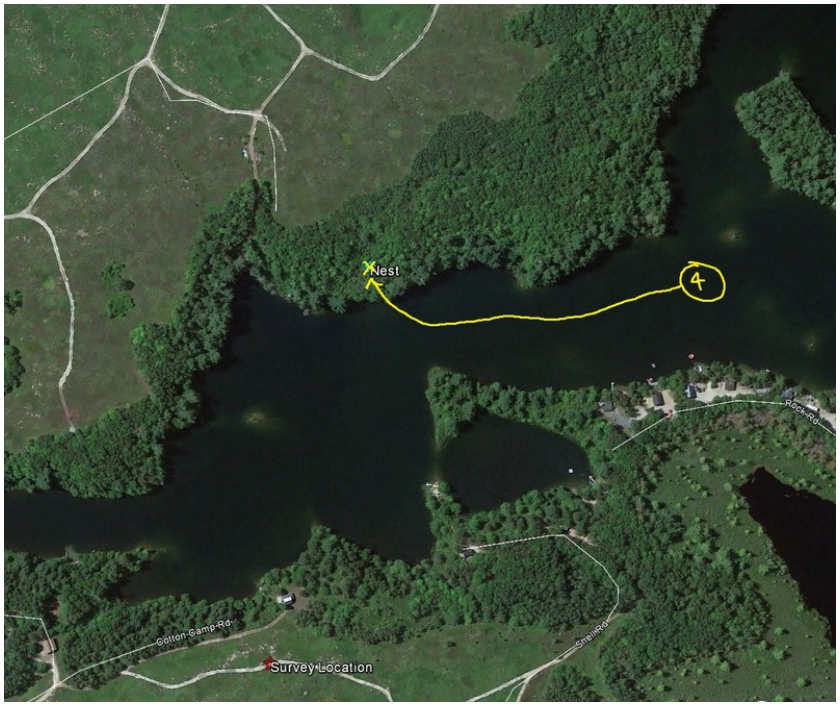
Weather during observation

Wind Speed	3 - Gentle breeze
Wind Direction	NW
Temperature (F)	50
Relative Humidity	77
Barametric Pressure (inches)	30.04

Cloud Cover (percent)	0
Visibility	16+
Precipitation	0 - none

Bald Eagle, 2

Raptor Site	Schoodic Nest
Raptor Date	6/12/19
Species	Bald Eagle
Raptor observation number	2
Count of individuals in group	1
number of eagles observed	1
Time first observed	07:19
Time last observed	07:20
Duration of observation (minutes)	1
Duration within survey boundary	0
Age	Adult
Sex	Unknown
Behavior	Flapping, Soaring
General Flight Direction	NW
Flight Height	0 - outside of turbine array area
Turbine Pad Utilized (WTG)	N/A
Horizontal Position Code	Over lake
Notes	Adult takes off from tree perch NW over lake and away.
Map of Flight Path	



Bald Eagle, 3

Raptor Site	Schoodic Nest
Raptor Date	6/12/19

Species	Bald Eagle
Raptor observation number	3
Count of individuals in group	2
number of eagles observed	2
Time first observed	07:30
Time last observed	10:00
Duration of observation (minutes)	150
Duration within survey boundary	0
Age	Juvenile
Sex	Unknown
Behavior	Flapping, Perching
General Flight Direction	None
Flight Height	0 - outside of turbine array area
Turbine Pad Utilized (WTG)	N/A
Horizontal Position Code	In nest
Notes	Update to note two juvenile BAEAs confirmed in nest. Both sit up on opposite ends of nest, opening wings, flapping a couple times. Both sit perched on edges of nest.
Map of Flight Path	

Bald Eagle, 4

Raptor Site	Schoodic Nest
Raptor Date	6/12/19
Species	Bald Eagle
Raptor observation number	4
Count of individuals in group	1
number of eagles observed	1
Time first observed	08:43
Time last observed	10:00

Duration of observation (minutes)	77
Duration within survey boundary	0
Age	Adult
Sex	Unknown
Behavior	Flapping, Perching
General Flight Direction	SE
Flight Height	0 - outside of turbine array area
Turbine Pad Utilized (WTG)	N/A
Horizontal Position Code	Over lake
Notes	One adult returns to area, flies into nest with fish. Perches, sits on edge of nest. Adult was still there upon survey end/departure.
Map of Flight Path	

07:35

Time of observation	07:35
Describe observation	Tractor passes by grating road headed north.

Schoodic Nest, 2019-06-20

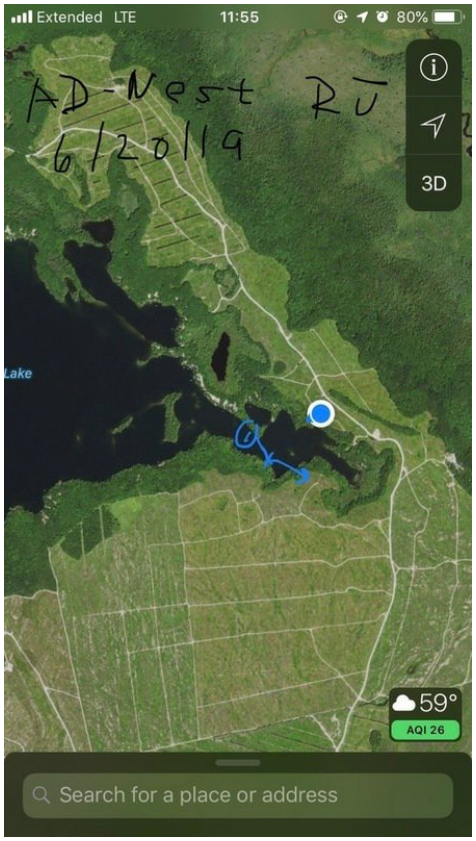
Survey Interval	June
Date	2019-06-20
Survey Site	Schoodic Nest

Survey Overview

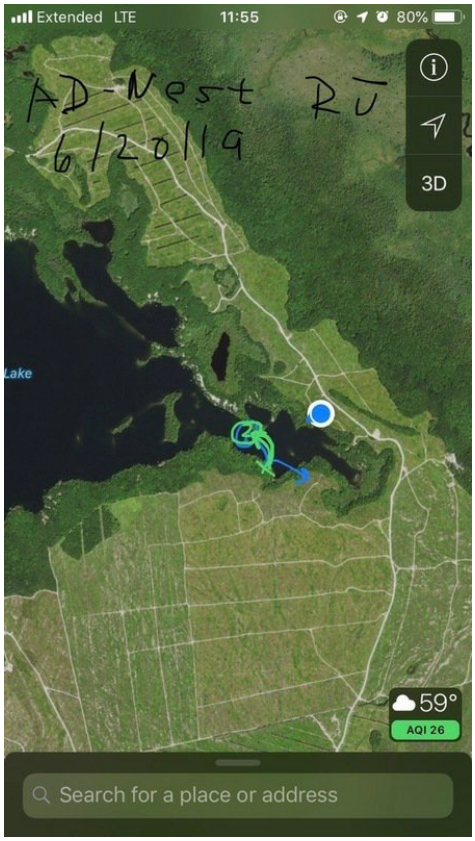


Survey Start Time	11:32
Survey End Time	15:33
Duration of survey (minutes)	241
Count of eagles observed	2
Count of raptors observed	3
Survey Summary Comments	Two juveniles observed sitting on the nest during the entire survey. Both moved periodically around the nest throughout the survey.

Weather Summary

Wind Speed	2 - Light breeze
Wind Direction	E
Temperature (F)	58
Relative Humidity	96
Barametric Pressure (inches)	29.85
Cloud Cover (percent)	100
Visibility	5km
Precipitation	1 - Haze or Fog

Bald Eagle, 1

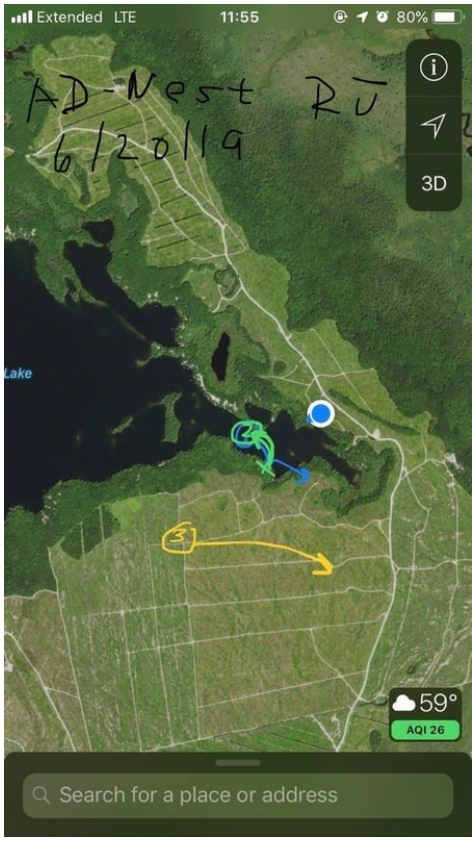


Raptor Site	Schoodic Nest
Raptor Date	6/20/19
Species	Bald Eagle
Raptor observation number	1
Count of individuals in group	1
number of eagles observed	1
Time first observed	11:36
Time last observed	11:42
Duration of observation (minutes)	6
Duration within survey boundary	6
Age	Adult
Sex	Female
Behavior	Flapping, Perching
General Flight Direction	W
Flight Height	2 - within rotor swept area
Horizontal Position Code	D - flight path over a valley

Notes	Spotted flying in from the south west side of the lake. Landed on the nest and fed the chicks. Took off after a minute and flew east over the lake out of site.
Map of Flight Path	

Bald Eagle, 2

Raptor Site	Schoodic Nest
Raptor Date	6/20/19
Species	Bald Eagle
Raptor observation number	2
Count of individuals in group	1
number of eagles observed	1
Time first observed	12:18
Time last observed	12:22
Duration of observation (minutes)	4
Duration within survey boundary	4
Age	Adult
Sex	Female
Behavior	Flapping, Gliding
General Flight Direction	W
Flight Height	2 - within rotor swept area
Horizontal Position Code	D - flight path over a valley
Notes	Flew in from the western side of the lake and landed on the nest. Hung out on the nest for a few minutes then took off flying west. *Confirmed two chicks in the nest.



Map of Flight Path

Turkey Vulture, 3

Raptor Site	Schoodic Nest
Raptor Date	6/20/19
Species	Turkey Vulture
Raptor observation number	3
Count of individuals in group	1
Time first observed	13:52
Time last observed	13:55
Duration of observation (minutes)	3
Duration within survey boundary	3
Age	Unknown
Sex	Unknown
Behavior	Soaring
General Flight Direction	E
Flight Height	2 - within rotor swept area
Notes	Spotted in the south over the blueberry fields gliding east.

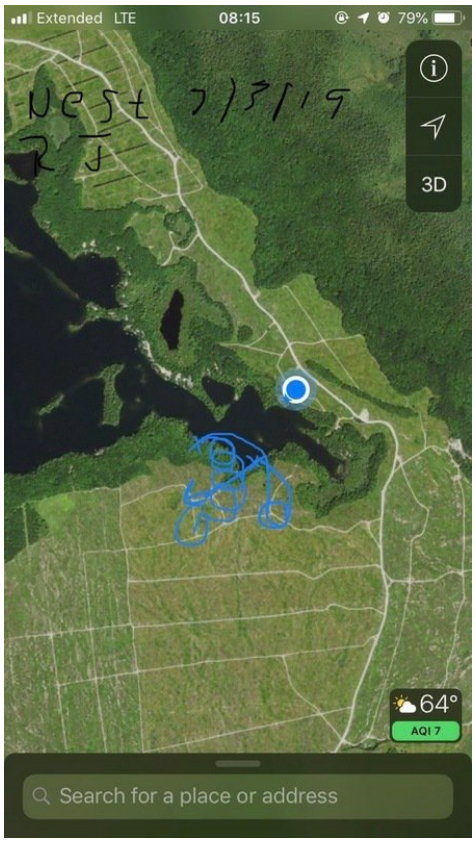
Species	Bald Eagle
Raptor observation number	1
Count of individuals in group	1
number of eagles observed	1
Time first observed	10:47
Time last observed	11:05
Duration of observation (minutes)	18
Duration within survey boundary	18
Age	Adult
Sex	Female
Behavior	Flapping, Nesting
General Flight Direction	S
Flight Height	2 - within rotor swept area
Horizontal Position Code	D - flight path over a valley
Notes	Spotted flying in from the western side of the lake. Flew in and perched on the nest for the rest of the survey duration.

Map of Flight Path

Schoodic Nest, 2019-07-03

Created	2019-07-03 12:08:09 UTC by Randi Jackson
Updated	2020-01-02 15:53:15 UTC by Randi Jackson
Location	44.6954757767, -67.8743711673
Lead Observer	Randi Jackson
Survey Interval	July
Date	2019-07-03
Survey Site	Schoodic Nest

Survey Overview



Survey Start Time	06:56
Survey End Time	10:56
Duration of survey (minutes)	240
Count of eagles observed	2
Count of raptors observed	7

Weather Summary

Wind Speed	3 - Gentle breeze
Wind Direction	E
Temperature (F)	71
Relative Humidity	66
Barametric Pressure (inches)	29.85
Cloud Cover (percent)	25
Visibility	Unlimited
Precipitation	0 - none

Bald Eagle, 1

Raptor Site	Schoodic Nest
Raptor Date	7/3/19
Species	Bald Eagle
Raptor observation number	1
Count of individuals in group	1
number of eagles observed	1
Time first observed	07:46
Time last observed	08:18
Duration of observation (minutes)	32
Duration within survey boundary	32
Age	Adult
Sex	Female
Behavior	Circling, Flapping, Gliding, Perching
General Flight Direction	S
Flight Height	2 - within rotor swept area
Horizontal Position Code	D - flight path over a valley

Notes	Initially spotted circling in the south heading north. Landed in the top of a tree on the edge of the lake near the nest. Perched until 8:08 when it took off to deter ravens away from the nest. Chased the ravens for a minute in the south then flew back and landed in another tree on the edge of the lake and perched. Left the tree at 8:18 and flew south out of sight.
Map of Flight Path	

Turkey Vulture, 2

Raptor Site	Schoodic Nest
Raptor Date	7/3/19
Species	Turkey Vulture
Raptor observation number	2
Count of individuals in group	2
Time first observed	09:12
Time last observed	09:21
Duration of observation (minutes)	9
Duration within survey boundary	9
Age	Adult, Unknown
Sex	Unknown
Behavior	Circling, Gliding
General Flight Direction	N
Flight Height	3 - above rotor swept area, 2 - within rotor swept area
Horizontal Position Code	A2 - Over ridge, perpendicular

Notes	Two individuals spotted circling in the south. Ascended high up while circling. Lost one of the individuals while circling high up. The second individual continued circling for a few minutes then began gliding north while descending. Circled a few minutes in the north then continued gliding north.
Map of Flight Path	

Turkey Vulture, 3

Raptor Site	Schoodic Nest
Raptor Date	7/3/19
Species	Turkey Vulture
Raptor observation number	3
Count of individuals in group	3
Time first observed	10:07
Time last observed	10:11
Duration of observation (minutes)	4
Duration within survey boundary	4
Age	Adult
Sex	Unknown
Behavior	Gliding, Circling
General Flight Direction	S
Flight Height	2 - within rotor swept area
Horizontal Position Code	A2 - Over ridge, perpendicular
Notes	Initially spotted gliding in together from the north. Circled a few times over the eastern branch of the lake then all three took off gliding south.

Map of Flight Path

Bald Eagle, 4

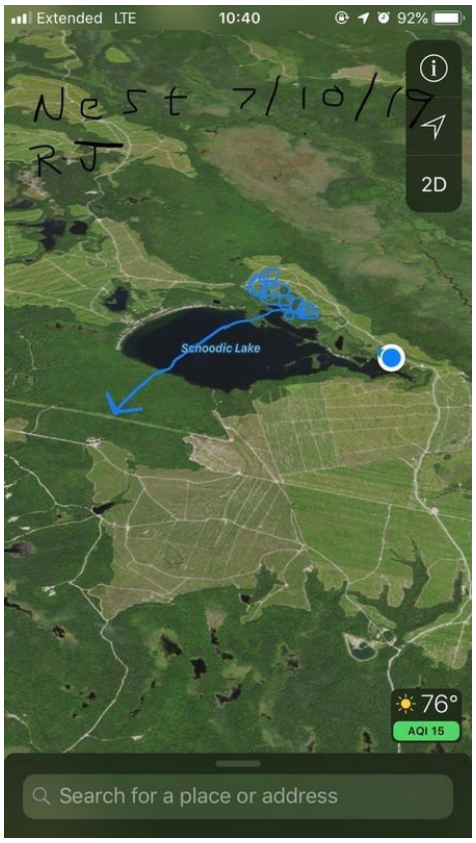
Raptor Site	Schoodic Nest
Raptor Date	7/3/19
Species	Bald Eagle
Raptor observation number	4
Count of individuals in group	1
number of eagles observed	1
Time first observed	10:12
Time last observed	10:54
Duration of observation (minutes)	42
Duration within survey boundary	42
Age	Adult
Sex	Female
Behavior	Flapping, Perching
General Flight Direction	W
Flight Height	1 - below rotor swept area
Notes	First spotted flying in from the eastern branch of the lake. Landed in a tree on the eastern edge of the lake. Took off from the tree at 10:54 and flew west over the lake out of sight.

Map of Flight Path

Schoodic Nest, 2019-07-10

Created	2019-07-10 14:16:58 UTC by Randi Jackson
Updated	2019-09-16 17:04:34 UTC by Randi Jackson
Location	44.6955046524, -67.8744520527
Lead Observer	Randi Jackson
Survey Interval	July
Date	2019-07-10
Survey Site	Schoodic Nest

Survey Overview



Survey Start Time	10:00
Survey End Time	14:01
Duration of survey (minutes)	241
Count of eagles observed	1
Count of raptors observed	1
Survey Summary Comments	Two juveniles observed in the nest sitting on the edge overlooking the lake. Calling throughout the survey.

Weather Summary

Wind Speed	2 - Light breeze
Wind Direction	N
Temperature (F)	77
Relative Humidity	53
Barametric Pressure (inches)	30.04
Cloud Cover (percent)	25
Visibility	Unlimited
Precipitation	0 - none

Bald Eagle, 1

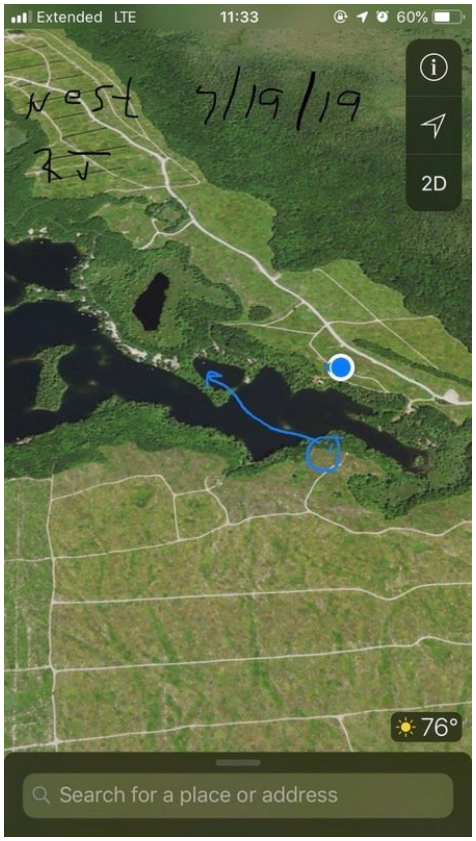
Raptor Site	Schoodic Nest
Raptor Date	7/10/19
Species	Bald Eagle
Raptor observation number	1
Count of individuals in group	1
number of eagles observed	1
Time first observed	10:28
Time last observed	10:39
Duration of observation (minutes)	11
Duration within survey boundary	11
Age	Adult
Sex	Unknown
Behavior	Circling, Gliding
General Flight Direction	SW
Flight Height	2 - within rotor swept area, 3 - above rotor swept area
Horizontal Position Code	D - flight path over a valley

Notes	Spotted circling in the north over a field. Circled for quite a long time before taking off and gliding south west over the lake. The two juveniles in the nest called during the observation.
Map of Flight Path	

Schoodic Nest, 2019-07-19

Created	2019-07-19 14:33:05 UTC by Randi Jackson
Updated	2019-08-05 16:33:44 UTC by Meg Stevenson
Location	44.6954125353, -67.8743498773
Lead Observer	Randi Jackson
Survey Interval	July
Date	2019-07-19
Survey Site	Schoodic Nest

Survey Overview

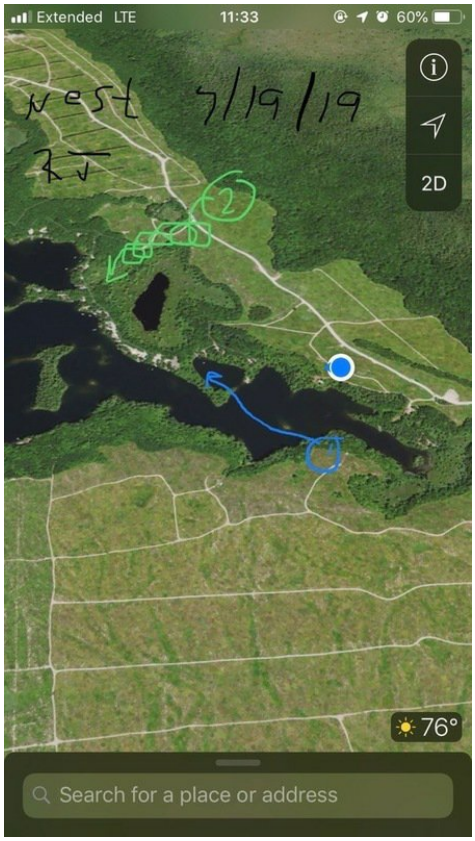


Survey Start Time	10:23
Survey End Time	14:24
Duration of survey (minutes)	241
Count of eagles observed	1
Count of raptors observed	4
Survey Summary Comments	Both juveniles still in the nest. The wind picked up slightly during the last hour of the survey. Both juveniles were observed raising and flapping their wings. Neither took flight.

Weather Summary

Wind Speed	2 - Light breeze
Wind Direction	S
Temperature (F)	74
Relative Humidity	57
Barametric Pressure (inches)	29.87
Cloud Cover (percent)	0
Visibility	Unlimiyed
Precipitation	0 - none

Bald Eagle, 1

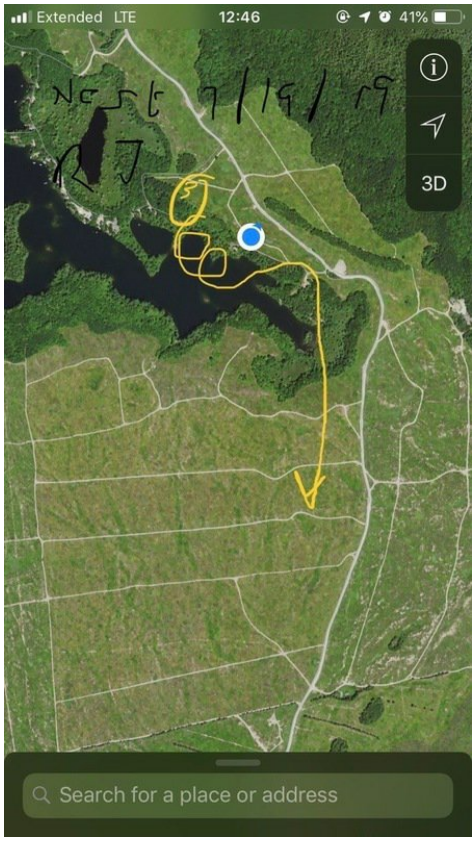


Raptor Site	Schoodic Nest
Raptor Date	7/19/19
Species	Bald Eagle
Raptor observation number	1
Count of individuals in group	1
number of eagles observed	1
Time first observed	11:32
Time last observed	11:33
Duration of observation (minutes)	1
Duration within survey boundary	1
Age	Adult
Sex	Unknown
Behavior	Flapping, Gliding
General Flight Direction	W
Flight Height	1 - below rotor swept area

Notes	Initially spotted flying low over the lake from the east. Continued flying low over the lake heading west.
Map of Flight Path	

Turkey Vulture, 2

Raptor Site	Schoodic Nest
Raptor Date	7/19/19
Species	Turkey Vulture
Raptor observation number	2
Count of individuals in group	2
Time first observed	11:37
Time last observed	11:44
Duration of observation (minutes)	7
Duration within survey boundary	7
Age	Unknown
Sex	Unknown
Behavior	Circling
General Flight Direction	SW
Flight Height	2 - within rotor swept area
Horizontal Position Code	D - flight path over a valley
Notes	Initially spotted in the north circling over the blueberry fields. Circled for a while making their way south west while circling.



Map of Flight Path

Turkey Vulture, 3

Raptor Site	Schoodic Nest
Raptor Date	7/19/19
Species	Turkey Vulture
Raptor observation number	3
Count of individuals in group	1
Time first observed	12:33
Time last observed	12:44
Duration of observation (minutes)	11
Duration within survey boundary	11
Age	Adult
Sex	Unknown
Behavior	Circling, Soaring
General Flight Direction	S
Flight Height	2 - within rotor swept area
Horizontal Position Code	C - flight path over lower slope of ridge
Notes	First spotted circling in from the north. Circled a few times over the edge of the lake then took off soaring south.

Map of Flight Path

Schoodic Nest, 2019-07-24

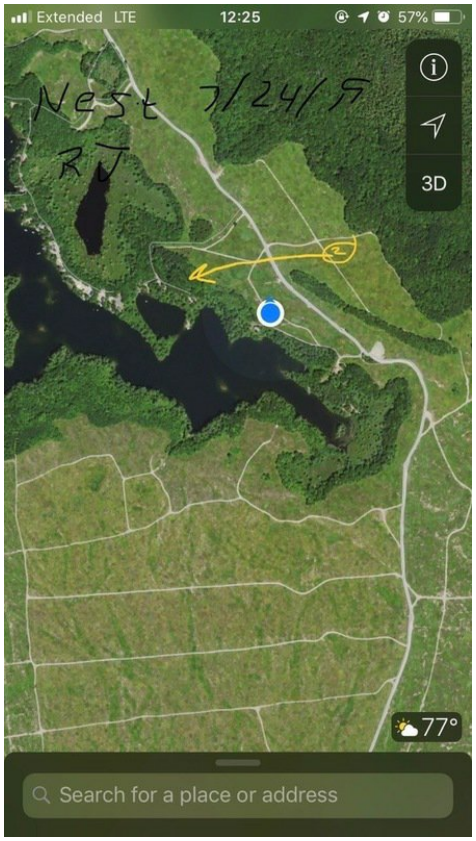
Created	2019-07-24 14:28:08 UTC by Randi Jackson
Updated	2019-09-16 16:56:11 UTC by Randi Jackson
Location	44.6954536904, -67.8743475304
Lead Observer	Randi Jackson
Survey Interval	July
Date	2019-07-24
Survey Site	Schoodic Nest

Survey Overview

Survey Start Time	08:30
Survey End Time	12:31
Duration of survey (minutes)	241
Count of eagles observed	3
Count of raptors observed	4
Survey Summary Comments	One juvenile spent the morning flying around the area of the nest. At one point one of the juveniles joined the female in a longer flight (about 20min). The other juvenile remained in the nest tree during the entire duration of the survey. This juvenile worked on flapping its wings and hoping from one branch to another. Both juveniles remained in the nest tree afterwards. Hoping from branch to branch.

Weather Summary

Wind Speed	1 - Light air
Wind Direction	W
Temperature (F)	82
Relative Humidity	51
Barametric Pressure (inches)	29.93
Cloud Cover (percent)	90
Visibility	Unlimited
Precipitation	0 - none



Bald Eagle, 1

Raptor Site	Schoodic Nest
Raptor Date	7/24/19
Species	Bald Eagle
Raptor observation number	1
Count of individuals in group	3
number of eagles observed	3
Time first observed	10:01
Time last observed	10:23
Duration of observation (minutes)	22
Duration within survey boundary	5
Age	Juvenile, Adult
Sex	Unknown, Female
Behavior	Flapping, Perching
General Flight Direction	W

Flight Height	1 - below rotor swept area
Horizontal Position Code	D - flight path over a valley
Notes	Only one juvenile was observed flying around the area of the nest all morning (blue on map). The female (red on map) came into the nest around 10 and perched briefly. The female and one of the juveniles (green on map) took of flying low over the lake heading west. The other juvenile remained in the nest calling. Very poor views of the western side of the lake due to tree line coverage. About 20 min later the female and juvenile were spotted flying low over the lake coming into the nest and landed. The female perched briefly then took off flying low over the lake again heading north west.
Map of Flight Path	

Osprey, 2

Raptor Site	Schoodic Nest
Raptor Date	7/24/19
Species	Osprey
Raptor observation number	2
Count of individuals in group	1
Time first observed	12:23
Time last observed	12:25
Duration of observation (minutes)	2
Duration within survey boundary	2
Age	Adult
Sex	Unknown
Behavior	Flapping
General Flight Direction	W
Flight Height	2 - within rotor swept area

Horizontal Position Code	D - flight path over a valley
Notes	Spotted flying in from the east heading west towards the lake.
Map of Flight Path

Survey Interval	August
Date	2019-08-02
Survey Site	Schoodic Nest

Survey Overview

Survey Start Time	09:32
Survey End Time	13:32
Duration of survey (minutes)	240
Count of eagles observed	2
Count of raptors observed	2
Survey Summary Comments	Both juveniles remained in the nest tree for the duration of the survey. They each hopped around to different branches but never left the tree.

Weather Summary

Wind Speed	3 - Gentle breeze
Wind Direction	S
Temperature (F)	82
Relative Humidity	37
Barametric Pressure (inches)	28.08
Cloud Cover (percent)	25
Visibility	Unlimited
Precipitation	0 - none

Bald Eagle, 1

Raptor Site	Schoodic Nest
Raptor Date	8/2/19
Species	Bald Eagle
Raptor observation number	1
Count of individuals in group	2
number of eagles observed	2
Time first observed	09:32
Time last observed	13:32
Duration of observation (minutes)	240
Duration within survey boundary	240
Age	Juvenile
Sex	Unknown
Behavior	Perching
Notes	Both juvenile eagles were observed in the nest tree for the duration of the survey. They sat in the nest and hoped around branches of the tree but never took flight.

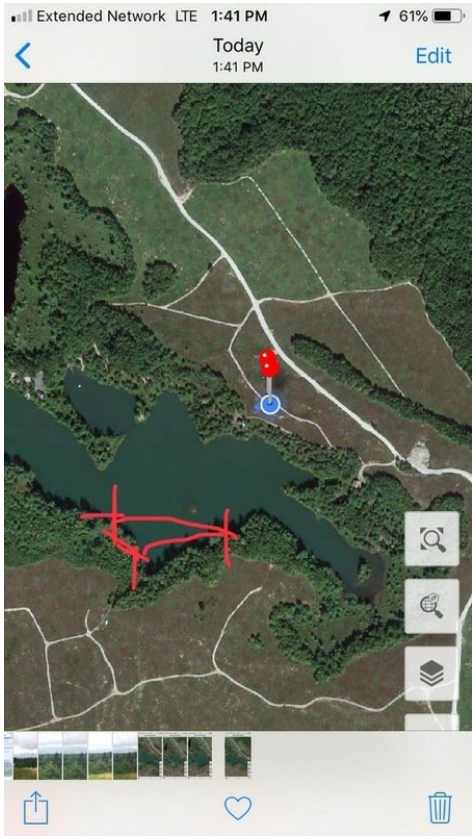
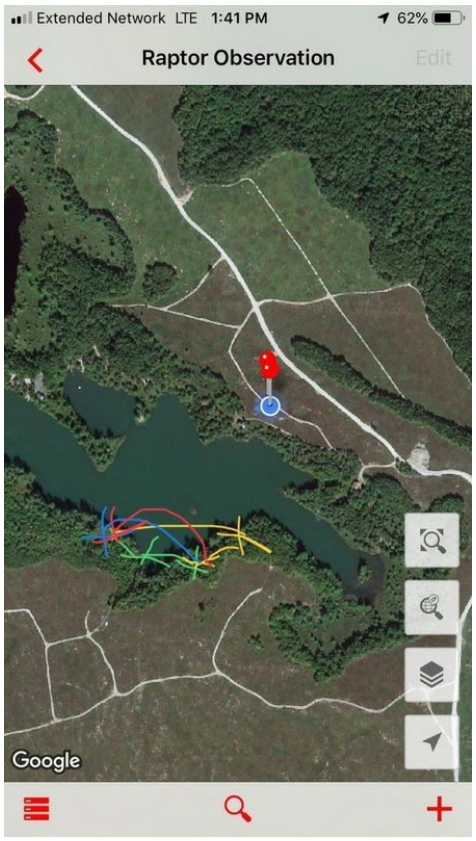
Survey Interval	August
Date	2019-08-07
Survey Site	Schoodic Nest

Survey Overview



Survey Start Time	11:08
Survey End Time	15:08
Duration of survey (minutes)	240
Count of eagles observed	5
Count of raptors observed	5



Bald Eagle, 1

Raptor Site	Schoodic Nest
Raptor Date	8/7/19
Species	Bald Eagle
Raptor observation number	1
Count of individuals in group	2
number of eagles observed	2
Time first observed	11:08
Time last observed	15:08
Duration of observation (minutes)	240
Duration within survey boundary	240
Age	Juvenile
Sex	Unknown
Behavior	Perching
General Flight Direction	E
Flight Height	1 - below rotor swept area
Notes	One perched in tree, one in nest until 12:00 when adult returns and lands in nest for moment. Both juveniles fly around tree for less than a minute before landing back in the tree, one on lower branch, one in nest. Adult takes off in direction it came, from west. Juveniles vocalize on and off. One juvenile flys to tree on shoreline across from survey location, then flys back to dead tree and stays perched there from 12:10 to 1:03. Individual then flys back to nest, low, below tree height. 1:30 both juveniles perch in trees along shore, one in dead snag, other just to the east in a tree. At 1:33 both birds move into same pine tree perched next to each other 1:37 both birds fly back to nest.

Weather during observation

Wind Speed	2 - Light breeze
Wind Direction	SW
Temperature (F)	67
Relative Humidity	87
Barametric Pressure (inches)	29.98
Cloud Cover (percent)	100
Visibility	10km
Precipitation	0 - none

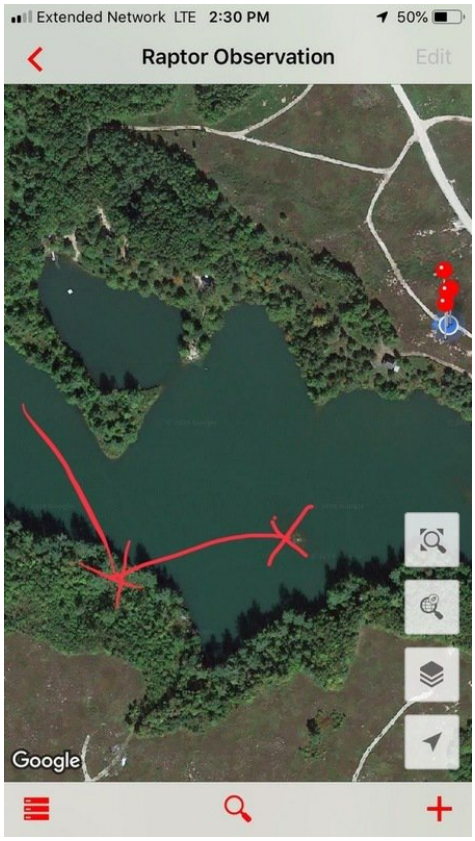
Bald Eagle, 2

Raptor Site	Schoodic Nest
Raptor Date	8/7/19
Species	Bald Eagle
Raptor observation number	2
Count of individuals in group	1
number of eagles observed	1
Time first observed	12:00
Time last observed	12:01
Duration of observation (minutes)	1
Duration within survey boundary	1
Age	Adult
Sex	Unknown

Behavior	Flapping, Perching
General Flight Direction	W
Flight Height	0 - outside of turbine array area, 1 - below rotor swept area
Notes	Adult flys in from west over lake, low below tree height. Swoops up and perches in nest, juveniles fly around nest tree, adult takes back off low over the lake to west
Map of Flight Path	

Bald Eagle, 3

Raptor Site	Schoodic Nest
Raptor Date	8/7/19
Species	Bald Eagle
Raptor observation number	3
Count of individuals in group	1
number of eagles observed	1
Time first observed	12:08
Time last observed	12:09
Duration of observation (minutes)	1
Duration within survey boundary	1
Age	Adult
Sex	Unknown
Behavior	Perching, Flapping
General Flight Direction	S
Flight Height	1 - below rotor swept area, 0 - outside of turbine array area
Notes	Adult flys up from lake and perches low in pine tree along lake west of the nest. Lost visual on bird when it flew into tree.



Map of Flight Path

Bald Eagle, 4

Raptor Site	Schoodic Nest
Raptor Date	8/7/19
Species	Bald Eagle
Raptor observation number	4
Count of individuals in group	1
number of eagles observed	1
Time first observed	14:21
Time last observed	14:26
Duration of observation (minutes)	5
Duration within survey boundary	5
Age	Adult
Sex	Unknown
Behavior	Flapping, Perching
General Flight Direction	E
Flight Height	1 - below rotor swept area
Notes	Adult returns and lands in nest then flys down to rocks in lake. Did not see it fly off, watching juveniles in nest.

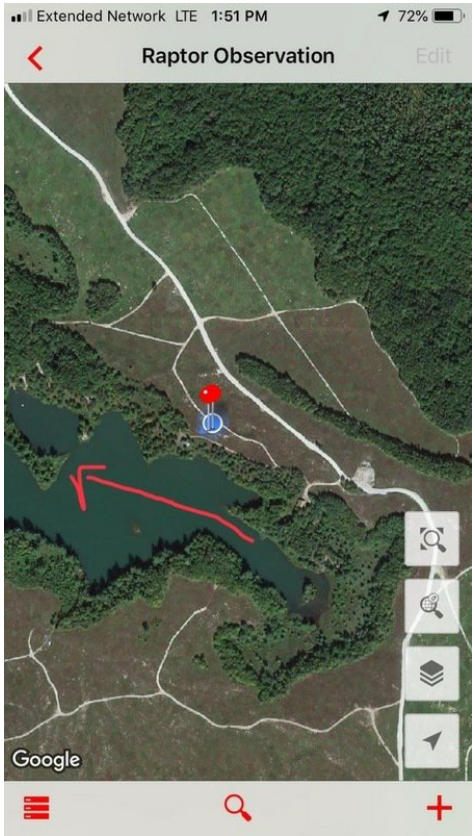
Survey Site	Schoodic Nest

Survey Overview

Survey Start Time	12:51
Survey End Time	16:51
Duration of survey (minutes)	240
Count of eagles observed	3
Count of raptors observed	3

Weather Summary



Wind Speed	3 - Gentle breeze
Wind Direction	NW
Temperature (F)	83
Relative Humidity	50
Barametric Pressure (inches)	26.76
Cloud Cover (percent)	80
Visibility	10km
Precipitation	0 - none

Bald Eagle, 1

Raptor Site	Schoodic Nest
Raptor Date	8/13/19
Species	Bald Eagle
Raptor observation number	1
Count of individuals in group	2
number of eagles observed	2
Time first observed	12:51
Time last observed	16:51
Duration of observation (minutes)	240
Duration within survey boundary	240
Age	Juvenile
Sex	Unknown
Behavior	Perching
Notes	Both juveniles stayed in tree. Brief 15s flight around tree at 1:34 before landing back in tree. Vocalized periodically.

Bald Eagle, 2

Raptor Site	Schoodic Nest
Raptor Date	8/13/19

Species	Bald Eagle
Raptor observation number	2
Count of individuals in group	1
number of eagles observed	1
Time first observed	13:42
Time last observed	13:43
Duration of observation (minutes)	1
Duration within survey boundary	1
Age	Adult
Sex	Unknown
Behavior	Flapping
General Flight Direction	W
Flight Height	0 - outside of turbine array area
Notes	Flight low, below 50ft. Flys from east end of lake out of site to the west, low below tree height entire time.

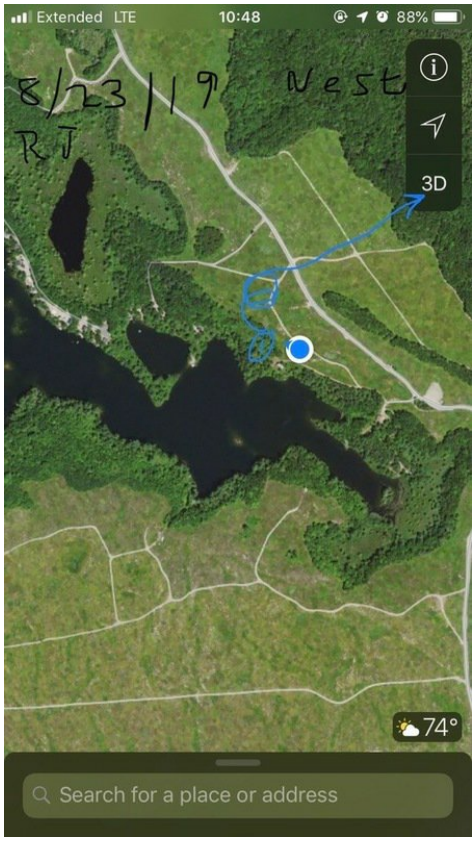
Survey Interval	August
Date	2019-08-23
Survey Site	Schoodic Nest

Survey Overview

Survey Start Time	08:00
Survey End Time	12:07
Duration of survey (minutes)	247
Count of eagles observed	3
Count of raptors observed	6

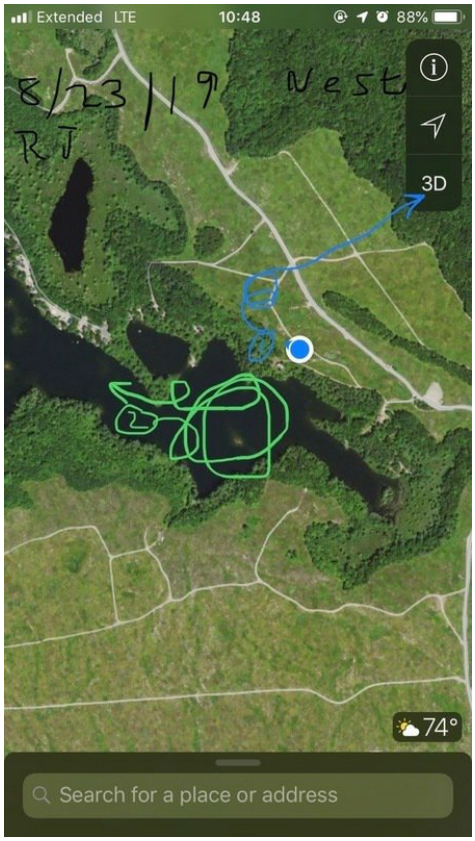


Weather Summary

Wind Speed	5 - Fresh breeze
Wind Direction	N
Temperature (F)	76
Relative Humidity	64
Barametric Pressure (inches)	29.91
Cloud Cover (percent)	25
Visibility	Unlimited
Precipitation	0 - none
Weather Comment	Absolute gorgeous day. A nice fresh breeze on a sunny day!

Broad-winged Hawk, 1

Raptor Site	AD-6
Raptor Date	8/23/19
Species	Broad-winged Hawk
Raptor observation number	1
Count of individuals in group	1
Time first observed	09:28
Time last observed	09:31
Duration of observation (minutes)	3
Duration within survey boundary	3
Age	Adult
Sex	Unknown
Behavior	Circling, Gliding
General Flight Direction	NE
Flight Height	2 - within rotor swept area
Horizontal Position Code	B - Flight path over upper slope of ridge
Notes	Spotted circling over the tree line on the northern side of the lake. Circled for a few minutes then took off gliding north east.



Map of Flight Path

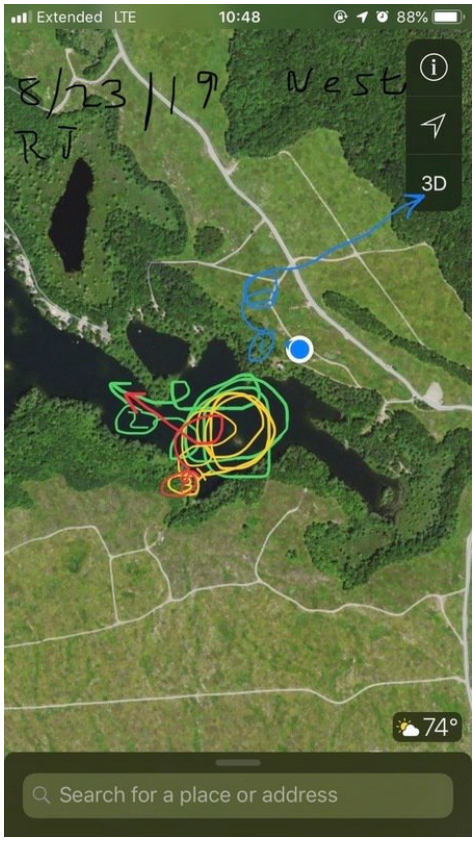
Osprey, 2

Raptor Site	Schoodic Nest
Raptor Date	8/23/19
Species	Osprey
Raptor observation number	2
Count of individuals in group	2
Time first observed	10:18
Time last observed	10:40
Duration of observation (minutes)	22
Duration within survey boundary	22
Age	Adult
Sex	Unknown
Behavior	Circling
General Flight Direction	W
Flight Height	2 - within rotor swept area
Horizontal Position Code	D - flight path over a valley
Notes	Two osprey Spotted flying in from the western side of the lake. Both individuals Circled over the lake for the entire observation. The juvenile bald eagle that was in the nest harassed the osprey while they were circling over the lake. Last spotted circling heading west.

Map of Flight Path

Bald Eagle, 3

Raptor Site	Schoodic Nest
Raptor Date	8/23/19
Species	Bald Eagle
Raptor observation number	3
Count of individuals in group	1
number of eagles observed	1
Time first observed	10:18
Time last observed	10:40
Duration of observation (minutes)	22
Duration within survey boundary	22
Age	Juvenile
Sex	Unknown
Behavior	Perching, Circling
General Flight Direction	S
Flight Height	2 - within rotor swept area
Horizontal Position Code	D - flight path over a valley
Notes	One juvenile bald eagle observed in the nest upon arrival. The eagle did not leave the nest until the osprey (observation 2) began circling over the lake near the nest. The juvenile eagle took off and began circling and harassing the osprey. The juvenile circled and pestered the osprey for the entire time they were circling around the lake. Once the osprey left the juvenile eagle landed back in the tree and perched.



Map of Flight Path

Bald Eagle, 4

Raptor Site	Schoodic Nest
Raptor Date	8/23/19
Species	Bald Eagle
Raptor observation number	4
Count of individuals in group	1
number of eagles observed	1
Time first observed	11:47
Time last observed	11:48
Duration of observation (minutes)	1
Duration within survey boundary	1
Age	Juvenile
Sex	Unknown
Behavior	Circling, Gliding, Perching
General Flight Direction	W
Flight Height	2 - within rotor swept area
Horizontal Position Code	D - flight path over a valley
Notes	The juvenile bald eagle took off from the nest. Circled once around the lake then took off gliding west.

Map of Flight Path

Bald Eagle, 5

Raptor Site	Schoodic Nest
Raptor Date	8/23/19
Species	Bald Eagle
Raptor observation number	5
Count of individuals in group	1
number of eagles observed	1
Time first observed	11:47
Time last observed	12:07
Duration of observation (minutes)	20
Duration within survey boundary	13
Age	Juvenile
Sex	Unknown
Behavior	Circling
General Flight Direction	E
Flight Height	2 - within rotor swept area
Horizontal Position Code	D - flight path over a valley
Notes	Spotted the juvenile bald eagle circling in from the western side of the lake. Circled over the lake for the rest of the duration of the survey.

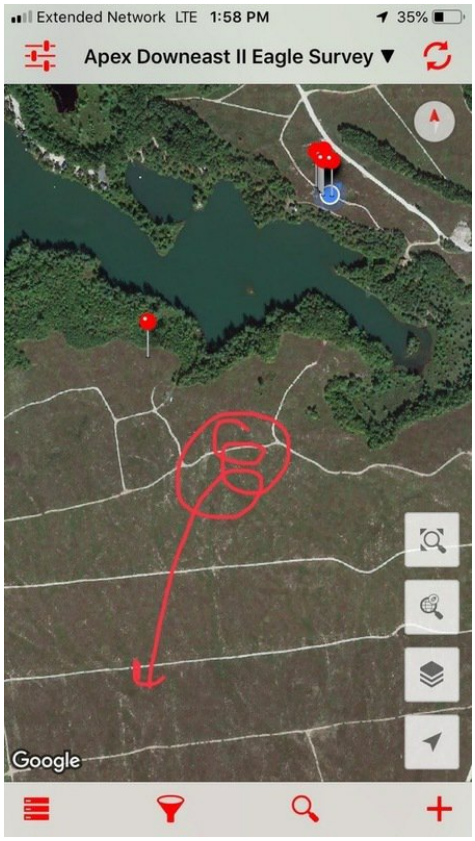
Survey Overview

Survey Start Time	11:43
Survey End Time	15:43
Duration of survey (minutes)	240
Count of eagles observed	3
Count of raptors observed	6



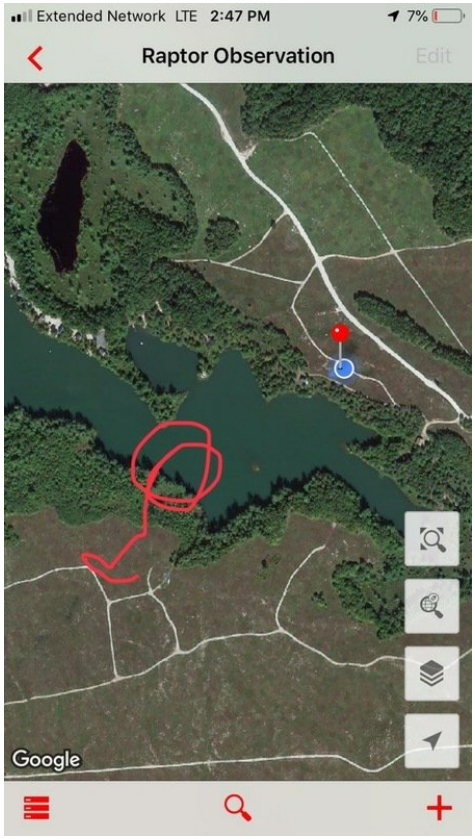
Weather Summary

Wind Speed	3 - Gentle breeze
Wind Direction	SW
Temperature (F)	77
Relative Humidity	80
Barametric Pressure (inches)	29.92
Cloud Cover (percent)	30
Visibility	10km
Precipitation	0 - none

Turkey Vulture, 1

Raptor Site	Schoodic Nest
Raptor Date	8/30/19
Species	Turkey Vulture
Raptor observation number	1
Count of individuals in group	3
Time first observed	13:54
Time last observed	13:56
Duration of observation (minutes)	2
Age	Unknown
Sex	Unknown
Behavior	Circling, Gliding
General Flight Direction	S
Flight Height	1 - below rotor swept area
Notes	Three TUVU circle about 50 ft above barren, drop down out of sight headed south

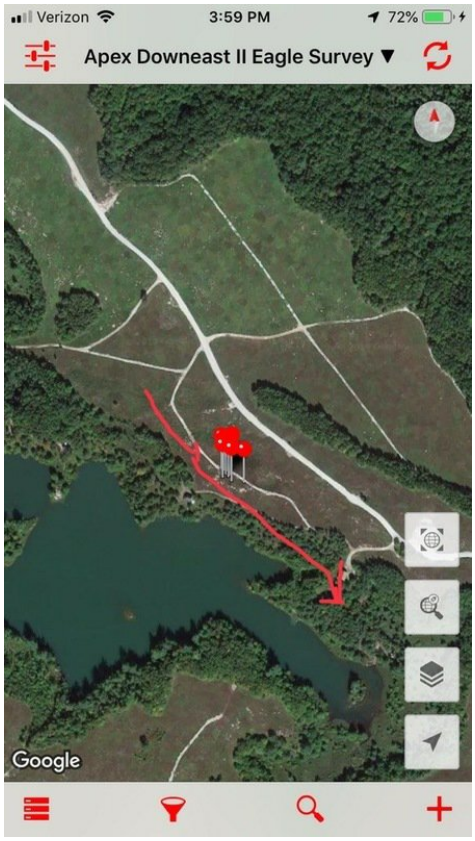
Map of Flight Path



Weather during observation

Wind Speed	5 - Fresh breeze
Wind Direction	SW
Temperature (F)	78
Relative Humidity	59
Barametric Pressure (inches)	29.91
Cloud Cover (percent)	10
Visibility	10km
Precipitation	0 - none

Bald Eagle, 2



Raptor Site	Schoodic Nest
Raptor Date	8/30/19
Species	Bald Eagle
Raptor observation number	2
Count of individuals in group	2
number of eagles observed	2
Time first observed	14:34
Time last observed	14:46
Duration of observation (minutes)	12
Duration within survey boundary	12
Age	Juvenile
Sex	Unknown

Behavior	Flapping, Circling, On ground
Flight Height	1 - below rotor swept area
Notes	Both juveniles fly in and circle down, landing in barren behind nest on hill. Chase ravens away in field. Walk out of site
Map of Flight Path	

Bald Eagle, 3

Raptor Site	Schoodic Nest
Raptor Date	8/30/19
Species	Bald Eagle
Raptor observation number	3
Count of individuals in group	1
number of eagles observed	1
Time first observed	15:23
Time last observed	15:25
Duration of observation (minutes)	2
Duration within survey boundary	2
Age	Juvenile
Sex	Unknown
Behavior	Flapping, Gliding
General Flight Direction	SW
Flight Height	1 - below rotor swept area
Notes	Juvenile 2nd year BAEA flys along northern shore, directly over truck, about 20ft -40 ft. Drops down below trees out of sight and end of lake. Some mottled white across breast and underside of wings.

Map of Flight Path

2015-2016 BALD EAGLE USE AND BALD EAGLE NEST AND HERON ROOKERY SURVEYS FOR THE DOWNEAST WIND PROJECT

November 10, 2016

Executive Summary

Stantec Consulting Services Inc. (Stantec) conducted bald eagle (*Haliaeetus leucocephalus*) surveys for the proposed 30-turbine (90-megawatt) Downeast Wind Project (DOW or Project) in Washington County, Maine. Bald eagle surveys included an aerial bald eagle nest survey in spring 2016 and bald eagle use surveys from September 2015 to September 2016. The objective of the aerial nest survey was to locate bald eagle nests and great blue heron (*Ardea herodias*) within 4 miles of the area proposed for development (Project area). The objective of bald eagle use surveys was to characterize seasonal and spatial use of the Project area by bald eagles to evaluate risk and inform siting Surveys followed methods described in the Project Work Plan developed in coordination with U.S. Fish and Wildlife Service (USFWS) and Maine Department of Inland Fisheries and Wildlife's (MDIFW) and were consistent with the USFWS April 2013 *Eagle Conservation Plan Guidance* (ECPG) and MDIFW's June 2015 *Curtailment Policy and Wind Power Preconstruction Study Recommendations* (MDIFW Recommendations) dated June 2015.

Aerial Nest Survey

Survey flights were completed on 13 April 2016 and 19 May 2016. Bald eagle nests, great blue heron rookeries, incidental observations of bald eagles, great blue heron and osprey (*Pandion haliaetus*) were recorded if observed. Two occupied and 5 unoccupied bald eagle nests were located within the survey area. The nearest occupied nest was located 3.3 miles southeast of the Project area boundary. The nearest unoccupied nest was within the Project area. One active great blue heron rookery was documented during the second flight in southern Deblois, approximately 2.2 miles west of the Project area. Seven nests containing 5 adult great blue herons were observed at this location. One new unoccupied nest was located during the second flight: the nest was composed of sticks and in a location and of a size that suggested it was either a great blue heron or osprey nest. This nest is located just outside and west of the Project area. One osprey was observed on the transmission line south of Schoodic Lake. No other incidental bald eagle or great blue heron observations were made during either survey flight.

Bald Eagle Use Surveys

Bald eagle use point count surveys were conducted from September 2015 to September 2016. Point count surveys consisted of 1-hour visual surveys at 31 locations within and adjacent to the Project area. Each location surveyed an area of 2 km^2 (800-m radius circle). Stantec surveyed approximately once every 3 weeks and completed 18 rounds of survey totaling 310 survey hours. Nine bald eagles were recorded at points inside the Project area, for a total of 21 eagle minutes recorded in 133 hrs of survey within the Project area. During 9 of those minutes, bald eagles flew at heights 200 m or less agl. Twenty two eagle observations were recorded outside but near the Project area in a total of 177 hrs of study. A single territorial display between 2 individuals was observed in the Project area in March 2016. All other observed behaviors in the Project area

Business Confidential

were soaring or gliding, or perching. For all points, bald eagle use was concentrated in the winter and spring months of January through May. The rate of bald eagle occurrence was highest in the month of March at points inside and outside the Project area. No eagles were observed in the months of June, July, October, and December. These data suggest that the area proposed for development presents low risk to the species.

Business Confidential

1.0 INTRODUCTION

Stantec Consulting Services Inc. (Stantec) conducted bald eagle (*Haliaeetus leucocephalus*) surveys on land in and adjacent to the 30-turbine (90-megawatt) Downeast Wind Project (DOW or Project) in Washington County, Maine. Bald eagle surveys included an aerial bald eagle nest in spring 2016 and bald eagle use surveys from September 2015 to September 2016. The objective of the aerial nest survey was to locate bald eagle nests and great blue heron (*Ardea herodias*) rookeries to evaluate risk and inform siting. The objective of bald eagle use surveys was to evaluate the seasonal and spatial patterns of bald eagle activity to evaluate risk and inform siting.

Surveys were conducted to comply with the U.S. Fish and Wildlife Service's (USFWS) *Eagle Conservation Plan Guidance* (ECPG) dated April 2013 and the Maine Department of Inland Fisheries and Wildlife's (MDIFW) *Curtailment Policy and Wind Power Preconstruction Study Recommendations* (MDIFW Recommendations) dated June 2015. Surveys followed methods described in the Project Work Plan submitted to MDIFW on 19 February 2016. The Work Plan was discussed with MDIFW at a meeting on 23 February 2016, and was revised on 17 March 2016 based on feedback from MDIFW (Appendix A). Revisions to the Work Plan were related to the aerial nest survey, and included the following: using a transect-based search approach within 4 miles of the Project; and timing the second aerial flight in early to mid-May to concurrently assess the status of the bald eagle nests identified in the first flight and to assess the status of known or new great blue heron rookeries.

2.0 2016 AERIAL BALD EAGLE NEST, GREAT BLUE HERON ROOKERY, AND LARGE RAPTOR NEST SURVEY

2.1 METHODS

Prior to the surveys, Stantec reviewed information provided by MDIFW regarding known active and historic bald eagle nest and great blue heron rookery locations in the vicinity of the Project. Following protocol previously established by the USFWS (2007)[1], Stantec notified Mark McCollough of the USFWS Maine Field Office on 4 April 2016 that flights were being conducted in the area and that Stantec was coordinating with MDIFW on the timing and methods of the flights.

Stantec conducted 2 aerial surveys in the spring of 2016. A revised Project area was provided to Stantec after surveys on 28 September 2016. Figure 1 depicts the initially proposed Project area and associated survey area, which fully encompasses the current Project area.

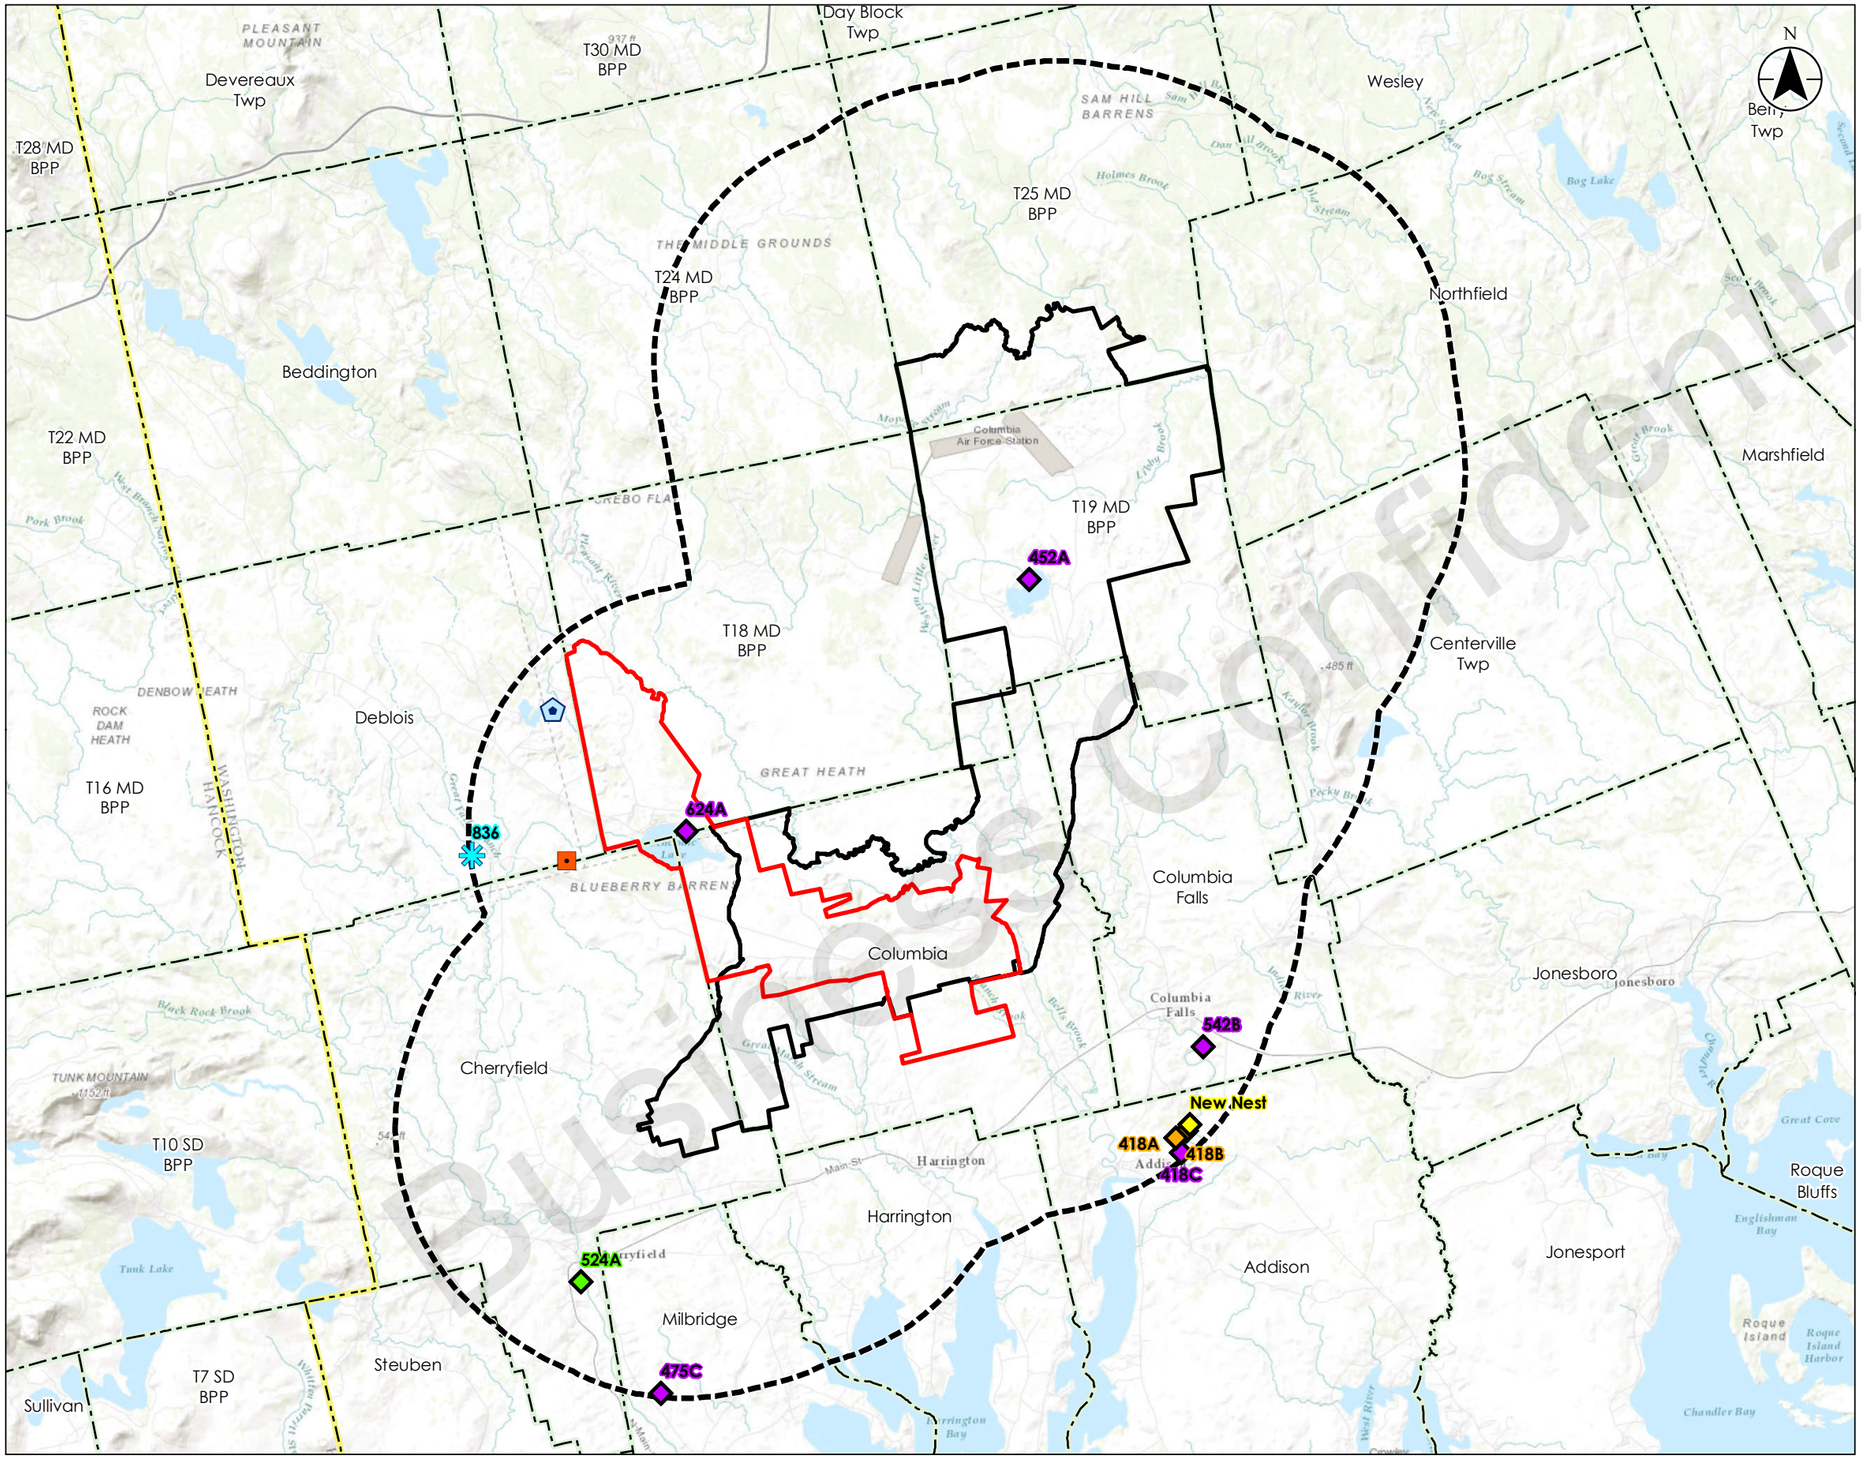
Business Confidential



The aerial surveys were conducted in a Cessna fixed-wing aircraft piloted by Mr. Jim Strang (first flight) and Mr. Jeremy Harmon (second flight) of Penobscot Island Air. The first flight was conducted on 13 April 2016 and was focused on surveying for bald eagle nests. The timing of the first flight was chosen to correspond with the time period when bald eagles are actively incubating eggs in the nests. The purpose of the first flight was to survey the mapped bald eagle nests and to search potential nesting habitat for new bald eagle nests within 4 miles of the initial Project area (Figure 1). The survey included inland waterbodies and portions of Narraguagus River and Bay, Harrington Bay and other bays and inlets on the Atlantic Ocean. We also performed low level flights along the shoreline of rivers, lakes, the ocean, and major wetland systems to target preferred potential bald eagle nesting habitat. During this flight observers also surveyed for great blue heron nests.

The second flight conducted on 19 May 2016 focused on surveying for great blue heron rookeries, continued to survey for new bald eagle nests, and also surveyed known bald eagle nests for eggs and/or occupancy. The timing of the second flight was chosen to correspond with the time period when great blue herons are actively incubating eggs or brooding chicks in the nests. The surveys consisted of low altitude passes, approximately 300–500 feet above ground level (agl), along transects within 4 miles of the initiall Project area. The planned transect spacing was ½ mile; however during desktop field map preparation, it was apparent that viewsheds would overlap significantly, so transects were widened to approximately ¾ mile[2]. In addition to the transects, the survey investigated large wetland complexes (marshes, bogs, etc.) and the adjacent upland habitat. The survey also included investigation of mapped rookeries within 4 miles of the initial Project area.

During the 2 flights, incidental observations of bald eagles, osprey (*Pandion haliaetus*), and great blue heron were recorded if these species were observed, and large stick nests were recorded if observed.

Business Confidential

[2] Stantec called MDIFW to inform them of the protocol change on 1 April and 7 April 2016

2.2 RESULTS

Stantec identified 7 total bald eagle nests within the survey area: 2 occupied and 5 unoccupied. As detailed in the ECPG, the occurrence of a pair of adult bald eagles at or near a nest during the normal incubation time period constitutes the nest being considered "occupied." One occupied nest was a new nest (does not have a MDIFW identification number), although this new nest was likely an alternate nest for the nests that were either not located (418A & 418B) or were unoccupied (418C). This new, occupied nest was located 3.3 miles to the southeast of the current Project area (Table 1). The other occupied nest, nest 524A, was located 5.4 miles from the current Project area. Both occupied nests had adults in the nest during the second flight. The adult bald eagle in the new nest obscured the view into the nest so we were unable to determine definitively if there were eggs or nestlings present. Two additional historic bald eagle nest sites were not located (Table 1, Figure 1).

Table 1. Results for bald eagle nests during the aerial nest survey, Downeast Wind Project, 2016.

MDIFW Nest #	Location	Flight 1 Nest Status	Flight 2 Nest Status	Distance to Current Project Area (mi)
524A	Narraguagus River-West	Not Located	Occupied	5.4
475C	Narraguagus River-East	Unoccupied	Unoccupied	6.7
418C	Pleasant River-West	Unoccupied	Unoccupied	3.4
418B	Pleasant River-West	Not Located	Not Located	3.3
418A	Pleasant River-West	Not Located	Not Located	3.2

624A	Schoodic Lake	Unoccupied	Unoccupied	Inside Project Area
New Nest	Pleasant River-West	Occupied, 1 adult in nest	Occupied, 1 adult in nest	3.3

Business Confidential

Stantec surveyed known great blue heron rookery 836 in southern Deblois, which was occupied with 7 nests containing 5 adult great blue herons. This rookery is located 2.2 miles from the current Project area. One new, unoccupied nest was located during the second flight. The nest was composed of sticks and in a location and of a size that suggested it was either a great blue heron or osprey nest. This was a single nest in a wetland north of Pineo Pond and south of Dorr Meadow Brook in Deblois. This nest is located just outside and west of the current Project area (Figure 1).

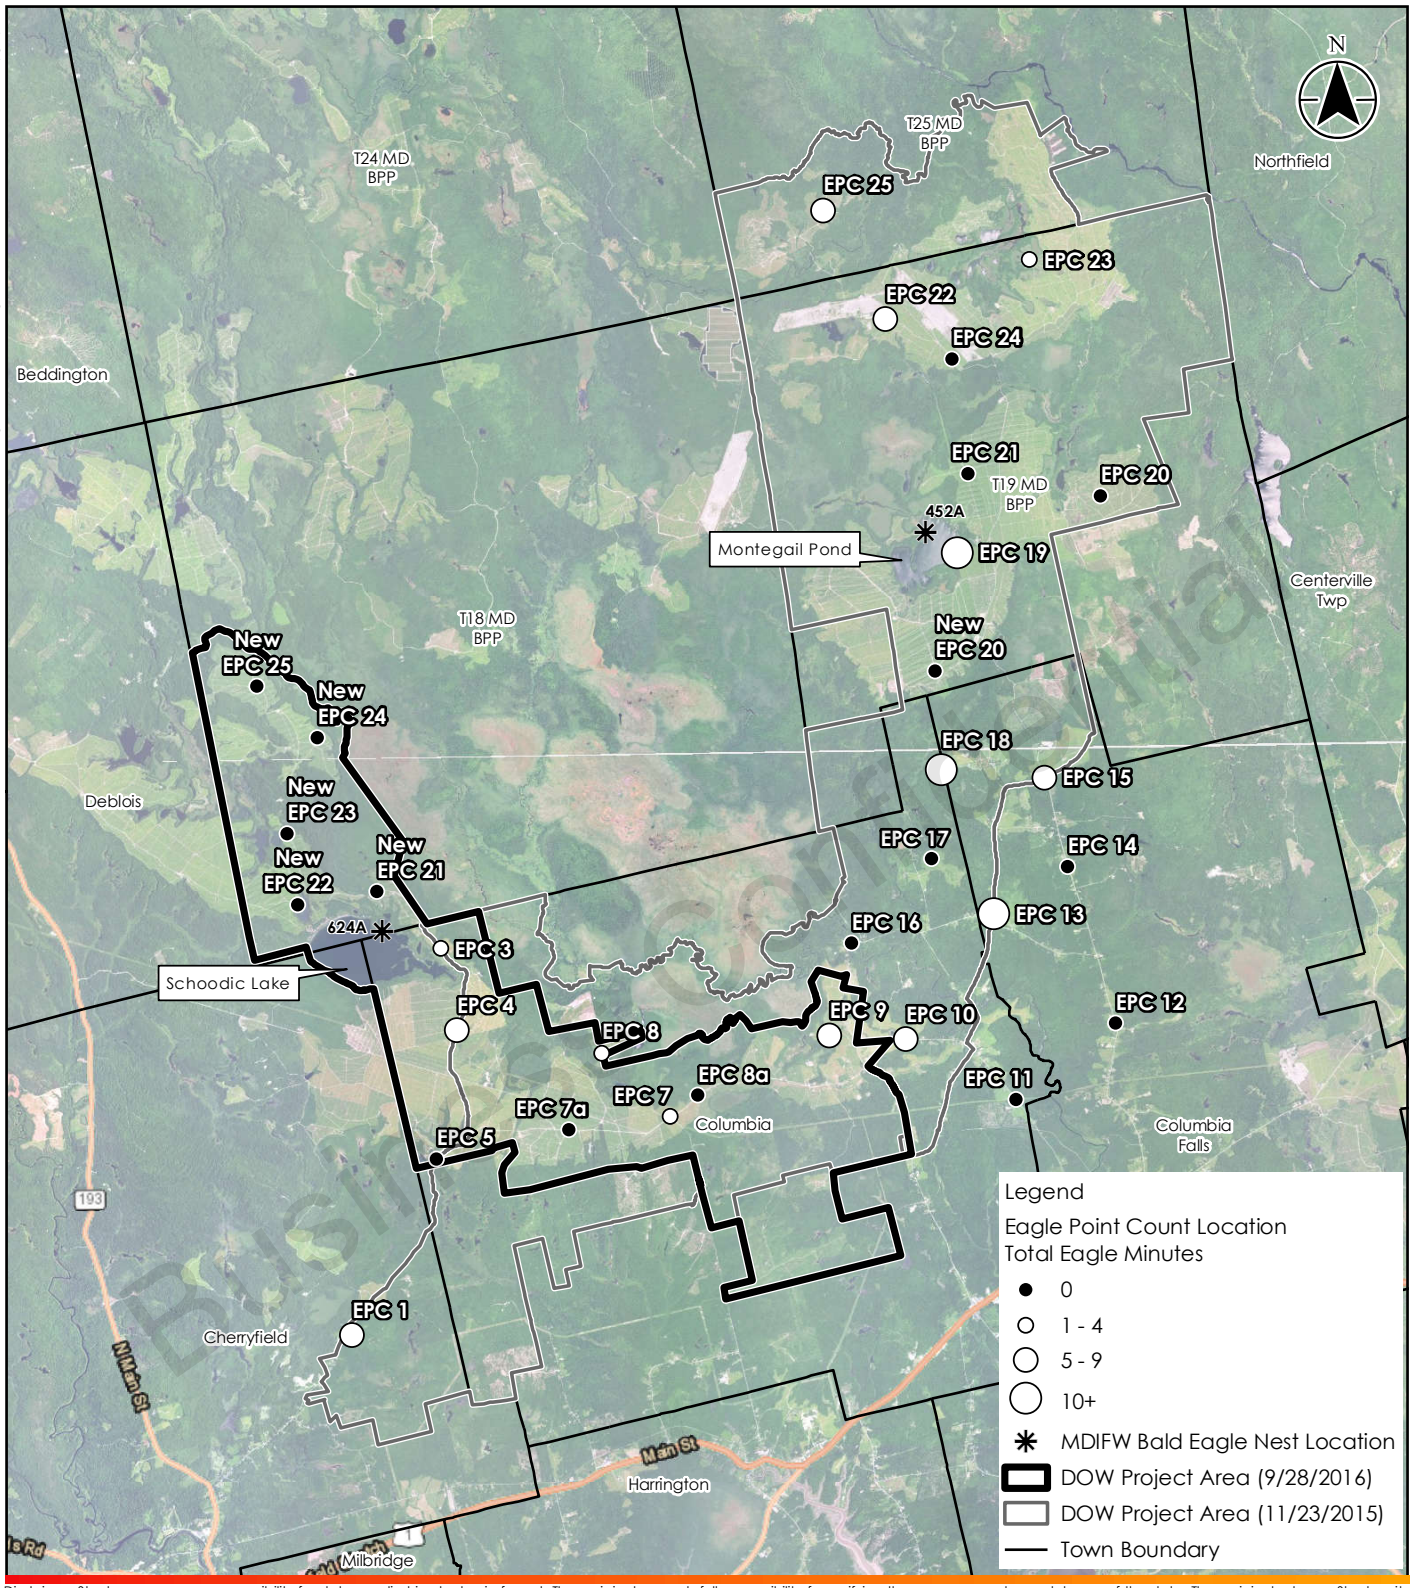
During the first flight, Stantec observed an osprey nest on the transmission line south of Schoodic Lake but no adult ospreys were observed around the nest. No other incidental bald eagle, great blue heron or osprey observations were made during either survey flight.

3.0 2015-2016 BALD EAGLE USE SURVEY

3.1 METHODS

3.1.1 Bald Eagle Use Point Count Surveys

Stantec conducted point count surveys for bald eagles for 1 full year consistent with the ECPG. Point count surveys consisted of 1-hour visual surveys at a total of 31 locations[3] within and adjacent to the Project area (Figure 2), each with an 800-meter radius and covering an area of 2 km^2. Surveys were conducted once approximately every 3 weeks resulting in 18 rounds.



Surveys occurred in all weather conditions except when visibility was poor, and occurred within the full range of daylight hours. The starting point count location changed each survey round to enable sampling of each point during a range of daylight hours. Though bald eagles were the target species, Stantec biologists recorded all birds observed during bald eagle point count surveys. Stantec also recorded any incidental observations of bald eagles observed outside of survey hours such as while traveling between survey points or while conducting other surveys.

3.1.2 Bald Eagle Use Data Analysis

Bald eagle data were summarized by point, including behavior, total observation minutes, and exposure minutes, which are minutes that eagles spent flying within 800 meters of the point count location and at heights below 200 meters agl. Exposure minutes were expressed as a percentage of total survey minutes.

Business Confidential

[3] At the time surveys were initiated, per the ECP Guidance, the number of point count locations was determined by calculating the entire estimated turbine area including a 1-km buffer around proposed turbines, calculating 30% of the area, and dividing by 2 (to account for the 2 km^2 plots). Since initiating surveys, the Project area has been revised and survey points have been relocated.

3.2 RESULTS

3.2.1 Survey Effort

Stantec conducted 310 hours of survey at 31 locations between 16 September 2015 and 7 September 2016. Thirteen of the points were located within the Project area; however, survey effort varied across these points due to the revision of the Project area on 28 September 2016 resulting in some points being added and some being relocated. Of the 310 survey hours, 133 occurred in the current Project area and 177 occurred adjacent to the Project area. Skies ranged from clear to overcast. Short periods of drizzle occurred during 2 survey rounds; no other precipitation occurred during surveys (Table 2).

3.2.2 Results Inside the Project Area

A total of 31 bald eagle observations were recorded, 9 of which were within the Project area. Twenty-one eagle bald eagle minutes were recorded inside the Project area and 9 total bald eagle exposure minutes. Total exposure minutes ranged from 0 –4 minutes per point (Table 3). The greatest number of flying bald eagle minutes per survey hour within the Project area occurred at Point 9 (n = 0.50 flying bald eagle minutes/survey hour; 43% of total flying bald eagle minutes within the Project area. Point 9 is in the eastern portion of the Project area, and most minutes occurred when the 2 bald eagles exhibited undulating, territorial flight on 22 March. The greatest number of bald eagle exposure minutes also occurred at this Point (n = 0.22 exposure minutes/survey hour; 44% total exposure minutes in the Project area). Of the 13 Points inside the Project area, no bald eagles were observed at Points 5, 7a, 8a, New 21, New 22, New 23, New 24, and New 25.

[1] Minutes that an bald eagle was observed perched are not included.

Observations occurred between 7:20 AM and 4:50 PM (Table 4). Bald eagles observed were adults, except for 1 bald eagle whose age could not be classified due to its distance from the observer. Most bald eagle observations exhibited soaring or gliding behavior.

Point 19 had the greatest bald eagle occurrence rate outside the Project area (Table 6). Point 19 is nearest to Montegail Pond, which has a historic bald eagle nest on its northern shore. Points 22 and 18 had similar occurrence rates. Point 22 was located in the far north near the abandoned radar station. Point 18 is approximately 2 miles south of Point 19. Montegail Pond, Point 18, Point 19, and Point 22 are outside the current Project area. Stantec found the Montegail Pond nest to be unoccupied during 2016 aerial nest surveys.

Mean use by bald eagles within the Project area (0.16 eagle minutes/hr of observation) was lower than observed at points outside the Project area (0.49 eagle minutes/hr of observation). Excluding point 9, overall mean use within the Project was very low (0.10 eagle minutes/hr of observation).

3.2.4 Seasonal Eagle Use

For all points, bald eagle use was concentrated in the winter and spring months of January through May (Figure 3). The rate of bald eagle occurrence was highest in the month of March at points inside and outside the Project area. No eagles were observed in the months of June, July, October, and December.

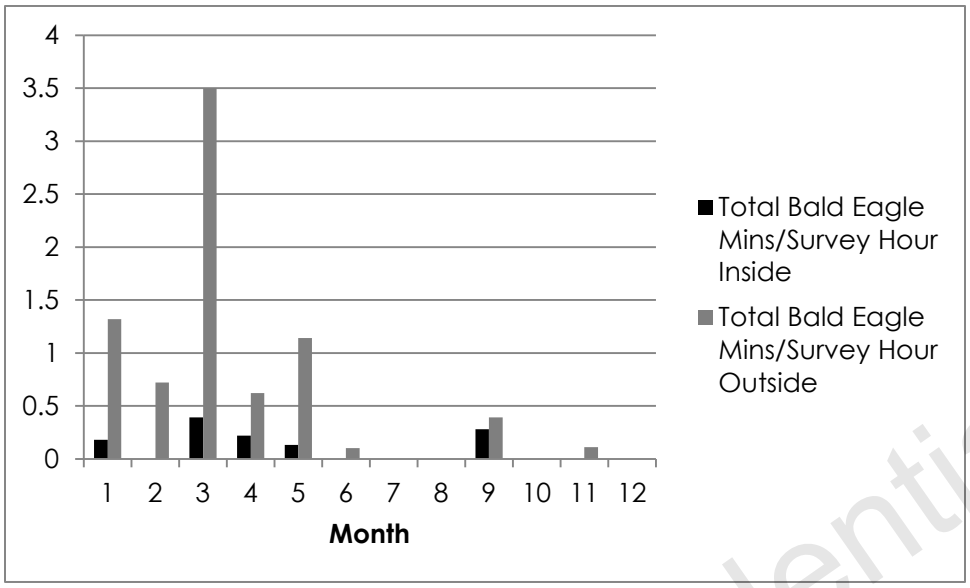

Figure 3. Bald eagle Occurrence Rates at All Survey Points by Month, Downeast Wind Project, 2015–2016.

3.2.5 Incidental Species

3.2.5.1 Non-bald eagle species

Bird species observed incidentally during bald eagle use surveys are listed in Appendix C Table 1. No federally listed species were observed, 1 state-listed threatened species: upland sandpiper (*Bartramia longicauda*) was recorded at Points 23 and 24 which are outside of the current Project area, and 5 state species of special concern were recorded, 2 outside the project area (black-and-white warbler (*Mniotilta varia*), chestnut-sided warbler (*Setophaga pensylvanica*)) and 3 within the project area (great blue heron (*Ardea herodias*), northern harrier (*Circus cyaneus*), and white-throated sparrow (*Zonotrichia albicollis*)). The single great blue heron was observed flying north between 50 and 100 m agl near Point 5 on 16 September 2015.

Stantec also observed a flock of approximately 200 shorebirds, the majority of which were semipalmated plovers (*Charadrius semipalmatus*), adjacent to Point 5 on 6 September 2016. The flock was present for the entire hour of survey, and individuals were loafing and feeding. The biologist returned to the site on 7 September and documented that the flock was no longer there. No other shorebirds (aside from upland sandpiper) were observed during bald eagle point count surveys.

4.0 DISCUSSION

One bald eagle nest, Nest 624A on the northeastern shore of Schoodic Lake, is within the Project area. The other bald eagle nests are over 3 miles from the current Project area.

Business Confidential

Nest 624A was found to be unoccupied during 2016 aerial nest flights. Bald eagle activity in the vicinity of this nest as assessed during bald eagle use surveys was low; in 18 survey hours, only 1 bald eagle was observed at Point Count 3, approximately 0.25 miles to the east of the lake. No bald eagles were observed at Point New 21, 0.25 miles north of the lake, and Point New 22, 0.25 miles northwest of the lake. These 2 points were surveyed 5 times.

The majority of bald eagle observations recorded outside the Project area occurred around Montegail Pond. Despite the fact that this nest was found to be unoccupied in 2016, relative to results from other survey points adjacent to the Project area, bald eagle activity was highest in the vicinity of this nest. Nonetheless, this nest is located outside the area currently proposed for development.

Mean use by bald eagles within the Project area was lower than observed at points outside the Project area. Excluding point 9, overall mean use within the Project was very low. At all points, bald eagle use was concentrated in the winter and spring months of January through May, which corresponds with the period when eagles migrate or make local movements to breeding grounds, create or repair nest sites, perform courtship displays, and lay and incubate eggs. Activity at points inside and outside the Project area peaked in March, when eagles construct nests and some individuals lay eggs. The time period of egg laying in Maine is broad, from late February to early May[4]. Eagle use of the Project area was observed to be extremely low or non-existent in months between May and December, when fledging occurs, juveniles and adults make localized movements between feeding areas, and some eagles migrate southward.

Behaviors thought to be associated with greater collision risk at wind projects include courtship displays, territorial displays, and foraging (USFWS 2013[5]). Young birds practicing flying during their first summer may be at increased risk of collision. However in 12 months of survey, only 1 territorial display occurred between 2 individuals in the Project area (in March), and no juvenile bald eagles were observed during the post-fledging period. The lack of observations in June or July may have been due to the fact that the nest on Schoodic Lake was inactive in 2016.

To date, there is no documented correlation between pre-construction bald eagle occurrence data and post-construction bald eagle mortality. In Maine, bald eagle use at wind projects has been documented during both pre- and post-construction surveys[6]. Stantec has assessed bald eagle use during project operation at 2 projects with active bald eagle nests within 2 miles of turbines (Stantec 2012a,b; Stantec 2015 b,c). At those projects, eagles continued to use the airspace in the vicinity of turbines, but did not collide with them. Despite a large and growing bald eagle population in Maine[7], no bald eagle fatalities have been recorded at operational wind projects in Maine or New England. This may in part be because bald eagles exhibit a high

Business Confidential

rate of avoidance at wind projects (Sharp et al. 2010; Stantec 2012 a,b; Stantec 2015 b,c). This, combined with the fact that no active nests occur within 4 miles of the Project, and that the majority of behaviors observed were not behaviors that are thought to be associated with greater collision risk at wind projects (courtship, territorial displays, or foraging), indicates that risk of collision and disturbance as a result of the Project likely is very low.

1.0 INTRODUCTION

Apex Clean Energy, Inc. (Apex) is the process of developing the Downeast Wind Project (Project) in Washington County, Maine in the towns of Cherryfield, Columbia, Columbia Falls, Township T19 MD BPP, and Township T25 MD BPP (Figure 1). At this time, the Project is expected to generate up to approximately 180 megawatts of power and include up to 60 turbines, and may be built in 2 phases. Turbines are expected to have a total height of approximately 183 meters (600 ft). Project infrastructure is expected to include underground collector lines, a generator lead transmission line, new and improved roads, a collection substation, an operations and maintenance building, and 2 or 3 permanent meteorological towers.

The Project area consists of actively managed blueberry fields and hills with mixed forest habitat. The western and central portions of the Project area have little topography and contain a network of dirt roads that intersect the blueberry fields. Other habitats in these portions include hedgerows, and a few lakes and ponds. The northern and eastern portion of the Project area is more topographically variable, developed with residences, farms, fallow fields, paved roads, and mixed forest.

In fall 2015, Stantec Consulting (Stantec) initiated eagle use surveys at the Project to assess eagle activity/presence consistent with the US Fish and Wildlife Service's (USFWS) *Eagle Conservation Plan Guidance* (ECPG; 2013), and bird and bat surveys following the Maine Department of Inland Fisheries and Wildlife's (MDIFW) *Curtailment Policy and Wind Power Preconstruction Study Recommendations* (MDIFW Recommendations; June 2015). This work plan outlines the bird and bat studies completed in 2015 and planned for completion in 2016.

- Eagle Activity Surveys (fall 2015 to fall 2016)
- Aerial Bald Eagle Nest and Great Blue Heron Rookery Survey (spring 2016)
- Nocturnal Migration Radar Surveys (fall 2015 and spring 2016)
- Diurnal Raptor Migration Surveys (fall 2015 and spring 2016)
- Breeding Bird Surveys and Upland Sandpiper Surveys (late spring/summer 2016)
- Acoustic Bat Monitoring (fall 2015, and spring/summer/fall 2016)

It is our intention to reconvene with MDIFW following completion of spring surveys to determine what studies should be conducted at the Project in fall 2016.

2.0 BIRD AND BAT SURVEYS

2.1 EAGLE ACTIVITY SURVEYS

The objective of eagle activity surveys is to provide input data for modeling to predict risk to eagles at the Project and inform siting decisions. Eagle point count surveys were initiated in mid-September 2015, and are planned to continue for at least 1 year throughout the Project area.

Business Confidential

Surveys consist of 1 hour point counts, with each point surveyed at approximately 3 week intervals. In fall 2015, 14 points[1] were surveyed in the southern and western portions of the Project area. In spring 2016, 6 additional points were added in the northern and eastern portions of the Project area, for a total of 20 points. An 800-meter radius plot is evaluated at each point, covering 2 square kilometers. Points are positioned to optimize the view shed of the Project area. Due to the low, flat cleared landscape throughout much of the Project area, most points in the southern and eastern portions have a nearly 360-degree view of the surrounding landscape.

Surveys will occur in all weather conditions except when visibility is poor, such as during heavy fog or rain events, and will be distributed throughout the daylight period. The order of surveys will be altered to provide representative spatial and temporal sampling throughout the Project. Surveys will end in mid-September 2016, resulting in 18 rounds of surveys.

Surveyors will also document any other raptors observed during eagle activity surveys. Data collected will include species, age, and sex, as possible, flight behavior, flight height, flight time, and weather conditions. Flight locations will be drawn on maps of the Project area.

A report summarizing the eagle use data will be provided after 1 year of data collection is complete. The analyses will evaluate seasonal and spatial use of the Project by eagles using standard metrics to inform siting decisions. The report will also include a list of other raptor observations in the project area including species, date observed, and minimum height inside the Project area. GIS shapefiles of the survey locations and eagle observations and flightpaths will be provided with the survey report.

2.2 AERIAL BALD EAGLE NEST, GREAT BLUE HERON ROOKERY, AND RAPTOR NEST SURVEYS

The objective of the aerial bald eagle nest, great blue heron rookery, and raptor nest surveys is to evaluate siting options and assess impacts to nesting eagles, great blue heron, and raptors at the Project.

In spring 2016, Stantec will conduct 1 aerial bald eagle nest and great blue heron rookery flight. The survey will occur in early to mid-May, before leaf out conditions, to document the status of existing bald eagle nests and great blue heron rookeries and to search for new nests and rookeries within 4 miles of the Project.

Prior to the survey, Stantec will review results of previous flights in the vicinity of the Project area and any information provided by MDIFW regarding known active and historic eagle nest locations near the Project. Stantec will notify USFWS before the flights are conducted in accordance with USFWS Bald Eagle Management Guidelines (USFWS 2007).

[1] The final locations of the 14 eagle point counts were determined prior to the third survey round and were based on landowner access permissions and reconnaissance survey for view shed. Some points surveyed during rounds 1 and 2 were moved or eliminated.

Business Confidential

The survey will use a transect based approach to identify suitable nesting/rookery habitat within 4 miles. Transects will be spaced approximately 0.25 miles apart, with 2 observers searching opposite sides of the plane. Flight paths will deviate from the transects to assess identified suitable habitat, nests, or rookeries more closely. Additionally, low altitude passes, approximately 500 to 1,000 ft above ground level will be completed around the shorelines of major rivers, lakes, ponds, and flowages. Data on new and previously identified nest and rookery locations will be documented during the flight. Incidental observations of adult bald eagles and other visible raptor nests (e.g. osprey nests) will also be recorded. Stantec will also survey the known eagle nest on Montegail Pond. If the nest is not detected during the aerial survey, it will be ground evaluated to determine if the nest is still intact and/or active.

After completion of the survey, we will summarize methods and results in a memo report which also will include data collected during the eagle activity surveys (Section 2.1). The report will include a map showing the locations of nests and rookeries identified (or those confirmed as no longer intact if applicable). GIS shapefiles of track log, survey area and nest/rookery locations will be provided with the survey report.

2.3 NOCTURNAL RADAR MIGRATION SURVEYS

The objective of the nocturnal radar migration surveys is to document patterns of nocturnal migrants at the Project. This information has been used by MDIFW to assess mortality risk. However, Stantec and others in the industry have recognized that reliance on pre-construction radar surveys as an indicator of post-construction mortality risk is challenging as they have not proven to accurately predict turbine-related bird and bat fatality patterns[2]. Evaluation of pre-construction surveys and post-construction mortality estimates at operating projects in Maine and New England has shown that there is no statistical correlation between pre-construction survey results (radar passage rates) and post-construction bird fatality estimates (Stantec unpublished data).

In order to follow MDIFW Recommendations at the Project, Stantec initiated radar surveys in early fall 2015 and will conduct radar surveys in spring 2016. Surveys utilize an X-band marine radar unit to document the abundance, timing, and flight altitudes of night-migrating species. The fall survey site was located in the west-central portion of the Project area. At this location, topography and surrounding tree height provide a nearly unobstructed view with less than 30% ground clutter, as called for in the MDIFW Recommendations. In spring 2016, Stantec will move the radar further north to an area that is central to the entire Project area as depicted in Figure 1. Stantec conducted 20 survey nights in fall 2015 between 9 September and 30 October and will conduct 20 nights at the new location in spring 2016, between 15 April and 1 June. Surveys will be conducted on nights with generally clear weather without long periods of substantial

[2] Ferrer, M., M. de Lucas, G.F.E. Janss, E. Casado, A.R. Muñoz, M.J. Bechard, and C.P. Calabuig. 2012. Weak relationship between risk assessment studies and recorded fatality at wind farms. Journal of Applied Ecology 49:38–46.

Business Confidential

precipitation. On nights when periodic showers are forecasted, surveys will occur between showers to collect information on migration activity during inclement weather.

Radar surveys will include up to 12 hours of data collection per night alternating every 10 minutes between vertical and horizontal mode. In horizontal mode, the antenna spins horizontally to survey the airspace around the radar and detects the number of targets and their flight direction as they pass through the Project site. By analyzing the echo trail, the flight direction and flight speed of targets can be determined. In vertical mode, the radar unit is tilted 90° to survey the airspace above the radar. In vertical mode, target echoes do not provide directional data, but do provide information on the altitude of targets passing through a vertical radar beam with a 20° angle of view. Horizontal data will be used to calculate passage rates and flight direction; vertical data will be used to calculate flight heights and percent of migrants flying below proposed turbine height.

Radar data will be post-processed using analysis software and methods developed by Stantec. Digital image data will be converted to numerical data for the calculation of migration statistics. Insect data will be separated from other target data (i.e., birds and bats) based on target flight speed. Stantec will calculate and report the average hourly and nightly passage rate (targets/kilometer/hour), seasonal passage rate, nightly and seasonal flight direction, and nightly and seasonal flight height. The percentage of targets flying below the height of the proposed turbines will be calculated on a nightly basis. Data will be compiled into a radar migration report after radar migration surveys are completed.

2.4 DIURNAL RAPTOR MIGRATION SURVEYS

The objective of the diurnal raptor migration surveys is to document species composition, timing, and flight patterns of migrating raptors at the Project to assist in evaluating siting decisions. It should be noted that while pre-construction data provides a snap-shot of raptor activity in an area at the time it was sampled, pre-construction data do not predict levels of post-construction mortality in raptors. For example, the Pennsylvania Game Commission prepares annuals reports in the form of a Cooperative Agreement that summarize results of pre and post-construction bird and bat surveys conducted at all Pennsylvania projects in an effort to assess the impacts of operational wind projects on local and migrant bird and bat populations. In 2012, Taucher et al.[3] reported that despite the volumes of pre-construction and post-construction data (45 sites) included in these assessments, they have not been able to develop a model that predicts the extent of bird or bat mortality.

Stantec completed raptor migration surveys in fall 2015, and will do so again in spring 2015. From 9 September to 25 November 2015, 24 survey days were completed from the raptor migration survey location shown in Figure 1. The survey site in fall 2015 was located a quarter mile from the

[3] Taucher, J., T. Librandi Mumma, W. Capouillez. 2012. Pennsylvania Game Commission Wind Energy Voluntary Cooperation Agreement Third Summary Report. Available online at: http://www.pccd.state.pa.us/portal/server.pt/document/1378280/pgc_3rd_wind_energy_summary_report_2012_pdf

Business Confidential

radar site. It was on flat ground and had an extensive view. In spring 2016, Stantec will move the raptor location northward to a location that is central and prominent to the Project area (Figure 1). Spring surveys will be conducted between 1 March and 15 June at a rate of 2 surveys every 7 days, pending suitable weather conditions. Surveys will occur on days with optimal migration weather, which typically include fair days with thermal development and winds generally from a southerly direction. Raptor surveys will be conducted from 9 am to approximately 2 hours before sunset. Binoculars will be used to aid in identification. In addition to raptors, incidental observations of songbirds and migrating flocks or individuals of large birds such as waterfowl, wading birds, and shorebirds will be documented.

Data for raptors will be documented on Stantec raptor datasheets and include species, age, and sex, as possible, flight behavior, flight height, flight time, flight locations, flight paths, and weather conditions. Data will be analyzed and summarized by hour, day, and for the season. Data will be compiled and results discussed in a raptor migration report.

2.5 BREEDING BIRD SURVEYS

The objective of the breeding bird surveys is to assess species composition, abundance, diversity, and distribution of songbirds relative to available habitat in the Project area during the breeding season to assist in evaluating siting decisions, in accordance with MDIFW Recommendations.

Breeding bird surveys will consist of point count surveys designed to document singing male birds and responses of territorial raptors breeding in the Project area. Stantec will conduct breeding bird surveys at 20 point count locations in the various habitat types present throughout the Project area. Due to the homogenous nature of the habitat in the southern and western portions of the Project, 20 point count locations is expected to sufficiently capture the breeding bird composition of the Project area. A GPS point will be taken at each location.

Surveys will occur in 3 rounds: 1 in May and 2 in June. Surveys will be scheduled to target fair-weather days. During each round, each point will be visited and birds seen or heard will be documented during a 10-minute sampling period. Immediately after each 10-minute period for points located in forested habitat, the observer will broadcast a great horned owl (*Bubo virginianus*) call and northern goshawk (*Accipiter gentilis*) call, alternating between species, for 5 minutes to attempt to observe any approaching or territorial raptors, indicative of potential breeders, proximal to the point.

A separate survey report will describe the habitat at each point count location, methods, and results, and will include a discussion section. Data will be analyzed and summarized to determine species richness, relative abundance, species frequency, and community diversity for each type of habitat available in the Project area and for the survey as a whole.

Business Confidential

2.6 ACOUSTIC BAT MONITORING

The objectives of the acoustic bat monitoring survey are to assess frequency of rare species presence at the Project, document seasonal patterns in bat activity and species presence, and to characterize conditions during which bats are present near the rotor zone.

Acoustic surveys began in fall 2015, when Stantec deployed 2 bat detectors in the single Project meteorological (met) tower (at ~5 m and ~20 m in height) and at 4 additional sites in the Project area in trees at ~5–8 m in height (the shore of the southern pond of Myer's Ponds, a hedgerow near the radar and raptor survey locations, and 2 forest edges in the southwest portion of the Project). Year 2016 acoustic surveys will expand on previous efforts and include a total of 11 detectors deployed from 1 April 2016 until 31 October 2016. This survey window is longer than suggested in MDIFW Recommendations, but was recommended by MDIFW during a meeting on 23 February 2016 between MDIFW, APEX, and Stantec. The 2016 survey period will encompass the spring migration, summer residency, and fall migration seasons for bats. In addition to the 6 detector locations used in fall 2015, Stantec will deploy an additional detector on the onsite met tower at ~40 m in height. Stantec will also deploy an additional 4 detectors in trees at ~5–8 m in new locations in the northern portion of the Project area, resulting in 11 detectors total. If a second met tower is deployed in the Project area, we will also deploy detectors at heights of ~40 m and ~20 m on the tower, for a total of 13 detectors.

A combination of SM3 (Wildlife Acoustics ©) and Anabat (Titley Electronics Pty Ltd.) detectors will be used for data collection. Specifically, we will use SM3 detectors in the met tower at heights of ~40 m and ~20 m. Detectors will sample from approximately ½ hour before sunset until ½ hour after sunrise on a nightly basis throughout the survey periods. Stantec will visit each detector at a maximum interval of every 3 weeks to download and store data and maintain equipment.

Acoustic data will be analyzed using Kaleidoscope (classifier version 3.1.0) and BCID (version 2.7b), approved USFWS automated analysis programs. Stantec will then visually examine any calls identified as a state or federally listed species. Additionally, automated programs calculate a nightly maximum likelihood estimator (MLE) to assess the likelihood that individual species are present at a given location on a single night. According to the USFWS *2015 Range-Wide Indiana Bat Summer Survey Guidelines* (April 2015) a MLE of less than 0.05 indicates likely presence. Stantec will compare file-level identification results for each automated program and manual vetting as well as nightly MLE values to evaluate patterns in rare species detection such as seasonality, frequency, and distribution across habitats.

Because automated analysis programs sometimes filter out poor quality bat passes, Stantec will also visually analyze all files recorded by the detectors deployed near the rotor zone in the met tower (detectors at ~20 and ~40 m in height) to ensure that all bat passes are included in analysis of activity versus conditions in the rotor zone, and to allow better comparability with results of similar studies at other Projects. Stantec will determine the temperature (hourly average) and wind speed (10-minute average) at which each bat pass occurred to quantify the conditions during which bats were active near the rotor zone. Stantec will also evaluate

Business Confidential

seasonal and temporal patterns in bat activity near the rotor zone based on acoustic data from the detectors deployed at ~20 and ~40 m. Methods, results, and a discussion will be included in an acoustic bat report after the completion of the survey.

APPENDIX B INCIDENTAL SPECIES

Business Confidential

Appendix B Table 1. Bird species observed incidentally during bald eagle use surveys, Downeast Wind Project, 2015–2016.

Species Common Name	Species Scientific Name	No. Observations	Point Locations
American black duck	*Anas rubripes*	1	9
American crow	*Corvus brachyrhynchos*	117	1, 5, 7, 8, 9, 10, 13, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, New 21, New 22, New 23, New 24
American goldfinch	*Spinus tristis*	5	10, 13, 16
American kestrel	*Falco sparverius*	18	1, 3, 4, 5, 7, 9, 10, 13, 15, 21, 7a, New 25
American robin	*Turdus migratorius*	61	1, 3, 4, 5, 7, 8, 9, 10, 13, 15, 16, 17, 18, 19, 20, 22, 23, 25, New 21, New 24, New 25
bald eagle	*Haliaeetus leucocephalus*	3	1, 5
belted kingfisher	*Megaceryle alcyon*	2	9, New 22
black-and-white warbler	*Mniotilta varia*	1	19
black-capped chickadee	*Poecile atricapillus*	42	1, 3, 4, 5, 7, 8, 9, 10, 11, 13, 15, 16, 17, 18, 19, 20, 24, New 21
blue jay	*Cyanocitta cristata*	38	1, 3, 4, 5, 8, 9, 10, 11, 13, 14, 15, 17, 18, 20, 22, 24, New 22, New 24
blue-headed vireo	*Vireo solitarius*	3	15, 16, 19
broad-winged hawk	Buteo platypterus	20	3, 4, 5, 7, 9, 11, 12, 13, 14, 17, New 25
brown thrasher	*Toxostoma rufum*	4	17, 22, 23
Canada goose	*Branta canadensis*	31	5, 9, 10, 22
cedar waxwing	*Bombycilla cedrorum*	16	1, 3, 7, 11, 13, 15, 18, New 24, New 25
chestnut-sided warbler	*Setophaga pensylvanica*	2	11, 17
chipping sparrow	*Spizella passerina*	12	13, 15, 16, 19, 21, New 21, New 22
cliff swallow	*Petrochelidon pyrrhonota*	3	7, 9, 10
common grackle	*Quiscalus quiscula*	12	16, 19, New 22
common loon	*Gavia immer*	5	17, 19, New 20
common nighthawk	*Chordeiles minor*	1	17
common raven	*Corvus corax*	176	All points besides 6 and 8a
common yellowthroat	*Geothlypis trichas*	3	10, 16, New 21
Cooper's hawk	Accipiter cooperii	2	10, 13
dark-eyed junco	*Junco hyemalis*	7	3, 10, 13, 15, 16, 18
double-crested cormorant	*Phalacrocorax auritus*	1	19
downy woodpecker	*Picoides pubescens*	1	16
eastern phoebe	*Sayornis phoebe*	2	13, 16
European starling	*Sturnus vulgaris*	2	13, 22
great blue heron	*Ardea herodias*	3	5, 7
hermit thrush	*Catharus guttatus*	2	16, 23
killdeer	*Charadrius vociferus*	1	9
mallard	*Anas platyrhynchos*	2	5
merlin	Falco columbarius	1	New 23
mourning dove	*Zenaida macroura*	16	1, 4, 5, 10, 13, 16, 18, 19, 21, 25
northern cardinal	*Cardinalis cardinalis*	2	1, 18
northern flicker	*Colaptes auratus*	6	7, 15, 18, 19, 21, 22
northern harrier	*Circus cyaneus*	20	1, 3, 4, 7, 8, 15, 16, 20, 21, 7a
northern parula	*Setophaga americana*	2	16, 19
osprey	Pandion haliaetus	5	19, 22, New 21
palm warbler	*Setophaga palmarum*	4	New 22

EXECUTIVE SUMMARY

TRC conducted eagle point-count surveys within the Downeast Project (Project) areas from January 2019 to February 2020. Surveys were conducted to collect information on eagle use within the Project area.

TRC established twelve point-count locations, which were surveyed from January 2019 to February 2020. Observers recorded all eagles observed from the site. Eagles detected within an 800-meter (m) radius and within 200 m above ground level (AGL) of the observer during the 120-minute point-count surveys were recorded as risk minutes. The total area surveyed represents 32 percent of the minimum convex polygon. Each survey point was monitored once every month for two daylight hours. In addition, any eagles or listed species were recorded incidentally (e.g. outside of survey times or survey plot), if observed within the Project area.

A total of 12 bald eagles were observed within the 800m radius by 200m AGL survey area. No golden eagles were observed during surveys. Northern harrier, a State of Maine Species of Special Concern was observed 3 times during eagle use surveys.

1.0 INTRODUCTION

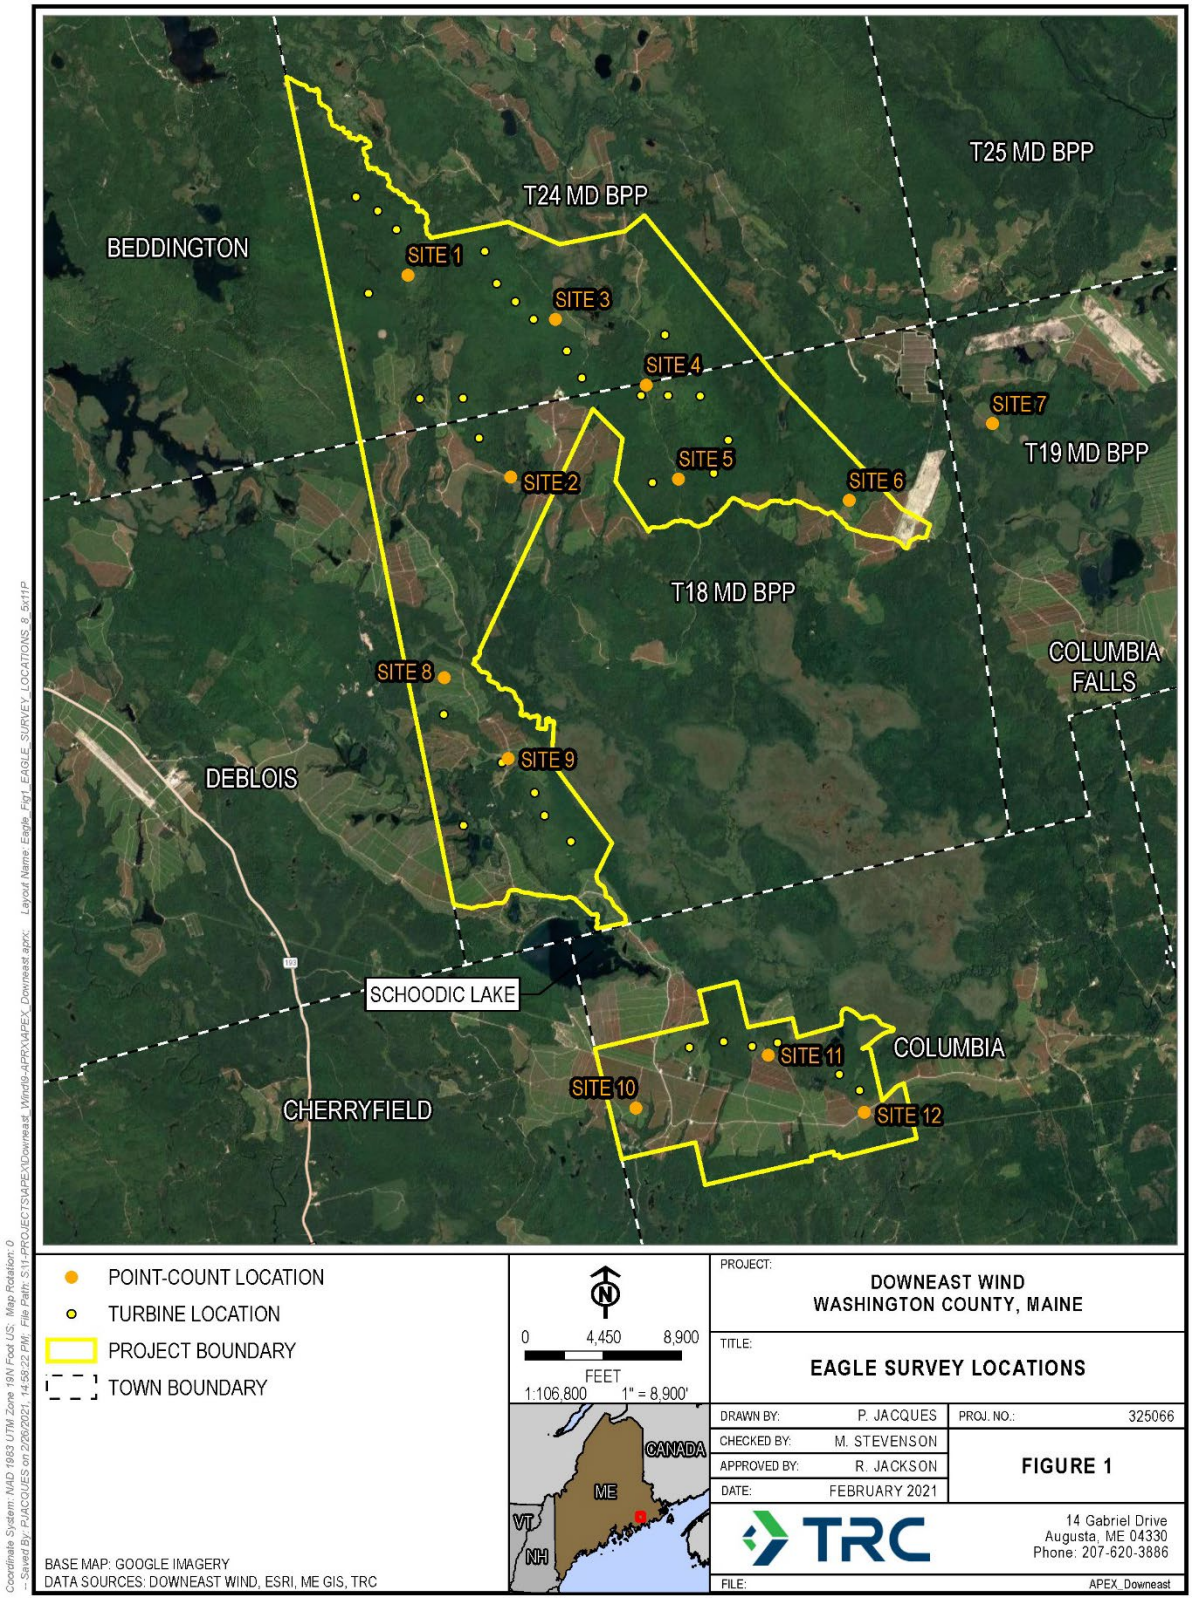
1.1 PROJECT DESCRIPTION

The Downeast Project (Project) is a proposed 126 MW wind generating facility located in Washington County, ME. The Project area is comprised of commercial agriculture and forestry land. Bald eagles (*Haliaeetus leucocephalus*) are known to occur in the area year-round and golden eagles (*Aquila chrysaetos*) could potentially migrate through the area in spring and fall. The following survey protocol was developed in coordination with USFWS (February 20, 2019).

1.2 EAGLE SURVEYS PREVIOUSLY PERFORMED AT THE SITE

Eagle use surveys were previously performed at the Project site September 2015 through September 2016 by Stantec. These surveys were done in accordance with the ECPG at 31 points, with 1-hour surveys performed every 3 weeks for 133 hours of survey within the Project Area.

Aerial eagle nest surveys were also performed in the Project vicinity during the spring of 2016, 2017, and 2019. Surveys consisted of five flights (April 13 and May 19, 2016, and April 10 and May 24, 2017, May 22, 2019). During the 2016 surveys a total of seven bald eagle nests were identified within the survey area: two occupied and five unoccupied. One occupied nest was a new nest. During the 2017 surveys five bald eagle nests were identified within the survey area: three occupied and two unoccupied. In 2019 one bald eagle nest on Schoodic Lake was located within the Project vicinity and was active during these surveys.



1.3 PURPOSE AND OBJECTIVES

The purpose of the eagle use survey was to determine the presence and Project area use by bald and golden eagles year-round. Data was used to develop a qualitative assessment of general patterns of use by those species in the vicinity of the proposed Project.

The main objectives of eagle surveys are to:

- Document presence/absence of eagles at the site;
- Document and map use of the Project Area by eagles, including nesting individuals; and
- Document and map use of the Project Area by any raptor species observed during surveys.

Figure 1: Eagle Survey Locations

2.0 SURVEY PROTOCOL

2.1 SURVEY SITE SELECTION

2.1.1 Eagle Use Survey

A total of 12 stationary point-count observation points were selected in the Project area based on USFWS guidance (Figure 1). The total area surveyed represents 32 percent of the minimum convex polygon.

2.2 NUMBER AND TIMING OF USE SURVEYS

2.2.1 Eagle Use Survey

Surveys were performed at all eagle use survey sites for an entire year. Sites were surveyed from January 2019 to February 2020. Each survey point was monitored once every month for two daylight hours. Surveys were completed in weather conditions where the 800-m horizontal and 200-m vertical survey area was visible. All surveys were completed by a qualified biologist who was trained and familiar with the survey protocol.

2.3 SURVEYOR PREPAREDNESS

Surveyors were familiarized with the area, including tree height and known distances, prior to starting eagle use surveys. Knowledge of these parameters was used in estimating flight height. Each surveyor was trained in the methodology and calibrated themselves to the survey site prior to commencing survey activity. All surveyors were experienced in bird identification.

2.4 DATA COLLECTION

Detailed weather and bird observation data was collected during eagle use surveys on digital data sheets accessed by smart phone or tablet. Data forms were developed based on those utilized by Hawk Migration Association of North America (HMANA) for raptor migration, using their suggested guidelines. An example data sheet is provided in Appendix A. Flight paths and behavior of any raptors observed were recorded on maps and a digital data sheet. Data was collected for any raptor species observed at the Project Area.

3.0 RESULTS

3.1 EAGLE USE SURVEY RESULTS

3.1.1 Survey Effort

A total of 286 hours of survey were completed during the 2019 eagle use surveys (see Table 1). During this time, 14 bald eagles were observed within the Project area, 12 of which were within the survey area. No golden eagles were observed.

Table 1: Summary of Survey Effort

Survey Period	Sites Surveyed	Weather Conditions During Survey	Comments
January	*AD-1 through AD-7*	*Drizzle/light rain during three of the surveys, did not impact visibility within survey area. Other surveys clear.*	
February	*AD-2 through AD-7*	*Clear weather for all surveys, full visibility.*	*Site AD-1 inaccessible due to road conditions at site*
March	*AD-1 through AD-12*	*Light to moderate winds, full visibility.*	*Surveys sites in Downeast I Project area added.*
April	*AD-1 through AD-12*	*Light drizzle during survey at AD-10, did not impact survey visibility. Calm winds and no precipitation during all other surveys.*	
May	*AD-1 through AD-12*	*Drizzle/rain during five of the surveys, with no impact to visibility requirement. Clear conditions for all other surveys.*	
June	*AD-1 through AD-12*	*Four surveys during haze or fog with adequate visibility for entire survey. All other survey days with unlimited visibility of the survey area.*	*First 20-30 minutes of survey at site AD-7 had visibility around 500m. The entire 800m survey area was clear after this time.*
July	*AD-1 through AD-12*	*All surveys with unlimited visibility. Drizzle during two surveys and a brief 10 min thunderstorm during the survey at AD-11.*	
August	*AD-1 through AD-12*	*Clear weather with unlimited visibility for all surveys,*	
September	*AD-1 through AD-12*	*No visibility issues, no precipitation.*	
October	*AD-1 through AD-12*	*Unlimited visibility for all surveys.*	
November	*AD-1 through AD-12*	*Drizzle during five surveys, rain during one survey, all other surveys were dry. Visibility was always far beyond the survey area.*	

Survey Period	Sites Surveyed	Weather Conditions During Survey	Comments
December	*AD-1 through AD-12*	*Calm, clear days with unlimited visibility*	
January	*AD-8 through AD-12*	*Rain recorded during one survey, unlimited visibility.*	*Only surveys completed in Downeast I Project area to achieve full year of survey.*
February	*AD-8 through AD-12*	*Light icing recorded for one survey, unlimited visibility*	*Only surveys completed in Downeast I Project area to achieve full year of survey*

3.1.2 Eagle Use by Site

Bald eagles were observed at 5 of 12 sites. Site 12 had the highest number of individual bald eagles observed (Table 2). The highest number of total eagle minutes recorded at a site was 59 minutes at site AD-10. This site had one 45-minute observation of a juvenile bald eagle that flew low into the site, then rose on thermals before gliding out of sight to the west. Only one eagle was observed during survey that never crossed into the survey site. This observation took place at survey site AD-10, and the minutes of the observation were included in the eagle minutes calculation for that site.

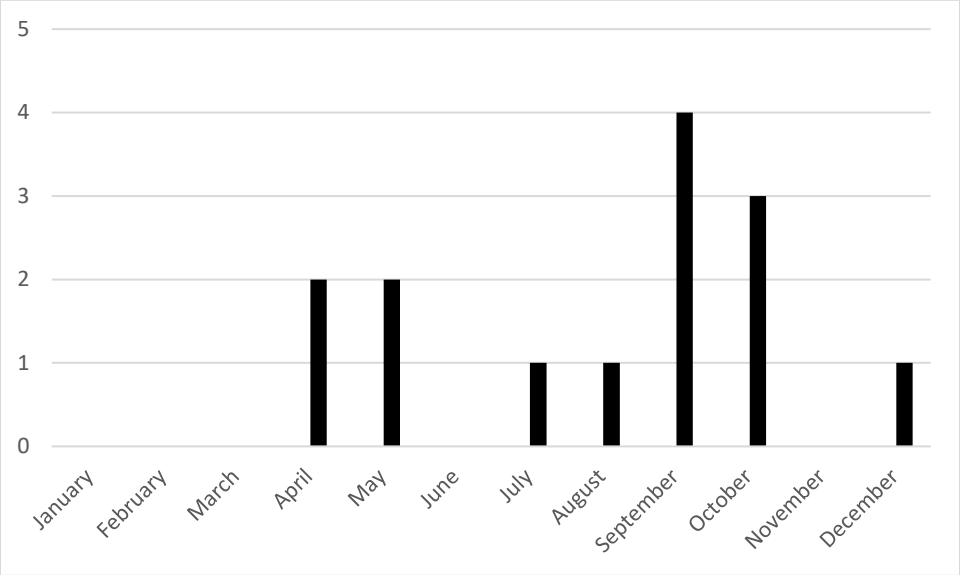


Table 2: Eagle Use and Exposure by Site

Site	Survey Hours	Number of Bald Eagles Observed	Observed Eagle Minutes	Eagle Minutes/ Survey Hour
AD-1	22	0	-	-
AD-2	24	1	12	0.50
AD-3	24	4	16	0.67
AD-4	24	0	-	-
AD-5	24	0	-	-
AD-6	24	0	-	-
AD-7	24	0	-	-
AD-8	24	0	-	-
AD-9	24	0	-	-
AD-10	24	3*	59	2.46
AD-11	24	1	1	0.04
AD-12	24	5	35	1.46

* Eagles outside of survey area for entire observation

Eagle use observed at the Project was highest during September (Figure 2). No eagles were observed during the surveys in the months of January, February, March, June, or November.

Figure 2: Eagle Observations by Month

3.2 INCIDENTAL OBSERVATIONS

Incidental observations of raptor species included 59 observations of 7 species (Table 3). A list of songbird species recorded during survey is attached in Appendix B.

Table 3: Incidental Raptor Observations During Eagle Point-Count Surveys

Species	Number of Individuals Observed
Broad-winged Hawk	3
American Kestrel	4
Merlin	1
Northern Harrier	3
Red-tailed Hawk	2
Sharp-shinned Hawk	1
Turkey Vulture	45
Total	**59**

4.0 CONCLUSIONS

A total of 286 hours of survey were completed during the eagle point-count surveys at the Project. During this time, 14 bald eagles were observed, 12 of which were within the survey area for some duration of the observation. No golden eagles were observed during surveys, suggesting that the Project would pose little to no risk for this species.

Bald eagles were observed at 5 of 12 points during the study (Table 1). The majority of observations occurred at Site 10, Site 11, and Site 12. These sites are all located to the south of Schoodic Lake.

High-risk behaviors such as territorial behavior, kiting, and hunting can increase the mortality rate from turbine collision (Smallwood et al 2009). It is thought that these behaviors increase mortality because birds lose their spatial awareness of the turbine locations. High risk behaviors were rarely observed during surveys, and the majority of observations were of eagles flying at high altitudes. Only one instance of high-risk behaviors was observed within the 800m radius and 200m AGL survey areas.

There are variable findings as to whether sub-adult birds are at a higher risk for collision with wind turbines than adults (USFWS, 2013). 82% of the birds observed within the 800m radius by 200m AGL survey area were adults, and only 2 sub adult birds were observed. From this information, it is unlikely that the Project will pose a higher risk to eagles due to limited use by sub-adult birds.

Areas of the Project received little use by eagles during the winter months, as only one adult was observed during eagle use surveys between the months of December through March. Eagles consume more carrion in the winter months and congregate in areas of open water where fish are still accessible. There are few, if any, of these resources available within the Project area during the winter, so the low numbers of use are to be expected.

Based on mortality data collected at wind energy facilities across the U.S., mortality of bald eagles due to turbine collision is low and may reflect avoidance of turbines by the species (Pagel, 2013). To date, no known bald eagle collisions have taken place at a wind energy facility in the State of Maine. Based on what data is known about risks to eagle mortality in Maine, the documentation of low use and minimal high-risk behavior observed, the Project would likely pose a low risk to bald eagles.

APPENDIX A
EXAMPLE DATA SHEET

Raptor Use Survey Data Sheet

Observers:	Date:	Time Start:	Time End:

Weather (see reverse for instructions)			Location:
wind speed:		bar. press:	
wind direction:		cloud cover:	
temp (C):		visibility:	
humidity:		precipitation:	

ID	Species	#	Age (J,A,U)	Gender (M,F,U)	Time of first Observation	Time of Last Observation	Behavior (So,Fl,Ci,Gl,Pe,Hu, Other [describe])	Flight Direction	Flight Height (0-4)	Turbine Pads Utilized (WTG #)	Horizontal Position Code	Notes

GENERAL INSTRUCTIONS:

For weather, enter for the first hour of observation, for following hours only if data changes, if there are no changes, draw a line from the recorded data through the hours in which no change occurred; do not use ditto marks or dashes.
For hawks, enter only the number seen (no zeros). Write notes, comments, etc. below.
Observers : Number of observers **CONTRIBUTING** to the count for the hour noted.
Duration of Observation : Specify time in minutes.

Weather Codes

Wind Speed Codes :

0-less than 1 km/h, (calm, smoke rises vertically)
1 - 1-5 km/h, (smoke drift shows wind direction)
2 - 6-11 km/h, (leaves rustle, wind felt on face)
3 - 12-19 km/h, (leaves, small twigs in constant motion; light flag extended)
4 - 20-28 km/h (raises dust, leaves, loose paper; small branches in motion)
5 - 29-38 km/h (small trees in leaf sway)
6 - 39-49 km/h (larger branches in motion; whistling heard in wires)
7 - 50-61 km/h (whole trees in motion; resistance felt walking against the wind)
8 - 62-74 km/h (twigs small branches broken off trees; walking generally impeded)
9 - Greater than 75 km/h

Wind Direction : Enter compass direction from which the wind is coming, i.e., N, NNE, SE, etc. If variable, enter VAR.
Temperature : Record temperature in degrees Celsius.
Humidity : Record the percent relative humidity.
Barometric Pressure : Record barometric pressure in inches.
Cloud Cover : Record percent of sky with background cloud cover.
Visibility : Judge from your longest view and enter distance in kilometers. To convert miles to kilometers multiply by 1.61.
Precipitation : Enter code: 0 for none, 1 for Haze or Fog, 2 for Drizzle, 3 for Rain, 4 for Thunderstorm, 5 for Snow, 6 for wind driven dust, sand or snow.

Observation Codes

Flight Direction : Enter compass direction migrants are heading, i.e., S, SSW, etc.
Flight Height Codes

0 - outside of turbine array area
1 - below rotor swept area
2 - within rotor swept area
3 - above rotor swept area
4 - No predominant height

Behavior Codes: So: soaring, Fl: flapping, Ci: circling, Gl: gliding, Pe: perching, Hu: Hunting
Horizontal Position Codes:

A) over ridge (A1-parallel to ridge, A2-perpendicular to ridge, A3-over saddle),
B) flight path over upper slope of ridge,
C) flight path over lower slope of ridge, and D) flight path over a valley

COMMENTS

DATA SHEETS

AD-1, 2019-01-31

Created	2019-02-04 14:47:51 UTC by Joseph Roy
Updated	2019-03-18 18:14:11 UTC by Meg Stevenson
Location	,
Lead Observer	Joseph Roy
Survey Interval	January
Date	2019-01-31
Survey Site	AD-1

Survey Overview

Survey Start Time	10:15
Survey End Time	12:15
Duration of survey (minutes)	120

Weather Summary

Wind Speed	4 - Moderate breeze
Wind Direction	SE
Temperature (F)	10
Relative Humidity	45
Barametric Pressure (inches)	29.7
Cloud Cover (percent)	0
Visibility	10
Precipitation	0 - none

Created	2019-03-27 15:35:14 UTC by Joe Roy
Updated	2019-05-07 13:05:37 UTC by Meg Stevenson
Location	44.7928287, -67.9159266
Lead Observer	Joe Roy
Survey Interval	March
Date	2019-03-27
Survey Site	AD-1

Survey Overview

Survey Start Time	10:15
Survey End Time	12:15
Duration of survey (minutes)	120

Weather Summary

Wind Speed	2 - Light breeze
Wind Direction	NE
Temperature (F)	35
Cloud Cover (percent)	0
Visibility	10
Precipitation	0 - none
Weather Comment	Clear and calm. Winds occasionally. Unlimited visibility

Survey Interval	May
Date	2019-05-24
Survey Site	AD-1

Survey Overview

Survey Start Time	07:54
Survey End Time	09:54
Duration of survey (minutes)	120

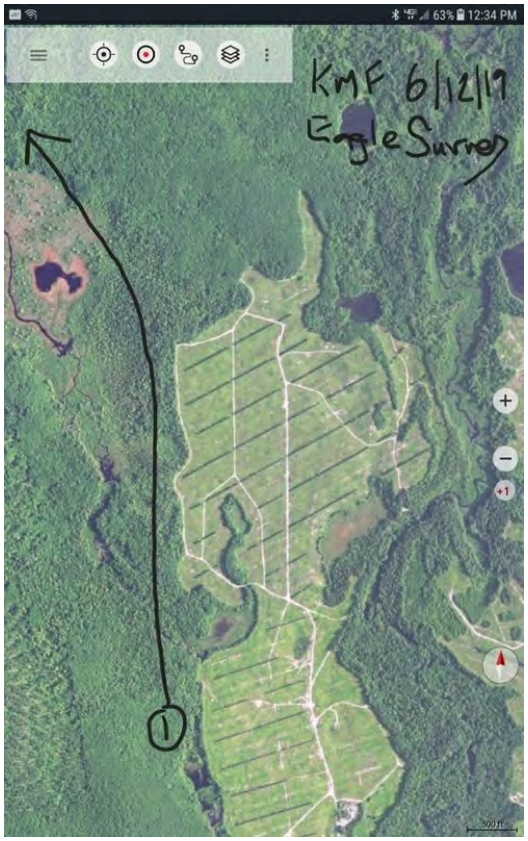
Weather Summary

Wind Speed	1 - Light air
Wind Direction	NE
Temperature (F)	47
Relative Humidity	96
Barametric Pressure (inches)	29.59
Cloud Cover (percent)	100
Visibility	5km
Precipitation	3 - Rain

AD-1, 2019-06-12

Created	2019-06-12 16:26:15 UTC by Karla Fortier
Updated	2019-08-05 16:22:12 UTC by Meg Stevenson
Location	44.7889478, -67.9291111
Lead Observer	Karla Fortier
Survey Interval	June
Date	2019-06-12
Survey Site	AD-1

Survey Overview



Survey Start Time	12:25
Survey End Time	14:25
Duration of survey (minutes)	120
Count of raptors observed	1
Survey Summary Comments	No eagles observed. One TUVU.

Weather Summary

Wind Speed	3 - Gentle breeze
Wind Direction	NW
Temperature (F)	70
Relative Humidity	50
Barametric Pressure (inches)	30
Cloud Cover (percent)	10
Visibility	16+
Precipitation	0 - none
Weather Comment	Gorgeous, clear, sunny day. Decent wind, comfortable.

Turkey Vulture, 1

Raptor Site	AD-1
Raptor Date	6/12/19
Species	Turkey Vulture
Raptor observation number	1
Count of individuals in group	1
Time first observed	12:33
Time last observed	12:36
Duration of observation (minutes)	3
Duration within survey boundary	0
Age	Unknown
Sex	Unknown
Behavior	Soaring
General Flight Direction	N, NW
Flight Height	1 - below rotor swept area, 2 - within rotor swept area
Turbine Pad Utilized (WTG)	N/A
Horizontal Position Code	D - flight path over a valley

Notes	Bird on a slow soar along Western treeline flying valley North/northwest until out of sight. No special behavior.
Map of Flight Path	

Weather during observation

Wind Speed	3 - Gentle breeze
Wind Direction	NW
Temperature (F)	70
Relative Humidity	50
Barametric Pressure (inches)	30
Cloud Cover (percent)	10
Visibility	16+
Precipitation	0 - none

AD-1, 2019-07-18

Created	2019-07-18 16:50:45 UTC by Randi Jackson
Updated	2019-12-19 21:21:22 UTC by Meg Stevenson
Location	44.7895048047, -67.9291177355
Lead Observer	Randi Jackson
Survey Interval	July
Date	2019-07-18
Survey Site	AD-1

Survey Overview

Survey Start Time	12:17
Survey End Time	14:20
Duration of survey (minutes)	123
Count of raptors observed	1

Turkey Vulture, 1

Raptor Site	AD-1
Raptor Date	7/18/19
Species	Turkey Vulture
Raptor observation number	1
Count of individuals in group	1
Time first observed	12:02
Time last observed	12:03
Duration of observation (minutes)	1
Age	Adult
Sex	Unknown
Behavior	Perching
Notes	*Incidental Observation while driving between sites* Spotted, as I drove by, at the edge of one of the blueberry fields on the ground. As I pulled up along side the TUVU it remained still for a few more seconds then hoped up a few branches into a nearby tree. Remained perched in the tree as I drove off.

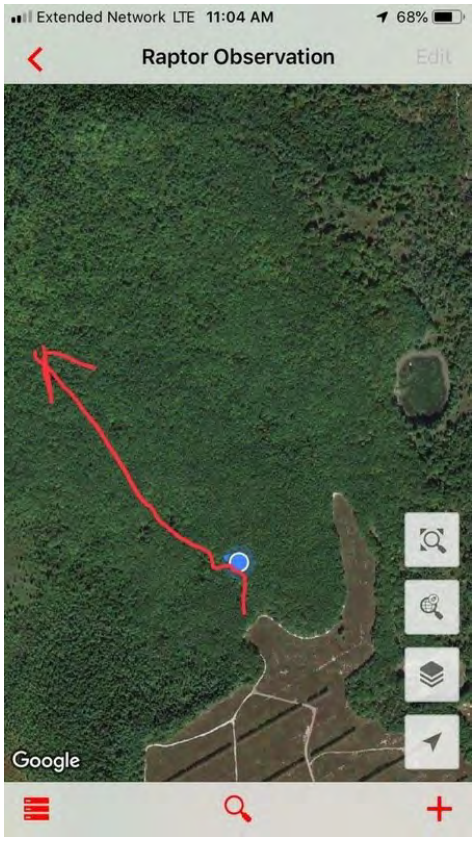
Survey Interval	August
Date	2019-08-28
Survey Site	AD-1

Survey Overview

Survey Start Time	09:21
Survey End Time	11:21
Duration of survey (minutes)	120
Count of raptors observed	1



Weather Summary

Wind Speed	2 - Light breeze
Wind Direction	SE
Temperature (F)	68
Relative Humidity	80
Barametric Pressure (inches)	30.01
Cloud Cover (percent)	0
Visibility	10km
Precipitation	0 - none

Turkey Vulture, 1

Raptor Site	AD-1
Raptor Date	8/28/19
Species	Turkey Vulture
Raptor observation number	1
Count of individuals in group	1
Time first observed	11:01
Time last observed	11:03
Duration of observation (minutes)	2
Duration within survey boundary	2
Age	Adult
Sex	Unknown
Behavior	Gliding, Soaring
General Flight Direction	NW
Flight Height	1 - below rotor swept area
Horizontal Position Code	Over met site
Notes	One TUVU Flys in from over barrens, gliding north west about 70ft in air. Eventually drops down out of site.

Survey Site	AD-2

Survey Overview

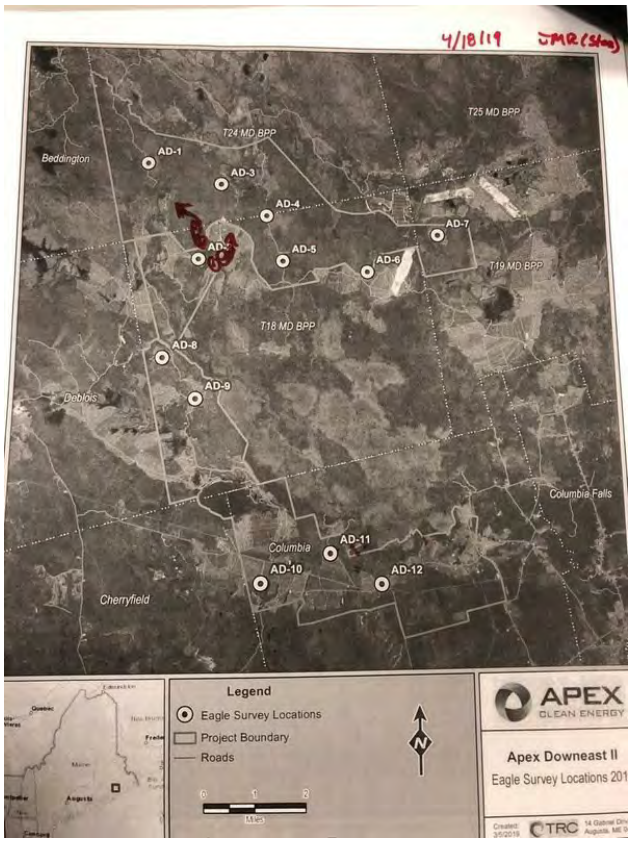
Survey Start Time	10:40
Survey End Time	12:40
Duration of survey (minutes)	120
Count of raptors observed	3

Northern Harrier, 1

Raptor Site	AD-2
Raptor Date	4/18/19
Species	Northern Harrier
Raptor observation number	1
Count of individuals in group	1
Time first observed	11:41
Time last observed	11:46
Duration of observation (minutes)	5
Age	Juvenile
Sex	Unknown
Behavior	Circling, Flapping, Hunting, Soaring
General Flight Direction	N
Flight Height	1 - below rotor swept area, 2 - within rotor swept area, 3 - above rotor swept area
Horizontal Position Code	over field

Map of Flight Path



Weather during observation

Wind Speed	1 - Light air
Wind Direction	NW
Temperature (F)	45
Barametric Pressure (inches)	1021
Cloud Cover (percent)	20
Visibility	10
Precipitation	0 - none

Turkey Vulture, 2

Raptor Site	AD-2
Raptor Date	4/18/19
Species	Turkey Vulture
Raptor observation number	2
Count of individuals in group	2
Time first observed	11:45
Time last observed	23:47
Duration of observation (minutes)	722
Age	Unknown
Sex	Unknown
Behavior	Circling
General Flight Direction	NW
Flight Height	3 - above rotor swept area

Horizontal Position Code	Flight over hill and field

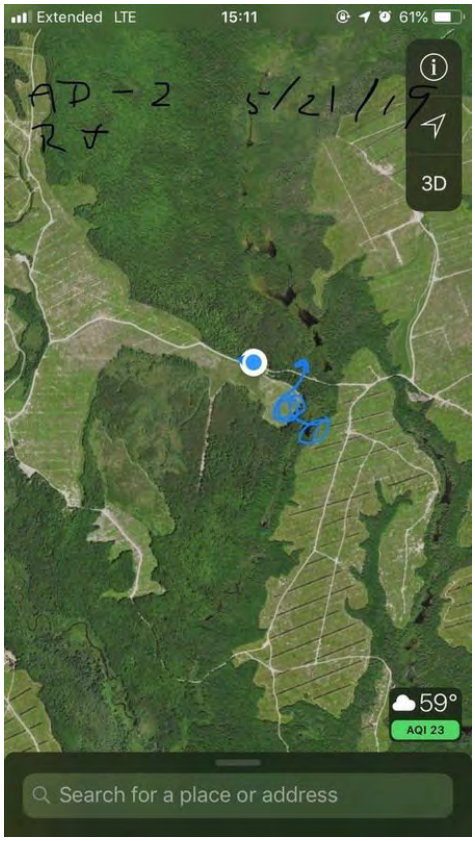
Lead Observer	Randi Jackson
Survey Interval	May
Date	2019-05-21
Survey Site	AD-2

Survey Overview

Survey Start Time	14:28
Survey End Time	16:29
Duration of survey (minutes)	121
Count of eagles observed	1
Count of raptors observed	4

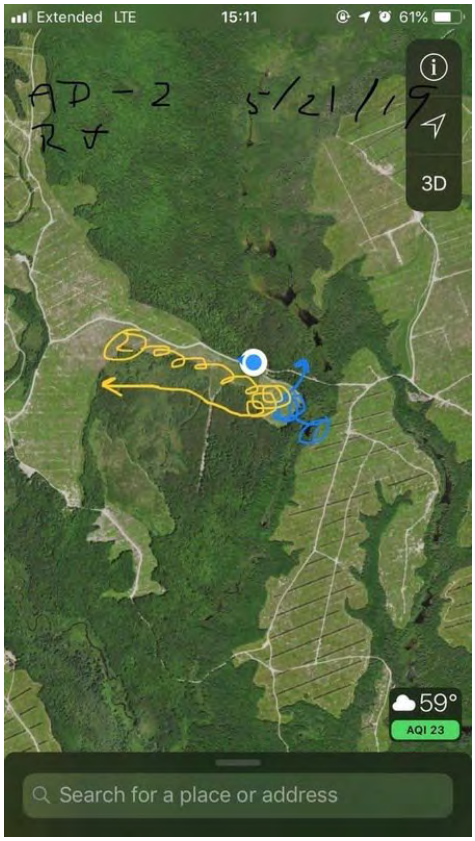


Weather Summary

Wind Speed	6 - Strong breeze
Wind Direction	NW
Temperature (F)	60
Relative Humidity	69
Barametric Pressure (inches)	29.59
Cloud Cover (percent)	95
Visibility	Unlimited
Precipitation	0 - none

Red-tailed Hawk, 1

Raptor Site	AD-2
Raptor Date	5/21/19
Species	Red-tailed Hawk
Raptor observation number	1
Count of individuals in group	1
Time first observed	15:07
Time last observed	15:09
Duration of observation (minutes)	2
Duration within survey boundary	2
Age	Adult
Sex	Unknown
Behavior	Circling
General Flight Direction	N
Flight Height	2 - within rotor swept area
Horizontal Position Code	D - flight path over a valley
Notes	First spotted circling in from the east. Circled a few times over the field then continued gliding north.



Map of Flight Path

Bald Eagle, 2

Raptor Site	AD-2
Raptor Date	5/21/19
Species	Bald Eagle
Raptor observation number	2
Count of individuals in group	1
number of eagles observed	1
Time first observed	15:44
Time last observed	15:56
Duration of observation (minutes)	12
Duration within survey boundary	12
Age	Adult
Sex	Unknown
Behavior	Gliding, Flapping, Circling
General Flight Direction	W
Flight Height	2 - within rotor swept area, 3 - above rotor swept area
Horizontal Position Code	D - flight path over a valley
Notes	First spotted the BAEA circling in from the west ascending and making its way east. Circled very high up then changed directions and began gliding making its way back west out of site.

Map of Flight Path

Turkey Vulture, 3

Raptor Site	AD-2
Raptor Date	5/21/19
Species	Turkey Vulture
Raptor observation number	3
Count of individuals in group	2
Time first observed	16:23
Time last observed	16:25
Duration of observation (minutes)	2
Duration within survey boundary	2
Age	Unknown
Sex	Unknown
Behavior	Gliding, Circling
General Flight Direction	N
Flight Height	1 - below rotor swept area
Horizontal Position Code	D - flight path over a valley
Notes	First spotted gliding in from the south headed north. They both circled a few times then continued gliding north.

Map of Flight Path

14:54

Time of weather observation	14:54
Wind Speed	6 - Strong breeze
Wind Direction	NW
Temperature (F)	60
Relative Humidity	69
Barametric Pressure (inches)	25.59
Cloud Cover (percent)	95
Visibility	Unlimited
Precipitation	3 - Rain
Weather Comment	Brief rain shower

15:01

Time of weather observation	15:01
Wind Speed	6 - Strong breeze
Wind Direction	NW
Temperature (F)	60
Relative Humidity	69
Barametric Pressure (inches)	29.59
Cloud Cover (percent)	95
Visibility	Unlimited
Precipitation	0 - none

Updated	2019-03-18 18:11:47 UTC by Meg Stevenson
Location	43.6191022, -70.3554819
Lead Observer	Joseph Roy
Survey Interval	February
Date	2019-02-19
Survey Site	AD-3

Survey Overview

Survey Start Time	07:44
Survey End Time	09:45
Duration of survey (minutes)	121
Survey Summary Comments	One Raven observed

Weather Summary

Wind Speed	2 - Light breeze
Wind Direction	SW
Temperature (F)	10
Cloud Cover (percent)	0
Visibility	10
Precipitation	0 - none
Weather Comment	Cold, clear, light winds, unlimited visibility.

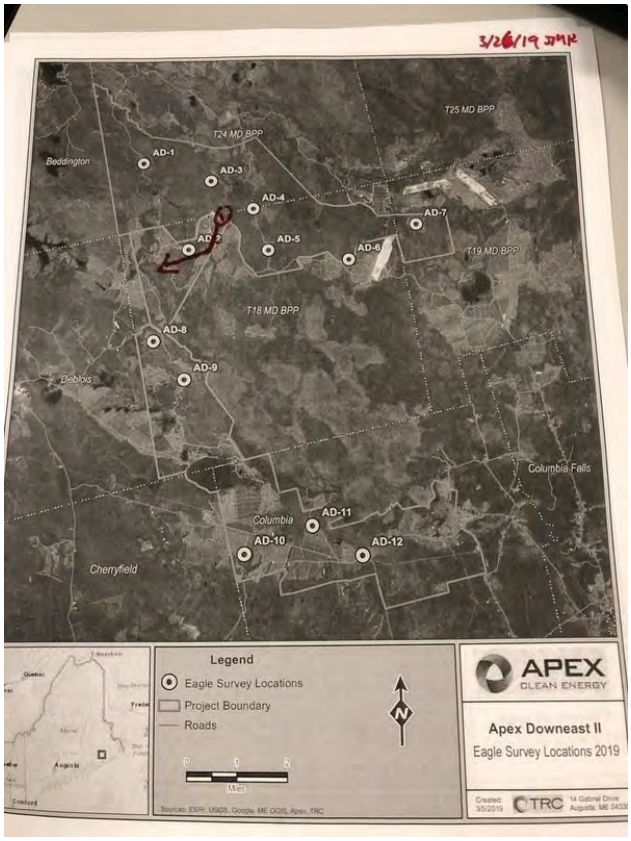
Updated	2019-07-02 15:09:18 UTC by Meg Stevenson
Location	44.7996005, -67.8916958
Lead Observer	Joe Roy
Survey Interval	March
Date	2019-03-26
Survey Site	AD-3

Survey Overview

Survey Start Time	09:30
Survey End Time	11:30
Duration of survey (minutes)	120
Count of raptors observed	3



Weather Summary

Wind Speed	4 - Moderate breeze
Wind Direction	NW
Temperature (F)	32
Cloud Cover (percent)	0
Visibility	10
Precipitation	0 - none
Weather Comment	Cool, clear, and windy.

Turkey Vulture, 1

Raptor Site	AD-3
Raptor Date	3/26/19
Species	Turkey Vulture
Raptor observation number	1
Count of individuals in group	3
Time first observed	11:22
Time last observed	11:25
Duration of observation (minutes)	3
Age	Adult
Sex	Unknown
Behavior	Circling, Flapping
General Flight Direction	S, W
Flight Height	1 - below rotor swept area, 2 - within rotor swept area, 3 - above rotor swept area
Horizontal Position Code	over field
Notes	Flight east to west. Circled before heading south with wind to their tails.

Map of Flight Path

Weather during observation

Wind Speed	4 - Moderate breeze
Wind Direction	NW
Temperature (F)	40
Barametric Pressure (inches)	1014
Cloud Cover (percent)	20
Visibility	10
Precipitation	0 - none

Location	44.7949231, -67.8866961
Lead Observer	Joe Roy
Survey Interval	April
Date	2019-04-18
Survey Site	AD-3

Survey Overview

Survey Start Time	08:30
Survey End Time	10:30
Duration of survey (minutes)	120

Weather Summary

Wind Speed	2 - Light breeze
Wind Direction	NW
Temperature (F)	43
Barametric Pressure (inches)	1022
Cloud Cover (percent)	20
Visibility	10
Precipitation	0 - none
Weather Comment	Warm and clear.

AD-3, 2019-05-21

Lead Observer	Randi Jackson
Survey Interval	May
Date	2019-05-21
Survey Site	AD-3

Survey Overview

Survey Start Time	12:21
Survey End Time	14:22
Duration of survey (minutes)	121
Count of eagles observed	1
Count of raptors observed	5

Weather Summary

Wind Speed	6 - Strong breeze
Wind Direction	NW
Temperature (F)	59
Relative Humidity	68
Barametric Pressure (inches)	29.59
Cloud Cover (percent)	95
Visibility	Unlimited
Precipitation	0 - none

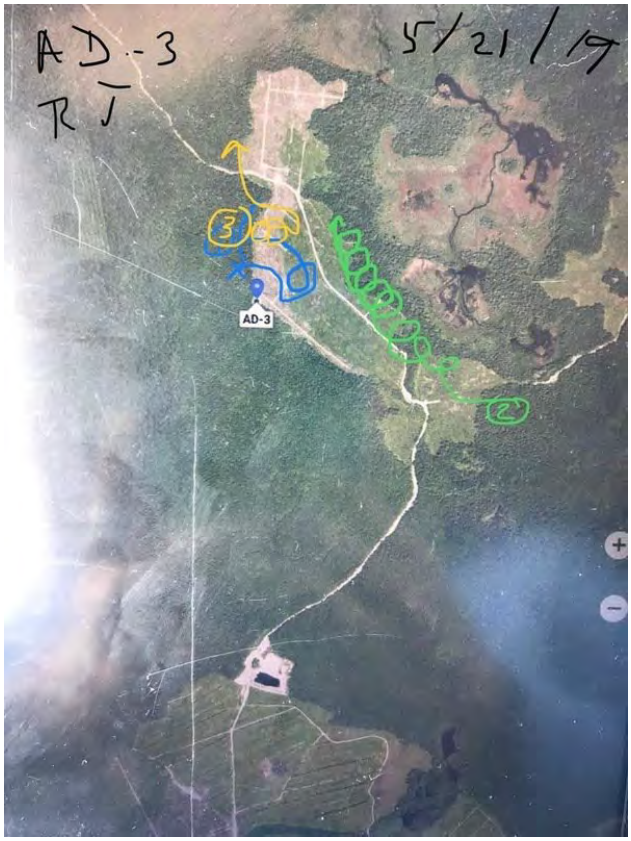
Turkey Vulture, 1

Raptor Site	AD-3
Raptor Date	5/21/19
Species	Turkey Vulture
Raptor observation number	1
Count of individuals in group	1
Time first observed	12:44
Time last observed	12:49
Duration of observation (minutes)	5
Age	Adult
Sex	Unknown
Behavior	Flapping, Circling, Gliding, Perching
General Flight Direction	W
Flight Height	1 - below rotor swept area
Horizontal Position Code	A2 - Over ridge, perpendicular, A3 - Over ridge, saddle
Notes	First spotted the TUVU flying in from over the tree line in the west. Circled and glided a few times over the field then glided its way to the tree line and perched in a tree at 12:47. Perched for a few minutes then took off over the tree line flying low and out of site.

Map of Flight Path

Bald Eagle, 2

Raptor Site	AD-3
Raptor Date	5/21/19
Species	Bald Eagle
Raptor observation number	2
Count of individuals in group	1
number of eagles observed	1
Time first observed	13:40
Time last observed	13:47
Duration of observation (minutes)	7
Duration within survey boundary	5
Age	Adult
Sex	Unknown
Behavior	Circling
General Flight Direction	N
Flight Height	2 - within rotor swept area, 3 - above rotor swept area
Horizontal Position Code	A3 - Over ridge, saddle
Notes	First spotted gliding in from the south east. Shortly after BAEA began gliding and ascending while making its way north. Eventually lost sight way up in the sky.



Map of Flight Path

Turkey Vulture, 3

Raptor Site	AD-3
Raptor Date	5/21/19
Species	Turkey Vulture
Raptor observation number	3
Count of individuals in group	3
Time first observed	14:13
Time last observed	14:17
Duration of observation (minutes)	4
Age	Adult
Sex	Unknown
Behavior	Circling
General Flight Direction	N
Flight Height	1 - below rotor swept area
Horizontal Position Code	A3 - Over ridge, saddle
Notes	First spotted three TUVU circling in from the west. The three individuals circled together over the field for a few minutes then eventually all three made their way north while circling.

Map of Flight Path

13:22

Time of weather observation	13:22
Wind Speed	6 - Strong breeze
Wind Direction	NW
Temperature (F)	56
Relative Humidity	69
Barametric Pressure (inches)	29.59
Cloud Cover (percent)	95
Visibility	Unlimited
Precipitation	3 - Rain
Weather Comment	A brief period of heavy rain.

13:36

Time of weather observation	13:36
Wind Speed	6 - Strong breeze
Wind Direction	NW
Temperature (F)	56
Relative Humidity	69
Barametric Pressure (inches)	29.59
Cloud Cover (percent)	95
Visibility	Unlimited
Precipitation	0 - none

13:56

Time of weather observation	13:56
Wind Speed	6 - Strong breeze
Wind Direction	NW
Temperature (F)	58
Relative Humidity	69
Barametric Pressure (inches)	29.59
Cloud Cover (percent)	95
Visibility	Unlimited
Precipitation	3 - Rain
Weather Comment	Brief heavy rain shower

Survey Site	AD-3

Survey Overview

Survey Start Time	08:12
Survey End Time	10:13
Duration of survey (minutes)	121
Count of raptors observed	2

Weather Summary

Wind Speed	5 - Fresh breeze
Wind Direction	S
Temperature (F)	65
Relative Humidity	69
Barametric Pressure (inches)	30.09
Cloud Cover (percent)	90
Visibility	Unlimited
Precipitation	0 - none

Sharp-shinned Hawk, 1

Raptor Site	AD-3
Raptor Date	7/11/19
Species	Sharp-shinned Hawk
Raptor observation number	1
Count of individuals in group	1
Time first observed	09:42
Time last observed	09:43
Duration of observation (minutes)	1
Duration within survey boundary	1
Age	Adult
Sex	Unknown
Behavior	Gliding
General Flight Direction	E
Flight Height	1 - below rotor swept area
Horizontal Position Code	D - flight path over a valley
Notes	Spotted gliding from the western tree line into the eastern tree line. Observed for less than a minute.

Map of Flight Path

Turkey Vulture, 2

Raptor Site	AD-3
Raptor Date	7/11/19
Species	Turkey Vulture
Raptor observation number	2
Count of individuals in group	1
Time first observed	10:07
Time last observed	10:08
Duration of observation (minutes)	1
Duration within survey boundary	1
Age	Unknown
Sex	Unknown
Behavior	Circling, Gliding
General Flight Direction	W
Flight Height	2 - within rotor swept area
Horizontal Position Code	A2 - Over ridge, perpendicular
Notes	Spotted circling over the tree line in the south. Circled a few times then glided west.

Map of Flight Path

Survey Interval	September
Date	2019-09-13
Survey Site	AD-3

Survey Overview

Survey Start Time	11:45
Survey End Time	13:45
Duration of survey (minutes)	120
Count of raptors observed	2

Weather Summary

Wind Speed	3 - Gentle breeze
Wind Direction	NW
Temperature (F)	65
Relative Humidity	56
Barametric Pressure (inches)	30
Cloud Cover (percent)	0
Visibility	Unlimited

Turkey Vulture, 1

Raptor Site	AD-3
Raptor Date	9/13/19
Species	Turkey Vulture
Raptor observation number	1
Count of individuals in group	1
Time first observed	12:27
Time last observed	12:28
Duration of observation (minutes)	1
Duration within survey boundary	1
Age	Adult
Sex	Unknown
Behavior	Gliding
General Flight Direction	NW
Flight Height	2 - within rotor swept area
Horizontal Position Code	A1 - Over ridge, parallel
Notes	Spotted gliding in from the south over the clearing. Continued gliding north west.

Map of Flight Path

Broad-winged Hawk, 2

Raptor Site	AD-3
Raptor Date	9/13/19
Species	Broad-winged Hawk
Raptor observation number	2
Count of individuals in group	1
Time first observed	12:50
Time last observed	12:51
Duration of observation (minutes)	1
Duration within survey boundary	1
Age	Adult
Sex	Unknown
Behavior	Circling
General Flight Direction	S
Flight Height	2 - within rotor swept area
Horizontal Position Code	A1 - Over ridge, parallel
Notes	Spotted initially circling in the west over the ridge line. Continued circling south following the ridge.

Map of Flight Path

11:45

Time of observation	11:45
Describe observation	Bobcat tracks crossing the road heading east.

Survey Interval	October
Date	2019-10-11
Survey Site	AD-3

Survey Overview

Survey Start Time	11:08
Survey End Time	13:08
Duration of survey (minutes)	120
Count of eagles observed	3
Count of raptors observed	4

Weather Summary

Wind Speed	5 - Fresh breeze
Wind Direction	NE
Temperature (F)	57
Relative Humidity	52
Barametric Pressure (inches)	30.3
Cloud Cover (percent)	75
Visibility	Unlimited
Precipitation	0 - none

Bald Eagle, 1

Raptor Site	AD-3
Raptor Date	10/11/19
Species	Bald Eagle
Raptor observation number	1
Count of individuals in group	1
number of eagles observed	1
Time first observed	11:23
Time last observed	11:28
Duration of observation (minutes)	5
Duration within survey boundary	5
Age	Adult
Sex	Unknown
Behavior	Circling, Flapping, Gliding, Soaring
General Flight Direction	W
Flight Height	2 - within rotor swept area, 3 - above rotor swept area
Horizontal Position Code	A2 - Over ridge, perpendicular

Notes	Initially spotted circling over the tree line in the east. Circled and soared for a few minutes over the tree line heading north, then turned NW and began slowly ascending while soaring over the fields. Soared slowly over the fields for a minute heading into a strong wind. It then began descending and gliding heading west over the ridge-line.
Map of Flight Path	

Weather during observation

Wind Speed	6 - Strong breeze

Red-tailed Hawk, 2

Raptor Site	AD-3
Raptor Date	10/11/19
Species	Red-tailed Hawk
Raptor observation number	2
Count of individuals in group	1
Time first observed	11:42
Time last observed	11:44
Duration of observation (minutes)	2
Duration within survey boundary	2
Age	Adult
Sex	Unknown
Behavior	Gliding, Kiting
General Flight Direction	E
Flight Height	2 - within rotor swept area, 1 - below rotor swept area
Horizontal Position Code	D - flight path over a valley

Notes	Initially observed flying over the ridge-line in the west heading east. Flew low over the field out of site.
Map of Flight Path	

Bald Eagle, 3

Raptor Site	AD-3
Raptor Date	10/11/19
Species	Bald Eagle
Raptor observation number	3
Count of individuals in group	1
number of eagles observed	1
Time first observed	11:54
Time last observed	11:57
Duration of observation (minutes)	3
Duration within survey boundary	3
Age	Adult
Sex	Unknown
Behavior	Circling, Gliding
General Flight Direction	W
Flight Height	2 - within rotor swept area, 3 - above rotor swept area
Horizontal Position Code	D - flight path over a valley
Notes	Initially observed circling over the Eastern tree line. Circled a few times while ascending and making its way west. Lost sight in the clouds.

Map of Flight Path

Bald Eagle, 4

Raptor Site	AD-3
Raptor Date	10/11/19
Species	Bald Eagle
Raptor observation number	4
Count of individuals in group	1
number of eagles observed	1
Time first observed	12:43
Time last observed	12:44
Duration of observation (minutes)	1
Duration within survey boundary	1
Age	Adult
Sex	Unknown
Behavior	Flapping, Gliding
General Flight Direction	N
Flight Height	2 - within rotor swept area
Horizontal Position Code	D - flight path over a valley
Notes	Spotted gliding in the south heading north. Observed briefly flapping and gliding over the tree line to the east.

Map of Flight Path

Turkey Vulture, 1

Raptor Site	AD-4
Raptor Date	9/13/19
Species	Turkey Vulture
Raptor observation number	1
Count of individuals in group	1
Time first observed	11:27
Time last observed	11:28
Duration of observation (minutes)	1
Duration within survey boundary	1
Age	Adult
Sex	Unknown
Behavior	Circling, Gliding
General Flight Direction	SW
Flight Height	2 - within rotor swept area
Horizontal Position Code	D - flight path over a valley
Notes	Spotted circling in the north. Circled twice then continued gliding south west.

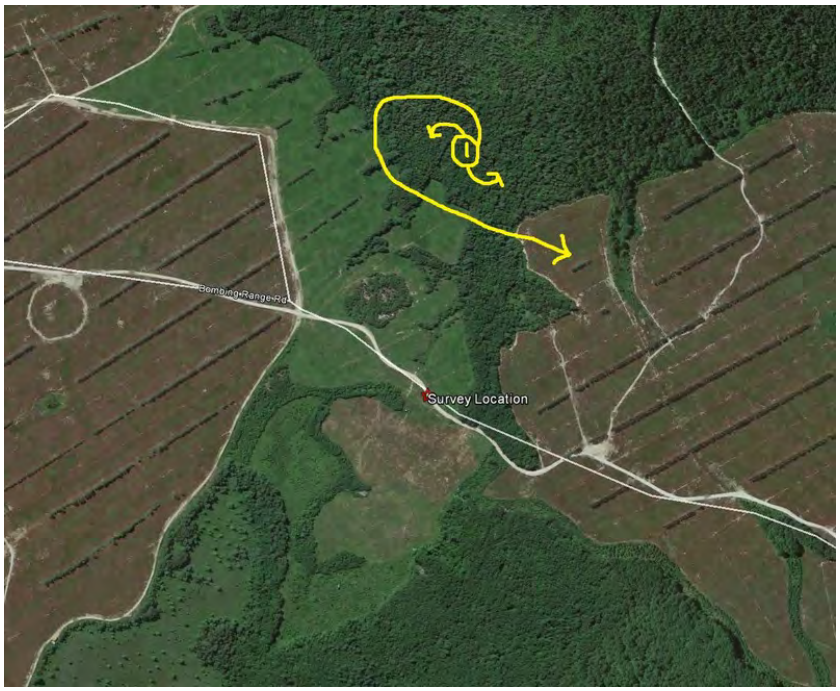
Location	44.7643914, -67.830922
Lead Observer	Karla Fortier
Survey Interval	June
Date	2019-06-04
Survey Site	AD-6

Survey Overview



Survey Start Time	06:35
Survey End Time	08:35
Duration of survey (minutes)	120
Count of raptors observed	3
Survey Summary Comments	No eagles observed. Gorgeous AM.

Weather Summary

Wind Speed	2 - Light breeze
Wind Direction	W
Temperature (F)	48
Relative Humidity	71
Barametric Pressure (inches)	29.93
Cloud Cover (percent)	50
Visibility	16
Precipitation	0 - none
Weather Comment	Clear and sunny between clouds.

Broad-winged Hawk, 1

Raptor Site	AD-6
Raptor Date	6/4/19
Species	Broad-winged Hawk
Raptor observation number	1
Count of individuals in group	2
Time first observed	08:09
Time last observed	08:12
Duration of observation (minutes)	3
Duration within survey boundary	0
Age	Adult
Sex	Unknown
Behavior	Circling, Flapping, Soaring
General Flight Direction	East then West
Flight Height	1 - below rotor swept area, 2 - within rotor swept area
Turbine Pad Utilized (WTG)	N/A
Horizontal Position Code	D - flight path over a valley

Notes	Both adults pop up circling low over tree tops south of survey location. Lots of flapping on a slow soar east then loop back west closer to survey location gaining enough height to be considered within RSA, before continuing to soar west over treeline out of sight.
Map of Flight Path	
	

Weather during observation

Wind Speed	3 - Gentle breeze
Wind Direction	W
Temperature (F)	53
Relative Humidity	65
Barametric Pressure (inches)	29.93
Cloud Cover (percent)	10
Visibility	16
Precipitation	0 - none

Kestrel, 2

Raptor Site	AD-6
Raptor Date	6/4/19
Species	Kestrel
Raptor observation number	2
Count of individuals in group	1
Time first observed	08:17
Time last observed	08:19
Duration of observation (minutes)	2
Duration within survey boundary	0
Age	Adult
Sex	Female
Behavior	Flapping, Hunting

General Flight Direction	NW
Flight Height	1 - below rotor swept area
Turbine Pad Utilized (WTG)	N/A
Horizontal Position Code	D - flight path over a valley
Notes	Bird hovering over fields north of survey location just beyond bee boxes, hunting. Slowly scoots it's way north west into trees out of sight.
Map of Flight Path	

Weather during observation

Wind Speed	3 - Gentle breeze
Wind Direction	W
Temperature (F)	53
Relative Humidity	65
Barametric Pressure (inches)	29.93
Cloud Cover (percent)	10
Visibility	16
Precipitation	0 - none

Survey Overview

Survey Start Time	10:00
Survey End Time	12:00
Duration of survey (minutes)	120

Weather Summary

Wind Speed	5 - Fresh breeze
Wind Direction	SW
Temperature (F)	12
Cloud Cover (percent)	5
Visibility	10
Precipitation	0 - none
Weather Comment	Cold and windy.

Kestrel, 1

Raptor Site	AD-7
Raptor Date	9/30/19
Species	Kestrel
Raptor observation number	1
Count of individuals in group	1
Time first observed	15:19
Time last observed	15:20
Duration of observation (minutes)	1
Duration within survey boundary	1
Age	Adult
Sex	Male
Behavior	Flapping, Gliding, Circling
General Flight Direction	NE
Flight Height	1 - below rotor swept area
Notes	Initially spotted circling over the field. Circled a few times then continued flapping and gliding

Map of Flight Path

Cloud Cover (percent)	100
Visibility	5km
Precipitation	3 - Rain

Turkey Vulture, 1

Raptor Site	AD-8
Raptor Date	5/24/19
Species	Turkey Vulture
Raptor observation number	1
Count of individuals in group	1
Time first observed	11:46
Time last observed	11:48
Duration of observation (minutes)	2
Age	Adult
Sex	Unknown
Behavior	Soaring
General Flight Direction	S
Flight Height	2 - within rotor swept area
Horizontal Position Code	D - flight path over a valley
Notes	Spotted gliding in from over the eastern tree line heading west. Turned over the fields and continued gliding south.

Map of Flight Path

Updated	2019-09-16 17:20:03 UTC by Randi Jackson
Location	44.7402785, -67.9177992
Lead Observer	Karla Fortier
Survey Interval	June
Date	2019-06-03
Survey Site	AD-8

Survey Overview

Survey Start Time	06:15
Survey End Time	08:15
Duration of survey (minutes)	120
Count of raptors observed	1
Survey Summary Comments	No eagles observed. AM fog lifts around 7:40am. Otherwise a very quiet AM. Only raptor observed right before departure.

Weather Summary

Wind Speed	2 - Light breeze
Wind Direction	S
Temperature (F)	50
Relative Humidity	96
Barametric Pressure (inches)	29.67
Cloud Cover (percent)	100
Visibility	3
Precipitation	1 - Haze or Fog
Weather Comment	AM fog but no hinerance to visibility requirements.

Merlin, 1

Raptor Site	AD-8
Raptor Date	6/3/19
Species	Merlin
Raptor observation number	1
Count of individuals in group	1
Time first observed	08:17
Time last observed	08:18
Duration of observation (minutes)	1
Duration within survey boundary	0
Age	Adult
Sex	Unknown
Behavior	Flapping
General Flight Direction	SW
Flight Height	1 - below rotor swept area
Turbine Pad Utilized (WTG)	N/A
Horizontal Position Code	D - flight path over a valley

Notes	Bird emerges from behind stand of trees from NE, flapping right across road in immediate view, crossing access road, SW to the next nearest treeline between blueberry fields. Bird flies low, disappears through and beyond treeline to SW.
Map of Flight Path	

Weather during observation

Wind Speed	2 - Light breeze
Wind Direction	S
Temperature (F)	52
Relative Humidity	94
Barametric Pressure (inches)	29.68
Cloud Cover (percent)	100
Visibility	3
Precipitation	0 - none

06:10

Time of observation	06:10
Describe observation	One adult Broadwing hawk on drive into eagle site off Hatchey Rd, flying between trees to cross road.

Survey Site	AD-9

Survey Overview

Survey Start Time	06:22
Survey End Time	08:22
Duration of survey (minutes)	120
Count of raptors observed	1
Survey Summary Comments	No Eagles observed. Really nice, crisp, clear AM.

Weather Summary

Wind Speed	2 - Light breeze
Wind Direction	NW
Temperature (F)	42
Relative Humidity	91
Barametric Pressure (inches)	30.21
Cloud Cover (percent)	0
Visibility	16+
Precipitation	0 - none
Weather Comment	Extremely gorgeous morning.

Turkey Vulture, 1

Raptor Site	AD-9
Raptor Date	5/8/19
Species	Turkey Vulture
Raptor observation number	1
Count of individuals in group	1
Time first observed	06:37
Time last observed	06:39
Duration of observation (minutes)	2
Duration within survey boundary	2
Age	Unknown
Sex	Unknown
Behavior	Circling, Soaring
General Flight Direction	SE
Flight Height	1 - below rotor swept area, 2 - within rotor swept area
Turbine Pad Utilized (WTG)	N/A
Horizontal Position Code	Plain, open terrain

Notes	TUVU emerges low NE over fields and treeline. Circles a few times , gains some altitude then soars off SE.
Map of Flight Path	
	

Weather during observation

Wind Speed	2 - Light breeze
Wind Direction	NW
Temperature (F)	43
Relative Humidity	90
Barametric Pressure (inches)	30.21
Cloud Cover (percent)	0
Visibility	16+
Precipitation	0 - none

07:00

Time of weather observation	07:00
Wind Speed	3 - Gentle breeze
Wind Direction	NNW
Weather Comment	Note only to comment wind has picked up. All other parameters same.

Northern Harrier, 1

Raptor Site	AD-9
Raptor Date	7/11/19
Species	Northern Harrier
Raptor observation number	1
Count of individuals in group	1
Time first observed	13:11
Time last observed	13:12
Duration of observation (minutes)	1
Duration within survey boundary	1
Age	Adult
Sex	Male
Behavior	Flapping, Gliding
General Flight Direction	S
Flight Height	1 - below rotor swept area
Horizontal Position Code	D - flight path over a valley
Notes	Spotted gliding in from the north low over the blueberry fields. Glided low over the fields heading south.

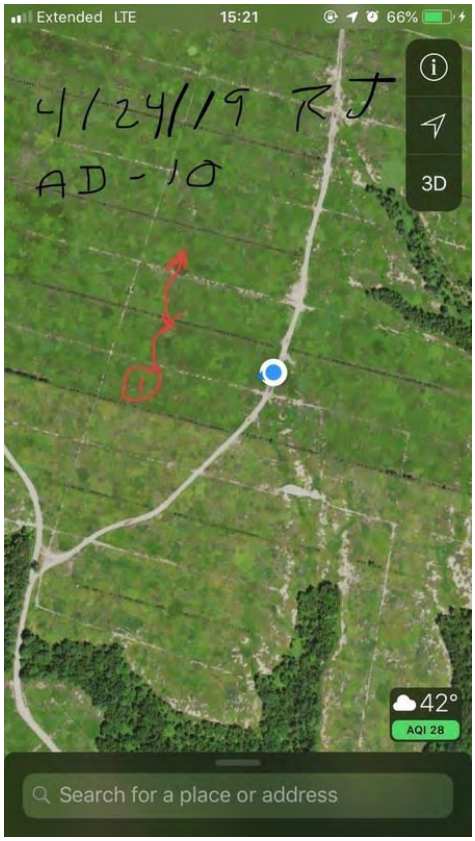
Date	2019-04-24
Survey Site	AD-10

Survey Overview

Survey Start Time	13:20
Survey End Time	15:25
Duration of survey (minutes)	125
Count of raptors observed	1



Weather Summary

Wind Speed	1 - Light air
Wind Direction	W
Temperature (F)	38
Relative Humidity	99
Barametric Pressure (inches)	29.97
Cloud Cover (percent)	100
Visibility	5km
Precipitation	2 - Drizzle

Kestrel, 1

Raptor Site	AD-10
Raptor Date	4/24/19
Species	Kestrel
Raptor observation number	1
Count of individuals in group	1
Time first observed	15:17
Time last observed	15:21
Duration of observation (minutes)	4
Age	Adult
Sex	Female
Behavior	Flapping, Gliding, Perching, Kiting
General Flight Direction	N
Flight Height	1 - below rotor swept area
Horizontal Position Code	Flight path over field
Notes	First spotted flying low over the blueberry barrens coming in from the south. Landed and perched for a few minutes one of the trees in the tree line break. Perched for a few minutes then popped up and began kiting. Kited for about 30sec then took off low over the barrens in the north where I lost site.

Map of Flight Path

14:34

Time of weather observation	14:34
Wind Speed	1 - Light air
Wind Direction	W
Temperature (F)	38
Relative Humidity	99
Barametric Pressure (inches)	29.97
Cloud Cover (percent)	100
Visibility	5km
Precipitation	3 - Rain

15:12

Time of weather observation	15:12
Wind Speed	1 - Light air
Wind Direction	W
Temperature (F)	39
Relative Humidity	97
Barametric Pressure (inches)	29.97
Cloud Cover (percent)	100
Visibility	5km
Precipitation	1 - Haze or Fog

AD-10, 2019-05-15

Created	2019-05-15 11:45:08 UTC by Karla Fortier
Updated	2019-05-15 13:59:34 UTC by Karla Fortier
Location	44.6728615, -67.87816
Lead Observer	Karla Fortier
Survey Interval	May
Date	2019-05-15
Survey Site	AD-10

Survey Overview

Survey Start Time	07:40
Survey End Time	09:40
Duration of survey (minutes)	120
Survey Summary Comments	No Eagles or other raptors observed. Precipitation most of survey period until end. No obstructions to visibility.

Weather Summary

Wind Speed	3 - Gentle breeze
Wind Direction	N
Temperature (F)	36
Relative Humidity	91
Barametric Pressure (inches)	29.68
Cloud Cover (percent)	100
Visibility	8
Precipitation	2 - Drizzle
Weather Comment	On drive in, some flurries, but upon arrival light drizzle. No hindrance to visibility. Gusts of 4.

08:05

Time of weather observation	08:05
Wind Speed	3 - Gentle breeze
Wind Direction	N
Temperature (F)	36
Cloud Cover (percent)	100
Visibility	8
Precipitation	Snow flurries, rainy mix
Weather Comment	Mixed precipitation, heavier than a drizzle and constant. Immediate visibility not hindered.

08:35

Time of weather observation	08:35
Precipitation	2 - Drizzle
Weather Comment	Update to note heavier rain turns back to light drizzle. Skies start to ckear, becomes brighter.

08:50

Time of weather observation	08:50

Precipitation	0 - none
Weather Comment	Update to note that drizzle stops.

08:55

Time of observation	08:55
Describe observation	One Raven flies fields east of survey location headed north.

09:20

Time of observation	09:20
Describe observation	Wind project far west becomes visibile.

Survey Site	AD-10

Survey Overview

Survey Start Time	11:14
Survey End Time	13:14
Duration of survey (minutes)	120
Survey Summary Comments	No eagles or other raptors observed. Ravens and Robin's around in surrounding fields.

Weather Summary

Wind Speed	2 - Light breeze
Wind Direction	SW
Temperature (F)	64
Relative Humidity	58
Barametric Pressure (inches)	29.82
Cloud Cover (percent)	70
Visibility	16
Precipitation	0 - none
Weather Comment	Some sun and blue skies opened up around 11am.

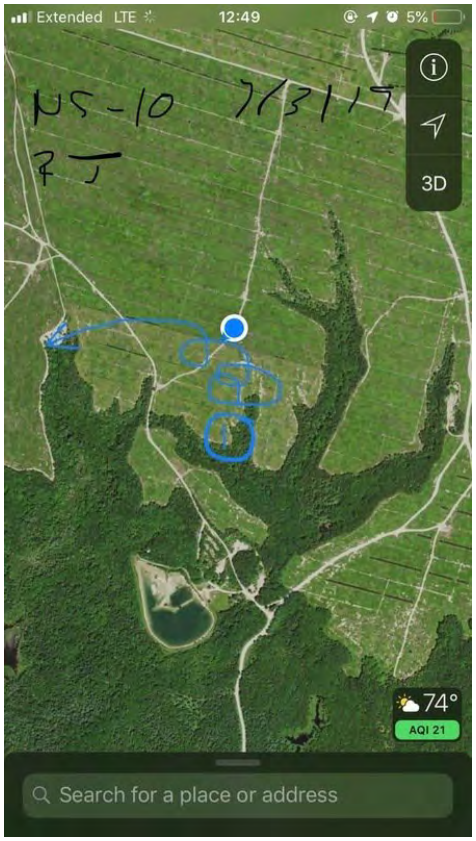
Count of raptors observed	1



Weather Summary

Wind Speed	3 - Gentle breeze
Wind Direction	E
Temperature (F)	75
Relative Humidity	76
Barametric Pressure (inches)	29.85
Cloud Cover (percent)	50
Visibility	Unlimited
Precipitation	0 - none

Bald Eagle, 1

Raptor Site	AD-10
Raptor Date	7/3/19
Species	Bald Eagle
Raptor observation number	1
Count of individuals in group	1
number of eagles observed	1
Time first observed	12:46
Time last observed	12:49
Duration of observation (minutes)	3
Duration within survey boundary	3
Age	Juvenile
Sex	Unknown
Behavior	Circling, Gliding
General Flight Direction	W
Flight Height	2 - within rotor swept area, 3 - above rotor swept area
Horizontal Position Code	D - flight path over a valley
Notes	Spotted initially circling in the south. Circled for a few minutes then took off gliding west. Looked to be a second year juvenile.

Map of Flight Path

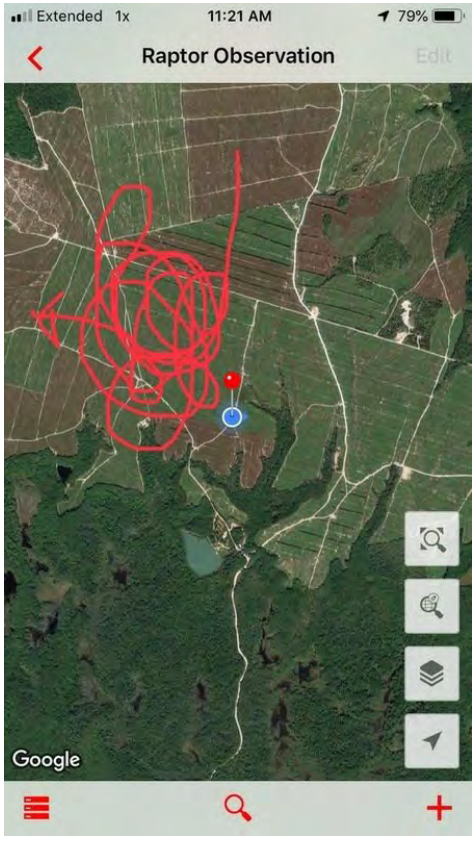
Survey Overview



Survey Start Time	09:29
Survey End Time	11:37
Duration of survey (minutes)	128
Count of eagles observed	1
Count of raptors observed	1

Weather Summary

Wind Speed	2 - Light breeze
Wind Direction	SW
Temperature (F)	74
Relative Humidity	80
Barametric Pressure (inches)	29.94
Cloud Cover (percent)	50
Visibility	10km
Precipitation	0 - none

Bald Eagle, 1

Raptor Site	AD-10
Raptor Date	8/30/19
Species	Bald Eagle
Raptor observation number	1
Count of individuals in group	1
number of eagles observed	1
Time first observed	10:52
Time last observed	11:37
Duration of observation (minutes)	45
Duration within survey boundary	14
Age	Juvenile
Sex	Unknown
Behavior	Flapping, Gliding, Circling
General Flight Direction	W
Flight Height	1 - below rotor swept area, 2 - within rotor swept area, 3 - above rotor swept area
Horizontal Position Code	Over barren

Notes	One Juvenile BAEA flys in from north, low, about 30 ft from ground, begins to circle up on thermal reaching max 800-1000 ft. Circles near survey site before eventually gliding west, out of site. Individual has light brown feathers on back, with a white band on the underside of the tail. Minimal white flecks on underside where wing joins body.
Map of Flight Path	

Weather during observation

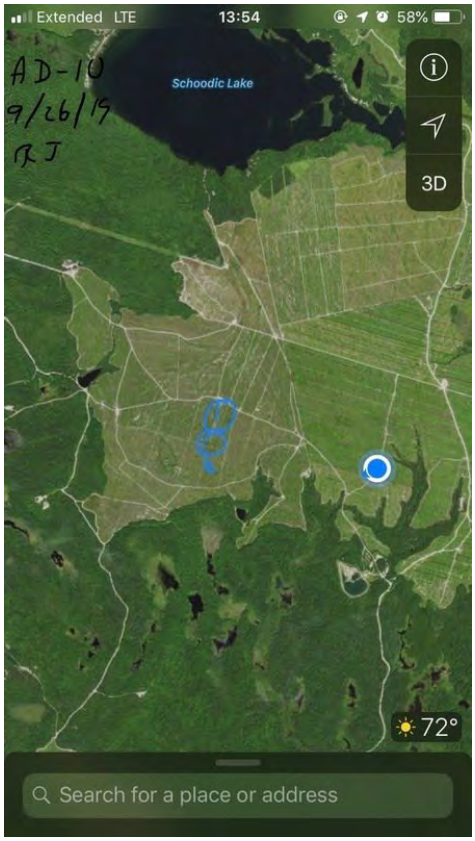
Survey Overview

Survey Start Time	13:32
Survey End Time	15:32
Duration of survey (minutes)	120
Count of eagles observed	1
Count of raptors observed	3

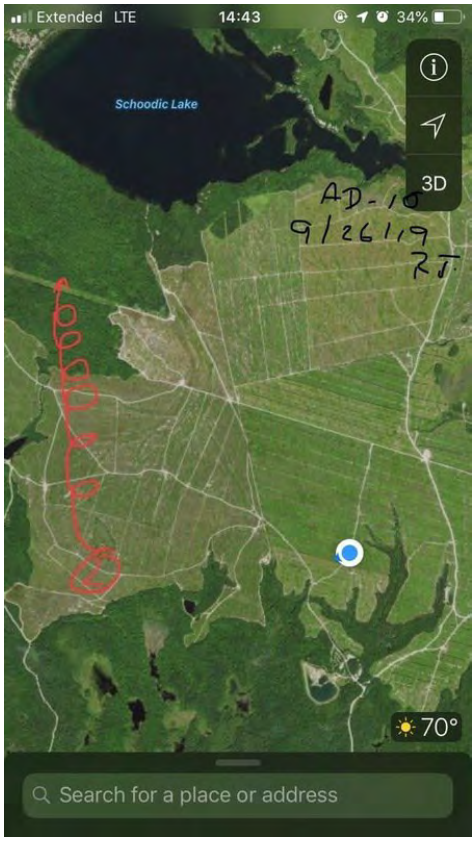


Weather Summary

Wind Speed	5 - Fresh breeze
Wind Direction	SW
Temperature (F)	70
Relative Humidity	75
Barametric Pressure (inches)	29.76
Cloud Cover (percent)	25
Visibility	Unlimited
Precipitation	0 - none

Turkey Vulture, 1

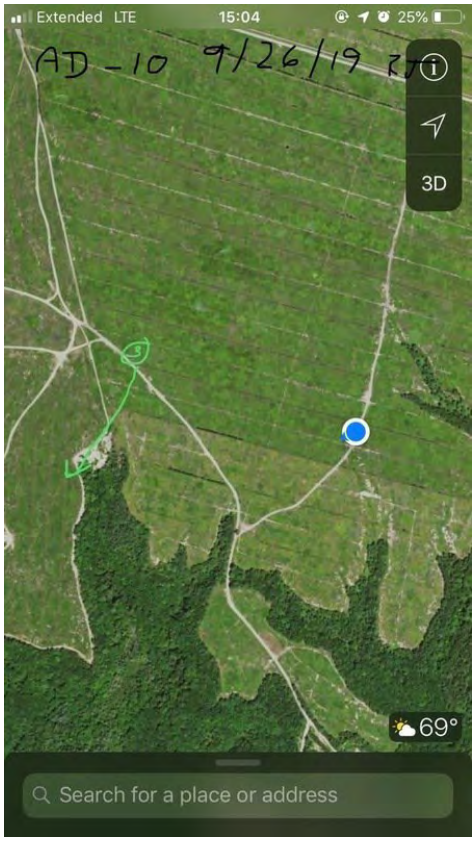
Raptor Site	AD-10
Raptor Date	9/26/19
Species	Turkey Vulture
Raptor observation number	1
Count of individuals in group	1
Time first observed	13:49
Time last observed	13:50
Duration of observation (minutes)	1
Age	Unknown
Sex	Unknown
Behavior	Circling
General Flight Direction	S
Flight Height	2 - within rotor swept area
Notes	Brief observation of a TUVU circling in the distance. Briefly observed circling making its way south where I lost site of it behind the trees.



Map of Flight Path

Bald Eagle, 2

Raptor Site	AD-10
Raptor Date	9/26/19
Species	Bald Eagle
Raptor observation number	2
Count of individuals in group	1
number of eagles observed	1
Time first observed	14:31
Time last observed	14:42
Duration of observation (minutes)	11
Duration within survey boundary	0
Age	Adult
Sex	Unknown
Behavior	Circling, Flapping
General Flight Direction	N
Flight Height	2 - within rotor swept area, 3 - above rotor swept area, 4 - No predominant height
Notes	Initially observed circling in the south low over the barren. Continued circling making its way north while ascending. Lost site of the individual high up in the north while circling.



Map of Flight Path

Turkey Vulture, 3

Raptor Site	AD-10
Raptor Date	9/26/19
Species	Turkey Vulture
Raptor observation number	3
Count of individuals in group	1
Time first observed	15:01
Time last observed	15:03
Duration of observation (minutes)	2
Age	Unknown
Sex	Unknown
Behavior	Flapping, Gliding
General Flight Direction	SW
Flight Height	1 - below rotor swept area
Notes	Spotted flying low over the barrens from behind a tree break in the north. Continued to fly very low (~20ft) over the barrens heading south west out of sight.

Map of Flight Path

15:00

Time of weather observation	15:00
Wind Speed	5 - Fresh breeze
Wind Direction	SW
Temperature (F)	67
Relative Humidity	81
Barametric Pressure (inches)	29.73
Cloud Cover (percent)	50
Visibility	Unlimited
Precipitation	0 - none
Weather Comment	Increasing cloud cover.

15:23

Time of weather observation	15:23
Wind Speed	6 - Strong breeze
Wind Direction	S
Temperature (F)	67
Relative Humidity	83
Barametric Pressure (inches)	29.73
Cloud Cover (percent)	100
Visibility	Unlimited
Precipitation	0 - none

Weather Comment	Air temperature feels cooler. Wind seems to picking up. Clouds rolling in very quickly. A storm is expected for tonight.

13:47

Time of observation	13:47
Describe observation	Other Birds: AMCR

Raptor Date	4/11/19
Species	Turkey Vulture
Raptor observation number	2
Count of individuals in group	3
Time first observed	16:56
Time last observed	17:01
Duration of observation (minutes)	5
Age	Adult
Sex	Unknown
Behavior	Circling, Flapping, Soaring
General Flight Direction	N, S
Flight Height	2 - within rotor swept area, 3 - above rotor swept area

Horizontal Position Code	over field
Notes	Flew from the south to north and then returned south
Map of Flight Path	

Weather during observation

Wind Speed	3 - Gentle breeze
Wind Direction	N
Temperature (F)	39
Barametric Pressure (inches)	1015
Cloud Cover (percent)	0
Visibility	10
Precipitation	0 - none

Created	2019-05-10 13:36:12 UTC by Karla Fortier
Updated	2019-05-10 15:53:51 UTC by Karla Fortier
Location	44.6803411, -67.8487191
Lead Observer	Karla Fortier
Survey Interval	May
Date	2019-05-10
Survey Site	AD-11

Survey Overview

Survey Start Time	09:36
Survey End Time	11:36
Duration of survey (minutes)	120
Survey Summary Comments	No Eagles or other raptors observed. Steady rain entire survey period but did not hinder visibility requirements.

Weather Summary

Wind Speed	2 - Light breeze
Wind Direction	SSE
Temperature (F)	44
Relative Humidity	99
Barametric Pressure (inches)	30.25
Cloud Cover (percent)	100
Visibility	6.4
Precipitation	3 - Rain
Weather Comment	Steady rain but no hinerance to visibility requirements.

09:40

Time of observation	09:40
Describe observation	One Raven walks fields immediately west of survey location, near bee hives along treeline.

Survey Interval	June
Date	2019-06-05
Survey Site	AD-11

Survey Overview

Survey Start Time	09:06
Survey End Time	11:06
Duration of survey (minutes)	120
Survey Summary Comments	No eagles or other raptors observed.

Weather Summary

Wind Speed	2 - Light breeze
Wind Direction	SW
Temperature (F)	54
Relative Humidity	78
Barametric Pressure (inches)	29.85
Cloud Cover (percent)	95
Visibility	16
Precipitation	0 - none
Weather Comment	Skies more clear to north. Otherwise no obstructions to visibility.

Lead Observer	Randi Jackson
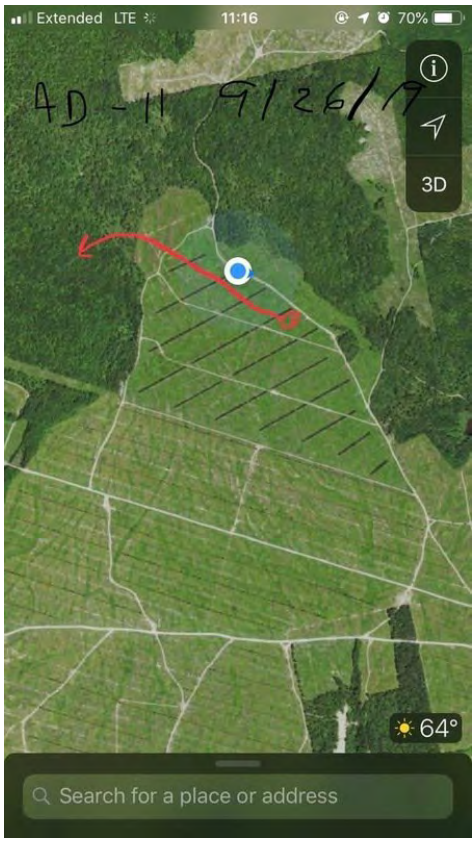
Survey Interval	September
Date	2019-09-26
Survey Site	AD-11

Survey Overview



Survey Start Time	09:20
Survey End Time	11:20
Duration of survey (minutes)	120
Count of eagles observed	1
Count of raptors observed	1

Weather Summary

Wind Speed	3 - Gentle breeze
Wind Direction	SW
Temperature (F)	55
Relative Humidity	97
Barametric Pressure (inches)	29.81
Cloud Cover (percent)	100
Visibility	300m
Precipitation	1 - Haze or Fog
Weather Comment	Very foggy morning. At survey prior to 8 am. Waited on fog to clear. Very heavy and wet fog this AM. Minimal visibility to conduct surveys.

Bald Eagle, 1

Raptor Site	AD-11
Raptor Date	9/26/19
Species	Bald Eagle
Raptor observation number	1
Count of individuals in group	1
number of eagles observed	1
Time first observed	11:15
Time last observed	11:16
Duration of observation (minutes)	1
Duration within survey boundary	1
Age	Adult
Sex	Unknown
Behavior	Flapping
General Flight Direction	W
Flight Height	1 - below rotor swept area
Horizontal Position Code	Over blueberry barrens

Notes	Initially spotted in the south behind a few tree break lines in the blueberry barrens. Observed flying low over the barrens (~30 feet) just cresting over the tops of the spruce breaks as it flew over. Observed flapping for the entire duration heading west.
Map of Flight Path	

11:02

Time of weather observation	11:02
Wind Speed	5 - Fresh breeze
Wind Direction	SW
Temperature (F)	58
Relative Humidity	88
Barametric Pressure (inches)	29.8
Cloud Cover (percent)	25
Visibility	Unlimited
Precipitation	0 - none
Weather Comment	Fog has rapidly cleared out. Minimal clouds on the sky. Strong breeze with mostly blue skies

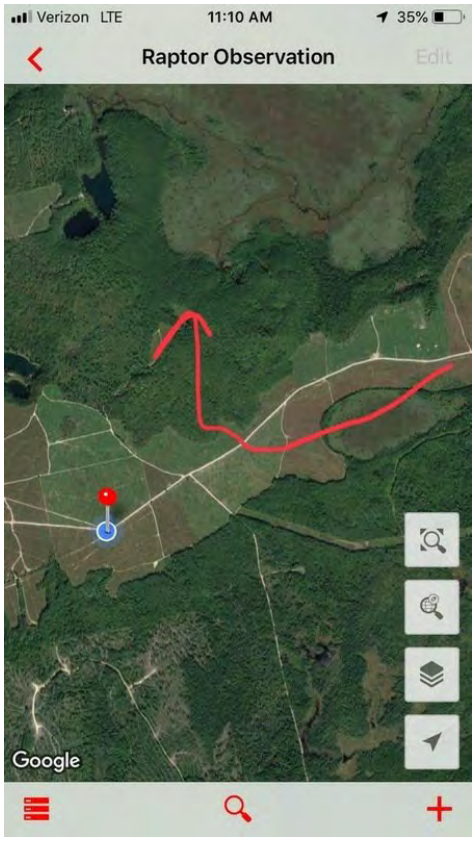
Turkey Vulture, 1

Raptor Site	AD-12
Raptor Date	3/28/19
Species	Turkey Vulture
Raptor observation number	1
Count of individuals in group	1
Time first observed	10:27
Time last observed	10:34
Duration of observation (minutes)	7
Age	Adult
Sex	Unknown
Behavior	Soaring, Circling
General Flight Direction	N
Flight Height	0 - outside of turbine array area, 3 - above rotor swept area, 2 - within rotor swept area
Horizontal Position Code	D - flight path over a valley
Notes	One TUVU glides over valley

Map of Flight Path



Weather during observation

Wind Speed	6 - Strong breeze
Wind Direction	S
Temperature (F)	40
Relative Humidity	70
Barametric Pressure (inches)	30.43

Survey Overview

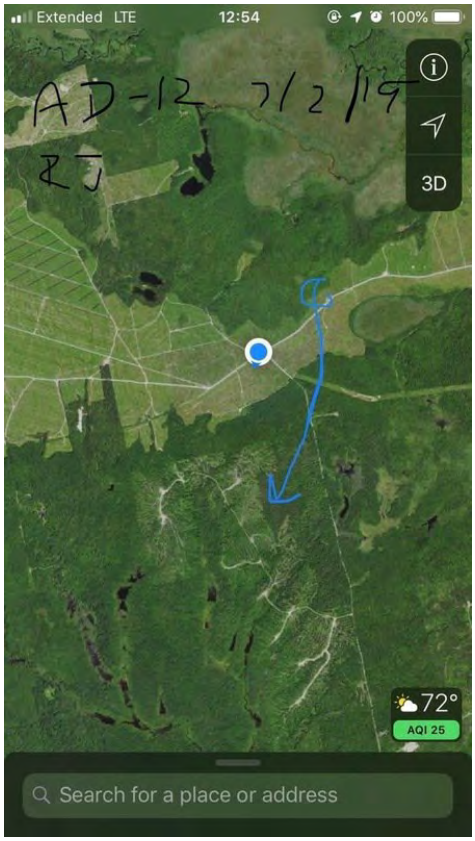
Survey Start Time	12:08
Survey End Time	14:08
Duration of survey (minutes)	120
Count of raptors observed	2

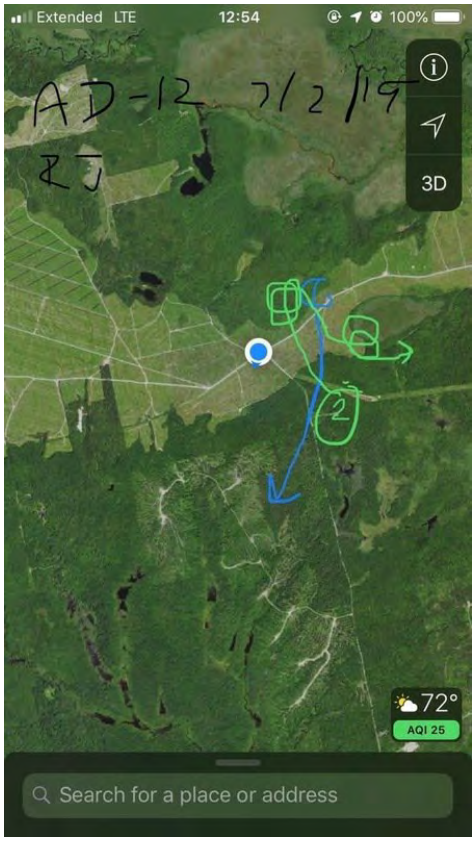


Weather Summary

Wind Speed	3 - Gentle breeze
Wind Direction	S
Temperature (F)	72
Relative Humidity	69
Barametric Pressure (inches)	29.81
Cloud Cover (percent)	50
Visibility	Unlimited
Precipitation	0 - none
Weather Comment	Thunderstorms rolling in in the evening.

Northern Harrier, 1

Raptor Site	AD-5
Raptor Date	7/2/19
Species	Northern Harrier
Raptor observation number	1
Count of individuals in group	1
Time first observed	12:52
Time last observed	12:54
Duration of observation (minutes)	2
Duration within survey boundary	2
Age	Adult
Sex	Male
Behavior	Flapping, Gliding
General Flight Direction	SW
Flight Height	1 - below rotor swept area
Horizontal Position Code	A2 - Over ridge, perpendicular
Notes	Spotted gliding in from the northern tree line heading south west over the tree line. Lost sight of the individual in the trees.



Map of Flight Path

Turkey Vulture, 2

Raptor Site	AD-5
Raptor Date	7/2/19
Species	Turkey Vulture
Raptor observation number	2
Count of individuals in group	1
Time first observed	13:55
Time last observed	13:58
Duration of observation (minutes)	3
Duration within survey boundary	3
Age	Adult
Sex	Unknown
Behavior	Gliding, Circling
General Flight Direction	E
Flight Height	2 - within rotor swept area
Horizontal Position Code	A2 - Over ridge, perpendicular
Notes	Spotted gliding from the south heading north. Circled over the northern tree line for a minute then began gliding south. Circled over the southern tree line for a minute then took off gliding east out of site.

Map of Flight Path

Survey Site	AD-12

Survey Overview

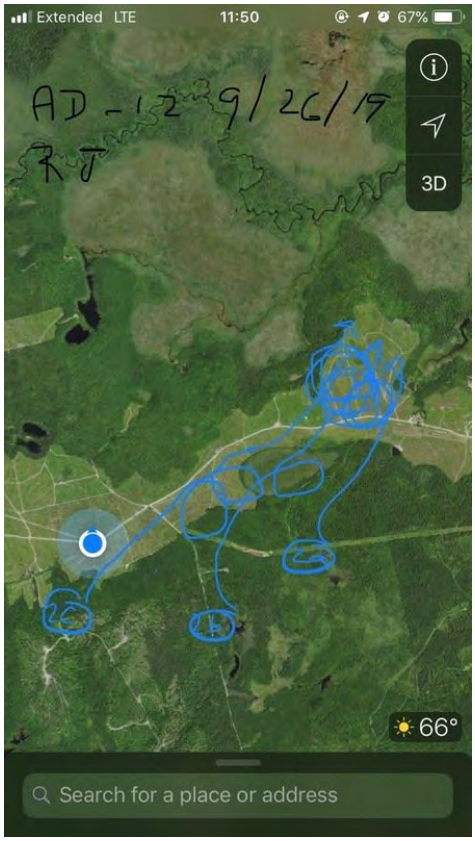
Survey Start Time	11:25
Survey End Time	13:25
Duration of survey (minutes)	120
Count of eagles observed	2
Count of raptors observed	17

Weather Summary

Wind Speed	5 - Fresh breeze
Wind Direction	SW
Temperature (F)	62
Relative Humidity	81
Barametric Pressure (inches)	29.8
Cloud Cover (percent)	25
Visibility	Unlimited
Precipitation	0 - none

Bald Eagle, 1

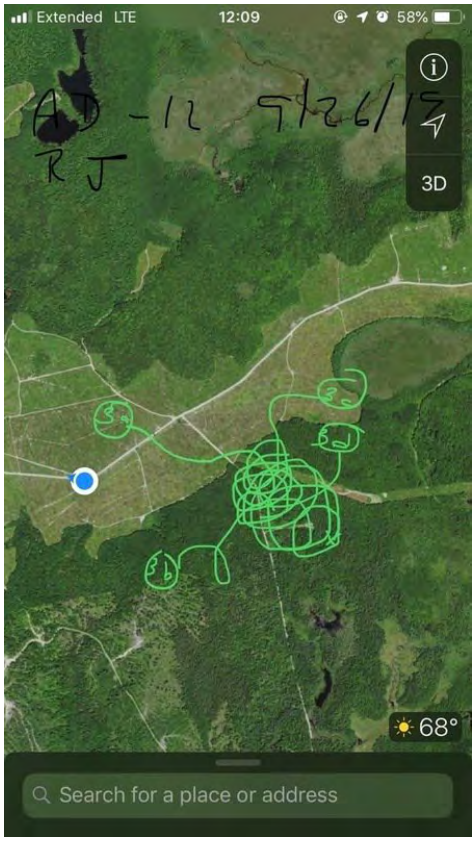


Raptor Site	AD-12
Raptor Date	9/26/19
Species	Bald Eagle
Raptor observation number	1
Count of individuals in group	2
number of eagles observed	2
Time first observed	11:32
Time last observed	11:41
Duration of observation (minutes)	9
Duration within survey boundary	2
Age	Adult
Sex	Unknown
Behavior	Circling, Gliding, Flapping
General Flight Direction	NE
Flight Height	4 - No predominant height

Notes	Initially spotted both adult BAEA circling in the north, low over a tree line. Circled for a few minutes over the tree line then continued flapping and gliding south east where they then began to circle over another tree line. Circled a few times then continued to flap and glide making their way north east. Circled for the rest of observation duration in the north east where they were last seen ascending high up out of site.
Map of Flight Path	

Turkey Vulture, 2

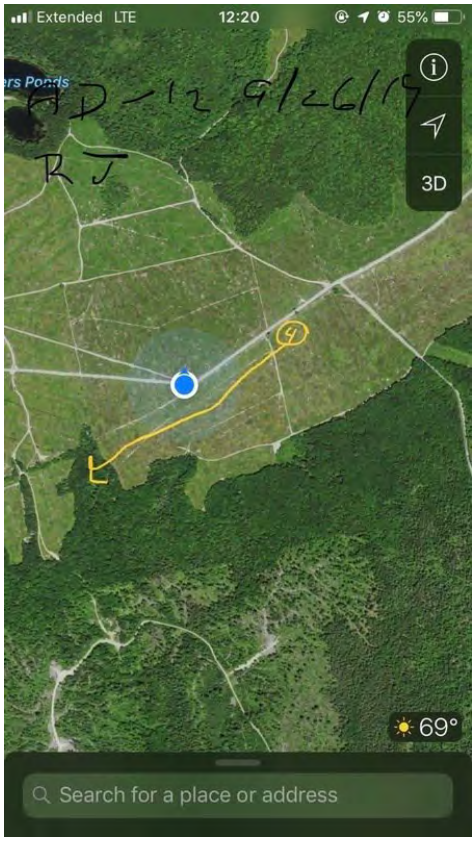
Raptor Site	AD-11
Raptor Date	9/26/19
Species	Turkey Vulture
Raptor observation number	2
Count of individuals in group	3
Time first observed	11:41
Time last observed	11:47
Duration of observation (minutes)	6
Duration within survey boundary	6
Age	Adult, Unknown
Sex	Unknown
Behavior	Gliding, Circling
General Flight Direction	NE
Flight Height	4 - No predominant height
Notes	Spotted three separate TUVU relatively all gliding in at the same time (within one min of each other). Each TUVU circled and gliding low over the field making their way north east where they met up with the bald eagles and circled together. Last observed ascending high up out of site with the two eagles.



Map of Flight Path

Turkey Vulture, 3

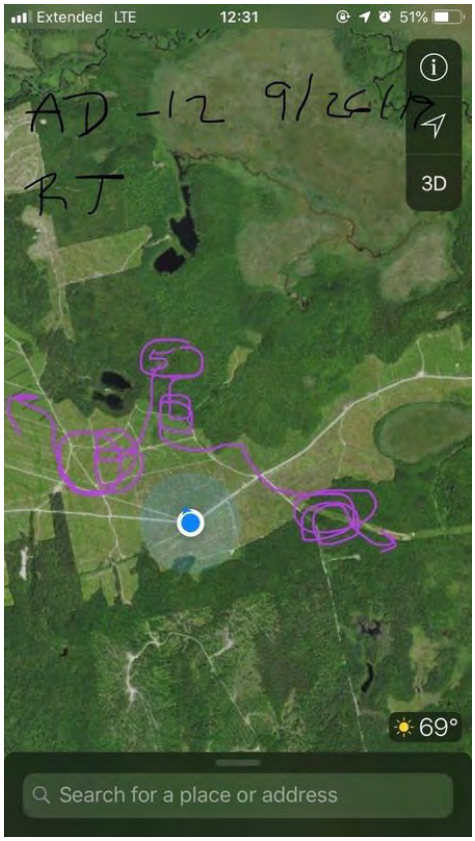
Raptor Site	AD-11
Raptor Date	9/26/19
Species	Turkey Vulture
Raptor observation number	3
Count of individuals in group	4
Time first observed	11:51
Time last observed	11:57
Duration of observation (minutes)	6
Duration within survey boundary	6
Age	Adult, Unknown
Sex	Unknown
Behavior	Circling, Gliding
General Flight Direction	SE
Flight Height	2 - within rotor swept area, 1 - below rotor swept area
Notes	Four TUVU all spotted within 30 seconds of each other. Each coming from different directions flapping and circling. All four TUVU were observed for a few minutes circling in the south east low over a tree line where I lost site of them heading south east.



Map of Flight Path

Kestrel, 4

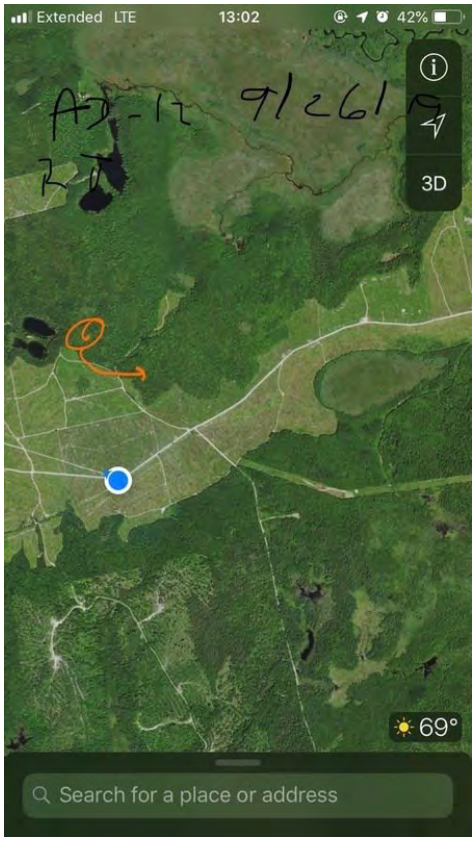
Raptor Site	AD-11
Raptor Date	9/26/19
Species	Kestrel
Raptor observation number	4
Count of individuals in group	1
Time first observed	12:18
Time last observed	12:19
Duration of observation (minutes)	1
Duration within survey boundary	1
Age	Adult
Sex	Female
Behavior	Gliding, Flapping
General Flight Direction	W
Flight Height	1 - below rotor swept area
Notes	Initially spotted gliding in the east heading west. Continued flapping and gliding west out of site over a tree line.



Map of Flight Path

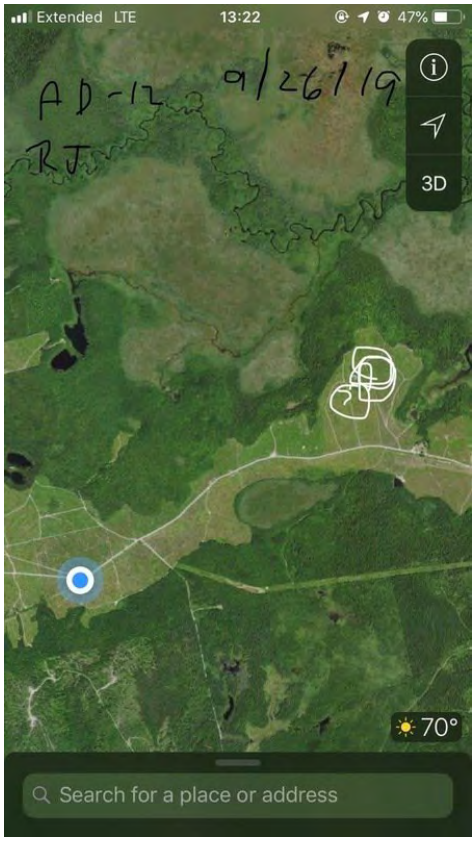
Turkey Vulture, 5

Raptor Site	AD-11
Raptor Date	9/26/19
Species	Turkey Vulture
Raptor observation number	5
Count of individuals in group	4
Time first observed	12:22
Time last observed	12:31
Duration of observation (minutes)	9
Duration within survey boundary	9
Age	Unknown
Sex	Unknown
Behavior	Circling, Gliding
General Flight Direction	SE, NW
Flight Height	2 - within rotor swept area
Notes	Initially spotted four TUVU circling together in the north over a tree line. Continued to circle together for a few minutes and then one TUVU took off gliding south west where it then circled over the field for a few minutes before gliding north west. The other three TUVU continued to glide together making their way south east where they circled over another tree line for a few minutes. After a few minutes of circling the three TUVU began gliding south east where I lost site of them.



Map of Flight Path

Turkey Vulture, 6



Raptor Site	AD-11
Raptor Date	9/26/19
Species	Turkey Vulture
Raptor observation number	6
Count of individuals in group	1
Time first observed	13:05
Time last observed	13:06
Duration of observation (minutes)	1
Duration within survey boundary	1
Age	Adult
Sex	Unknown
Behavior	Gliding
General Flight Direction	E
Flight Height	1 - below rotor swept area
Notes	Brief observation of a TUVU. Briefly observed gliding over the field in the north before it then glided low over the tree line out of site.

Map of Flight Path

Turkey Vulture, 7

Raptor Site	AD-11
Raptor Date	9/26/19
Species	Turkey Vulture
Raptor observation number	7
Count of individuals in group	2
Time first observed	13:19
Time last observed	13:21
Duration of observation (minutes)	2
Age	Unknown
Sex	Unknown
Behavior	Circling
General Flight Direction	E
Flight Height	1 - below rotor swept area, 2 - within rotor swept area
Notes	Spotted two TUVU circling above the blueberry barren for a few minutes. Last spotted circling low over the barren.

APPENDIX A RAPTOR MIGRATION DATA PHOTOS AND TABLES

APPENDIX B RAPTOR USE DATA TABLES

Business Confidential

Executive Summary

Stantec Consulting Services Inc. (Stantec) conducted three seasons of diurnal raptor migration and use surveys for the proposed Downeast Wind Project (DOW or Project) in Washington County, Maine. Surveys were completed as part of pre-construction planning efforts for DOW in accordance with the Maine Department of Inland Fisheries and Wildlife's (MDIFW) *Curtailment Policy and Wind Power Pre-construction Study Recommendations* (June 2015), the U.S. Fish and Wildlife Service's *Land-based Wind Energy Guidelines* (March 2012), and methods similar to those employed at other wind energy projects in Maine and the Northeast. Raptor migration surveys followed methods detailed in the Project Work Plan submitted to MDIFW on 19 February 2016 and updated 18 March 2016. The goal of the surveys was to characterize raptor migration activity. The objectives were to document timing, species composition, and flight characteristics of migrating raptors.

Raptor Migration Surveys

Raptor migration surveys were conducted from a location inside and central to the Project area during Fall from 9 September to 25 November 2015, and from a location outside the Project area in similar habitat and terrain during Spring (1 March to 16 June 2016) and Fall (2 August to 22 November 2016). Surveys were completed from 9:00 A.M. to approximately 2 hours before sunset at approximately 3-4 day intervals.

Fall 2015 Raptor Migration Survey

In 24 survey days totaling 160 survey hours the overall passage rate was 3.12 raptors per hour (raptors/hr). Peak migratory activity occurred in September, specifically on 21 September (11.74 raptors/hr). The species most commonly observed was turkey vulture (*Cathartes aura*) (n=185, 37.1%), followed by broad-winged hawk (*Buteo platypterus*) (n=65, 13.0%) and northern harrier (*Circus cyraneus*) (n=54, 10.8%). Flight behaviors were predominantly soaring and gliding and the average minimum flight height of all observations was 179m (587 ft).

Fall 2016 Raptor Migration Survey

In 34 survey days totaling 245 survey hours, the overall passage rate was 0.77 raptors/hr. Peak migratory activity occurred in September, specifically on 30 September (3.03 raptors/hr). The species most commonly observed was turkey vulture (n = 61, 32.4%), followed by American kestrel (*Falco sparverius*) (n = 48, 25.5%). Flight behaviors were predominantly soaring and gliding and the average minimum flight height of all observations was 70m (230 ft).

Business Confidential

Spring 2016 Raptor Migration Survey

In 32 survey days totaling 265 hours the overall passage rate was 0.94 raptors/hr. Peak migratory activity occurred on 30 March (3.38 raptors/hr). The species most commonly observed was turkey vulture (n = 108, 43.4%), followed by bald eagle (*Haliaeetus leucocephalus*) (n = 69, 27.7%). Flight behaviors were predominantly soaring and gliding and the average minimum flight height was 117 m.

Raptor Use Surveys

Raptor use surveys were completed at 13 points distributed in representative habitats throughout the Project area from 16 September 2015 – 7 September 2016. Each point was surveyed for 1 hour at approximately 3-week intervals. These data were used to evaluate raptor migration activity during the fall migration periods (16 September to 18 November 2016 and 16 August to 7 September 2016) and spring migration period (3 March and 15 June 2016).

Fall 2015 Raptor Use Survey

In 4 survey days (24 survey hours) daily passage rates ranged from 0.50 to 2.33 raptors/hr, and the overall seasonal passage rate was 1.46 raptors/hr. The species with the greatest observations were broad-winged hawk (n = 9, 26%), followed by turkey vulture (n = 8, 23%).

Spring 2016 Raptor Use Survey

In 10 survey days (40 survey hours) daily passage rates ranged from 0.00 to 3.00 raptors/hr, and the overall seasonal passage rate was 0.80 raptors/hr. The species with the greatest observations were turkey vulture (n = 16, 50%), followed by bald eagle (n = 6, 19%).

Fall 2016 Raptor Use Survey

In 4 survey days (22 survey hours) daily passage rates ranged from 0.00 to 0.67 raptors/hr, and the overall seasonal passage rate was 0.36 raptors/hr. The species with the greatest observations were turkey vulture (n = 5, 63%), followed by bald eagle, merlin (*Falco columbarius*) and sharp-shinned hawk (*Accipiter striatus*) (n = 1, 13% each).

Conclusions

Although results differed between the raptor migration survey and raptor use survey methods, and raptor migration surveys more effectively documented peaks in migration activity, the data from each study method showed similar patterns. Overall, species composition and timing of peak activity were similar during the fall 2015 and fall 2016 seasons, with peaks documented in late September. Passage rates from both studies were higher during fall 2015 than in spring or fall of 2016. In spring 2016, peak raptor migration occurred in late March.

Business Confidential

Raptors observed were typical of the region surveyed, and the timing of activity was similar to that at other projects in Maine and in the Northeast. Patterns in raptor migration and use at the Project are consistent with those documented at other wind projects, and species composition was as expected based on the region and habitats present in the Project area. Raptors observed making localized movements exhibited various behaviors including perching, aerial displays and foraging. Because raptor activity at DOW is similar to that recorded at operating wind projects in Maine, and raptor fatalities at these projects have been very rare (4 fatalities recorded in 10 years of operating projects), raptor fatalities at DOW are expected to be uncommon. Monitoring of collision mortality is recommended to support this conclusion.

1.0 INTRODUCTION

Stantec Consulting Services Inc. (Stantec) conducted three seasons of diurnal raptor surveys (migration and use) for the proposed Downeast Wind Project (DOW or Project) in Washington County, Maine. Raptor migration surveys were completed as part of pre-construction planning efforts for DOW in accordance with the Maine Department of Inland Fisheries and Wildlife's (MDIFW) *Curtailment Policy and Wind Power Pre-construction Study Recommendations* (June 2015), the U.S. Fish and Wildlife Service's *Land-based Wind Energy Guidelines* (March 2012), and methods similar to those employed at other wind energy projects in Maine and the Northeast. Two types of surveys were completed: raptor migration surveys from a single point and raptor use surveys from points distributed throughout the Project area. Surveys followed methods detailed in the Project Work Plan submitted to MDIFW on 19 February 2016 and updated 18 March 2016.

The goal of the surveys was to characterize raptor migration activity. The objectives were to document timing, species composition, and flight characteristics of migrating raptors.

2.0 METHODS

2.1 RAPTOR MIGRATION SURVEYS

2.1.1 Survey Effort and Location

Survey seasons overlapped with the known migration window for the 15 raptor species which typically occur in the northeast during migration (Figure 2-1).

Business Confidential

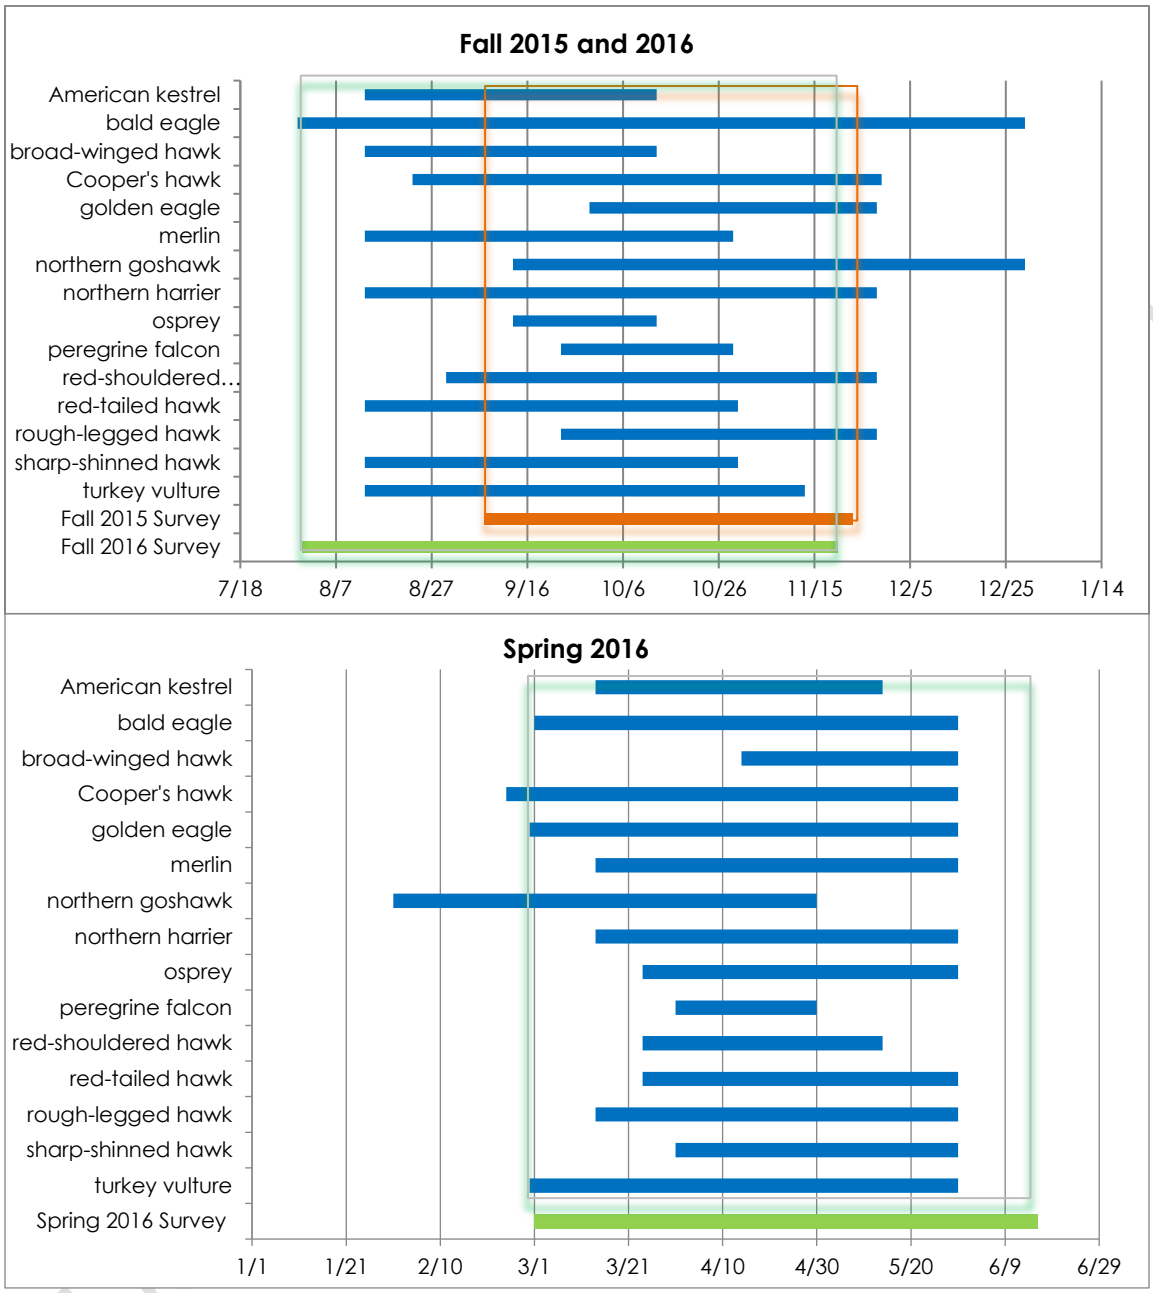

Figure 2-1. Survey timeframe and raptor species' migration window in the Northeast U.S. for three raptor seasons (Wheeler 2003; top: fall 2015 effort in orange, fall 2016 effort in green; bottom: spring 2016 effort in green).

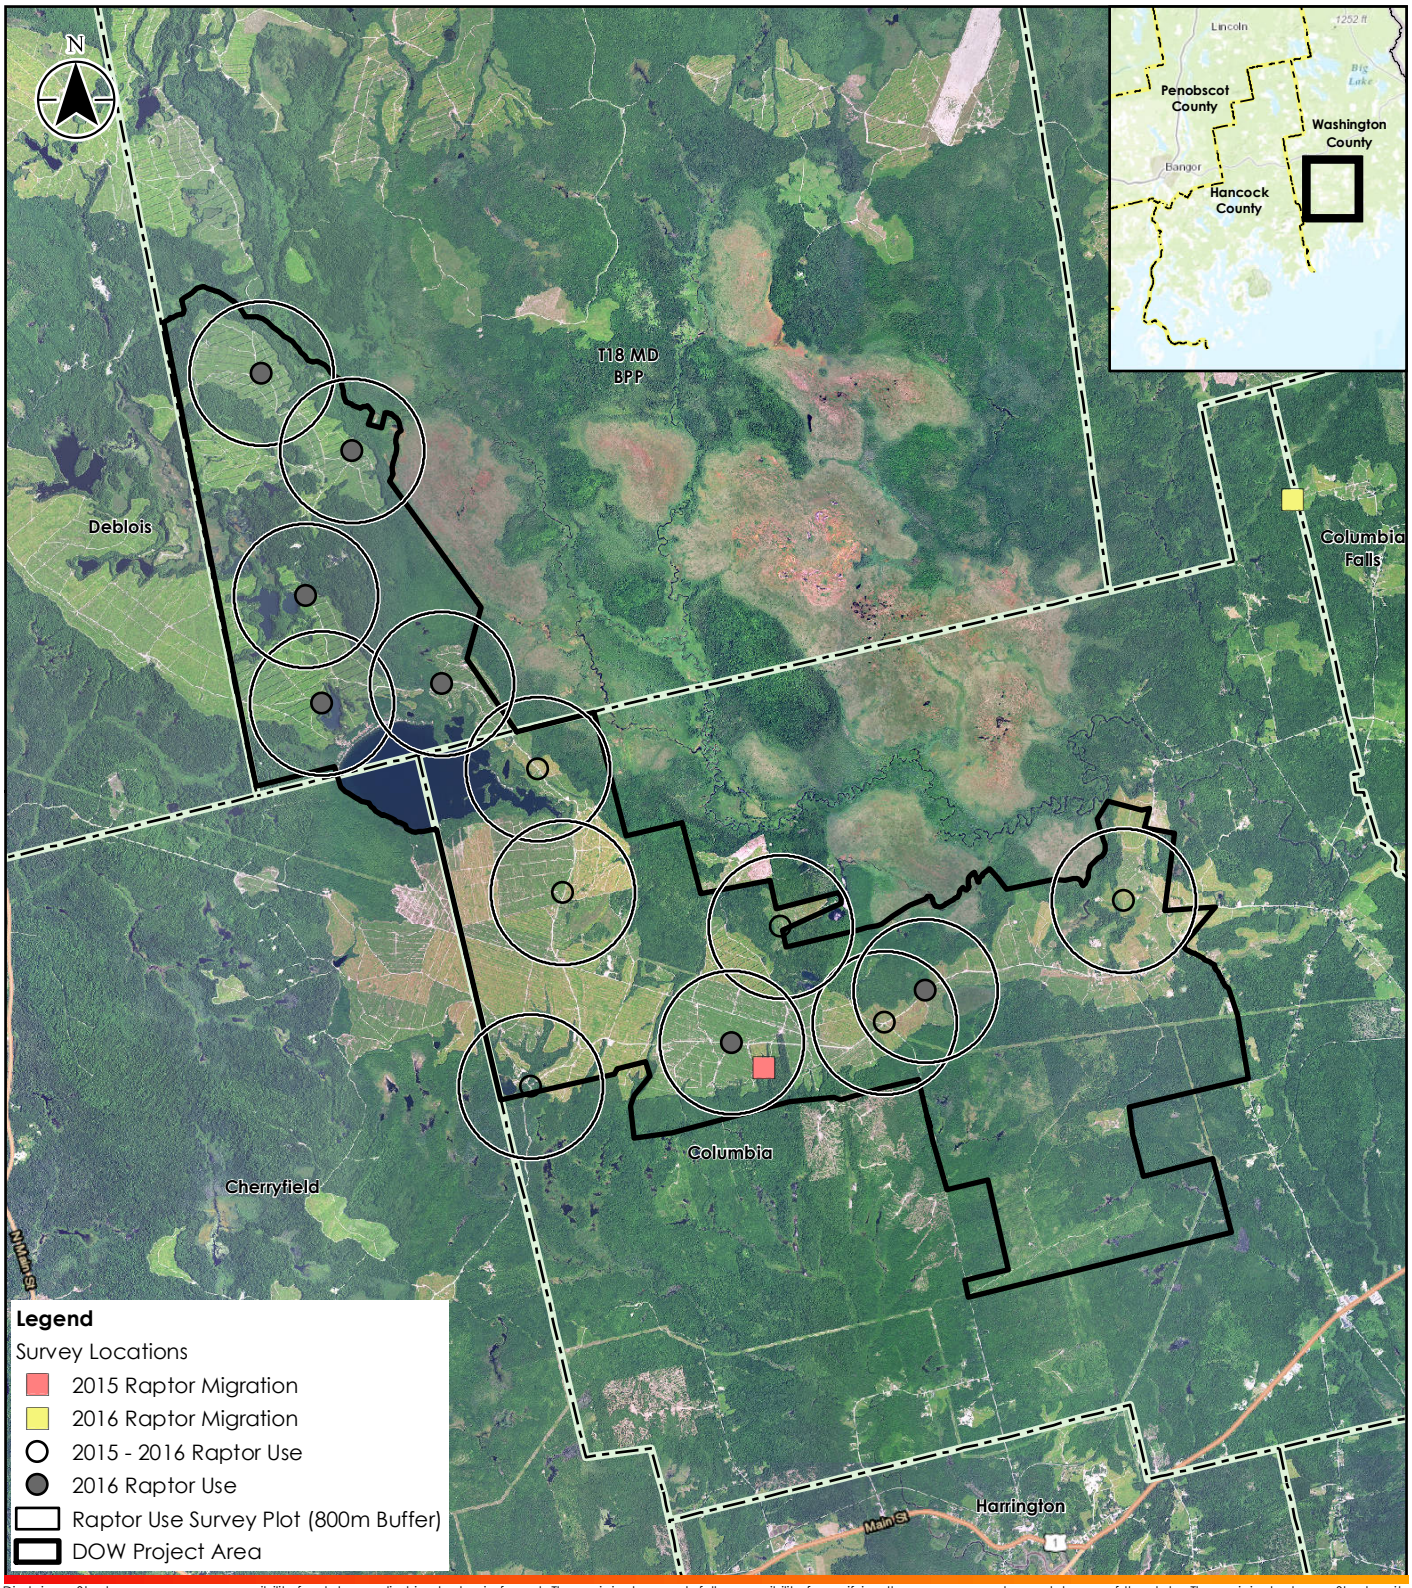

Surveys days were selected based on weather forecast predictions, targeting days with optimal migration weather, i.e., fair days with thermal development and winds from a following direction (south in spring, north in fall). As a result, days with sub-optimal migration weather, e.g., moderate winds and varied wind direction, were surveyed at a lower frequency than optimal

days. Surveys were conducted from 9 A.M. to 2 hours before sunset. Binoculars aided in identification.

Raptor migration surveys were conducted from a location inside and central to the Project area during Fall from 9 September to 25 November 2015, and from a location outside the Project area in similar habitat and terrain during Spring (1 March to 16 June 2016) and Fall (2 August to 22 November 2016). Survey locations are presented in Figure 2-2.

The survey site in fall 2015 was centrally located on flat ground with an extensive view of the Project area (Appendix A Figure 1, Figure 2-2). In spring 2016, after the Project area was revised to include a parcel of land to the northeast, Stantec shifted the survey location approximately 7.5 miles to the northeast to accommodate this revision (Appendix A Figure 2, Figure 2-2). The shifted survey location was subsequently moved approximately 10 m in mid-May to avoid bee activity from nearby commercial bee hives (Appendix A Figure 3); this location was retained for the remainder of the 2016 surveys.

Title
Raptor Survey Locations, 2015 - 2016
3/21/2017

2.1.2 Data Collection

For each observation the following were recorded:

- Time of observation
- Species identification (when possible)
- Number of individuals
- Age class (when possible)
- Flight path drawn on a study area map
- The bird's minimum flight height above ground level
- Time below proposed turbine height (183 m), when applicable
- Flight behaviors
- Flight azimuth
- General behavior notes

2.1.3 Data Summary and Analysis

The following were summarized or calculated for the survey season and survey day:

- Observation rates
- Number of species and individuals
- Timing of peak activity (within and among survey days)
- Range of flight heights
- The percentage of birds seen below proposed turbine height
- Flight Behaviors

For summary and analysis, a single "pass" of a raptor was considered a single raptor observation; that is, an "observation" is considered a view of a single raptor from the time it is detected to the time it flies out of view. Differentiating between individuals in most cases is nearly impossible for this type of survey, so the same individual could be detected and recorded multiple times.

2.2 RAPTOR USE SURVEYS

2.2.1 Survey Effort and Location

Raptor use data were recorded at 13 points within the Project area in representative habitats. Each point was surveyed for 1 hour at approximately 3-week intervals between September 2015 and September 2016; however, 7 points were only surveyed in 2016 (Figure 2-1).

2.2.2 Data Collection

The same data collection methods used for Raptor Migration Surveys were utilized for Raptor Use Surveys, except that eagles were the focus species during these surveys; therefore, in cases

Business Confidential

when eagles and raptors were observed simultaneously, data collection on the eagles would have been a higher priority than raptor data collection.

2.2.3 Data Summary and Analysis

Data was collected year round; however, only data collected during each migration season (1 August to 30 November in fall and 1 March to 15 June in spring) were used in analysis of raptor migration. Observation rates, and the number and proportion of species and individuals relative to the total number and species observed were calculated.

3.0 RESULTS

3.1 RAPTOR MIGRATION SURVEYS

3.1.1 Survey effort and results summary

The fall 2015 effort, comprising 24 survey days, had the highest number of raptor observations (n = 499) compared to the fall 2016 effort (34 survey days; n = 188) and spring 2016 effort (32 survey days; n = 24; Table 3-1). Detection rates and number of species observed in spring 2016 were similar to fall 2016.

Table 3-1. Raptor migration survey effort and results during three raptor seasons, Downeast Wind Project, 2015-2016.

	Fall 2015	Fall 2016	Spring 2016
Range of survey dates	9/9–11/25	8/2-1/22	3/1–6/16
No. survey days	24	34	32
No. survey hours	160	245	265.5
No. raptor species observed	9	13	12
Total no. observations of raptors	499	188	249
Mean no. raptor observations/hour	3.12	0.77	0.94
Total no. of observations of raptors below 183 m height (% total raptor obs)	268 (53.7%)	159 (84.6%)	183 (73.5%)

Business Confidential

3.1.2 Raptor Observations

3.1.2.1 Daily Passage Rates

The fall 2015 daily passage rates increased to a peak on 21 September (11.74 raptors/hour [raptors/hr]; Figure 3-1, Appendix A Table 1) and declined thereafter.

The fall 2016 daily passage rates peaked much less prominently around 30 September (Figure 3-1, Appendix A Table 2). Passage rates ranged from 0 raptors/hr on 9 and 15 November to 3.03 raptors/hr on 30 September (Figure 3-1, Appendix A Table 2).

In spring 2016, the daily passage rates ranged from 0 raptors/hr on 18 May to 3.38 raptors/hr on 30 March (Figure 3-1, Appendix A Table 3). Spring 2016 had two peaks in activity, one in late March and another less pronounced peak in mid-June.

Business Confidential

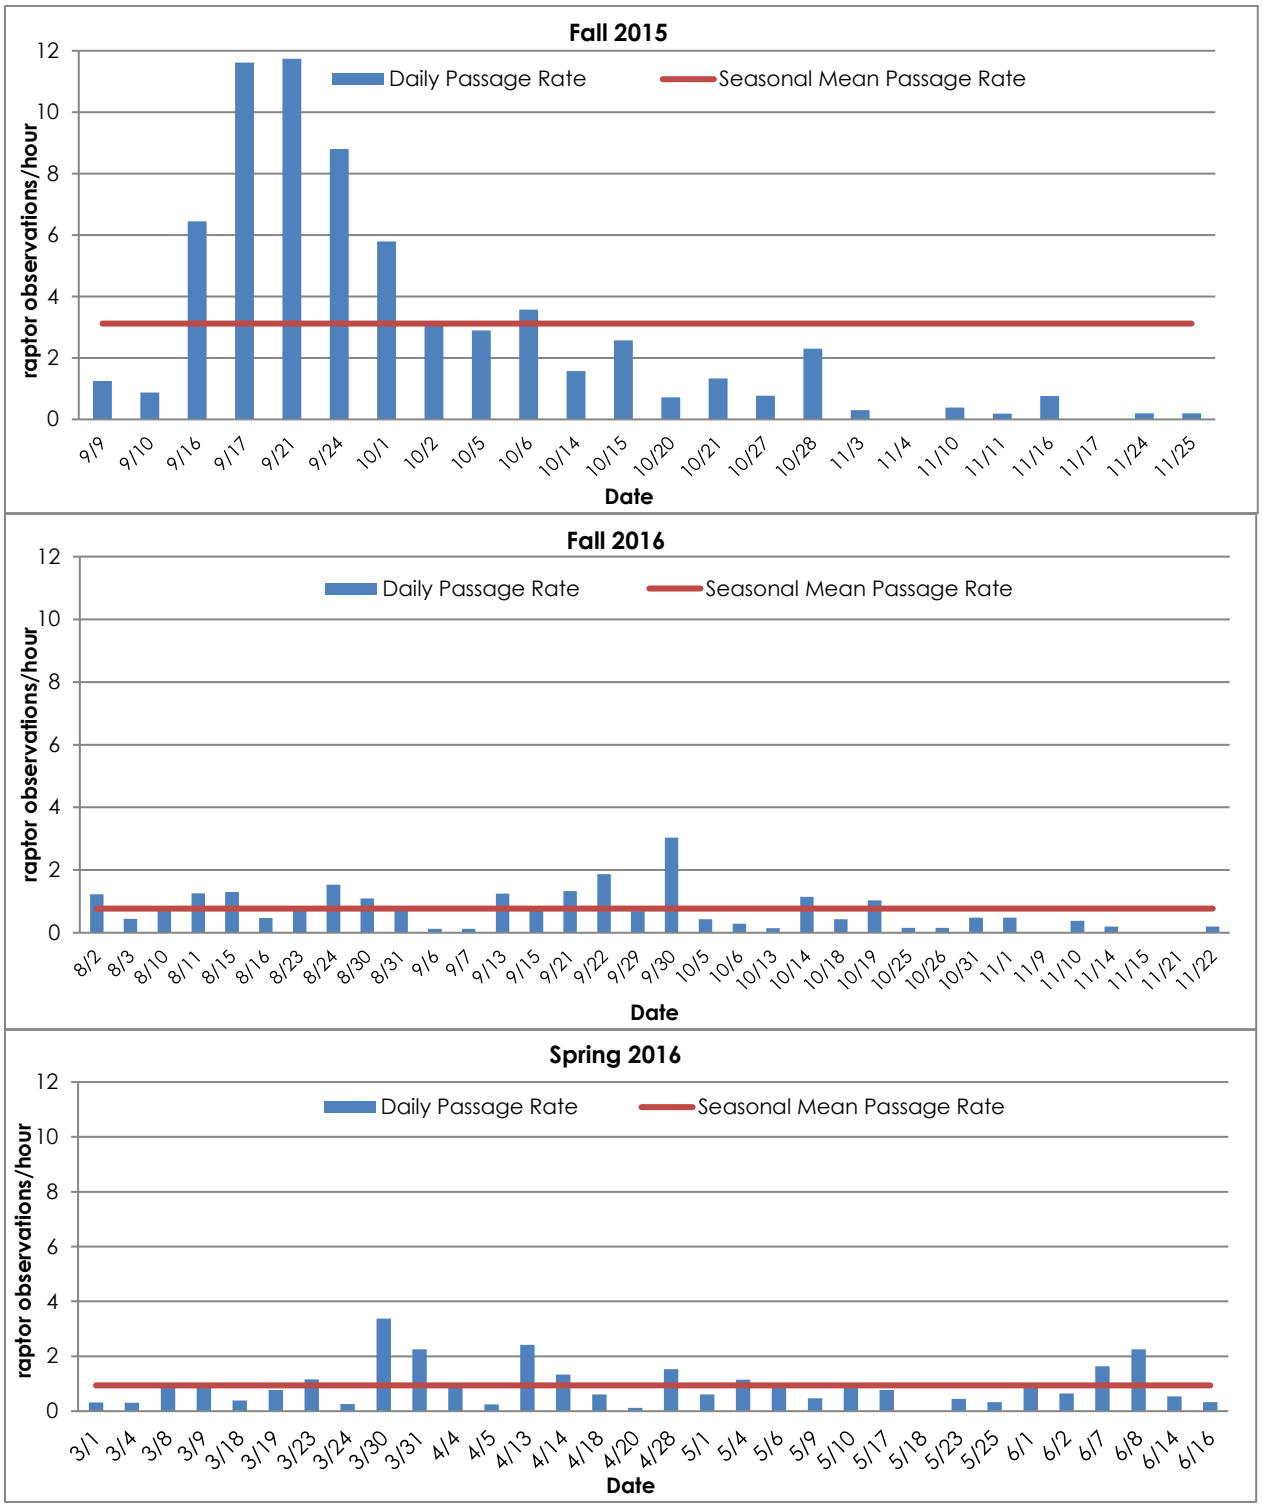

Figure 3-1. Daily mean and seasonal raptor passage rates for three raptor seasons, Downeast Wind Project, 2015-2016.

3.1.2.2 Species

Similar numbers of species were observed in spring and fall 2016(12 in spring, 13 in fall). Fewer species were observed in fall 2015 (n = 9) than in spring or fall 2016 (Table 3-2, Figure 3-2, Appendix A Table 1-3). The most commonly observed species in all three seasons was turkey vulture (*Cathartes aura*; n = 185, 37.1% in fall 2015; n = 61, 32.4% in fall 2016; n = 108, 43.4% in spring 2016). The second most commonly observed species were broad-winged hawk (*Buteo platypterus*) in fall 2015 (n = 65, 13.0%), American kestrel (*Falco sparverius*) in fall 2016 (n = 48, 25.5%), and bald eagle (*Haliaeetus leucocephalus*) in spring 2016 (n = 69, 27.7%).

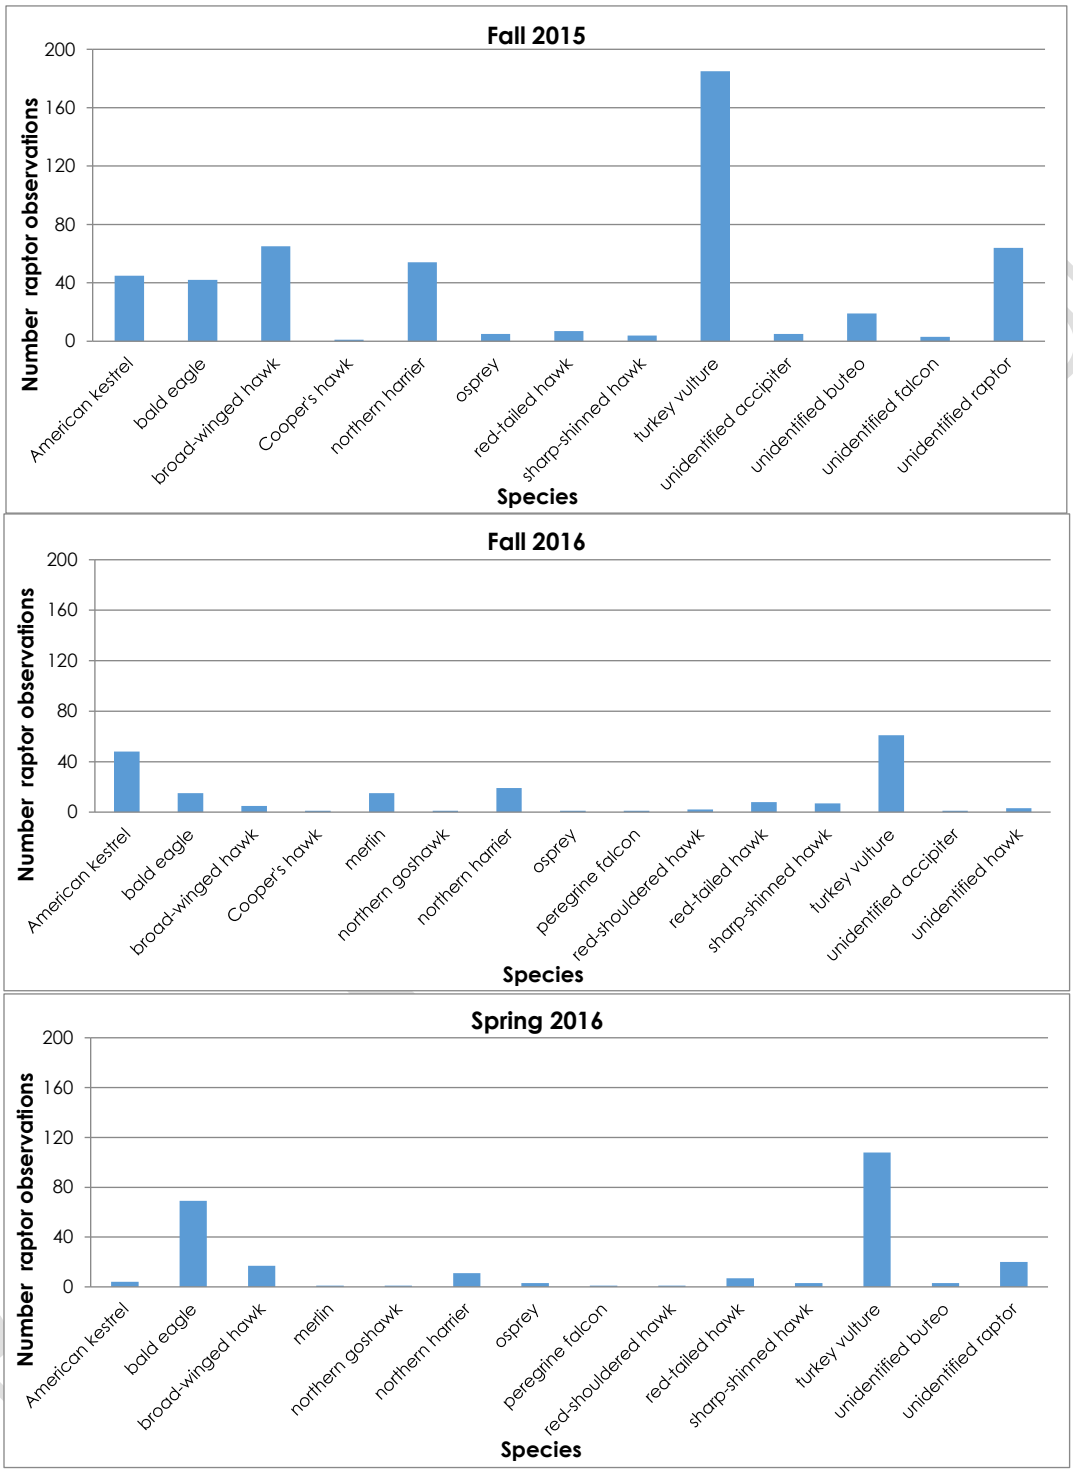

Figure 3-2. Numbers of raptor observations by species for three raptor seasons, Downeast Wind Project, 2015-2016.

3.1.2.3 Observations Per Survey Hour

In fall 2015 and 2016, observations peaked from 10:00 – 11:00 A.M. In fall 2015 this peak was distinct relative to the other hours; the hourly distribution in the other two seasons were more evenly distributed. All seasons had few observations after 5:00 P.M. (Figure 3-3, Appendix A Table 4).

Business Confidential

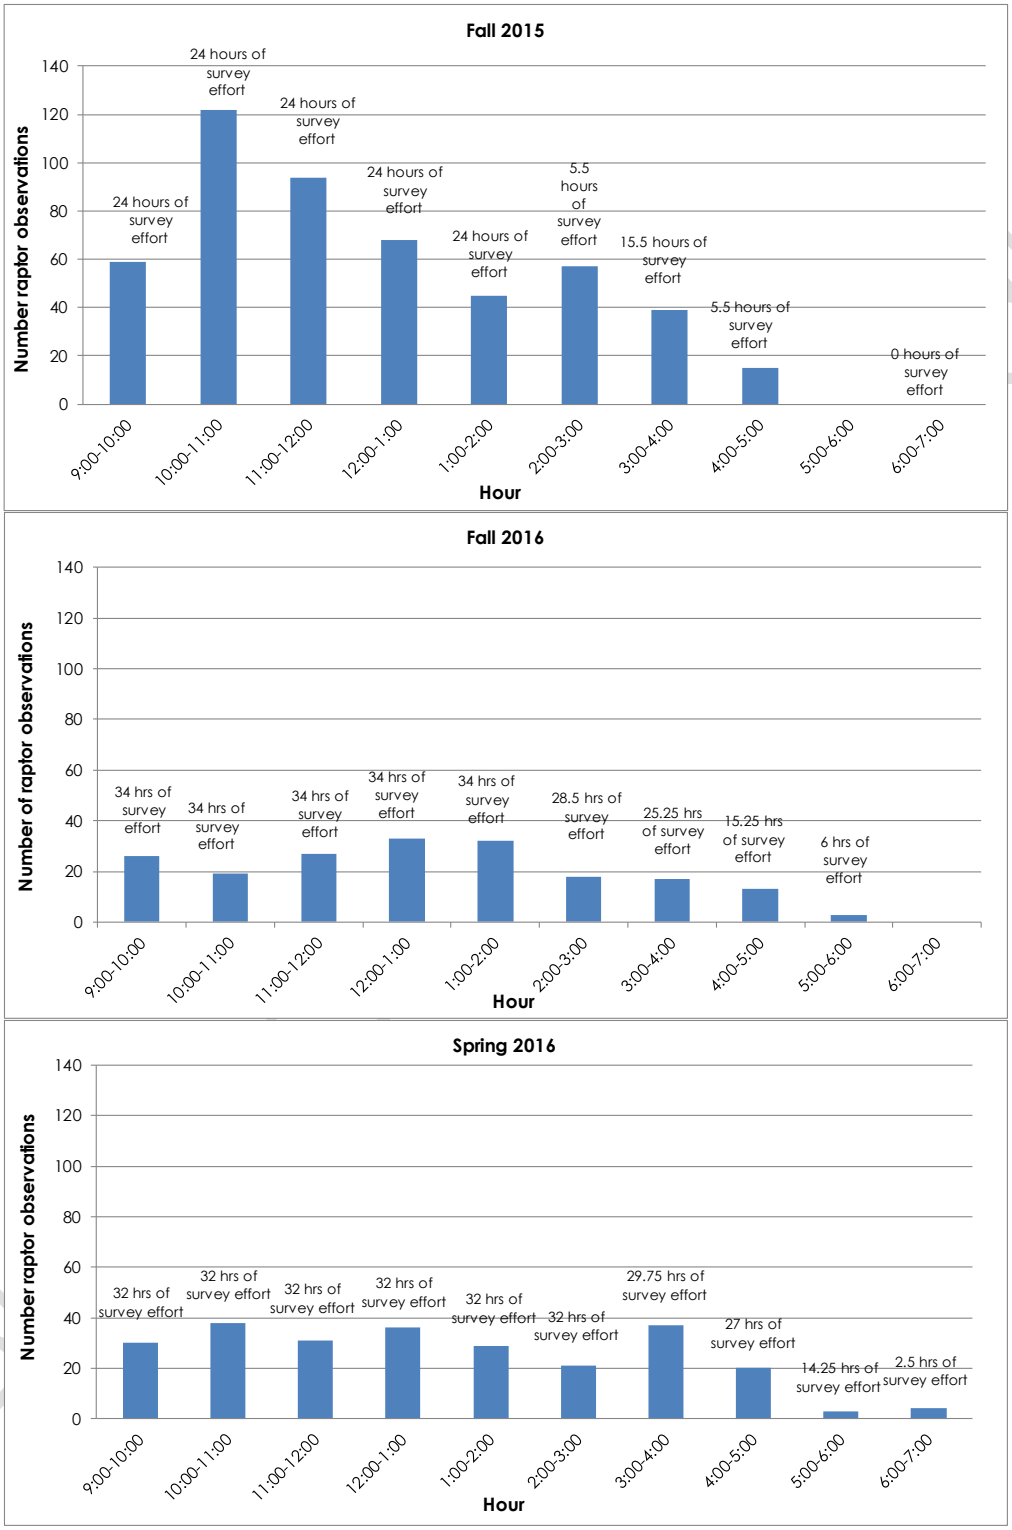

Figure 3-3. Numbers of raptor observations per survey hour for three raptor seasons, Downeast Wind Project, 2015-2016.

3.1.2.4 Flight Heights

In fall 2015, 268 of the 499 observations (54%) were observed at heights below 183 m. The average minimum flight height of all raptors observed in fall 2015 was 179 m (Figure 3-4, Appendix A Table 5).

Average flight height and percent below turbine height were similar during the fall 2016 and spring 2016 seasons. In fall 2016, 159 of 188 observations (84.6%) were observed below 183 m, and the average minimum flight height was 70 m. The most common species below turbine height were American kestrel, merlin (*Falco columbarius*), and turkey vulture. In spring 2016, 183 of 249 observations (73.5%) were observed below 183 m and the average minimum flight height was 117m.

The species with the greatest number of observations below turbine height in all three seasons were turkey vulture (n = 89 in fall 2015, n = 50 in fall 2016, n = 76 in spring 2016), followed by American kestrel (n = 45 in fall 2015, n = 47 in fall 2016), northern harrier (*Circus cyaneus*) (n = 51 in fall 2015), merlin (n = 15 in fall 2016), and bald eagle (n = 48 in spring 2016) (Figure 3-4, Appendix A Table 5).

Business Confidential

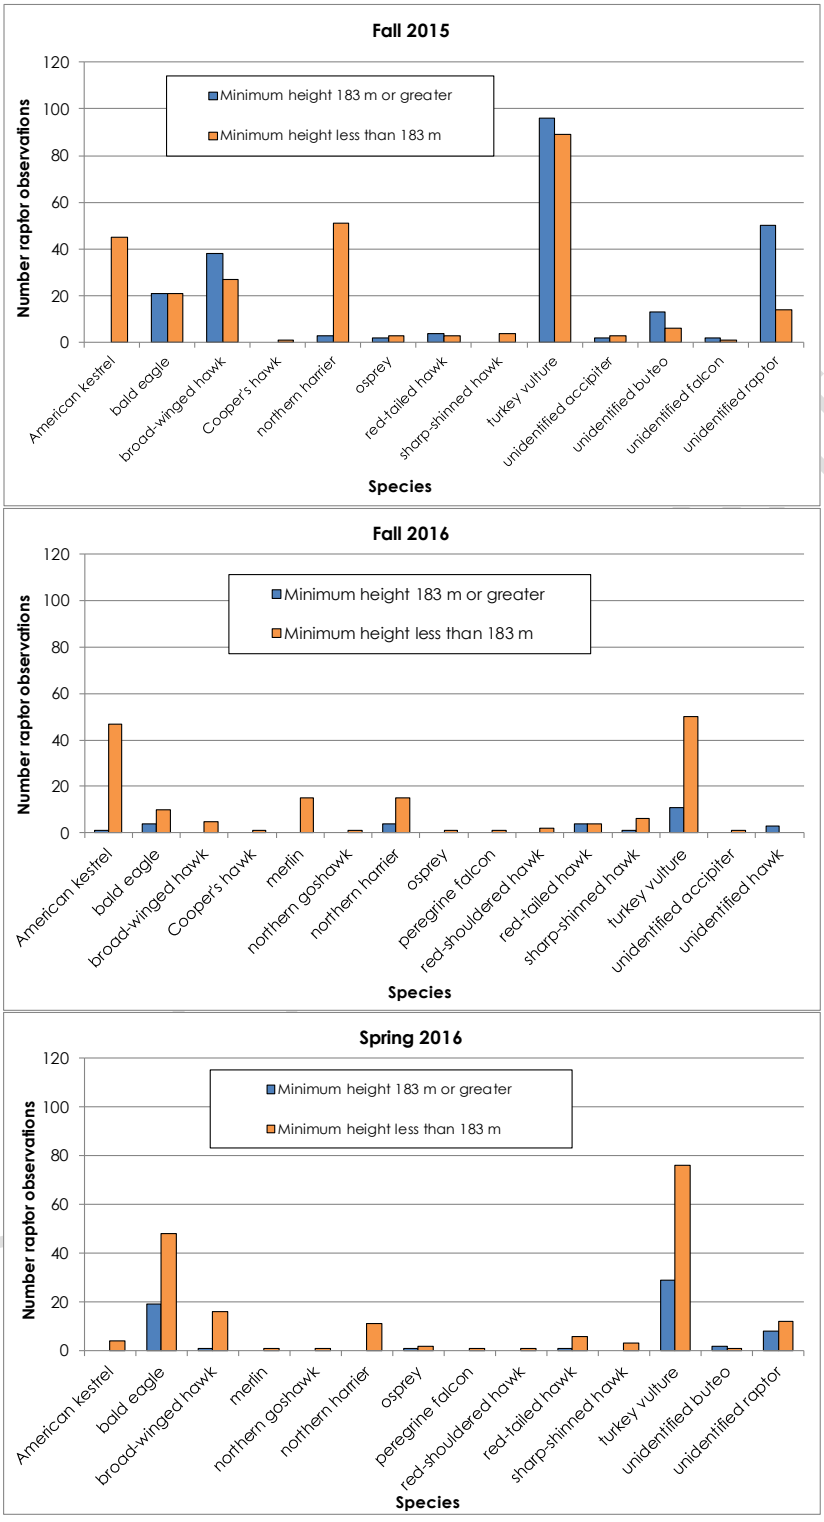

Figure 3-4. Number of raptor observations by species at heights above and below 183 m for three raptor seasons, Downeast Wind Project, 2015-2016.

3.1.2.5 Behaviors

Some raptors exhibited multiple behaviors in the Project area, resulting in more behavior observations than total raptor observations. In all three seasons, soaring and/or gliding was the most commonly observed behavior (75.7% of observations in fall 2015, 42.0% of observations in fall 2016, 77.6% of observation in spring 2016; Table 3-3). Other behaviors observed included powered flight, aerial displays, foraging, and perching.

Table 3-3. Number of raptor observations by behavior during three raptor migration seasons, Downeast Wind Project, 2015-2016.

Behavior[1]	Fall 2015		Fall 2016		Spring 2016	
	No. Obs.[2]	% Obs.	No. Obs.	% Obs.	No. Obs.[3]	% Obs.
soaring, gliding	358	75.7	102	42.0	249	77.6
powered flight	27	5.7	70	28.8	37	11.5
aerial display	2	0.4	13	5.3	9	2.8
foraging	73	15.4	52	21.4	23	7.2
perched	13	2.7	6	2.5	3	0.9
TOTAL	**473**	**100.0**	**243**	**100.0**	**321**	**100.0**

[1] Some individuals exhibited multiple behaviors.

[2] Flight behavior not recorded for 39 of 499 observations.

[3] Flight behavior not recorded for 2 of the 249 observations.

Aerial displays included both courtship and intra- and inter-species territorial displays. Bald eagles were observed exhibiting aerial displays in all three seasons with most instances in spring 2016 (80%) between 8 March and 30 March. Other species involved in aerial displays include American kestrel (n = 4), merlin (n = 4), red-tailed hawk (*Buteo jamaicensis*) (n = 3), and northern harrier (n = 1), all during fall survey periods (Appendix A Table 6). Only one aerial display occurrence was observed from the 2015 raptor survey location inside the current Project area. All other occurrences were observed from the 2016 raptor survey location outside the current Project area.

Three species and 73 observations exhibited foraging behavior in fall 2015, 8 species and 52 observations exhibited foraging in fall 2016, and 8 species and 23 observations exhibited foraging in spring 2016 (Table 3-4, Appendix A Table 6). Forty-nine percent of foraging behaviors were observed from the 2015 raptor migration location inside the current Project area and involved two species, American kestrel and northern harrier.

3.1.2.6 Rare, Threatened, and Endangered Species

No federally or state-listed threatened or endangered raptor species were observed. Bald eagles, federally protected by the Bald and Golden Eagle Protection Act (16 U.S.C. 668-668c) and a Species of Special Concern in Maine (MDIFW 2013a), were observed all three seasons, and most frequently in spring 2016 (Table 3-5).

Table 3-5. Bald eagle observations, Downeast Wind Project, 2015-2016.

Season	Number of Observations	% of Total Observations	Number flying below 183m
Fall 2015	42	8%	21
Fall 2016	15	8%	10
Spring 2016	69	28%	48

Northern harrier (*Circus cyaneus*), a Species of Special Concern in Maine (MDIFW 2013a), was observed all three seasons, and most frequently in fall 2015 (Table 3-6).

Business Confidential

Table 3-6. Northern harrier observations, Downeast Wind Project, 2015-2016.

Season	Number of Observations	% of Total Observations	Number Flying Below 183m
Fall 2015	54	11%	51
Fall 2016	19	10%	15
Spring 2016	11	4%	11

Peregrine falcon (*Falco peregrinus*), whose breeding population is state-listed endangered (MDIFW 2013b), was observed once in fall 2016 and spring 2016; both observations occurred at heights below 183 m.

3.1.2.7 Weather and Passage Rates

During fall 2015 and fall 2016 surveys winds were primarily from the north (following) (Table 3-7). Wind speeds ranged from calm (0 miles per hour [mph] to high (13-18 mph) with speeds primarily in the 4-8 mph range. Sky conditions were clear to partly cloudy with a few overcast days.

In fall 2015, the three days with the highest numbers of observation rates, 17 September (11.61 raptors/hr), 21 September (11.74 raptors/hr), and 24 September (8.8 raptors/hr), had clear skies and the presence of a high pressure system. Wind direction was generally favorable on these days; from the west on 17 September, from the northeast on 21 September, and from the northwest on 24 September. All three days had relatively moderate to high wind speeds (9-12 mph).

In fall 2016, high pressure systems were present on 73% of survey days including the three days with the highest observation rates, 30 September (3.03 raptors/hr); 22 September (7.87 raptors/hr); and 24 August (1.53 raptors/hr). Wind direction was generally favorable on these days; from the northeast on 30 September, from the northwest on 22 September, and from the west 24 August. Mean wind speed varied among days ranging from 0 to 12 mph.

In spring 2016, wind direction was more variable than in fall survey seasons both within and among survey days. Wind speeds ranged from calm (0 mph) to strong (13-18 mph), and sky conditions were clear to overcast. The two days with the highest passage rate, May 18 (3.38 raptors/hr), and 13 April (2.42 raptors/hr) had variable wind speeds, partly cloudy skies, and the presence of a high pressure system. On 18 May, winds from the south (following), and on 13 April, winds were from various directions. The day with the third highest passage rate, 8 June (2.26 raptors/hr), had winds from the north that were moderately high (9-18 mph), overcast skies, and the presence of a low pressure system. Survey days with the lowest passage rates had northerly winds.

3.2 RAPTOR USE SURVEYS

3.2.1 Survey Effort and Results Summary

Table 3-8 shows a summary of the survey effort and results for raptor use surveys in fall 2015, spring 2016, and fall 2016.

Table 3-8. Raptor use survey effort and results summary, Downeast Wind Project, 2015-2016.

	Fall 2015		Fall 2016		Spring 2016	
	Migration Count Survey	Raptor Use Survey	Migration Count Survey	Raptor Use Survey	Migration Count Survey	Raptor Use Survey
Range of survey dates	9/9-11/25	9/16-11/18	8/2-11/22	8/16-9/7	3/1-6/16	3/3-6/15
No. survey days	24	4	34	4	32	10
No. survey hours	160	24	245	22	265.5	40
No. raptor species observed	9	4	13	4	12	6
Total no. observations of raptors	499	35	292	8	249	32
Mean no. raptor observations/hour	3.12	1.46	0.77	0.36	0.94	0.80
Total no. of observations of raptors below 183 m height (% total raptor obs)	268 (90%)	26 (74%)	159 (86%)	5 (63%)	183 (73%)	26 (81%)

Wind direction during the fall 2015 and fall 2016 surveys was primarily from the north (following), and wind direction during the spring 2016 surveys was variable. Wind speeds ranged from calm (0 mph to strong (19-24 mph) with speeds primarily in the 4-12 mph range. Sky conditions were most often clear to partly cloudy with a few overcast days. The day with the highest passage rate, 2 May (3.00 raptors/hr), was mostly cloudy and a low pressure system was present (Table 3-9).

3.2.2 Raptor Observations

3.2.2.1 Observations of Species

The species with the greatest number of observations in fall 2015 were broad-winged hawk (n = 9, 26%), followed by turkey vulture (n = 8, 23%; Figure 3-5, Appendix B Table 1). The species with the greatest observations in fall 2016 was turkey vulture (n = 5, 63%). The species with the greatest observations in spring 2016 was turkey vulture (n = 16, 50%) followed by bald eagle (n = 6, 19%).

Business Confidential

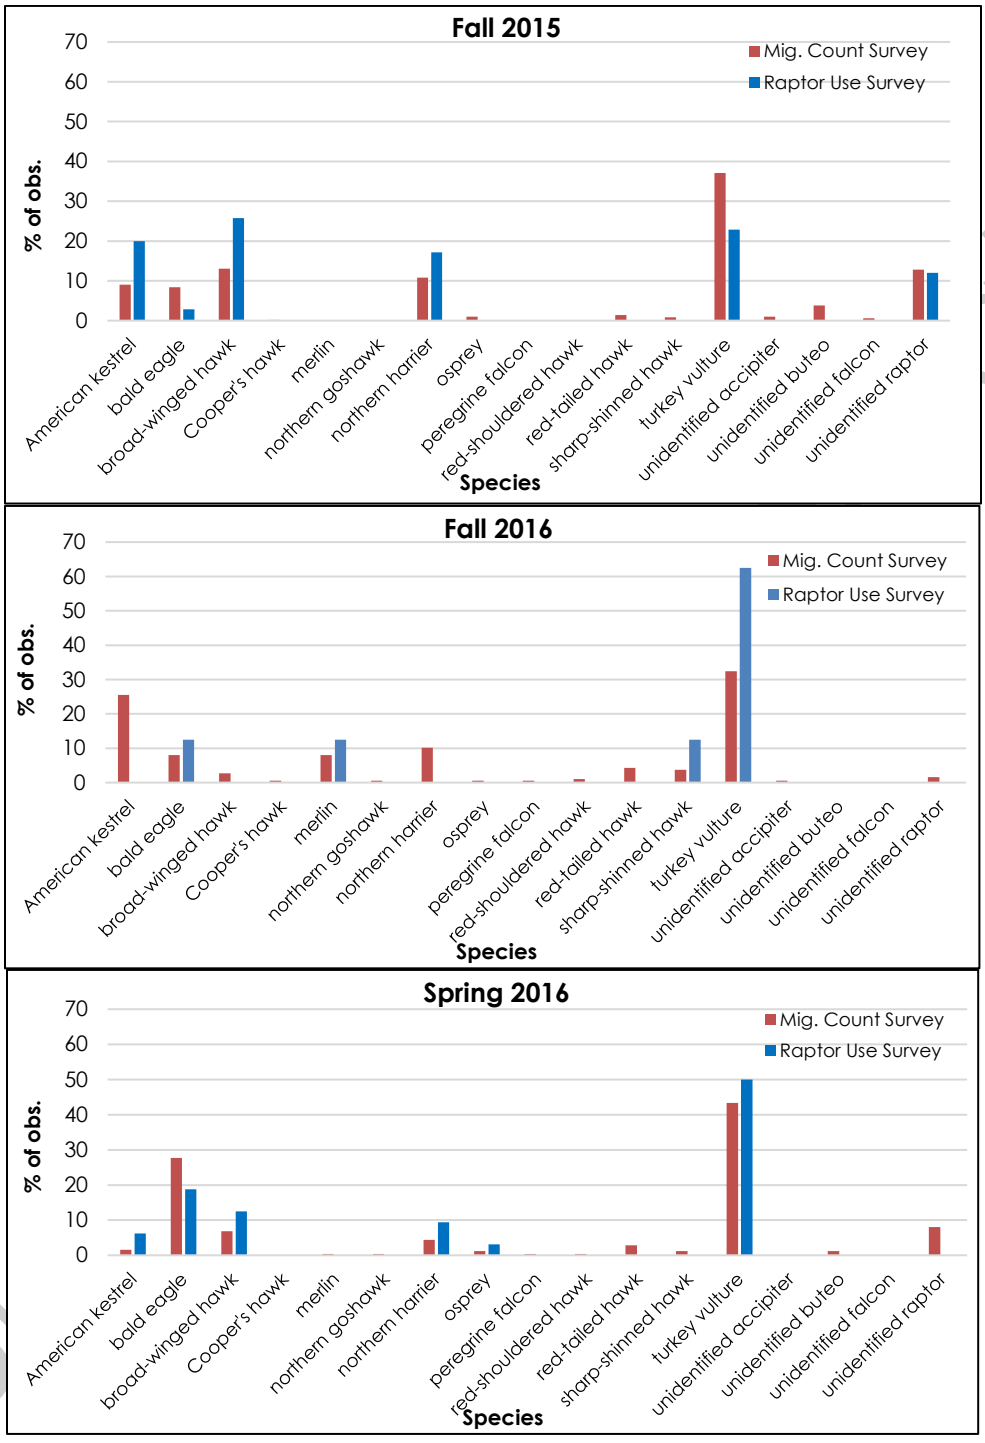

Figure 3-5. Species observed (% of total) during raptor migration and raptor use surveys for three raptor seasons, Downeast Wind Project, 2015-2016.

3.2.2.2 Daily Passage Rates

Daily passage rates ranged from 0.50 to 2.33 raptors/hr in fall 2015, from 0.00 to 0.67 raptors/hr in fall 2016, and from 0.00 to 3.00 raptors/hr in spring 2016 (Figure 3-6, Appendix B Table 2).

Business Confidential

3.2.2.3 Overall Observation Rates

Fall 2015 had the highest overall observation rates for both raptor migration count surveys (n = 3.12) and raptor use surveys (n = 1.46) (Figure 3-7, Appendix B Table 2).

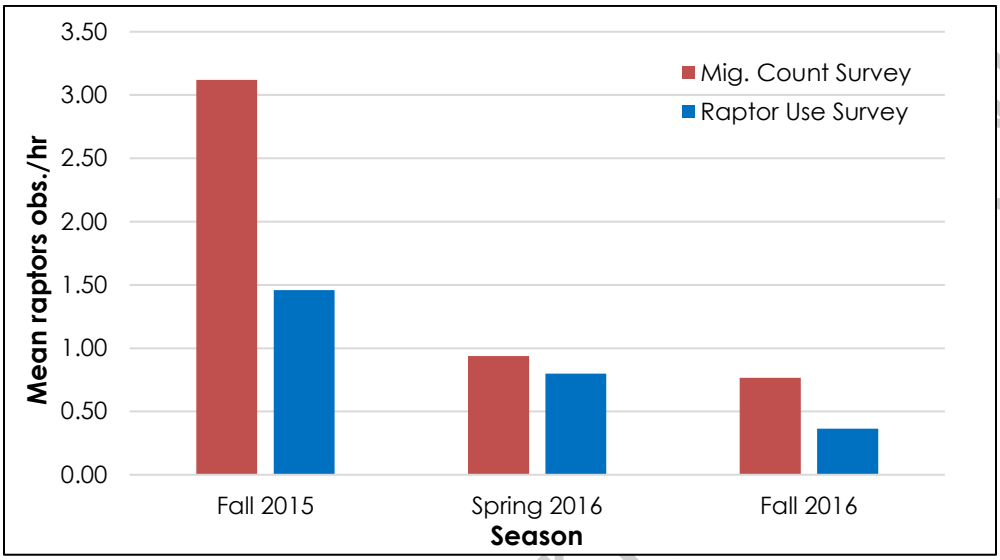

Figure 3-7. Overall raptor observation rates per study, Downeast Wind Project, 2015-2016.

4.0 DISCUSSION

The two fall survey seasons had similar periods of peak activity occurring in September and activity tapering off in November. The seasonal passage rate in fall 2015 was higher than in fall 2016, largely due to the observation of broad-winged hawk kettles (i.e., groups of birds circling in a thermal updraft). Seasonal and yearly variation in raptor migration timing, location, and species composition is common and dependent upon a variety of stochastic factors.

In general, the seasonal average passage rate for all seasons was within the range of results at proposed wind projects in Maine, New Hampshire, and Vermont (0.68–12.70 raptors/hr in the fall, and 0.5-6.78 raptors/hr in the spring (Appendix A Tables 7, 8). Species detected during each seasonal survey are species regularly observed in the region, with turkey vultures being the species most commonly observed during all three seasons.

The percentage of observations below 183 m ranged from 54% (n = 268) in fall 2015 to 85% (n = 159) in fall 2016, with turkey vultures, American kestrels, and northern harries flying at lower heights relative to other birds. The seasonal average percent below turbine height for all seasons is within the range of results at proposed wind projects in Maine, New Hampshire, and Vermont (21–100%) (Appendix A Tables 7, 8).

Business Confidential

Based on behaviors of raptors during the migration surveys conducted at DOW, some raptors appeared to be making localized movements evidenced by behaviors such as aerial displays, perching or foraging. These individuals could have been resident birds or birds stopping over during migration. American kestrel and northern harrier were observed foraging from the 2015 survey location inside the Project area. This is expected due to the blueberry and field habitats proximal to this location. Species observed from the 2016 survey location that were foraging were greater in number, likely due to the presence of more diverse habitats (e.g., pond, intact forest) providing a broader assemblage of prey species and habitat for forest-breeding raptors (e.g., sharp-shinned hawk, northern goshawk, red-shouldered hawk) proximal to the 2016 survey location.

More bald eagles were observed in spring 2016 at offsite location than in either fall season. Only one occurrence of eagles exhibiting an aerial display was observed from the 2015 raptor survey location; all others were observed from the 2016 raptor survey location outside the Project area.

Northern harriers made up a relatively large proportion of individuals observed in all three seasons, though considering the timing of these observations and the fact that blueberry fields are known foraging habitats for the species, it is likely that many harrier observations were of the same individual(s). No northern harriers exhibited territorial displays as observed from the 2015 raptor migration survey location in the Project area, and no northern harrier nests were observed in the Project area during raptor surveys.

Weather and wind influence raptor migration paths and flight heights. Wind, air temperature, and cloud cover influence the development of updrafts and thermals used by raptors making long-distance flights. In both fall 2015 and fall 2016, the days with the highest passage rate (21 September 2015 and 30 September 2016) were characterized as clear days with the presence of a high pressure system and moderate northwest winds. In spring 2016, on the day with the highest passage rate (30 March), a high pressure system was present and winds were variable winds and from the south and southwest. Generally, days with lower passage rates were days when a low pressure system was present.

Species composition was similar for raptor migration surveys and raptor use surveys during all three seasons. Overall passage rates for both survey types were highest in fall 2015, and lowest in fall 2016. Raptor migration surveys had higher daily and seasonal passage rates than raptor use surveys. This is likely due to a greater survey effort (i.e., more survey hours) for raptor migration surveys, and the observance of groups of migrants.

5.0 CONCLUSIONS

Raptor surveys conducted during spring (1 year) and fall (2 years) effectively characterized the levels and timing of raptor migratory activity at DOW. Patterns in raptor migration and use at the Project are consistent with those documented at other wind projects, and species composition was as expected based on the region and habitats present in the Project area. Raptors

Business Confidential

observed making localized movements exhibited various behaviors including perching, aerial displays and foraging. Foraging species observed from the raptor migration survey location inside the Project area included northern harrier and American kestrel.

Raptors are thought to be more at risk of collision during localized movements (Smallwood et al. 2009, Katzner et al. 2012); however, avoidance has been documented at operational wind projects. Avoidance rates estimated using the 'Band Model' (Madders and Whitfield 2006) for geese and raptor species at several existing wind farms in the U.S. were estimated at greater than 95%(Fernley et al. 2006). Avoidance of turbines at a fine scale, i.e., individual birds slightly altering their flight paths while flying between turbines to avoid colliding with blades, has been documented during fatality monitoring or targeted post-construction raptor surveys at Maine projects (Stantec 2009, 2013, 2014, 2015; Tetra Tech 2013) and projects in other areas (Chamberlain et al. 2006; Sharp et al. 2010). Yet very few raptor fatalities have been documented in the Northeast and in Maine (4 fatalities, recorded in 10 years of operating projects), likely due to such avoidance behavior. Because raptor activity at DOW is similar to that recorded at operating wind projects in Maine, and raptor fatalities at these projects have been very rare, raptor fatalities at DOW are expected to be uncommon. Monitoring of collision mortality is recommended to confirm this conclusion.

10/19/2016	11:00-12:00	northern harrier	1	A	Y	0	0:02:00	foraging	same as above
10/19/2016	2:00-3:00	northern harrier	1	A	Y	3	0:00:45	foraging	Foraging over blueberry fields
10/26/2016	10:00-11:00	northern harrier	1	A	Y	1	0:00:45	foraging	
11/1/2016	11:00-12:00	bald eagle	1	A	Y	75	0:01:30	aerial display	Seemed to be attacking each other (NOHA below); couple crows/ravens involved
11/1/2016	11:00-12:00	northern harrier	1	A	Y	75	0:01:30	aerial display	see BAEA above
11/22/2016	10:00-11:00	northern harrier	1	A	Y	2	0:01:15	foraging	
8/2/2016	10:00-11:00	turkey vulture	1	A	Y	20	0:03:30	foraging, soaring/gliding	after 1 minute, joined TUVU below, circle soaring together
8/2/2016	10:00-11:00	turkey vulture	1	A	Y	100	0:02:30	foraging, soaring/gliding	circle soaring with TUVU above
8/2/2016	11:00-12:00	turkey vulture	1	A	Y	75	0:03:30	foraging, soaring/gliding	foraging, then circle soared to get height, then shot south
8/2/2016	11:00-12:00	merlin	1	A	Y	2	0:00:30	foraging, powered flight	flew by fast
8/2/2016	4:00-5:00	merlin	2	A	Y	5	0:04:00	aerial display, powered flight	2 birds chasing, vocalizing, likely aerial display, not fighting
8/11/2016	12:00-1:00	sharp-shinned hawk	1	U	Y	25	0:00:52	foraging, soaring/gliding	soaring/flap/glide, then dove onto forest
8/23/2016	5:00-6:00	American kestrel	2	A	Y	2	0:00:50	foraging, powered flight	darting around
8/24/2016	9:00-10:00	American kestrel	1	A	Y	10	0:00:30	foraging, powered flight	
8/24/2016	10:00-11:00	merlin	2	A	Y	60	0:01:45	aerial display, powered flight	seemed to be in aerial display together, but then NOHA came on
8/24/2016	12:00-1:00	turkey vulture	4	A	Y	75	0:04:00	foraging, soaring/gliding	circling as they move slowly east
8/24/2016	5:00-6:00	northern harrier	1	A	Y	1	0:01:30	foraging, powered flight	
8/31/2016	9:00-10:00	American kestrel	1	A	Y	8	0:00:45	foraging, powered flight	flying fast, hassled a song bird
9/13/2016	9:00-10:00	northern harrier	1	A	Y	2	0:00:45	foraging, powered flight	being harassed by AMKE (see next)
9/13/2016	11:00-12:00	American kestrel	2	A	Y	10	0:02:45	foraging, powered flight	residents: not migrating
9/13/2016	4:00-5:00	turkey vulture	1	A	Y	10	0:01:10	foraging, soaring/gliding	flew right over me, headed south but not migrating (likely)
9/21/2016	11:00-12:00	turkey vulture	2	A	Y	8	0:06:00	foraging, soaring/gliding	circle soaring over field
9/22/2016	4:00-5:00	American kestrel	1	A	Y	8	0:00:45	foraging, powered flight	looking for food - resident
9/22/2016	4:00-5:00	American kestrel	1	A	Y	6	0:00:45	foraging, powered flight	resident
9/22/2016	4:00-5:00	American kestrel	3	A	Y	4	0:01:30	foraging, powered flight	could be residents or stopping for night - hover hunting
9/30/2016	9:00-10:00	red-tailed hawk	1	A	Y	200	no data	aerial display, soaring/gliding	circle soaring - constantly harrassed by AMKE (below)
9/30/2016	9:00-10:00	American kestrel	1	A	Y	200	no data	aerial display, soaring/gliding	Harrassing above RTHA whole time
9/30/2016	9:00-10:00	turkey vulture	1	A	Y	50	0:01:30	foraging, soaring/gliding	circle soaring - looks more like foraging
9/30/2016	10:00-11:00	turkey vulture	1	A	Y	50	0:04:30	foraging, soaring/gliding	circle soaring into wind
3/8/2016	1:00-2:00	bald eagle	1	A	Y	75	0:00:30	aerial display	chasing and diving on SA-BAEA (below obs)
3/8/2016	1:00-2:00	bald eagle	1	SA	Y	75	0:00:30	aerial display	being chased and dived on by BAEA (above obs)
3/19/2016	9:00-10:00	bald eagle	1	A	Y	75	0:02:15	aerial display, soaring/gliding	diving on BAEA (2) until (2) moved out of possible territory of (1) then changed direction
3/19/2016	9:00-10:00	bald eagle	1	A	Y	125	0:01:00	aerial display, soaring/gliding	being dived on by (1) until (2) moved out of possible territory by (1) - continued north
4/14/2016	11:00-12:00	turkey vulture	1	A	Y	30	0:00:30	foraging	quick glimpse popped above treeline then back down
4/14/2016	12:00-1:00	turkey vulture	1	A	Y	2	0:00:30	foraging	appeared over ridge - quick - foraging
4/28/2016	4:00-5:00	American kestrel	1	A	Y	0	0:02:00	foraging	
5/1/2016	4:00-5:00	northern harrier	1	A	Y	0	0:03:00	foraging	
5/6/2016	12:00-1:00	red-tailed hawk	1	A	Y	50	0:00:45	foraging	quickly lost sight
5/17/2016	10:00-11:00	northern harrier	1	A	Y	10	0:02:00	foraging	
6/2/2016	4:00-5:00	northern harrier	1	A	Y	5	0:02:00	foraging	
3/30/2016	10:00-11:00	bald eagle	1	SA	Y	75	0:05:00	aerial display, soaring/gliding	#5 and #6 exposed bellies and talons to each other once
3/30/2016	11:00-12:00	bald eagle	1	A	Y	75	0:07:00	aerial display, soaring/gliding	flew with #10 then split off NW after #11 joined them
3/30/2016	11:00-12:00	bald eagle	1	A	Y	75	0:08:00	aerial display, soaring/gliding	flew with #9. they dove at each other from time to time. #11 joined them. After #9 split off NW, #10 split off w
3/30/2016	1:00-2:00	bald eagle	2	SA	Y	25	0:03:00	aerial display, soaring/gliding	flew together low over trees diving at each other. #16 and #17 joined then #15 & #16 went south.
4/14/2016	2:00-3:00	northern harrier	1	A	Y	10	0:00:45	foraging, soaring/gliding	flitting around edge of field
4/18/2016	4:00-5:00	northern harrier	1	A	Y	25	0:02:00	foraging, powered flight	
4/28/2016	10:00-11:00	sharp-shinned hawk	1	A	Y	50	0:00:30	foraging, soaring/gliding	
5/4/2016	12:00-1:00	broad-winged hawk	2	A	Y	50	0:02:00	foraging, soaring/gliding	
5/6/2016	4:00-5:00	turkey vulture	1	A	Y	100	0:01:00	foraging, soaring/gliding	flying low SE of field

Appendix A Table 7. Summary of Publicly Available Fall Raptor Survey Results Conducted at Proposed (Pre-Construction) Wind Power Facilities in Maine, New Hampshire, and Vermont (1996–Present).

Project Site	Year	Landscape	Survey Period	# of Survey Days	# of Survey Hours	Total # Observed	# of Species Observed	Seasonal Average Passage Rate (raptors/hr)	(Turbine Ht) and % Raptors Below Turbine Height	Reference
Maine										
Mars Hill, Aroostook Cty, ME	Fall 2005	Forested ridge	Sept. 9 - Oct. 13	8	42.5	115	13	1.5	(120 m) 58%[1]	Woodlot Alternatives, Inc. 2005. A Fall 2005 Radar, Visual, and Acoustic Survey of Bird and Bat Migration at the Proposed Mars Hill Wind Project in Mars Hill, Maine. Prepared for UPC Wind Management, LLC.
Stetson, Penobscot Cty, ME	Fall 2006	Forested ridge	Sept. 14 - Oct. 26	7	42	86	11	2.1	(125 m) 63%[1]	Woodlot Alternatives, Inc. 2007. A Fall 2006 Survey of Bird and Bat Migration at the Proposed Stetson Mountain Wind Power Project in Washington County, Maine. Prepared for Evergreen Wind V, LLC.
Rollins, Penobscot Cty, ME	Fall 2007	Forested ridge	Sept. 13 - Oct. 16	12	89	144	12	1.8	(120 m) 82%[1]	Stantec Consulting Services Inc. 2008. Fall 2007 Bird and Bat Migration Survey Report: Visual, Radar and Acoustic Bat Surveys for the Rollins Wind Project. Prepared for First Wind, LLC.
Roxbury, Oxford Cty, ME	Fall 2007	Forested ridge	Sept. 3 - Oct. 15	14	86	96	12	1.1	n/a	Stantec Consulting Services Inc. 2008. Fall 2007 Migration Survey Report: Visual, Acoustic, and Radar Surveys of Bird and Bat Migration conducted at the proposed Record Hill Wind Project In Roxbury, Maine. Prepared for Independence Wind, LLC.
Oakfield, Aroostook Cty, ME	Fall 2008	Agricultural plateau	Sept. 26 - Oct. 14	12	84	60	8	0.7	(120 m) 67%[2]	Woodlot Alternatives, Inc. 2008. A Fall 2008 Survey of Bird and Bat Migration at the Oakfield Wind Project, Washington County, Maine. Prepared for Evergreen Wind, LLC.
Highland, Somerset Cty, ME	Fall 2008	Forested ridge	Sept 3 to Oct 31	15	135	301	10	2.2	(128 m) 43%[1]	Stantec Consulting Services Inc. 2009. Fall 2008 Bird and Bat Migration Survey Report: Radar and Acoustic Avian and Bat Surveys for the Highland Wind Project Highland Plantation, Maine. Prepared for Highland Wind LLC.
Bowers, Washington Cty, ME	Fall 2009	Forested ridge	Sept 9 to Oct 14	15	105	95	9	0.9	(119 m) 69%[1]	Stantec Consulting Services Inc. 2009. Fall 2009 Avian and Bat Surveys for the Bowers Wind Project in Washington County, Maine. Prepared for Champlain Wind Energy, LLC.
Bull Hill, Hancock Cty, ME	Fall 2009	Forested ridge	Sept 2 to Oct 14	12	87	124	11	1.43	(145 m) 98%[2]	Stantec Consulting Services Inc. 2009. Summer and Fall 2009 Avian and Bat Survey Report for the Bull Hill Project in T16 MD, Maine. Prepared for Blue Sky East Wind, LLC.
Bingham, Somerset Cty, ME (Kingsbury Ridge)	Fall 2010	Forested ridge	Sept 2 to Oct 13	12	84	57	11	0.68	(150 m) 85%[2]	Stantec Consulting Services Inc. 2010. 2010 Spring Avian and Spring/Summer Bat Surveys for the Bowers Wind Project. Prepared for Champlain Wind Energy, LLC.
Bingham, Somerset Cty, ME (Johnson Ridge)	Fall 2010	Forested ridge	Sept 2 to Oct 13	5	35	61	9	1.74	(150 m) 92%[2]	Stantec Consulting Services Inc. 2010. 2010 Spring Avian and Spring/Summer Bat Surveys for the Bowers Wind Project. Prepared for Champlain Wind Energy, LLC.
Passadumkeag, Grand Falls Twp, ME	Fall 2011	Forested ridge	Sept 9 to Oct 12	12	84	171	11	2.04	(140 m) 58%[2]	Stantec Consulting Services Inc. 2011. Summer and Fall 2011 Avian and Bat Survey Report for the Passadumkeag Wind Project in Grand Falls Township, Maine. Prepared for Passadumkeag Windpark LLC.
Hancock, Hancock Cty, ME	Fall 2012	Forested ridge	Sept 27 to Oct 17	10	69.25	158	13	2.28	(156 m) 98%[2]	Stantec Consulting Services Inc. 2012. MEMO Results of fall 2012 raptor surveys, Hancock Wind Project, Hancock County, Maine. Prepared for First Wind.
Weaver, Hancock Cty, ME	Fall 2013	Forested ridge	Sept 11 to Oct 21	10	70	62	10	0.89	(180 m) 85%[2]	Stantec Consulting Services Inc. 2014. 2014 Pre-Construction Avian and Bat Surveys – Weaver Wind Project. Prepared for First Wind, LLC.
Weaver, Hancock Cty, ME	Fall 2014	Forested ridge	Sept 18 to Nov 11	10	70	88	11	1.26	(180 m) 97%[2]	Stantec Consulting Services Inc. 2014. 2014 Pre-Construction Avian and Bat Surveys – Weaver Wind Project. Prepared for First Wind, LLC.

Executive Summary

Stantec Consulting Services Inc. (Stantec) conducted a diurnal raptor migration survey in spring 2017 for the proposed 30-turbine Downeast Wind Project (DOW or Project) in Washington County, Maine. This survey represented the fourth season and second spring season of diurnal raptor migration surveys conducted at DOW. The survey was completed as part of pre-construction planning efforts for DOW in accordance with the Maine Department of Inland Fisheries and Wildlife's (MDIFW) *Curtailment Policy and Wind Power Pre-construction Study Recommendations* (June 2015), the U.S. Fish and Wildlife Service's *Land-based Wind Energy Guidelines* (March 2012), and methods similar to those employed at other wind energy projects in Maine and the Northeast. The survey followed methods detailed in the Project Work Plan submitted to MDIFW on 19 February 2016 and updated 18 March 2016. The goal of the survey was to characterize raptor migration activity. The objectives were to document timing, species composition, and flight characteristics of migrating raptors.

Raptor migration surveys were conducted from a location inside and central to the Project area from 15 March to 15 June 2017. Surveys were completed from 9:00 A.M. to approximately 2 hours before sunset at approximately 3–4 day intervals.

In 28 survey days totaling 239 survey hours, the overall passage rate was 0.69 raptors per hour (raptors/hr). Peak migratory activity occurred in May, specifically on 4 May (2.63 raptors/hr). The species most commonly observed was turkey vulture (*Cathartes aura*) (n = 70, 42.7%), followed by bald eagle (*Haliaeetus leucocephalus*) (n = 24, 14.6%) and broad-winged hawk (*Buteo platypterus*) (n = 19, 11.6%). Flight behaviors were predominantly soaring and gliding and the average minimum flight height of all observations was 109 m (358 ft).

Raptors observed were typical of the region surveyed, and the timing of activity was similar to that at other projects in Maine and in the Northeast. Compared to the spring 2016 raptor migration survey, species composition and the seasonal passage rate were similar (0.94 raptors/hr in 2016). The timing of peak migratory activity differed from the 2016 spring survey during which peak activity was observed in late March.

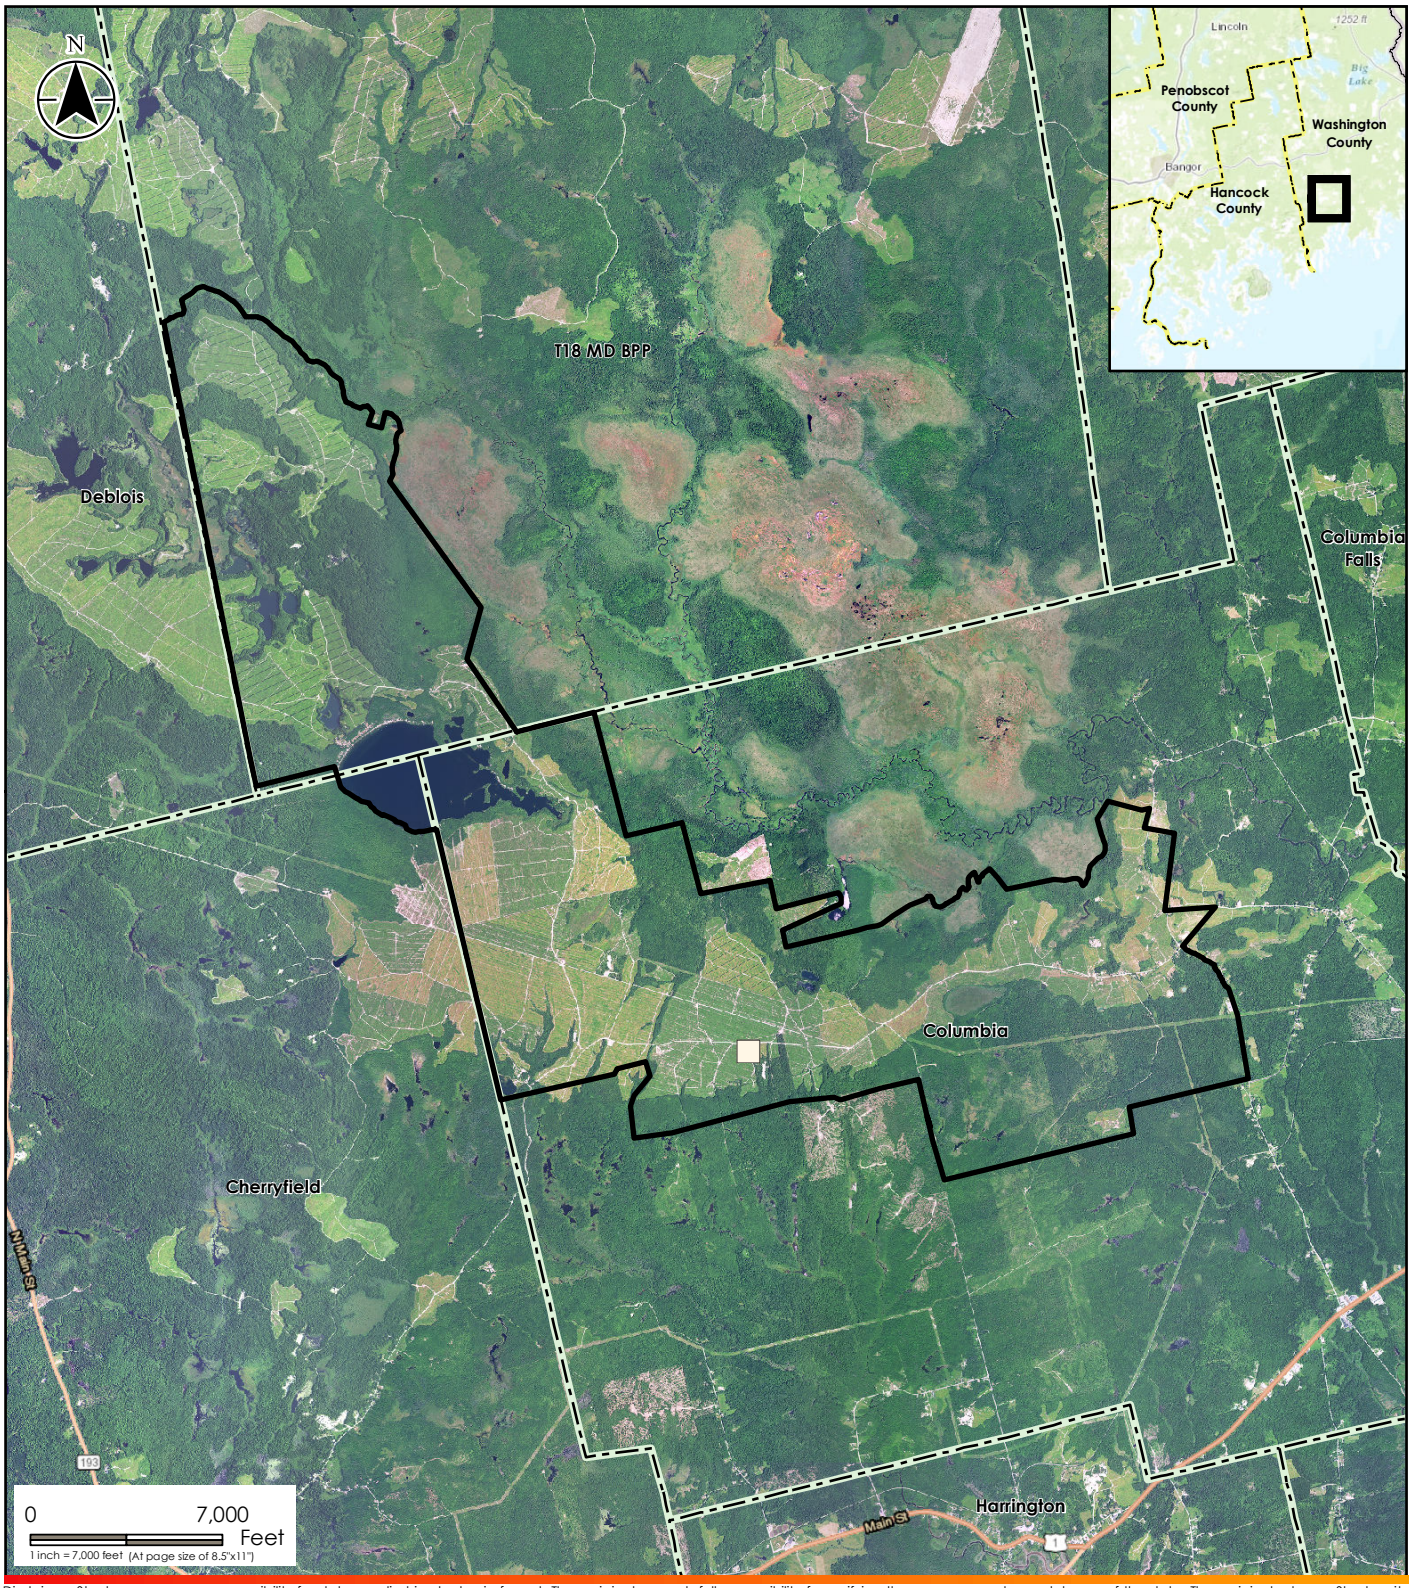
1.0 INTRODUCTION

Stantec Consulting Services Inc. (Stantec) conducted a diurnal spring raptor migration survey for the proposed 30-turbine Downeast Wind Project (DOW or Project) in Washington County, Maine. The survey represented the fourth season and second spring season of raptor migration surveys conducted at DOW. The survey was completed as part of pre-construction planning efforts for DOW in accordance with the Maine Department of Inland Fisheries and Wildlife's (MDIFW) *Curtailment Policy and Wind Power Pre-construction Study Recommendations* (June 2015), the U.S. Fish and Wildlife Service's *Land-based Wind Energy Guidelines* (March 2012), and methods similar to those employed at other wind energy projects in Maine and the Northeast. The survey followed methods detailed in the Project Work Plan submitted to MDIFW on 19 February 2016 and updated 18 March 2016. The goal of the survey was to characterize raptor migration activity. The objectives were to document timing, species composition, and flight characteristics of migrating raptors. Results of the previous three seasons of diurnal raptor migration surveys were included in *the Diurnal Raptor Migration and Use Report, Downeast Wind Project, September 2015 to November 2016* (2015-2016 Raptor Report, Stantec 2017).



2.0 METHODS

2.1 SURVEY EFFORT AND LOCATION

Surveys days were selected within the spring survey window of 15 March to 15 June based on weather forecast predictions, targeting days with optimal migration weather, i.e., fair days with thermal development and winds from the south. As a result, days with sub-optimal migration weather, e.g., moderate winds and varied wind direction, were surveyed at a lower frequency than optimal days. Surveys were conducted from 9 A.M. to approximately 2 hours before sunset. Binoculars aided in identification.

Raptor migration surveys were conducted from a location inside and central to the Project area (Figure 2-1), which was the same location used in fall 2015.

Title

Spring 2017 Raptor Survey Location

6/28/2017

2.2 DATA COLLECTION

For each observation, the following were recorded:

- Time of observation
- Species identification (when possible)
- Number of individuals
- Age class (when possible)
- Flight path drawn on a study area map
- The bird's minimum flight height above ground level
- Time below proposed turbine height (183 m), when applicable
- Flight behaviors
- Flight azimuth
- General behavior notes

2.3 DATA SUMMARY AND ANALYSIS

The following were summarized or calculated for the survey season and survey day:

- Observation rate
- Number of species and individuals
- Timing of peak activity (within and among survey days)
- Range of flight heights
- The percentage of birds seen below proposed turbine height
- Flight behaviors

For summary and analysis, a single "pass" of a raptor was considered a single raptor observation; that is, an "observation" was considered a view of a single raptor from the time it was detected to the time it flew out of view. Differentiating between individuals in most cases is nearly impossible for this type of survey, so the same individual could be detected and recorded multiple times.

3.0 RESULTS

The effort consisted of 28 survey days in which 164 raptors were observed.

3.1 PASSAGE RATE

The seasonal mean passage rate was 0.69 raptors/hr and daily passage rates ranged from 0 raptors/hr on 5 days (21 March, 24 March, 28 March, 5 April, and 20 April) to 2.63 raptors/hr on 4 May (Figure 3-1; Appendix A Table 1). Activity was variable, gradually increasing between March and early May then gradually decreasing until mid-June. Eight days (26 March, 10 April, 25 April, 9 May, 12 May, 16 May, 18 May, and 25 May), five of which occurred in May, had similar daily passage rates between 1.11 and 1.49 raptors/hr.

BUSINESS CONFIDENTIAL

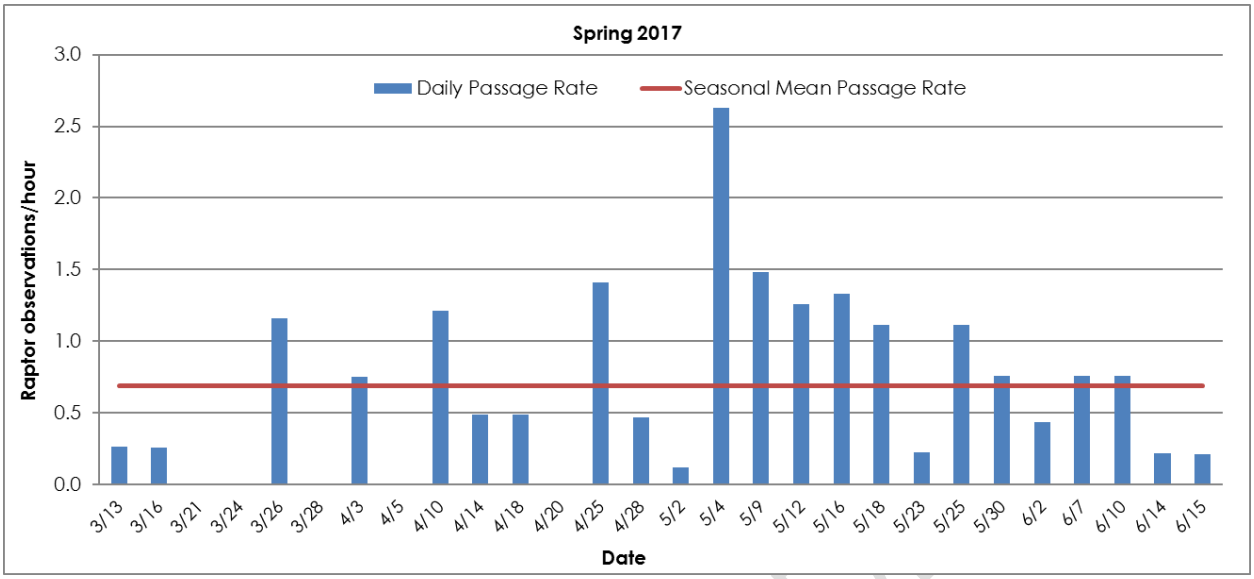

Figure 3-1. Daily mean and seasonal raptor passage rates, spring 2017, Downeast Wind Project.

Hourly observations generally were evenly distributed, with the hour of 4:00–5:00 P.M. having slightly greater activity and hour 3:00–4:00 P.M. having slightly lower activity (Figure 3-2; Appendix A Table 2).

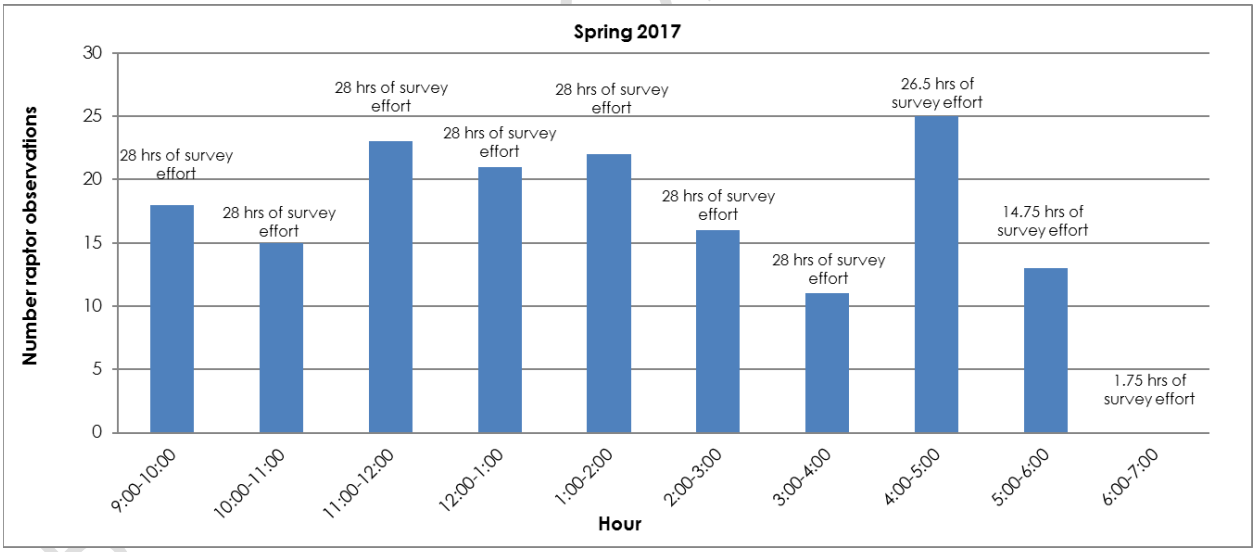

Figure 3-2. Numbers of raptor observations per survey hour, spring 2017, Downeast Wind Project.

3.1.1 Weather and Passage Rate

On survey days winds were primarily from the south (Table 3-1). Wind speeds ranged from calm (0 mph) to strong (13–18 mph); the 2 days with strongest were the first 2 survey days in March. Sky conditions were clear to overcast. No precipitation events occurred during survey days.

On the day with the highest passage rate, 4 May (2.63 raptors/hr), wind direction was variable, wind speeds ranged from 0–8 mph, sky conditions were partly cloudy to clear, and a high pressure system was advancing. Four of the 5 survey days with zero raptors observed occurred when sky conditions were cloudy or overcast and when a low pressure system was either present or advancing. Interestingly, winds on these days were southerly, favorable for migration.

3.2 SPECIES

Turkey vulture(*Cathartes aura*) represented the greatest proportion of raptors observed (42.7%; Table 3-2, Figure 3-3; Appendix A Table 1). Four species, American kestrel (*Falco sparverius*), bald eagle (*Haliaeetus leucocephalus*), broad-winged hawk (*Buteo platypterus*), and turkey vulture comprised 79.9% of total observations.

Table 3-2. Number of raptor observations by species, spring 2017, Downeast Wind Project.

Raptor Species Observed			
Common Name	**Scientific Name**	**No. obs**	**% obs**
American kestrel	*Falco sparverius*	18	11.0
bald eagle	*Haliaeetus leucocephalus*	24	14.6
broad-winged hawk	*Buteo platypterus*	19	11.6
Cooper's hawk	*Accipiter cooperii*	1	0.6
merlin	*Falco columbarius*	7	4.3
northern harrier	*Circus cyaneus*	3	1.8
osprey	*Pandion haliaetus*	2	1.2
peregrine falcon	*Falco peregrinus*	1	0.6
red-shouldered hawk	*Buteo lineatus*	2	1.2
red-tailed hawk	*Buteo jamaicensis*	5	3.0
turkey vulture	*Cathartes aura*	70	42.7
unidentified accipiter	*Accipitrinae; Accipiter (sp)*	1	0.6
unidentified raptor	*Accipitridae (gen, sp)*	11	6.7
	Total	**164**	**100.0**

BUSINESS CONFIDENTIAL

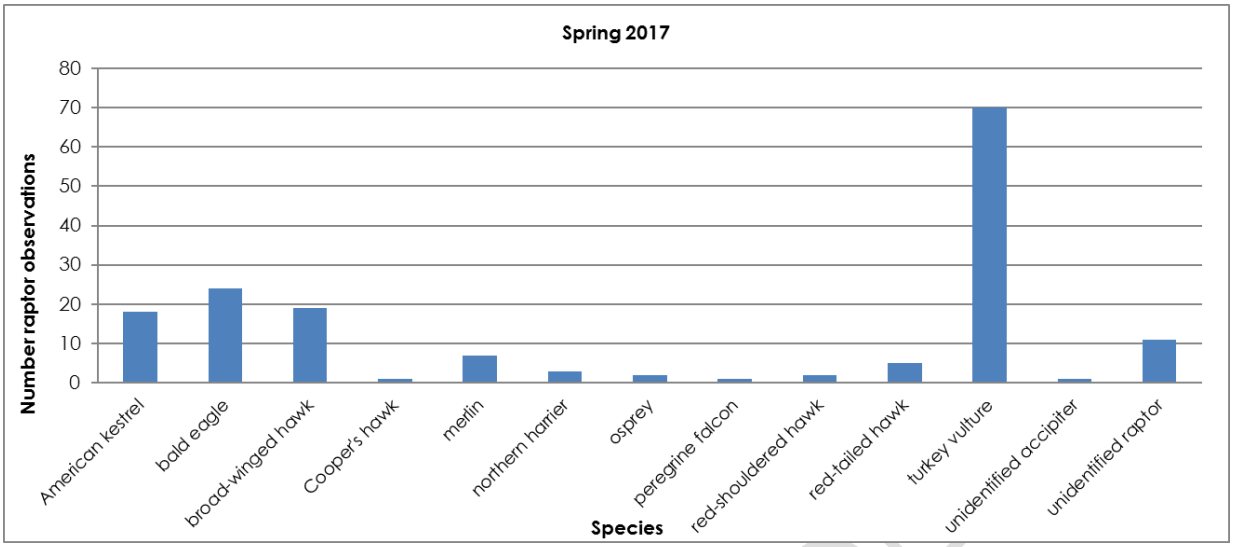

Figure 3-3. Numbers of raptor observations by species, spring 2017, Downeast Wind Project.

No federally endangered or threatened raptor species were observed. No state-listed threatened raptor species were observed. One peregrine falcon (*Falco peregrinus*), whose breeding population is state-listed endangered (MDIFW 2013b), was observed (0.6% of total observations). Twenty-four bald eagle observations (14.6% of total observations) and 3 northern harrier (*Circus cyaneus)* observations (1.8% of total observations), Species of Special Concern in Maine (MDIFW 2013a), were documented.

3.3 FLIGHT CHARACTERISTICS

Of the total 164 observations, 109 (66.5%) were observed at heights below 183 m. The average minimum flight height of all raptors observed in spring 2017 was 109 m (Figure 3-4; Appendix A Table 3). The most common species observed below turbine height were American kestrel, broad-winged hawk, and turkey vulture. American kestrel and turkey vulture commonly exhibited foraging behaviors (Appendix A Table 4).

BUSINESS CONFIDENTIAL

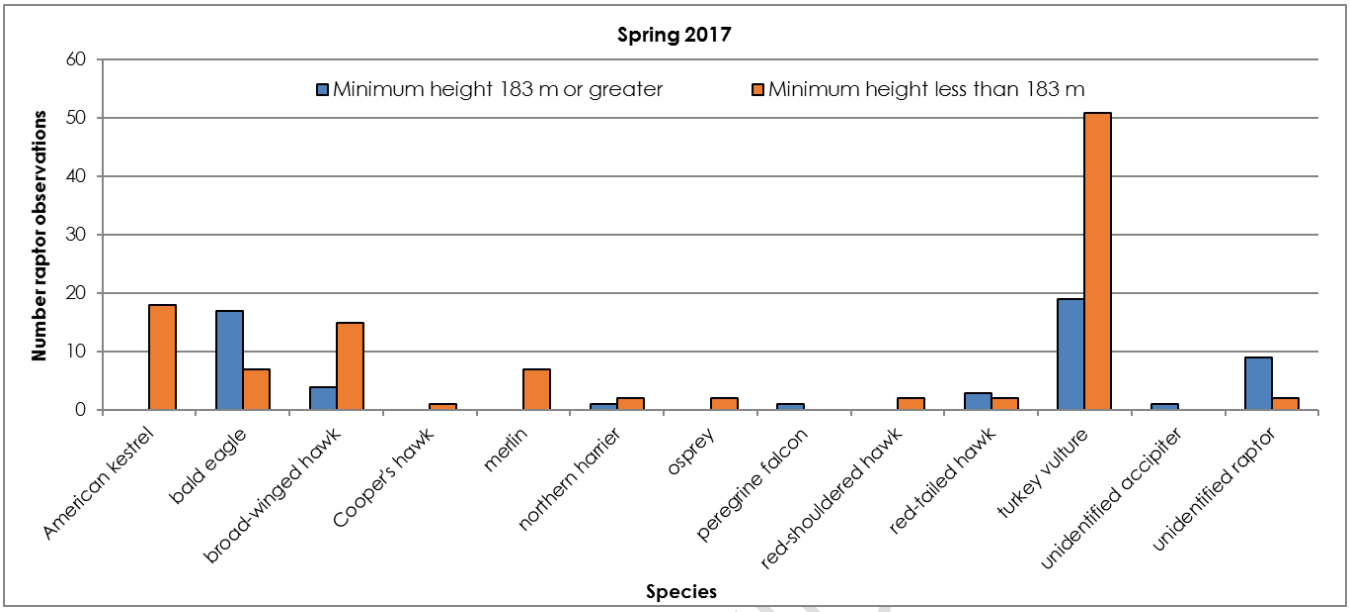

Figure 3-4. Number of raptor observations by species at heights above and below 183 m, spring 2017, Downeast Wind Project.

Some raptors exhibited multiple behaviors in the Project area, resulting in more behavior observations than total raptor observations. Soaring was the most commonly observed behavior (63.0% of observations) (Table 3-3; Appendix A Table4). Other behaviors observed included foraging, flap and glide, perched, and territorial or courtship flight.

Table 3-3. Number of raptor observations by behavior, spring 2017, Downeast Wind Project.

Behavior[1]	Spring 2017	
	No. obs.	% obs.
soaring	119	63.0
flap and gliding	21	11.1
foraging	35	18.5
territorial or courtship flight	4	2.1
perched	10	5.3
Total	**189**	**100.0**

[1] Some individuals exhibited multiple behaviors.

Foraging behavior by turkey vultures and American kestrels comprised 86.0% of all foraging behaviors (Appendix A Table 4). Other species observed foraging included broad-winged hawk and northern harrier. Two separate observations of single, foraging northern harriers occurred between 3:00 PM and 5:00 PM on 26 March and 15 June.

BUSINESS CONFIDENTIAL

Territorial or courtship flight was observed in 2 species, American kestrel and broad-winged hawk. Two American kestrels were observed exhibiting this behavior on 12 May and 2 broad-winged hawks were observed exhibiting this behavior on 18 May (Appendix A Table 6). Bald eagle observations were soaring or exhibiting powered flight; no bald eagles were observed foraging, or engaged in territorial or courtship behavior.

4.0 DISCUSSION

In general, the seasonal average passage rate for the spring 2017 season (0.69 raptors/hr) was within the range of results at proposed wind projects in Maine, New Hampshire, and Vermont (0.5–6.78 raptors/hr; Appendix A Table 5). Species detected during the survey are species regularly observed in the region. Weather, particularly the presence or passage of high pressure systems, appeared to influence passage rates.

The seasonal average percent below turbine height (66.5%) is within the range of results at proposed wind projects in Maine, New Hampshire, and Vermont (25–100%; Appendix A Table 5). Observations of turkey vulture, American kestrel, broad-winged hawk, and northern harrier exhibited foraging, territorial, or perching behavior, which typically occurs at relatively low heights and, in some cases, may be indicative of resident status. No nests of these species have been observed in the Project area. Bald eagle observations exhibited soaring or powered flight, and most observations (70.8%) occurred above turbine height (183 m).

Compared to the spring 2016 raptor migration survey, species composition and the seasonal passage rate were similar (0.94 raptors/hr in 2016). The timing of peak migratory activity differed from the 2016 spring survey during which peak activity was observed in late March. Seasonal and yearly variation in raptor migration timing, location, and species composition is common and dependent upon a variety of stochastic factors. In spring 2017, the month of March was unseasonably cold and snow events occurred well into April, which may have contributed to an observed delay in migration activity.

5.0 CONCLUSIONS

Raptor surveys conducted during spring 2017 effectively characterized the levels and timing of raptor migratory activity at DOW. Patterns in raptor migration and use at the Project are consistent with those documented at other wind projects, and species composition was as expected based on the region and habitats present in the Project area. Raptors observed making localized movements, particularly turkey vultures, American kestrels, broad-winged hawks, and northern harriers, exhibited various behaviors including perching, territorial or courtship flight, and foraging.

The collection and analysis of additional raptor migration data collected in spring 2017 does not change Stantec's conclusion in the 2015-2016 Raptor Report that raptor fatalities at DOW are

BUSINESS CONFIDENTIAL

expected to be uncommon and that monitoring of collision mortality is recommended to confirm this conclusion.

Sent via e-mail to Robert.D. Stratton@maine.gov

Dear Bob:

The following report outlines results from the Spring 2019 raptor migration surveys at the proposed Downeast Wind Energy Project located in T2 MD BPP, T18 MD BPP, and T19 MD BPP in Washington county. This was the first season of raptor survey completed in the northern portion of the project; however, two years of surveys, including 2 fall and 2 spring migration periods, were completed between 2015-2017 in the southern Downeast I Project area. Due to the low passage rate observed during this and previous studies completed at the site, we do not recommend completing additional fall raptor migration surveys.

Sincerely,

Dana Valleau
Project Manager

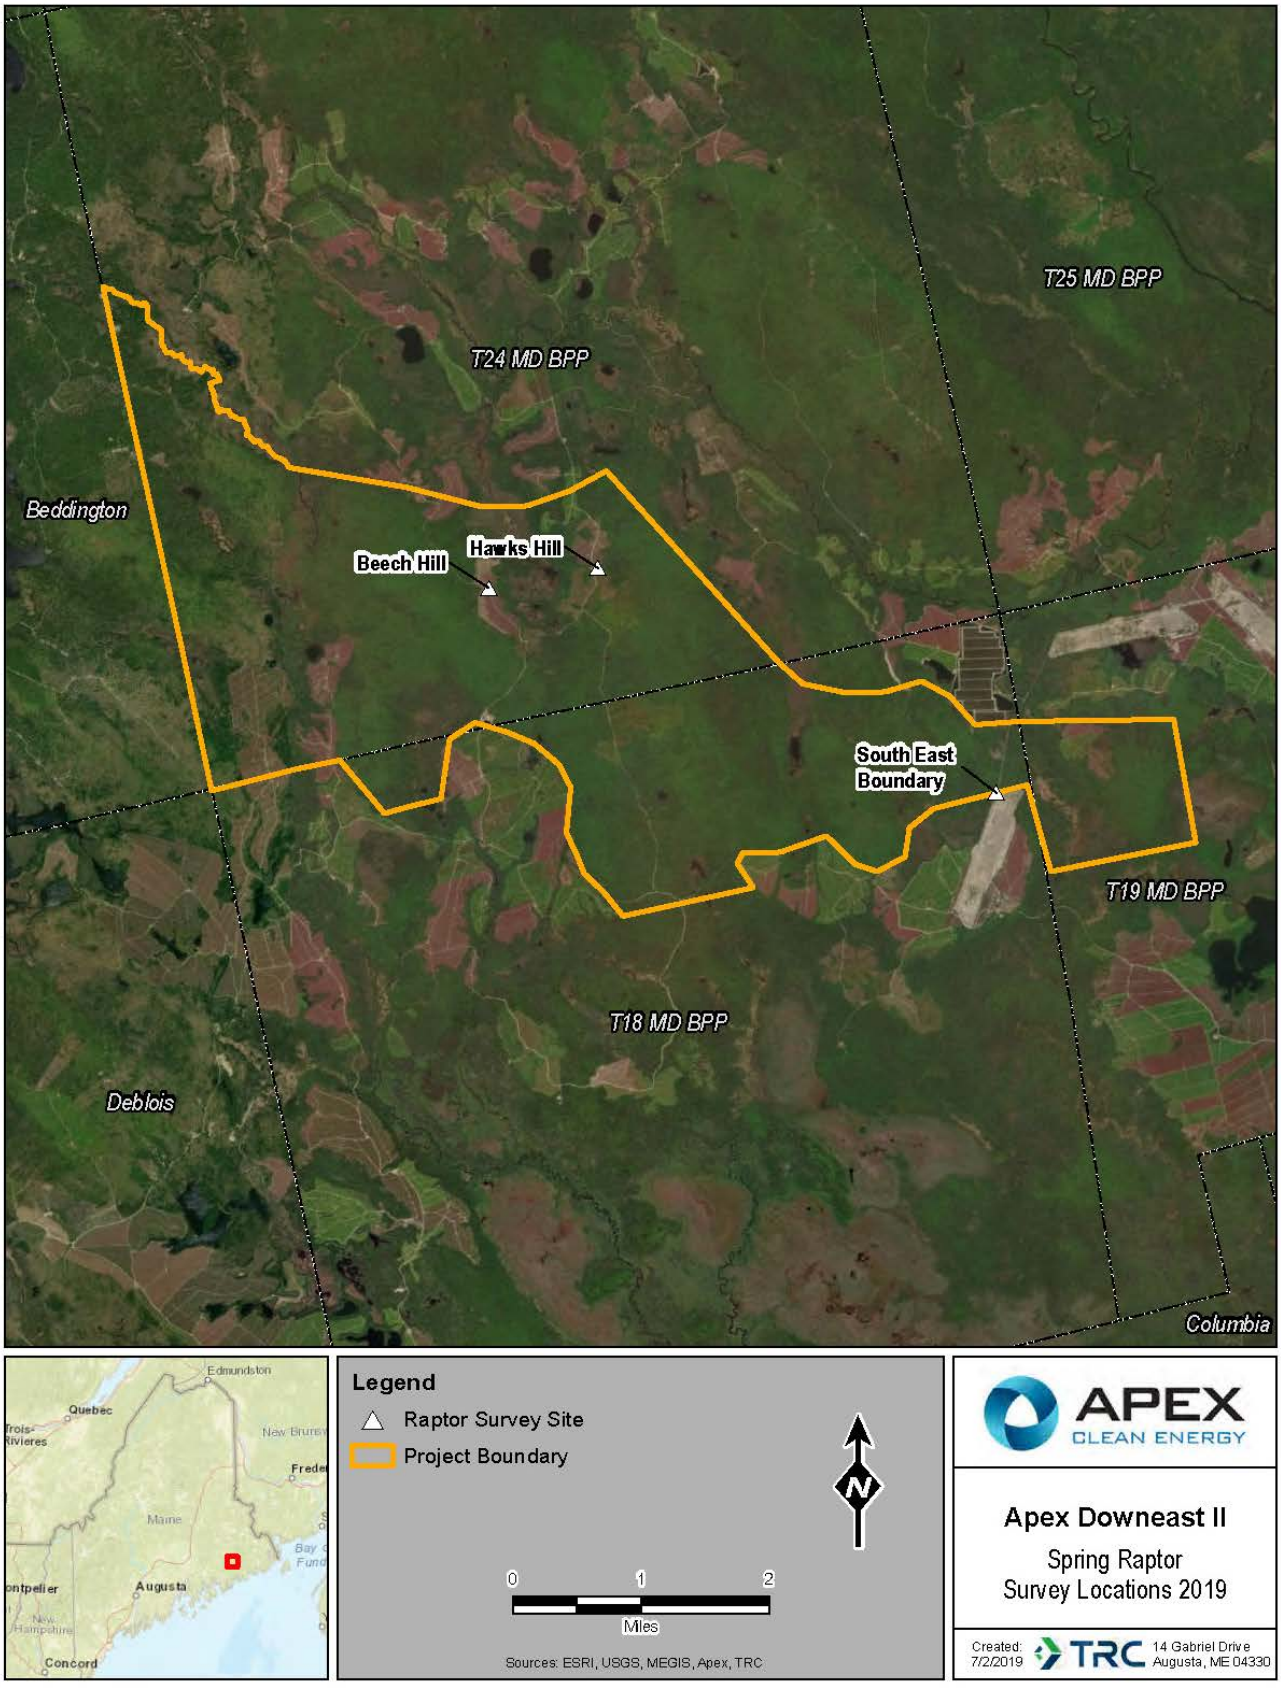
August 27, 2019

INTRODUCTION

TRC completed daytime raptor migration surveys for the proposed Downeast Wind Energy Project (Project) in Maine (Figure 1). This was the first raptor migration survey completed within the Downeast II Project area. Two previous spring and fall migration surveys were completed in the adjacent Downeast I Project area in June of 2017. The purpose of these surveys was to document raptor flight paths as they move through the Project. The survey was completed in accordance with the Maine Inland Fisheries and Wildlife (MDIFW) Maine Wind Power Preconstruction Recommendations and Turbine Curtailment Recommendations to Avoid/Minimize Bat Mortality, updated March 5, 2018.



PROJECT AREA

The Apex Downeast II Project is a proposed 197.4 MW wind generating facility located in Washington County, ME. The Project Area is mostly forested with some active and inactive blueberry barrens.

Figure 1: Project Area and Survey Locations

METHODS

Three different observation points were used for weekly surveys within the Project Boundary (Figure 1). The first site on Hawks Hill Rd was used for five of the first six surveys. Due to poor snow conditions on March 19th, surveys were conducted on the southeast boundary of the Project, as crews could not reach the Hawks Hill Rd site by truck or snowmobile. Surveys were moved to the Beech Hill Rd Site on March 27th for the remainder of the study, as the site had a wider view to the south than the Hawks Hill Site. The spring 2019 daytime raptor survey effort consisted of 221 hours and 26 minutes of observations between March 6 and June 14.

Observation points were selected to maximize views to the south for the spring migration season. Both the Hawks Hill Rd site and Beech Hill Rd site offered the best southern views within the Project boundary. Surveys were completed from 9am till two hours before sunset and all raptors including eagles were recorded.

At each survey point, the date, start and end time of the survey, and weather information (e.g., temperature, wind speed and direction, and cloud cover) were recorded for each survey. Species or best possible identification, number of individuals, sex and age class (if possible), flight height, activity (behavior), and flight path were recorded for each raptor observation.

RESULTS

A total of 91 individual raptors, representing 9 different species were observed (Table 1.1). The majority of these were turkey vultures (*Cathartes aura*), which compromised 74 percent (n=67) of all observations. The next most abundant species was bald eagle (*Haliaeetus leucocephalus*), which compromised 12 percent (n=11) of all observations (Table 1.1).

Table 1.1: Raptor species observed during the 2019 Spring Raptor Survey

Species	# of individuals	% Observations
Bald Eagle	11	12%
Broad-winged Hawk	2	2%
Coopers Hawk	1	1%
American Kestrel	4	4%
Merlin	1	1%
Osprey	1	1%
Red-Tailed Hawk	2	2%
Sharp-shinned Hawk	2	2%
Turkey Vulture	67	74%
Total	**91**	

The site on Beech Hill Rd had a passage rate of 0.5 raptors per hour (Table 1.2). Between all sites, the average passage rate was 0.41 raptors an hour. Data specific to bald eagles was also broken out in a separate table (Table 1.3).

Table 1.2: 2019 Spring Raptor Observations by hour (March 6, 2019 – June 14, 2019)

Site	Total Time (hours: minutes)	Total Raptors	Mean number of raptors/hour
South East Boundary	6:15	0	0
Hawks Hill Rd	34:47	1	0.029
Beech Hill Rd	180:24	90	0.50
All	221:26	91	0.41

Table 1.3: 2019 Eagles Observed During 2019 Spring Raptor Migration Surveys

Site	# of Bald Eagles	Eagles Per Minute
South East Boundary	0	0
Hawks Hill Rd	1	0.0005
Beech Hill Rd	10	0.00092

Raptor flight height during surveys consisted of 32%(n=29) of raptor observations below rotor swept height and 60%(n=55) within rotor swept height during some portion of their travel through the Project (Table 1.4). Of the observations within rotor swept height, 79% (n=43) were turkey vulture.

Table 1.4: 2019 Raptor Flight Height

Flight Height	# of individuals	% Observations
Below Turbine Height	29	32
Within Turbine Height	55	60
Above Turbine Height	7	8

THREATENED OR ENDANGERED SPECIES

There were no state or federally-listed endangered or threatened species observed during the spring 2019 raptor surveys.

CONCLUSION

This was the first season of raptor survey completed in the northern portion of the project; however, two years of surveys, including 2 fall and 2 spring migration periods, were completed between 2015-2017 in the southern Downeast I Project area.

Stantec conducted studies in Fall 2015, Spring 2016, Fall 2016, and Spring 2017 at the Apex Downeast I Site, south of the Downeast II Site. Each survey period is summarized below.

	Fall 2015	**Spring 2016**	**Fall 2016**	**Spring 2017**
Range of Survey Dates	9/9-11/25	3/1-6/16	8/2-11/22	3/16-3/15
No. Survey days	24	32	34	28
No. Survey hours	160	265.5	245	265.5
No. raptor species observed	9	12	13	11
Total no. observations of raptors	499	249	292	239
Mean no. raptor observations/hour	3.12	0.94	0.77	0.69
% of raptor observations below turbine height	90%	73%	86%	67%

Due to the low passage rate observed during this and previous studies completed at the site, we do not recommend completing additional fall raptor migration surveys.

ATTACHMENT A MAINE WIND PROJECTS MORTALITY REPORT.... A.1

1.0 INTRODUCTION

Downeast Wind, LLC (Downeast) proposes to construct the Downeast Wind Project (Project) in Washington County, Maine. As part of permitting the Project, Downeast has been consulting with the Maine Department of Inland Fisheries and Wildlife (MDIFW) for the past several years. Due to the duration of ongoing communications, MDIFW provided a letter to Downeast summarizing their concerns, potential resolutions, and outstanding issues (dated June 28, 2019). The MDIFW letter addressed numerous natural resources to be considered during development of the Project; however, a key focus was placed on upland sandpiper (*Bartramia longicauda*), whimbrel (*Numenius phaeopus*), migrating songbirds, and bats. The purpose of this risk evaluation and mitigation proposal, which incorporates summaries of the MDIFW letter, is to identify the key Project impacts and avoidance and minimization measures that have been implemented to reduce potential impacts to upland sandpipers, whimbrels, migrating songbirds, and bats, along with a detailed mitigation plan that further provides a net conservation benefit to these species.

Since 2015, Downeast has performed numerous surveys to document natural resources and wildlife within the Project site. The results presented herein are not an exhaustive summary of all field survey efforts conducted for the Project, but rather focus on impacts, avoidance and minimization, and mitigation for the species/species groups for which MDIFW has expressed concern.

2.0 PROJECT OVERVIEW

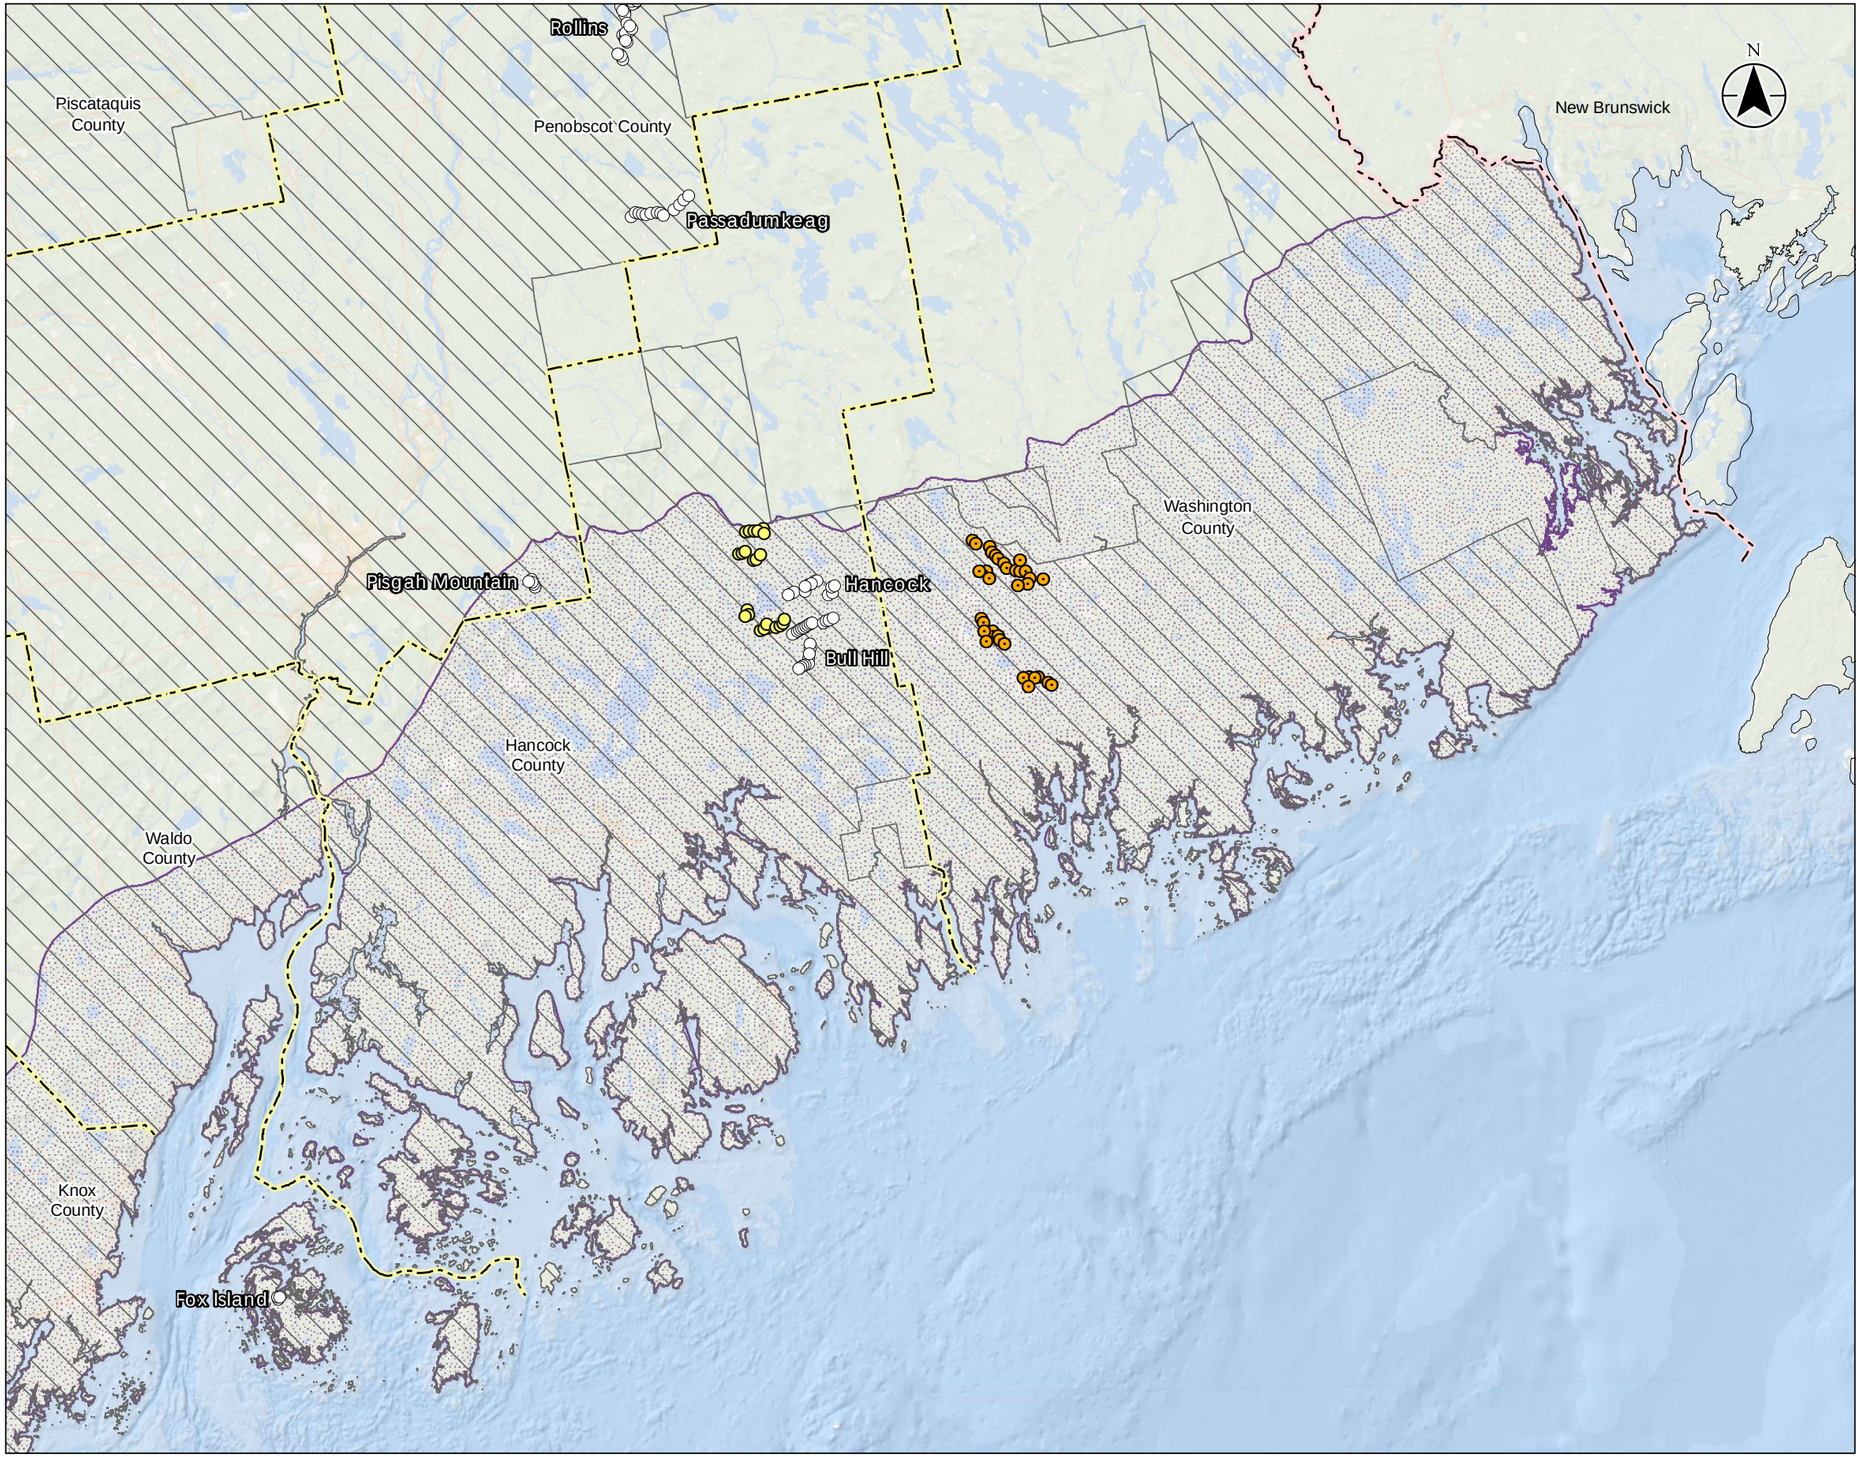
2.1 PROJECT SITE

The Project site is located in the Town of Columbia and the unorganized townships of T18MD BPP and T24MD BPP in Washington County, Maine. The Project is sited within Maine's coastal plain region, as identified by the MDIFW, and within the North American Bird Conservation Initiative's Bird Conservation Region 14 (Atlantic Northern Forest). The Project site is associated with Pineo Ridge, an extensive glacial outwash delta and moraine complex dominated by sandy deposits across an open landscape with elevations ranging from approximately 50 to 250 feet. The primary land use in this area is commercial blueberry production. The landscape also includes a network of unpaved roads used to access blueberry barrens, seasonal camps, and adjacent forested uplands for timber harvesting. Upland forests include dense windrows through the blueberry barrens planted with jack pine (*Pinus banksiana*) and early successional rocky woodland communities dominated by Red Oak – Northern Hardwoods – White Pine Forest (Gawler and Cutko 2010) in various stages of regeneration. The understory ranges from sparse to densely vegetated depending on different past and ongoing private and commercial land uses.

2.2 PROPOSED PROJECT

The Project as proposed is expected to consist of 33 turbine locations (30 sited and 3 spare sites), access roads, underground collection, a meteorological (MET) tower, two temporary power performance towers, a substation, laydown areas, and associated infrastructure. An operations and maintenance facility is

proposed for a nearby location on U.S. Route 1 in Columbia, Maine. Anticipated nameplate capacity for the Project is 126 megawatts (MW) with an expected lifespan of 30 years once operational. Through multiple consultations with MDIFW since 2015, and after review of field survey results and feedback from MDIFW, Downeast has performed numerous Project layout iterations (39 to date) to avoid and minimize impacts to natural resources to the extent practicable.



2.2.1 Comparison with Nearby Projects

In addition to statewide data, three wind projects near the Project were used for comparison to help inform use and potential risk at the Project: Bull Hill Wind Project (Bull Hill), Hancock Wind Project (Hancock), and Weaver Wind Project (Weaver). Bull Hill and Weaver provide pre-construction data for nocturnal migrating songbirds and bats in MDIFW's identified coastal plain region, and both Bull Hill and Hancock have 2 years of post-construction bird and bat fatality data.

Bull Hill is a 19-turbine facility capable of generating 34 MW located in Hancock County, Maine. Bull Hill, which went in service in 2012, is approximately 11.1 miles west of the proposed Project site and located within the coastal plain region (see Figure 1).

Hancock is a 17-turbine facility with a generating capacity of 51 MW located in Hancock County, Maine. Hancock, which is directly adjacent to Bull Hill and approximately 9.6 miles west of the proposed Project site, went in service in December 2016. As with Bull Hill, Hancock is located in Maine's coastal plain region (see Figure 1).

Weaver is a 22-turbine facility proposed in Hancock County, Maine with an installed capacity of approximately 73 MW that went in service in December 2020. Weaver is located approximately 13.7 miles west of the proposed Project site. As with Bull Hill and Hancock, Weaver is also located in Maine's coastal plain region (see Figure 1).

Title
Maine Coastal Plain in Downeast Maine

3.0 CONSULTATION HISTORY

- October 16, 2015: Initial Project information requests to state agencies, including MDIFW, MDEP, Maine Natural Areas Program (MNAP), and Maine Historic Preservation Commission (MHPC).
- February 23, 2016: Meeting with MDIFW to discuss wildlife surveys and study plans for the Project.
- March 3, 2016: Meeting with U.S. Fish and Wildlife Service (USFWS) to discuss potential Project impacts to federally listed species.
- January 19, 2017: Meeting with MDIFW to provide a Project update and review bird and bat studies.
- Based on feedback received during 2016 consultations, Downeast reduced the Project area by eliminating a large portion of land surrounding Montegail Pond. Much of the area eliminated consisted of blueberry barrens, where upland sandpipers are known to occur.
- March 2, 2017: Meeting with MDIFW to provide another Project update, review 2015-2016 survey results, and discuss 2017 study plans.
- May 31, 2017: Meeting with MDIFW to provide a Project update, review study results for bats and upland sandpipers, and discuss potential incidental take permitting.
- January 18, 2019: Interagency meeting with MDIFW and MDEP to provide a Project update and review completed studies and upcoming planned studies.
- February 20, 2019: Interagency meeting with MDIFW and USFWS to discuss potential Project impacts to upland sandpipers and whimbrels.
- April 26, 2019: Meeting with MDIFW to discuss results of field surveys for upland sandpipers and whimbrels, as well as research on these species from other sites in North America.
- November 19, 2019: Pre-Application Meeting with MDIFW, MDEP, MNAP, MHPC, and Maine Land Use Planning Commission.

4.0 UPLAND SANDPIPERS

The Project site contains suitable habitat for upland sandpiper during the species' breeding and staging seasons and is also within the migratory range of the species. In Maine, upland sandpiper, a state-listed threatened species, primarily breed in grassland-barrens recently managed for commercial blueberry production and, which are mainly seasonally maintained through mowing and burning (Vickery et al. 1994). Other areas known to support breeding upland sandpipers in Maine include grassy portions of airports and large areas of peatlands (Vickery et al. 1994; Weik 2006). The primary concerns for upland sandpipers are direct collision with turbines, habitat loss, and indirect effects of potential habitat displacement due to construction and operations.

4.1 SURVEYS

Spring grassland bird surveys were developed in consultation with MDIFW and conducted in and around the Project site from May 9 to June 23, 2016, and from April 24 to June 16, 2017 (Stantec 2018b). Summer/fall grassland bird surveys were performed from July 24 to September 9, 2016, and from August 7 to October 5, 2017. In total, grassland bird surveys were conducted at a total of 44 sites within MDIFW-mapped suitable upland sandpiper habitat. In 2016, a total of 40 sites were selected, including 16 sites within the Project area at the time. During 2017, grassland bird surveys were repeated at these same 16 sites within the Project area, at 9 sites previously surveyed in 2016 but outside of the Project area, and at an additional 4 new sites associated with recently installed MET towers. During the 2016 and 2017 surveys, upland sandpipers were detected at 32 (73%) of the 44 surveyed sites from May 3 to June 16, with no occurrences documented in fields less than approximately 35 hectares (90 acres) in size. Thirteen (81.3%) of the original 16 sites from these surveys remain within the most recent Project area. An additional three sites from the 2017 surveys associated with MET towers remain within the most recent Project area. Of these sites, upland sandpipers were detected at 10 (62.5%) of the 16 locations in 2016 and/or 2017. Twenty-nine (78%) of the total 37 upland sandpiper individuals from these sites were documented in May and June. Based on these survey results and a Project area of 7,100 hectares, the density estimate of upland sandpiper is approximately 0.005 per hectare. This estimate is lower than other survey estimates from 90 grassland-barrens sites in Maine (Vickery et al. 1994)

During the breeding season, courtship displays by upland sandpipers result in mated pairs (or individual males) rising from the ground to heights of around 30 meters (m) with a maximum height of 400 m, followed by a nearly vertical descent to the ground (Houston et al. 2011). During these displays, individual birds may fly at typical rotor sweep heights, leading to a heightened risk of collision. Outside of courtship displays, upland sandpipers fly slowly and at low elevations (Houston et al. 2011), presumably below the typical sweep of turbine blades. During grassland bird surveys at the Project site in 2016 and 2017, 13 of the total 16 (81%) observed upland sandpiper courtship displays were during mean wind speeds between 1.7 and 3.3 m per second (m/s) (Stantec 2018b). Only two courtship displays were observed when mean wind speeds were greater than 5.0 m/s. During these surveys, only two (12.5%) courtship displays reached anticipated rotor-sweep heights, estimated at 130 to 180 m above ground level.

4.2 LITERATURE SUMMARY ON WIND ENERGY EFFECTS

4.2.1 Collision

There are no records of upland sandpiper mortality at wind projects in Maine or the Northeast between 2006 and 2011 and there have been no reported mortalities from the nearby Bull Hill and Hancock wind projects. The Weaver Wind Project became operational in 2020 and is not required to completed post-construction monitoring by the agencies. In addition, Stantec maintains, and reviewed, an internal database containing 21 years of publicly available post-construction mortality (PCM) data (1997–2018), for wind projects in the U.S. and Canada, including 67 projects within the upland sandpiper's range. These projects have documented 7 upland sandpiper mortalities in 21 years, all of which occurred in Ontario, Canada and the midwestern U.S. Four of the mortalities occurred at facilities in Ontario, three at the Wolfe Island Wind

Plant (86 turbines; Stantec 2010, Stantec 2011a), and one at the Kruger Energy projects[1] (88 turbines; Stantec 2012). The remaining three mortalities occurred in the Great Plains: two at Tatanka Wind Farm (120 turbines; Graff et al. 2016) in North Dakota and South Dakota, and one at Ainsworth Wind Farm (36 turbines; Derby et al. 2007) in Nebraska.

Howe et al. (2002) spent more than 1,200 field hours investigating bat and bird mortality at 31 wind turbines in northeastern Wisconsin between 1998 and 2001. Upland sandpipers were observed a total of 297 times during diurnal point counts of the turbine sites and a reference site with regular observations in the vicinity of turbines. However, no upland sandpipers were recovered as fatalities during the study. In Canada, PCM studies of 65 wind facilities documented that upland sandpipers represent 0.27% of all mortalities recorded (Bird Studies Canada 2016). None of these studies implemented any operational controls for avoiding collision risk. The American Wind and Wildlife's Institute's (AWWI) bird fatality technical report (2019) examined 193 PCM studies at 130 wind energy projects throughout the U.S. from 2002 to 2017. Note that AWWI's reporting period overlaps with, but is different from, the reporting period reviewed by Stantec in the preceding paragraph. While there is likely overlap between the two reviews, this difference, in addition to AWWI's access to non-public data, results in different mortality results. This included 70 studies from 56 wind energy projects or phases in the Prairie avifaunal biome where upland sandpiper populations are greatest. Only six upland sandpiper mortalities from a total of four studies were noted, representing less than 0.1% of recorded mortalities (AWWI 2019). All mortalities occurred within the Central Mixed Grass Prairie and Shortgrass Prairie Bird Conservation Regions, where habitat for upland sandpiper is more abundant and populations are greater.

The Northern Great Plains contains much of North America's remaining temperate grasslands, providing important habitat for birds, including many species of grassland-dependent birds such as upland sandpiper. This region also contains more than 2,200 operating wind turbines (Graff et al. 2016), including the 120-turbine Tatanka Wind Farm and the 41-turbine Edgeley-Kulm Wind Farm. The Tatanka Wind Farm, commissioned in 2008, is sited on approximately 14,080 acres in North and South Dakota. Over 90% of turbines at the Tatanka Wind Farm were located in grassland or pasture when the project was constructed (Graff et al. 2016). The Edgeley-Kulm Wind Farm in North Dakota was commissioned in 2003, and all turbines, except for one, were sited in row-crop (e.g., corn, soybean) agricultural fields. Two consecutive years of PCM surveys were performed at each of these two facilities, totaling 2,398 carcass searches around operational turbines. The PCM sampling period coincided with spring migration, as well as the initial nesting period for most grassland nesting birds (March-June). A total of 92 mortalities were documented, 2 (2%) of which were determined to be upland sandpiper, both documented at Tatanka Wind Farm.

4.2.2 Displacement and Use

Studies have also been performed to determine if wind facilities placed in native mixed-grass prairies displace breeding grassland birds. One study evaluated three wind facilities in North and South Dakota using a before-after-control-impact (BACI) assessment (Shaffer and Buhl 2016). The three study sites included Tatanka Wind Farm, Oliver Wind Energy Center in North Dakota, and South Dakota Wind Energy Center. These facilities were situated within expanses of native grassland within a larger landscape

[1] Kruger Energy projects includes Kruger Energy Chatham and Kruger Energy Port Alma.

characterized by rolling plains interspersed with wetlands, mixed-grass prairie pastures, and few planted grasslands, hayfields, or cropland.

Results of the BACI assessment indicated no change in upland sandpiper nesting density following construction at the Tatanka Wind Farm (Shaffer and Buhl 2016). At the other two wind facilities, displacement behavior of upland sandpipers was observed following construction. At the Oliver Wind Energy Center, displacement behavior within 1 year was documented but only within 100 m of turbines, and with no effect beyond 100 m. After the first year, displacement behavior was observed at both the Oliver Wind Energy Center and the South Dakota Wind Energy Center. However, displacement behavior was similar to the first year of displacement and only occurred within 100 m of turbines at the Oliver Wind Energy Center. At the South Dakota Wind Energy Center, overall habitat displacement was observed, as well as some habitat displacement beyond 300 m. Pearce-Higgins et al. (2009) and as cited in Gove et al. (2013), referenced by MDIFW, noted habitat displacement by Eurasian curlew (*Numenius arquata*) up to 800 m away from turbines at wind facilities in the United Kingdom. The applicability of this study to understanding habitat displacement for upland sandpiper at the Project, however, is uncertain because these data were collected on a different species and outside North America. The previously described Shaffer and Buhl (2016) study was purposely designed to examine upland sandpiper habitat response to wind facilities and also occurred within the core geographic range of the species.

As is evident in the Shaffer and Buhl (2016) study results, displacement can vary by facility based on undetermined variables. It is important to consider the substantial distinctions between the surveyed facilities and the proposed Project, such as location and facility size. All of these projects occur in the Great Plains where native short grass prairie grassland habitat conditions are more abundant for upland sandpiper and where the upland sandpiper population is drastically greater than Maine (Cornell University 2017; Hodgman 2006; MDIFW 2011). Additionally, there are more than 2,200 operating wind turbines in the Great Plains Region (Graff et al. 2016), compared to the 58 operating wind turbines in the coastal plain region of Maine.

The Buffalo Ridge wind development area comprises three different facilities on Buffalo Ridge, Minnesota. The first facility was constructed in 1994 and consisted of 73 turbines (25 MW). In 1998, another 143 turbines capable of generating approximately 107 MW were added to Buffalo Ridge. The third Buffalo Ridge facility, capable of generating approximately 104 MW, was completed in 1999. The Buffalo Ridge study area consists of a 62-mile segment of the Bemis Moraine in southwest Minnesota. Vegetation types in the study area are primarily composed of agricultural crops (including corn, soybeans, small grains, and hay), pasture, and United States Department of Agriculture Conservation Reserve Program grasslands.

A BACI analysis was performed to determine potential wind power development area effects on 22 species of breeding grassland birds in the Buffalo Ridge area (Johnson et al. 2000). Trends in use for grassland breeding species recorded during point count surveys conducted over the four-year study period varied by year and study area. In 1999, 2 years after construction of the second Buffalo Ridge facility, use of turbine plots was lower than expected for all grassland breeding species combined. However, data specific to upland sandpiper use showed no significant difference following construction. A BACI analysis was also used to examine potential large-scale wind development effects at roadside plots; no significant effects were detected for upland sandpiper. Overall, Johnson et al. (200) found 7 of the 22 species of grassland

breeding birds showed reduced use near turbines, with the area of reduced use primarily occurring within 100 m of turbines. The authors concluded that at the regional scale, reduced use by birds associated with wind power development appears to be relatively minor and would not likely have any population consequences on a regional level. In conclusion, both comprehensive studies showed that displacement of upland sandpipers was not significant at most wind facilities and would likely not have a population effect at the regional level. Based on the results of these two studies, purposely designed to examine avian (including upland sandpiper) habitat use in response to wind facility development, and the small amount of marginal habitat that a few turbines intersect based on the current project layout, 100 m is a recommended distance for considering potential habitat effects to upland sandpiper from the Project.

4.2.3 Density

Bird and bat PCM surveys were conducted at the Wolfe Island Wind Plant, which is a 197.8-MW wind facility composed of 86 turbines on approximately 16,800 acres in the Township of Frontenac Islands, Ontario. BirdLife International, in cooperation with Bird Studies Canada and Nature Canada, has identified Wolfe Island as an Important Bird Area due to the presence of globally and continentally significant numbers of waterfowl species that congregate offshore during spring migration (BirdLife International 2020). Additionally, high quality grassland habitat on Wolfe Island supports an abundance of diverse grassland breeding bird species of conservation priority and also attracts wintering raptors.

Recognizing the Important Bird Area designation for waterfowl and the importance of the area to breeding grassland birds and wintering raptors, extensive pre-construction data were collected through multi-year bird and bat baseline studies on Wolfe Island (Stantec 2014b). These data were augmented with data from published and unpublished sources to generate a robust dataset from which to assess the potential effects of the project during operations. Specific to grassland birds, pre-construction point count surveys were conducted in 2006 and 2007, with post-construction point count surveys in 2010 through 2012. Paired point count surveys and area searches for grassland breeding birds were also performed. Results of the paired point count surveys did not detect a noticeable change in density within 0 to 100 m from turbines or 100 to 200 m from turbines. Of additional note, an upland sandpiper nest was found within 35 m of a turbine. In conclusion, the survey data indicated that upland sandpiper nesting density was not affected by the wind facility.

4.3 POTENTIAL IMPACTS

The Project has the potential to result in direct and indirect impacts to upland sandpipers. Potential direct impacts may include minor habitat loss and incidental take of upland sandpiper due to collision, and potential indirect impacts may include displacement due to construction of vertical structures in potentially suitable habitats. However, through consultation with MDIFW and implemented avoidance and minimization measures, both direct and indirect impacts have been significantly minimized due to reduction in the overall number of turbines within suitable habitat.

4.3.1 Collision

Upland sandpiper populations in areas where collision mortalities have been documented are substantially higher than the estimated population size in Maine. Upland sandpiper populations are highest in the native prairie lands of the Great Plains (Cornell University 2017). Specifically, in North Dakota, population estimates for upland sandpiper are approximately 198,000, as reported in 1993 (Igl and Johnson 1997 as cited in Vickery et al. 2010). Population estimates for upland sandpiper in Canada are approximately 10,000 (Morrison et al. 2001 as cited in Vickery et al. 2010), with the breeding distribution of upland sandpipers primarily concentrated in four provinces: Ontario, Manitoba, Saskatchewan, and Alberta. In Maine, the upland sandpiper population in the 1990s was estimated to be in excess of 320 (Hodgman 2006), with more recent estimates at approximately 200 pairs (MDIFW 2016).

Based on publicly available data reviewed by Stantec, in 2016 there were approximately 2,200 operating wind turbines and three documented upland sandpiper collision mortalities in the Great Plains. Relative to the Great Plains, the northeastern U.S. supports a small proportion of North America's breeding upland sandpipers (Weik 2006). Given that documented collision mortality is extremely low in areas with high populations of upland sandpipers and at projects without curtailment, it is reasonable to estimate that the collision mortality risk to upland sandpipers in Maine, where the population is small, would be even lower. Lastly, collision risk is expected to be further limited to only the courtship period when individuals may reach rotor sweep heights.

4.3.2 Habitat and Displacement

To determine potential upland sandpiper impacts from the Project as currently designed, habitat impacts were evaluated based on the following (Table 1):

1. Permanent impacts from the physical location of access roads and turbines in upland sandpiper habitat;
2. Temporary impacts[2] due to construction; and
3. Displacement effects from turbines using 100 m as supported by available literature.

Estimated Permanent Habitat Impacts

As the Project is currently designed, approximately 4.56 acres of permanent habitat impacts will occur as a result of Project access roads (4.25 acres) and turbine pads (0.31 acres). Based on habitat mapping by the MDIFW, approximately 11,005 acres of available upland sandpiper habitat is located immediately adjacent to the Project footprint (Figure 2). This area includes fields that are within or intersected by the project but extend well outside of the project boundary. Turbine impacts are associated with one turbine (T30) that clips the edge of potentially suitable upland sandpiper habitat (0.31 acres). The 4.56 acres of

[2] Areas of temporary impacts will be revegetated following Project construction.

estimated permanent habitat impacts from improvements to existing roads represent 0.04% of the 11,005 acres of upland sandpiper habitat adjacent to the Project footprint.

Turbines and Meteorological Towers

To calculate the amount of land from which upland sandpipers may be potentially displaced from turbines, Stantec applied the peer-reviewed average habitat displacement estimate of 100 m (Shaffer and Buhl 2016). Direct habitat impacts associated with turbines will only occur from one turbine, T30. Turbine T30 is located within 50 m of forest edge and provides marginal habitat since upland sandpipers do not generally occur within approximately 50 m of the forest edge. The impact calculation for this turbine considered only the portion of area in the northeastern portion of the turbine pad and excluded the area within 50 m of the forest edge (Figure 2) The habitat impacted from T30, while mapped as upland sandpiper habitat, is conservatively included in the impact calculations although currently is inactive blueberry barren with early successional tree regeneration. It is important to note that areas converting to forest with increasing woody stems are less suitable for upland sandpipers. However, due to known plans for this area to be potentially re-established as future commercial blueberry barrens, the 0.31 acres has been included in the impact calculations for turbines.

Three turbines (Turbine 22, 30, and 31 A) could potentially result in displacement impacts. In addition to turbines, potential displacement effects were also calculated from one MET tower north of T30. The displacement estimates for turbines and MET tower is 7.72 acres (Figure 3). This calculation excludes marginal habitat within 50 m of tree lines but includes habitat loss along existing road corridors that are unlikely to be suitable nesting habitat for upland sandpipers due to proximity to the road. At T22, a small portion (0.03 acres) of the area within 100 m provides potential upland sandpiper habitat. This area is adjacent to an existing road and greater than 50 m from the forest edge to the west and 50 m from a mature hedgerow to the east. Turbine 31a consists of 1.11 acres of upland sandpiper habitat displacement impact. This area is adjacent to forest edge and includes portions of an old private road. Turbine 30 includes a potential displacement area of 2.71 acres of mapped habitat but much of this habitat is currently inactive blueberry barren with patches of early successional tree species. The MET tower north of T30 has the potential to displace up to 3.86 acres of habitat but this area is currently marginal habitat, consisting of inactive blueberry barren with patches of early successional trees species and bordered to the north and east by a gravel road and to the west by a secondary two track road.

During upland sandpiper surveys in 2016 and 2017, no upland sandpipers were detected during either year from a point located approximately 150 ft northeast of the proposed T30 location. Similarly, no upland sandpipers were detected in 2016, and two were observed in 2017, at a survey point located approximately 1,300 ft east of the T22 location in a blueberry barren containing hedgerows. As noted above, Turbine 31a is located adjacent to a blueberry barren with hedgerows and approximately 4,200 ft north of two survey points. During 2016 and 2017, a total of five upland sandpipers were observed from these two locations.

Access Roads

No new roads will be constructed in upland sandpiper habitat and habitat impacts are limited to existing road widening and upgrades along the edges of existing road.

Estimated Temporary Habitat Impacts

Temporary impacts due to construction are largely associated with the underground collection system, which will be trenched during construction but immediately re-laid and allowed to revegetate following construction. A total of 14.32 acres of temporary impacts will occur for the underground collection system during construction. The majority of these impacts are collection lines will be co-located of within existing roads.

Table 1. Upland Sandpiper Habitat Impacts

Design Feature	Impact Type	Impact Acres
Access Road / Crane Path / Grading Limits	PERM	7.27
Turbine Pad (T30)	PERM	0.31
Total Impacts	**PERM**	**7.59**
Design Feature	**Impact Type**	**Displacement Acres**
Turbine T22	100-m Displacement	0.03
Turbine T30	100-m Displacement	2.71
Turbine T31a	100-m Displacement	1.11
MET Tower	100-m Displacement	3.86
Assumed Impact for Mitigation	**Total Displacement**	7.72
	Total PERM	7.59
	Total	**15.31**

As calculated in accordance with the above, the Project currently results in a total of 15.31 acres of upland sandpiper habitat impacts when considering direct habitat loss and potential habitat displacement, which represents only 0.13% of suitable upland sandpiper habitat adjacent to the Project footprint.

4.4 IMPLEMENTED AVOIDANCE AND MINIMIZATION MEASURES

The Project has undergone numerous design iterations to avoid upland sandpiper habitat to the greatest extent possible. In winter 2016, 25 turbines were proposed in upland sandpiper habitat. Subsequently, numerous design revisions have resulted in only one turbine being located in upland sandpiper habitat and displacement impacts associated with two additional turbines and a MET tower. As a result of these Project revisions, direct habitat impacts from turbines only have been reduced from a total of approximately 6.25[3] acres to 0.31 acres from a single turbine (T30). Further, these turbine locations and MET tower have been

[3] Earlier project layouts did not include civil design. Therefore, an assumed turbine pad area of 0.25 acre was selected.

microsited within 50 m of forest edge to further minimize potential habitat displacement effects. As noted previously, upland sandpipers are expected to avoid open areas closer than 50 m to mature vegetation. Project access roads and collection lines have also been sited away from suitable upland sandpiper habitat to the extent practicable, and the length of roads and collector lines within suitable habitat has been minimized. While some existing roads will be upgraded, there are no new roads proposed within upland sandpiper habitat. As designed, the Project does not fragment available upland sandpiper habitat which consists of large open fields, preferably greater than 125 to 150 acres (Vickery et al. 1994; MDIFW 2011). The Project layout considered potential habitat effects to areas near this threshold by co-locating project infrastructure to avoid fragmenting habitat or reducing the size of remaining available habitat that could lead to complete avoidance of the area, regardless of habitat quality. While habitat impacts have been limited to the edge of sandpiper habitat near one turbine or limited to upgrades at existing roads, the Project will work with MDIFW, if necessary, to consider measures to avoid potential impacts during construction.

The Project does not anticipate impacts to upland sandpiper from direct take via collision because turbines have been micro sited towards the edge of open habitat and within 50 m of the forest edge. This is based on the assumption that upland sandpipers will generally avoid these areas of marginal habitat and not be exposed to turbine activity.

5.0 WHIMBRELS

The Project site is within the migratory range of whimbrel, a Species of Special Concern in Maine. During fall migration, whimbrels concentrate at inland feeding sites where they forage in blueberry barrens and fields during the day and congregate at communal roosts at night (Ferns et al. 1979). In the Project area, whimbrels are known to move between coastal mudflats in nearby towns and blueberry barrens during daily roosting and foraging activities (MDIFW 2018c). Survey data collected in the 1980s and early 1990s suggest this region supported an estimated 600 whimbrels using blueberry barrens and intertidal habitats (Tudor 2017). The blueberry barrens in the Downeast Region are estimated to annually support approximately 100–200 whimbrels (Tudor 2017).

Whimbrels may stopover along Maine's coastal plain and use blueberry barrens between roughly July 15 and September 15, based on MDIFW survey results (MDIFW 2018c), but residence times for individual birds are unknown. Observations of whimbrels in Maine on eBird (n = 2,297) are concentrated along the coast between July and September, consistent with MDIFW observations (eBird 2020). Fall migratory routes of whimbrels and level of passage overland through Maine are not well understood; however, satellite tracking of fall routes by The Center for Conservation Biology and Canadian Wildlife Service showed a direct west to east overland passage of three whimbrels from Eastern Canada through the Maritimes (well north of the Project area), before beginning a direct open-ocean flight to South America (CCB 2012). Mean travel length (or days) of satellite tracked birds during fall migration from their breeding grounds in Canada to their Caribbean/South American wintering sites was 45.3 ± 2.2 days (Watts et al. 2019). Preliminary data from Virginia's coast indicated fall migrating whimbrels staged for 23 to 36 days before continuing their flight south (Smith et al. 2010). Individuals arriving later in the fall season appeared to stage for a longer period than those arriving earlier in the season. The primary concerns for whimbrel include potential collision with wind turbines and potential displacement.

5.1 SURVEYS

As previously described, grassland bird surveys were developed in consultation with MDIFW and were conducted at the Project in 2016 and 2017. No whimbrels were observed in the Project area during these survey periods (Stantec 2018b). Additionally, no incidental observations of whimbrels occurred while biologists were in the Project area performing other avian use surveys for the Project (e.g., breeding bird surveys, raptor migration surveys).

5.1.1 Whimbrel Observations

Whimbrels have been documented outside but adjacent to the Project area incidentally during avian use and grassland bird survey efforts (Stantec 2018b). A flock of approximately 50 whimbrels was observed on July 24, 2017, in a large, open area several miles west of the Project area in Deblois. During a site visit with MDIFW, approximately 108 whimbrels were observed northwest of the Project site near Schoodic Lake on July 27, 2019. As noted in their June 28, 2019 letter, MDIFW documented whimbrels at blueberry barrens near Schoodic Lake (Deblois, Cherryfield, Columbia), less than 1 mile west of turbine areas, during surveys in July and August 2016 and 2017. It is recognized that whimbrel foraging use of blueberry barrens is

dependent on active blueberry production and areas of use may change depending on areas that are in production. MIDFW observations in 2016 and 2017 were in expansive areas consisting of dense blueberry and lacking windrows.

5.2 LITERATURE SUMMARY ON WIND ENERGY EFFECTS

The Atlantic Canada region (particularly New Brunswick, Prince Edward Island, Nova Scotia, and Newfoundland) has been identified as a staging area for whimbrels during fall migration. Also, within the Atlantic Canada region, blueberry production is extensive, with approximately 11,000 to 13,000 hectares of blueberry barrens in New Brunswick alone (Smith and Watts 2015). To better understand population size and habitat use of whimbrels on the Acadian Peninsula of New Brunswick, aerial and ground surveys during fall migration were performed on the Acadian Peninsula, including approximately 1,448 hectares of blueberry barrens. Survey results indicate that the Acadian Peninsula appears to support a significant portion of the total whimbrel population that uses Atlantic Canada during fall migration. Additionally, over 99% of all whimbrels detected originated from blueberry barrens, suggesting that tidal influences on behavior are negligible.

The Wind Energy Bird and Bat Mortality Monitoring Database includes mortality data for five wind facilities (92 total turbines) in the Atlantic Canada region. Despite high whimbrel use in this area during fall migration, no whimbrel mortalities have been documented at any of these facilities (Bird Studies Canada 2016). One of these facilities is in Lingan, Nova Scotia, and consists of seven turbines that began operating in 2007. The Lingan Wind Farm is located along the northeastern coast of Nova Scotia, immediately adjacent to the Atlantic Ocean, and occurs within the Atlantic Flyway.

Post-construction bird monitoring was conducted at this facility to document bird use around the turbines and bird mortality due to the turbines and to evaluate which species were most at risk of collision due to their behavior (McCorquodale 2009). Point count surveys were performed from June 2008 to May 2009 to document bird use of areas around the turbines. Carcass searches were conducted to document bird mortality resulting from the facility. To determine species potentially at risk of colliding with the turbines, observational surveys were performed to count the number of birds flying between turbines, with attention to those at the height of the turbine blades.

The same species that commonly nested at the site in 2005 were also the most common nesting birds observed in 2008 (McCorquodale 2009). Additionally, the assemblage of birds that foraged and roosted around the wind turbines from 2008 through 2009 was similar to those observed during pre-construction surveys performed in 2005. Point count surveys conducted at the facility from June to August 2008 identified whimbrel as one of the 25 most frequent summer species observed; however, no whimbrel fatalities were recorded. Whimbrels observed during the study occurred within 50 to 100 m of turbines, with the number of whimbrels recorded at turbine sites and control sites remaining consistent indicating no potential displacement.

5.3 POTENTIAL IMPACTS

The Project anticipates a low risk to whimbrels from either collision or indirect habitat impacts. The Project layout has been modified to microsite turbine locations outside of blueberry barrens to minimize impacts to known foraging habitat. Lastly, despite this species' generally low flight heights, turbine locations have also been re-sited to avoid potential flight paths (and potential collision risk) during whimbrels' travel between coastal foraging areas and the blueberry barrens where MDIFW documented whimbrels during July and August 2016 and 2017 surveys.

5.3.1 Collision

PCM surveys of bird fatalities from the Bull Hill and Hancock have documented no whimbrel mortalities. Though suitable stopover habitat does not exist at these projects, they are located within the coastal plain and potentially within the migratory route. Stantec conducted a search of documented fatalities at existing wind energy facilities through PCM studies. AWWI's bird fatality technical report examined 193 PCM studies at 130 wind energy projects throughout the U.S. from 2002 to 2017 and documented no whimbrel mortalities (AWWI 2019). In Canada, PCM studies of 65 wind facilities also documented no whimbrel mortalities (Bird Studies Canada 2016). There are currently no reported mortalities resulting from 195 wind projects in the U.S. and Canada, including sites with known whimbrel use. In addition, other than during courtship displays on breeding grounds in Alaska and Canada, whimbrel flight patterns when traveling over water or between roosting sites are often low and in long lines (Bent 1929 in Skeel and Mallory 1996). Skeel and Mallory (1996) also report that flight height over land during migration is high, but without reference to specific distances above ground.

While the Project believes collision risk for whimbrels is low based on the reports available, the further micro siting of turbines in or near the edge of blueberry barrens and closer to forest edges is proposed as an additional avoidance measure. MDIFW's concern is that whimbrels may be exposed to turbine collision during their flights between coastal mud flats to the south and blueberry barrens. As a result of micrositing, whimbrels traveling directly between the coast and blueberry barrens within the Project area will encounter no turbines in their flight path. MIDFW notes from their 2016 and 2017 surveys that whimbrels feeding on the mud flats 2 hours on either side of low tide were observed leaving in a northerly direction presumably toward the blueberry barrens. During a falling tide MDIFW observed whimbrels flying in a southerly direction presumably back to the mud flats. Whimbrel roosting areas are suspected to be offshore.

As a result, due to this species' general preference for low flight heights when traveling between foraging areas, their short seasonal presence in the area, turbines being sited outside of their presumed flight path, and the absence of detected carcasses during PCM surveys at other wind facilities within the species' range, Downeast believes the Project poses a very low collision risk, and whimbrel mortality is not anticipated.

5.3.2 Habitat and Displacement

Based on the current Project design, permanent and temporary impacts during construction to foraging habitat (i.e., blueberry barrens) for whimbrels match the values provided for upland sandpiper in Section

4.3.2 (Figure 2), recognizing that whimbrel use of the area will change based on blueberry production. Habitat displacement from the Project is not expected, as research conducted by McCorquodale 2009 did not indicate any habitat displacement effects on whimbrels from turbines or any staging habitat limitations resulting from wind facilities. In addition, available habitat in the form of blueberry barrens is available and more plentiful outside the Project area. Since the scientific literature provides no examples of individuals being displaced from suitable habitat around turbine sites at operational wind facilities and because whimbrels are known to change foraging locations based on blueberry production, habitat displacement effects are not anticipated.

5.4 IMPLEMENTED AVOIDANCE AND MINIMIZATION MEASURES

While Downeast does not anticipate any Project impacts to whimbrel from direct take, the Project has undergone numerous design iterations to avoid blueberry barrens to the greatest extent possible to minimize potential impacts to whimbrel.

- In winter 2016, 25 turbines were proposed in blueberry barrens.
    - Numerous design revisions have resulted in removal of all proposed turbines from the middle of blueberry barrens with only one turbine, T30, at the edge of a blueberry barren. Additionally, T30 is located between two forest stands connected to a blueberry baren fragment by hedgerows. As of 2019, this location is not actively managed for blueberry production, which further reduces habitat suitability for whimbrels.
- Project access roads and collector lines have been sited away from blueberry barrens to the extent practicable, and the length of roads and collector lines within blueberry barrens has been minimized.
- Eleven turbines sited within the flight path from Harrington Bay to the blueberry barrens near Schoodic Lake (where MDIFW has documented whimbrel use) were removed and relocated outside this flight path. No turbines in the current layout are within the presumed flight paths for whimbrel traveling from coastal areas to the south.

6.0 NOCTURNAL MIGRANTS

The coastal plain is an important region for millions of migrating birds during both the spring and fall migration periods and is an area of significant concern to the MDIFW (MDIFW 2018a). In their June 28, 2019, letter, MDIFW indicated that the concentration of migratory birds in the coastal plain “is greater than in other areas of Maine, and the seasonal and daily movement patterns are unique for represented guilds.” Additionally, the MDIFW maintains that records from nocturnal radar monitoring surveys in Maine to date have indicated that Maine’s coastal plain is subject to some of the highest passage rates recorded in New England.

6.1 SURVEYS

Nocturnal migration radar surveys were conducted in fall 2015, spring 2016, and fall 2016 to document passage rates for migrating birds in the Project area. Surveys were performed for 20 nights per season, for a total of 60 survey nights. The mean passage rate in fall 2015 was 920 (±52) targets/kilometer/hour (t/km/hr) (Stantec 2017b). In 2016, the mean passage rate was 469 (±39) t/km/hr in the spring and 486 (±30) t/km/hr in the fall. The overall mean passage rate for the Project was 529 t/km/hr. The seasonal mean flight height was 428 (±1) m in fall 2015, 384 (±2) m in spring 2016, and 465 (±1) m in fall 2016. Seasonal mean flight heights in all seasons were > 200 m, which is above the maximum blade-tip height (200 m) of the proposed Project turbines.

The passage rates documented for the Project are consistent with the results from other radar surveys completed in the coastal plain (Figure 4). While some seasonal results in the coastal plain are among the highest in the state, other seasons are consistent with radar surveys results across Maine with similar seasonal high radar passage rates observed at inland sites.

6.1.1 Other Radar Studies from Coastal Plain

Bull Hill Wind Project

Prior to construction of Bull Hill, Stantec conducted nocturnal radar surveys of migratory songbirds in fall 2009, spring 2010, spring 2011, and fall 2011 (Stantec 2011b,c). Passage rates ranged between 387 (±21) t/km/hr in spring 2010 and 614 (±32) t/km/hr in fall 2009 (see Figure 4). Flight heights ranged from 217 (±8) m in spring 2010 to 371 (±3) m in spring 2011. Average flight heights were greater than 200 m or general tip height of proposed turbines.

Weaver Wind Project

Stantec conducted pre-construction nocturnal radar surveys of migratory songbirds in spring 2014, fall 2014, and fall 2016 at Weaver (Stantec 2014a; see Figure 4). Passage rates ranged between 543 (±28) t/km/hr in fall 2016 and 806 (±56) t/km/hr in spring 2014. Flight heights ranged from 365 (±2) m in spring 2014 to 479 (±1) m during fall 2016. Average flight heights were greater than 200 m or general tip height of proposed turbines.

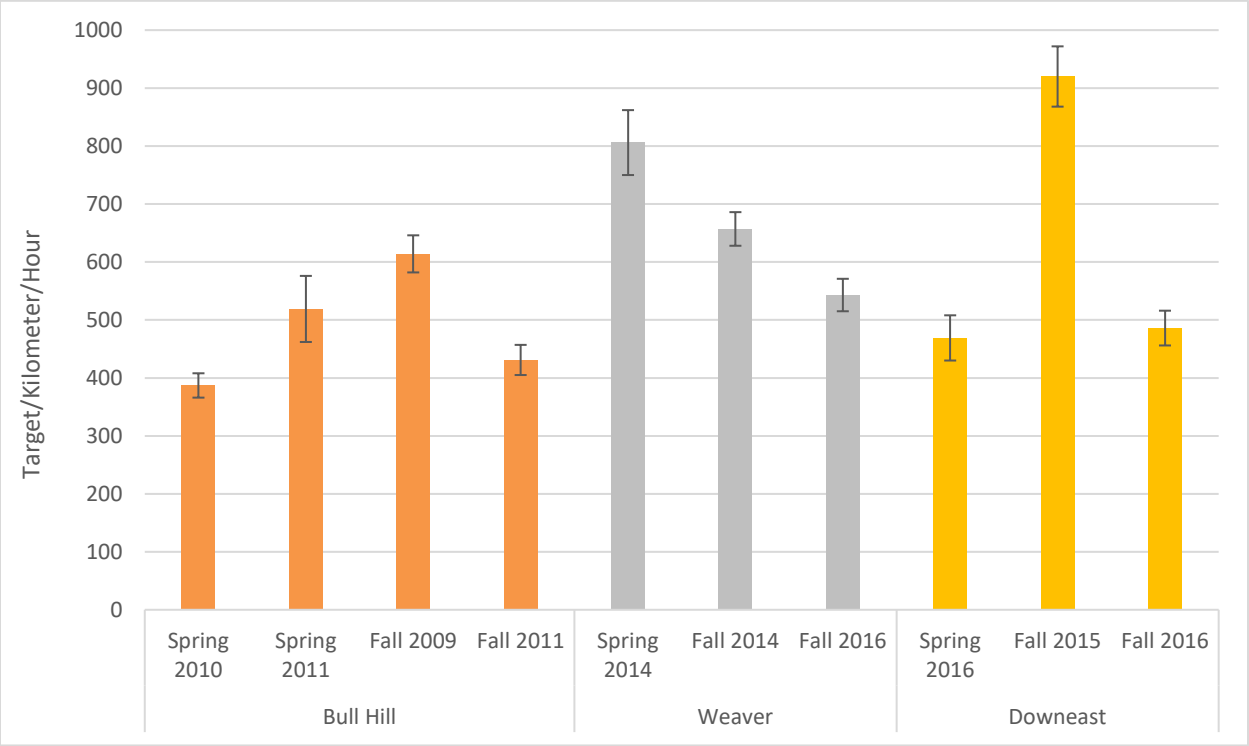

Figure 4. Nocturnal Migrant Passage Rates at Bull Hill, Weaver, and Downeast

6.1.2 Other State, Regional, and National Projects

Stantec reviewed publicly available nocturnal radar results from other Maine, regional, and national wind projects to further compare the results of their 2015 and 2016 nocturnal radar surveys of the Project area. The Project area's overall average passage rate of 529 t/km/hr falls within the upper third of documented mean passage rates from 14 total Maine wind projects from across the state, including Bull Hill and Weaver (Figure 5; Stantec 2018a; Attachment A). Note that the overall passage rate was heavily skewed by particularly high rates on two nights in fall 2015; rates during other sampling periods were in the range of 400 t/km/hr. Additionally, the Bingham and Highland Wind Projects, which recorded some of the highest passage rates, are located outside of the coastal plain region.

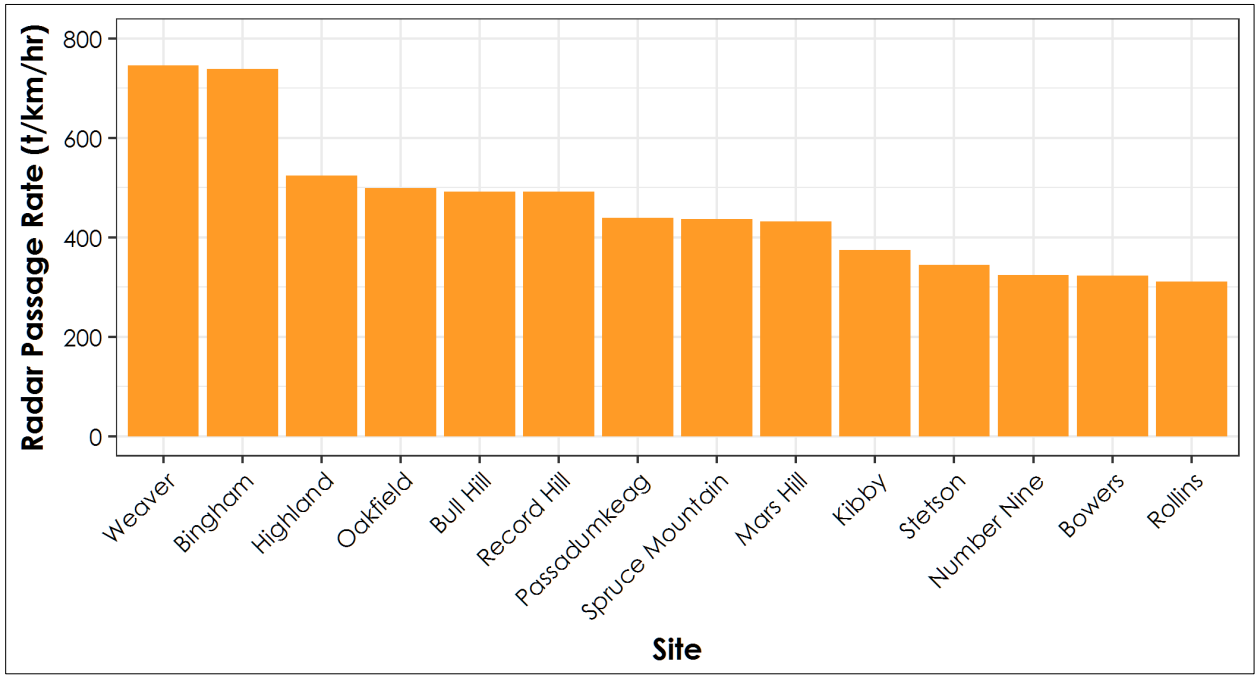

Figure 5. Mean Radar Passage Rates from Pre-Construction Surveys at Maine Wind Projects

Stantec maintains a database of avian passage rates from previous monitoring reports for wind facilities. Stantec examined fall passage rates from monitoring reports for 67 wind projects, mostly in the Northeast between 2004 and 2017. Fall passage rates averaged 408 (±26 SE) t/km/hr with mean flight heights of 401 (±10 SE) m (Stantec, unpublished data). Similarly, spring passage rates for 54 wind projects available out of the 67 wind projects, mostly in the Northeast between 2005 and 2017, averaged 367 (±24 SE) t/km/hr with mean flight heights of 372 (±11 SE) m (Stantec, unpublished data. Between 2007 and 2010, Walsh et al. (2017) examined bird migration (14,000,000 targets over 16,360 hours of radar operation) using marine radar at two sites along the gulf coast of Texas. Mean autumn passage rate was 1,186 t/km/hr and was 46% higher than spring passage rates. These rates are higher than the passage rates documented in Maine, yet passerine mortality rates in the gulf coast of Texas have not been significantly higher. This again indicates that nocturnal passerine migration passage rates are not indicative of passerine mortality at a site. This may be because passerines are flying well above rotor swept areas for turbines. In addition, most projects reduce lighting to the greatest extent practicable to avoid attracting and causing potential collision of nocturnal migrants.

6.2 LITERATURE SUMMARY ON WIND ENERGY EFFECTS

Significant wind facility development occurs within important migratory concentration areas. One such example is Gulf Wind, which is a 283-MW facility comprised of 118 turbines on the Gulf Coast of Texas that began commercial operation in 2009. The facility is close to the Gulf Coast and near several National Wildlife Refuges specifically designated for concentrated avian staging and wintering habitat. Additionally, the facility occurs in an area where birds from the Central and Mississippi Flyways converge, resulting in significant concentrations of migrating and wintering birds. PCM surveys were conducted for Gulf Wind in

2009–2010 and 2010–2011. Results of PCM surveys indicated that mortality rates at the Gulf Wind site were near national averages and risk to migrating songbirds was low despite high passage rates detected during radar surveys (AWWI 2017).

Research by Kerlinger et al. (2010) examined avian mortality data from studies at 30 wind facilities across North America to estimate how many nocturnal migrants collide with turbines. Results of the avian mortality data demonstrate that mortality rates of nocturnal migrants at wind facilities is low, ranging from one to seven mortalities per turbine per year. Similarly, Erickson et al. (2014) compiled data from 116 PCM studies at wind facilities in the U.S. and Canada to estimate the annual rate of small-passerine mortality. The 116 studies analyzed represented 15% of current operating capacity for all wind facilities in the U.S. and Canada, and most of these studies were conducted in the northern third of the contiguous U.S. For all wind facilities in operation at the time of the analysis, Erickson et al. (2014) estimated that wind turbines cause 2.10 to 3.35 small-passerines/MW of installed capacity. Using the most conservative estimates, this analysis determined that less than one-tenth of one percent of the continent-wide population for each species is estimated to be killed annually by collisions with wind turbines.

In a recent study by the American Wind and Wildlife Institute small passerines were the dominant bird group (85.4% of total fatalities) noted by 17 monitoring events at wind facilitates in the Northern Forest region (AWWI 2019). This region includes portions of Minnesota, Wisconsin, Michigan, New York, New Hampshire, Vermont, and Maine. Within the small passerines group, forest dwelling species were the most commonly noted fatalities (as a percentage of all observations) with red-eyed vireo (*Vireo olivaceus*), golden-crowned kinglet (*Regulus satrapa*), magnolia warbler (*Dendroica magnolia*), common yellowthroat (*Geothlypis trichas*), black and white warbler (*Mniotilta varia*), ovenbird (*Seiurus aurocapillus*), northern parula (*Parula americana*), ruby-crowned kinglet (*Regulus calendula*), ruffed grouse (*Bonasa umbellus*), and bay-breasted warbler (*Dendroica castanea*) as the top 10 species (AWWI 2019).

Stantec (2018c) examined the relationship between pre-construction avian surveys (i.e., passage rates) with recorded post-construction bird fatalities across 11 operational wind facilities in Maine. Results showed no strong or consistent relationship between the measured level of pre-construction bird activity and calculated mortality rates from PCM surveys after wind operations began. The lack of any pattern in Maine wind facilities matches with similar studies across North America, supporting the conclusion that measures of bird activity alone are not meaningful predictors of actual observed avian mortality. Post construction monitoring studies from nearby wind projects are likely better indicators of bird fatality rates.

6.3 POTENTIAL IMPACTS

The Project has the potential to result in direct impacts to nocturnal migrants, composed primarily of small forest passerines, due to collision mortality as demonstrated by other studies (Erickson et al. 2014). Conservative estimates indicate that mortality will be low and will not have population-level impacts on passerines, as is the case for other wind farms located in higher passage rate areas (Erickson et al. 2014).

6.3.1 Collision

MDIFW has indicated their concern that the coastal plain presents unique challenges in evaluating Project-related risks to migratory birds due to documented high passage rates and weather conditions that may force birds to fly at lower heights, potentially increasing collision risk (MDIFW 2018c). As previously discussed in Section 6.2, high passage rates do not correspond to an increased risk based on national (Erickson et al. 2014) or Maine-specific studies (Stantec 2018a).

Gulf Wind, in the same general area where Walsh et al. (2017) reported the high mean passage rates previously presented in Section 6.2, averaged a bird fatality rate of 4.91 birds/MW/year during 1,449 surveys at 8-day intervals and 3,000 daily searches (AWWI 2017).

Bull Hill PCM surveys were conducted in Year 1 (2013) and Year 2 (2014) of operation. Based on these surveys, mortality estimates were 12.13 birds/turbine/study period (6.73 birds/MW) and 6.28 birds/turbine/study period (3.48 birds/MW) in 2013 and 2014, respectively (Stantec 2015a; Stantec 2015b). Bird mortality estimates for Years 1 and 2 at Bull Hill were on the upper end of the range of estimates reported from other wind facilities in New England.

Hancock PCM surveys were also conducted in Year 1 (2017) and Year 2 (2018) of operation. The mortality estimates were 4.56 birds/turbine/study period (1.38 birds/MW) and 2.35 birds/turbine/study (0.71 birds/MW) in 2017 and 2018, respectively (TRC 2017a; TRC 2018). Bird mortality rates during Years 1 and 2 at Hancock were on the low end of the range of estimates reported from other wind projects in New England and were also much lower than those observed at Bull Hill, even though these facilities are directly adjacent to one another. Finally, mean annual bird fatality estimates from 22 PCM events at Maine wind projects across the state are provided in Figure 6 and show fatality rates in the Coastal Plain were highly variable suggesting there is no pattern in the relationship between the Project's location and calculated annual bird mortality.

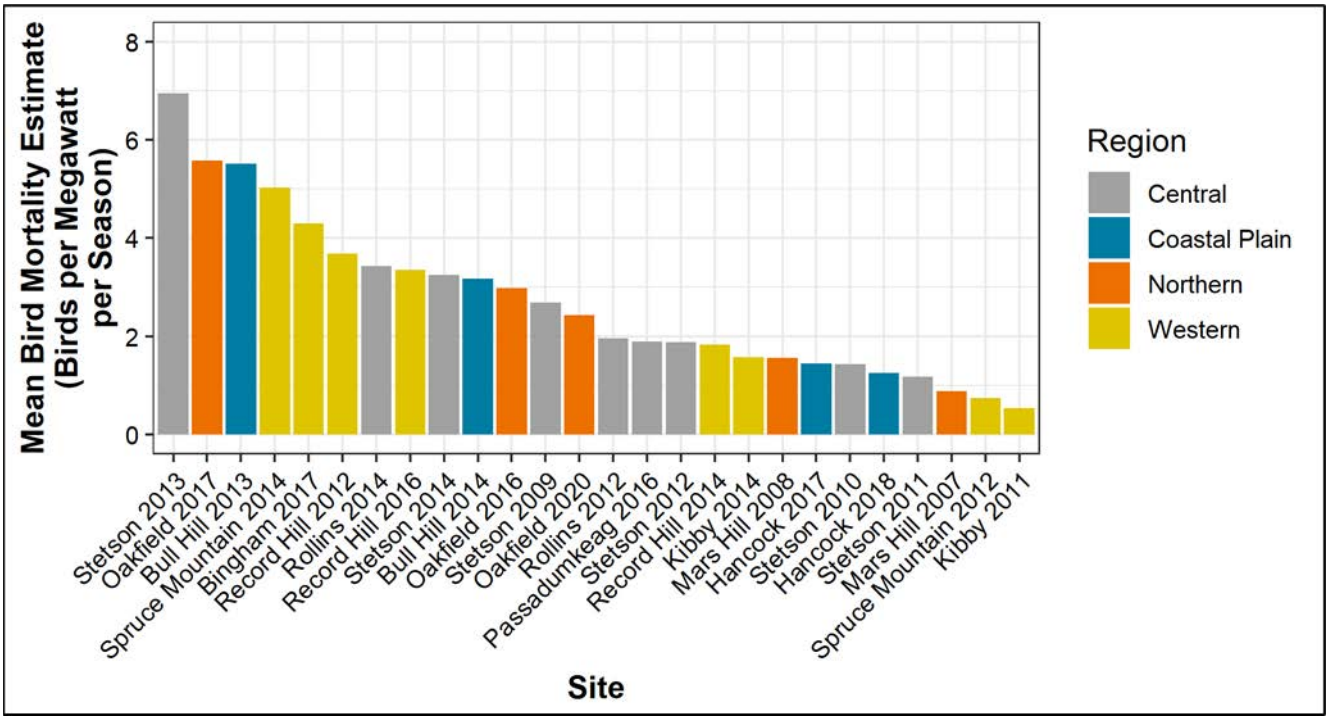

Figure 6. Mean Bird Fatality Estimates by Year from Maine Wind Projects (from Stantec 2018a)

These results demonstrate that mortality rates vary widely among years and sites and do not necessarily correlate with high passage rates or regional location. As suggested in Erickson et al. (2014), and given past local and regional PCM studies, Project impacts are expected to be in the range of the reported mortality rates found at other projects. Additionally, impacts are not expected to be significant and will not adversely affect overall population sizes. Fatality estimates from Downeast are expected to fall within the range of these reported values but will be confirmed through PCM studies once operational. To offset any direct impacts (i.e., collision) to bird species, the Project will protect forest and open habitat through deed restrictions. See Section 8.2.3.

6.4 IMPLEMENTED AVOIDANCE AND MINIMIZATION MEASURES

As scientific literature (Kerlinger et al. 2010; Longcore et al. 2012) suggests, steady burning bright lights pose a collision risk for nocturnal migrating birds. The Project will minimize lighting to the extent practicable and will use Federal Aviation Administration (FAA)-approved flashing lighting on turbines. Additionally, nighttime lighting will not be used on nacelles or on tower doors. Motion activated lighting will likely be installed on tower doors, the substation, and the operations and maintenance facility. Although research does not indicate a statistical correlation between FAA-lighting and collision risk (Kerlinger et al. 2010), the Project will utilize an Aircraft Detection Lighting System, thereby minimizing the period of time the turbines will be lit. In addition, the Project will mitigate any potential impacts, even if low, by implementation of tract deed restrictions (see Section 8). This mitigation will provide a net conservation benefit to passerine species. Maine Audubon co-authored a study in 2013 suggesting that roughly 1/3 of Maine's native plant and animal species are increasingly vulnerable to the effects of climate change (Whitman et al. 2013). For

birds specifically, migratory species may be affected by climate change during their migratory periods as well as during periods spent on breeding and wintering grounds. In addition, climate change is affecting the phenology of bird migration with documented changes in arrival dates to breeding grounds. This can lead to earlier egg hatching during periods of time when natural food supplies are less abundant, with corresponding effects to population recruitment. MDIFW's Wildlife Action Plan also recognizes climate change vulnerability for many wildlife species as an area needing further recognition (MDIFW 2016). Renewable energy production is an important part of the solution for transitioning away from traditional power sources that produce greenhouse gas emissions and contribute to these potential effects.

7.0 BATS

Eight species of bats occur in Maine. Little brown bats (*Myotis lucifugus*) and northern long-eared bats (*M. septentrionalis*) are state-endangered, eastern small-footed bats (*M. leibii*) are state-threatened, and the remaining five species are considered Species of Special Concern in Maine. White-nose syndrome has caused dramatic declines in Maine bat populations since it was detected in the state in 2011.

7.1 SURVEYS

Acoustic bat surveys were conducted in fall 2015, spring/summer 2016, and fall 2016. Survey data for the Project indicate that bat activity is concentrated during a relatively limited time of year (mid/late summer) and during warm, low-wind conditions with 95% of activity recorded in July, August, and September. This pattern is similar to other wind projects in state and has been observed at other projects throughout North America. Observed bat activity levels at the Project were very low outside of this mid/ate summer period. In addition, nearly all bat activity (96%) was documented when temperatures were ≥ 50ºF, and most activity (70%) occurred at wind speeds of less than 6 m/s (Stantec 2017a). This is consistent with other studies and USFWS recommendations, which do not recommend conducting bat surveys when temperatures are below 50ºF because bat activity is low to nonexistent at these lower temperatures. Potential calls of state-listed endangered or threatened *Myotis* bat species (eastern small-footed bat, little brown bat, and northern long-eared bat) were detected on 2.7% (n = 13) out of a total 473 detector nights. Of these 13 *Myotis* detections, 12 (92%) occurred between July and September and 1 was detected in April.

7.2 LITERATURE SUMMARY ON WIND ENERGY EFFECTS

Bats are most active in the rotor zone of wind turbines during relatively calm, warm conditions, as demonstrated through nightly analyses comparing mortality records with weather conditions (e.g., Arnett et al. 2008). These patterns have also been shown through extensive acoustic monitoring at nacelle height conducted at operating wind projects in the mid-Atlantic and through acoustic monitoring on nacelle towers at Oakfield in Maine (Stantec 2016; TRC 2017b). Based on more than 6 years of monitoring at two wind farms in West Virginia, where baseline mortality rates are substantially higher than in Maine, 75% of bat passes recorded at nacelle height occurred at wind speeds less than 5 m/s and 94% occurred when temperatures were above 50ºF (Stantec, under peer review). At both projects, seasonal peak activity

occurred from July to September. Similar patterns have also been observed at nearby projects, as discussed below.

7.2.1 Studies at Nearby Projects

Bull Hill Wind Project

Stantec performed pre-construction acoustic bat surveys during summer/fall 2009 and spring/summer 2010 to characterize bat migration at Bull Hill. During summer/fall 2009 and spring/summer 2010, six detectors were deployed in the project area, two of which were on MET towers (which are more representative of turbine locations) and four of which were in trees adjacent to suitable bat habitat. In 2009, the overall detection rate was 0.2 bat call sequences per detector-night for the MET tower detectors and 10.8 bat call sequences per detector-night for the tree detectors (Stantec 2009). Of the 1,564 *Myotis* calls recorded in 2009, 1,554 (99%) were recorded between July and September. In 2010, the overall detection rate was 0.4 bat call sequences per detector-night for the MET tower detectors and 8.6 bat call sequences per detector-night for the tree detectors (Stantec 2010). Of the 1,108 *Myotis* calls recorded in 2010, 507 (46%) were recorded between July and September. Please note that this data was collected before the detection of white-nose syndrome in Maine and when myotis bat populations were more abundant.

Post-construction bat acoustic monitoring was performed from mid-July to mid-October 2013 and from June to October 2014 (Stantec 2014a; Stantec 2014b). The overall detection rate was 4.9 bat call sequences per detector-night in 2013 and 0.9 bat call sequences per detector-night in 2014. In 2013, there were a total of 2,036 detections at five detectors, with 2,020 (99%) detections occurring between July and September. Of the 1,315 identifiable calls, 1,211 (92%) were of *Myotis* species and 1,210 occurred between July and September. In 2014, there were a total of 631 detections at 7 detectors, with the majority (97%) occurring between July and September. Of the 381 identifiable calls, 20 (5%) were of *Myotis* species and all occurred between July and September.

Weaver Wind Project

Stantec also performed pre-construction acoustic bat surveys during spring, summer, and fall 2014 at Weaver. The overall detection rate was 0.5 bat call sequences per detector-night between April and October, with acoustic activity rates peaking in August at a rate of 1.4 call sequences per detector-night (Stantec 2014a). The majority (88%) of the 334 total detections occurred between July and September. A small percentage (3.6%) of identified calls were of the genus *Myotis*, which include the species listed as threatened or endangered in Maine. Of the 12 *Myotis* detections, nine (75%) occurred between July and September. Approximately 96% of bat call sequences were recorded during nights with average temperatures ≥ 50ºF, and 87% of call sequences were recorded when average nightly wind speeds were ≤ 6 m/s. These results show a positive correlation between bat activity and nightly mean temperatures and a negative correlation with average nightly wind speeds.

7.3 POTENTIAL IMPACTS

The forested habitat in the project area could support foraging and roosting bats; however, the Project lacks any known maternity roosts, and there are no known hibernacula (including talus slopes, large rock piles,

or rock ledges) within the Project. area. However, consistent with studies at operational projects in the U.S., bat collision has been documented at wind projects in Maine, predominantly during the fall migration; therefore, the Project has the potential to result in direct impacts to bats due to collision mortality. To minimize impacts to bats from operation, the Project will operate under a curtailment schedule to reduce and minimize impacts to the greatest extent practicable (see Sections 7.4 and 8.2.4).

7.3.1 Collision

Annual bat mortality estimates in Maine range from 0.12 to 2.95 bats/MW/year, with a mean of 0.76 bats/MW/year and a median of 0.43 bats/MW/year. Bat mortality rates in Maine are lower than the Northeast and other regions in the U.S. AWWI's technical report on bat fatality examined 137 wind energy projects throughout the U.S. and 202 fatality estimate studies, most of which occurred from 2005 through 2012 (AWWI 2018). The median fatality estimate for all studies evaluated was 2.66 bats/MW/year. In examining fatality estimates by region, the Northeast Region[4] included 52 studies, resulting in a range of 0.1 to 49.7 bats/MW/year and a median of 3.5 bats/MW/year. Maine's median of 0.4 bats/MW/year is less than the lowest regional median calculated for the entire U.S., indicating that bat collision mortality in Maine is not of any greater concern than in other regions of the U.S. Furthermore, several Maine wind projects contributing PCM data are not operating under a curtailment program, indicating that bat mortality in Maine is already low even without curtailment. Although the data demonstrates a low bat mortality rate in Maine compared to other regions of the U.S., MDIFW's minimum curtailment recommendations are more rigorous than those recommended by other state agencies.

In recognition of MDIFW's concern regarding potential impacts to bats, bat mortality rates at the two closest operational wind projects (Bull Hill and Hancock) were evaluated. Bull Hill PCM surveys were conducted in Year 1 (2013) and Year 2 (2014) of operation. Based on these surveys, mortality estimates were 1.41 bats/MW.study period) and 0.24 bats/MW/study period) in 2013 and 2014, respectively (Stantec 2015a; Stantec 2015b). Curtailment measures at Bull Hill have varied since the project began operating. In 2016, the Land Use Planning Commission directed curtailment of all 19 turbines at 6 m/s from 30 minutes before sunset to 30 minutes after sunrise from June 1 to September 30. Currently and for the life of the project, Bull Hill is curtailing all 19 turbines at 5 m/s from 30 minutes before sunset to 30 minutes after sunrise from July 1 to September 30.

Hancock PCM surveys were conducted in Year 1 (2017) and Year 2 (2018) of operation. The mortality estimates were 0.27 bats/MW/study period and 0.37 bats/MW/study period in 2017 and 2018, respectively (TRC 2017a; TRC 2018). Hancock operates under a seasonal curtailment regime of 6 m/s 30 minutes before sunset to 30 minutes after sunrise from April 20 to October 15.

[4] The Northeast Region used in this report is the U.S. Fish and Wildlife Service Northeast Region, which includes 13 states from Maine to Virginia.

[5] Equation used to estimate annual bat mortality = average of 1.49 bats/turbine/study period x 19 turbines. Equation used to estimate bat mortality for the life of the project = 1.49 bats/turbine/study period x 19 turbines x 30 years. Conversion to bats/MW/study period was obtained by dividing this value by the respective turbine size (i.e., 1.8 MW).

Finally, most carcasses recovered during fatality searches at operational wind facilitates in Maine and throughout U.S. are from three migratory tree bat species: hoary bat (*Lasiurus cinereus*), eastern red bat (*L. borealis*), and silver-haired bat (*Lasionycteris noctivagans*) (Arnett et al. 2008). These three species are state Species of Special Concern in Maine.

7.3.2 Habitat and Displacement

Anticipated Project impacts to blueberry barrens are not considered bat habitat and, therefore, will not negatively affect habitat for state-listed bats potentially using the Project area. In addition, there are no known roost trees in the Project area. Tree removal (≥ 4 inches diameter at breast height) will be consistent with 5 MRSA §8057-A and will occur outside of the pup-rearing season for bats in Maine (June 1–July 31) to further reduce direct habitat loss or indirect displacement from Project activities. Lastly, while the tree clearing for the Project is not anticipated to have an adverse effect to bats, the Project under its mitigation land for songbirds will have a benefit to bats by protecting forested lands adjacent to large wetlands and riparian areas (see Section 8).

7.4 IMPLEMENTED AVOIDANCE AND MINIMIZATION MEASURES

MDIFW recommends siting wind projects away from key habitats where bats congregate (MDIFW 2018b). Accordingly, no key habitats known to host bats (e.g., hibernacula, talus slopes, or rocky outcrops) occur within the vicinity of the Project. MDIFW has also recommended seasonal operational curtailment measures. Specifically, MDIFW's minimum turbine curtailment recommendations include operating at cut-in speeds exceeding 6 m/s from at least 30 minutes before sunset to at least 30 minutes after sunrise between April 15 and September 30 when ambient air temperature is ≥ 32ºF, measured both at ground level and nacelle hub height (MDIFW 2018b).

Downeast proposes to implement MDIFW's minimum turbine curtailment recommendations during the first year of operations, in combination with conducting a site-specific "smart" curtailment study during Year 2 or subsequent years as an additional part of an adaptive management strategy to determine the most effective and efficient avoidance and minimization strategy for bats at the Project.

Bat Minimization Strategy Proposal

Stantec has previously and successfully developed site-specific "smart" curtailment plans for other northeastern wind facilities that predict the effectiveness of various curtailment regimes by predicting weather conditions when bats are most at risk using nacelle height acoustic data. Using this strategy, curtailment plans can be tailored to the conditions and bat activity patterns at a particular site. This approach works because past studies support the assumptions that: 1) fatality risk is closely related to bat exposure; 2) patterns in bat activity are consistent among years and turbines; and 3) most bat activity occurs below 5.0 m/s and temperatures greater than 50ºF. The "smart" curtailment approach can be used to improve the efficacy of curtailment, while also improving energy production.

Using the acoustic data from the 2015–2016 surveys described in Section 7.0 as a proxy, Stantec modeled various curtailment options for Downeast, including MDIFW's minimum recommendations of operating at cut-in speeds exceeding 6 m/s from at least 30 minutes before sunset to at least 30 minutes after sunrise

between April 15 and September 30 when ambient air temperature is ≥ 32ºF. Other curtailment scenarios included using various blanket cut-in speeds and temperatures, as well as the use of scenarios where cut-in speeds are applied at 0.5 m/s increments from sunrise to sunset from April to October and when temperatures exceed 50ºF. While acoustic data from 2015–2016 surveys was not collected at nacelle heights, this modeling effort resulted in the avoidance of 66% of observed bat passes under MDIFW minimum curtailment guidelines. Under a curtailment plan more tailored to when bat passes were detected in the Project area, modeling resulted in an equal or greater percentage of avoided bat passes at 70%.

As a result of this analysis, Downeast is proposing to implement MDIFW-recommended bat curtailment guidelines during Year 1 along with funding a study evaluating the use of "smart" curtailment to optimize turbine restrictions during peak levels of bat activity at the Project. As previously noted, the majority of bat activity observed during acoustic surveys at the Project site and other Maine wind projects occurred between July and September. During the first year of facility operations, and with MDIFW coordination, acoustic bat detectors would be deployed at nacelle heights on 20 to 50% of turbines to directly measure bat activity and risk at actual collision risk heights, corresponding with MDIFW recommendations. Weather information, including data on wind speed and temperature, will also be recorded in concert with measured bat activity levels and turbine operations. Data from the first year would be used to establish a management goal for risk reduction and provide the matching benchmark for the alternative "smart" curtailment design. In the second year, Downeast would implement the "smart" curtailment design and MDIFW guidelines simultaneously at 50% of turbines to provide for a direct comparison. Bat fatality surveys and carcass searches, as currently required for most commercial wind facilities, will also occur during the first 2 years of operation. These first 2 years of monitoring would be used to evaluate the long-term implementation of a "smart" curtailment plan.

Downeast may also test the use of bat deterrent systems or other technology that may become available, as a further measure to avoid and minimize potential impacts to bats using the best-available science and adaptive management throughout life of the Project. The current bat deterrent systems emit ultrasonic noise in the same natural frequency range as bats, interfering with their ability to echolocate and discouraging them from the area. These systems have been shown to be effective in reducing bat fatalities and can be paired with curtailment for even further reductions (Romano et al. 2019). Depending on the outcome and success of deterrent testing, Downeast may consider future adjustments to curtailment cut-in speeds with the goal of implementing a minimization strategy for bats that will equal or exceed the reductions in bat exposure risk observed from the MDIFW recommended curtailment regime and reduce the lost generation of clean renewable energy.

Balancing the production of clean renewable energy and potential impacts to the environment is important but requires long term alternative thinking. As previously noted in Section 6,4, Maine Audubon issued a report suggesting many of Maine's native species are at risk from climate change. For bats in particular, climate change may affect the timing of emergence or reproduction and alter species' geographic ranges (Jones et al. 2009; Loeb and Winters 2013). Increasing droughts or variable weather conditions may influence the availability of water and insect prey leading to reproductive declines and reduced energy reserves heading into winter hibernation (Rodenhouse et al. 2009; Adams 2010). Renewable energy production is an important part of the solution for transitioning away from traditional power sources that produce greenhouse gas emissions and contribute to these potential effects.

8.0 PROPOSED PROJECT MITIGATION

8.1 PROPOSED MITIGATION STRATEGIES

In addition to the implemented avoidance and minimization measures that further reduce risk to birds and bats, Downeast has also identified potential mitigation strategies to offset potential Project risks to the species identified here. Mitigation strategies, such as land conservation, will result in a net conservation benefit to the species of concern. Nocturnal migrants, bats, and upland sandpipers will benefit from land protection via deed restrictions.

8.2 PROPOSED SPECIES MITIGATION FOR PROJECT RISKS

8.2.1 Upland Sandpipers

Downeast believes there will be minimal habitat effects to upland sandpipers from the Project given the large amount of available blueberry barrens and by siting turbines outside of blueberry barrens. However, to offset potential impacts as a result of direct habitat loss and displacement (15.31 acres) the land considered for songbird mitigation in Section 8.2.3 below includes one 90-acre field that will be maintained as an active blueberry barren. This field will provide comparable habitat that will offset the 15.31 acres of impact at a greater than 3:1 ratio.

8.2.2 Whimbrel

Downeast believes there will be negligible effects to whimbrel from the Project given the large amount of available blueberry barrens in the region, turbines sited outside of blueberry barren habitat, turbines sited out of the potential flight path from tidal mud flats, and low documented collision risk found during a literature review. As such, Downeast believes there is no need for additional mitigation to offset Project impacts to whimbrels, however mitigation for upland sandpipers can also provide beneficial habitat for whimbrel.

8.2.3 Nocturnal Migrants – Conservation via Land Deed Restrictions

In the June 28, 2019, letter, MDIFW expressed concern about the concentration of migratory birds in the coastal plain as “greater than in other areas of Maine and the seasonal and daily movement patterns are unique for represented guilds.” An additional focus was placed on the high rates of spring and fall passerine migration obtained from pre-construction nocturnal radar surveys conducted for the Project, as well as the nearby Bull Hill and Weaver projects. However, as previously discussed in Section 6.2, there is no correlation between avian passage rates or pre-construction surveys with post-construction mortality events for Maine wind projects (Stantec 2018a). This lack of correlation between passage rates and mortality rates at operational wind farms is mirrored from studies completed across the U.S., Canada, and Europe (Ferrer et al. 2012, AWWI 2017). Mortality from turbine collision does occur, but these events are far lower in population severity than interactions with communication towers and buildings. The conservative estimate of annual passerine mortalities resulting from wind turbines in the U.S. and Canada is 230,000 compared to 6.6 million annual passerine mortalities resulting from communication tower collisions in the U.S. and

Canada (Erickson et al. 2014) and 365 million to 988 million annual mortalities resulting from building collisions in the U.S. (Loss et al. 2014).

Stantec reviewed avian mortality monitoring data from Bull Hill and Hancock Wind projects (Table 1). From these data, there were a total of 93 fatalities to 4 years of monitoring combined. The five most commonly encountered species were red-eyed vireo (34), golden-crowned kinglet (9), black and white warbler (7), pine warbler (6), and northern parula (5), accounting for 66% of all fatalities. All documented fatalities involved passerine bird species. Regionally, this matches with results of other similar studies. Small passerines were the dominant bird group (85.4% of total fatalities) noted by 17 monitoring events at wind facilitates in the Northern Forest region (AWWI 2019). This region includes portions of Minnesota, Wisconsin, Michigan, New York, New Hampshire, Vermont, and Maine. Within the small passerines group, forest dwelling species were the most commonly noted fatalities (as a percentage of all observations) with red-eyed vireo, golden-crowned kinglet, magnolia warbler, common yellowthroat, black and white warbler, ovenbird, northern parula, ruby-crowned kinglet, ruffed grouse, and bay-breasted warbler as the top ten species (AWWI 2019).

Table 2. Passerine Mortalities from Wind Facilities in the Coastal Plain Region of Maine

Species	# Found in Downeast Coastal Plain[1]	Lower [2]	Upper [2]
American redstart*	2	7	13
bay-breasted warbler	2	7	13

* Maine Species of Special Concern

[1] Includes Bull Hill Wind Project (2013 and 2014) and Hancock Wind Project (2017 and 2018).

[2] Lower and upper levels calculated following correction approaches for estimator bias as developed by Western EcoSystems Technology, Inc.

In its Department Order for Weaver, MDEP required deed restrictions for the protection of two parcels, totaling approximately 5,791 acres as mitigation for potential impacts to migratory birds (MDEP 2019). The scientific basis for conserving this amount of land to offset potential nocturnal migrant project mortality is unclear. Further, Downeast notes that Weaver is the only known wind facility in Maine that has been required to implement mitigation for migratory birds. Downeast proposes the following science-based approach to address potential Project risks to nocturnal migrants.

In determining appropriate mitigation for nocturnal migrants, MDIFW has previously referred to Goodale (2009), which suggests that large, contiguous habitats can produce more than two birds/acre/year. While a useful metric, it is also important to consider the species composition of mortalities caused by wind facilities, as well as the associated habitat requirements for those species. With this information, specific mitigation strategies may be developed to address Project-related effects. National and Maine-specific PCM data indicate small, forest passerines comprise most fatalities associated with wind facilities. This metric provides a scientific based method for evaluating the potential value of a mitigation action.

To offset direct impacts (i.e., collision) to nocturnal migrants, particularly small, forest passerines that represent the majority of wind-related fatalities, the Project will protect forestland through conservation deed restrictions in T18MD BPP. Downeast relies on bird mortality data collected for Bull Hill and Hancock to estimate bird mortality for the Project and determine an appropriate amount of habitat preservation for mitigation. Based on 4 years of PCM data at these two Maine projects, the average bird mortality in the coastal plain region is 6.33 birds/turbine/year or an annualized estimated take of up to 190 birds. Using Goodale's value of two birds/acre/year, it would require approximately 95 acres of habitat to offset this annual loss. The Project proposes to mitigate potential direct take of birds at the 10:1 mitigation ratio previously communicated by MDIFW by the conservation of approximately 977 acres of blueberry barren and forested land.

Downeast has identified a mitigation site near the proposed Project that will benefit birds and other species (Figure 7). The proposed site consists of approximately 977 acres and is located in T18MD BPP, set back approximately 1.4 miles from the nearest proposed Project turbine. Identified natural communities from a desktop review within the 977-acre mitigation area include blueberry barren, scrub-shrub/barren habitat, early successional forest, deciduous forest, coniferous forest, mixed deciduous-coniferous forest, emergent wetland, scrub-shrub wetland, and riparian habitat. At the regional scale, the site is located adjacent to the 7,000-acre Great Heath, the largest peatland complex in the Downeast Region. The project proposes placing a deed restriction on the mitigation parcel to ensure that it continues to provide appropriate habitat for nocturnal migrants.

Based on the composition of avian species (i.e., passerines) subject to potential collision mortality at the Project, the proposed mitigation area will provide appropriate habitat for these species, other species of concern, and provide support to local avian populations. All five of the most commonly encountered species fatalities from the Bull Hill and Hancock Wind projects generally occupy forested habitats. There are some specific differences in these associations; as an example, northern parula may be more closely associated with mature forests close to waterbodies. Pine warblers occupy pine or mixed pine-deciduous forests while black and white warbles, golden-crowned kinglets, and red-eyed vireos show more flexibility in their forest associations. For each of these birds, the diversity of specific forest communities and successional stages within the proposed 977 acres will ensure the region continues to provide suitable habitat. In addition to the five birds described, three additional species from Table 1 are Maine Species of Special Concern. Veery typically breed in dense and damp deciduous woods that often located near waterbodies. The American redstart prefers larger tracts of second-growth woodlands with a prominent shrub layer. Finally, chestnut-sided warblers are associated with early-successional woodlands where thickets of shrubs and smaller trees become established after logging, fire, or natural events create open conditions. Again, the varied natural communities of these 977 acres, along with the connectivity to the Great Heath, provide habitat that could provide a benefit to these species at potential risk.

8.2.4 Bats

Habitat Conservation via Deed Restrictions

The conservation via deed restrictions of approximately 977 acres in T18MD BPP for nocturnal migrants will provide further bat risk mitigation by conserving both suitable roosting and foraging habitat. The forested condition of this site offers potential roosting habitat, while the assemblage of wetlands and streams provides foraging habitat. While current scientific knowledge suggests that Maine's bats are not habitat-limited, the known protection of potential bat roosting and foraging habitat on this parcel provides additional capacity for the persistence and growth of local bat populations over the life of the Project if habitat-related concerns arise.

9.0 SUMMARY AND CONCLUSION

In summary, Downeast has reconfigured the proposed Project in response to concerns identified by MDIFW to avoid and minimize potential impacts to upland sandpipers and whimbrels, removing all but one turbine from blueberry barrens in the process. Downeast also plans to implement MDIFW's curtailment recommendations for a trial period followed by a study of its efficacy in bat risk reduction,The Project believes that taking such a "smart" approach to curtailment will protect bat populations while maximizing clean energy production that in the long run will benefit all species.

Downeast also aims to provide a net benefit to species of concern by proposing additional mitigation. For upland sandpiper, Downeast will mitigate loss of grassland habitat for upland sandpiper through a deed restriction as part of the songbird mitigation parcel which contains blueberry barren habitat that will be maintained at a compensation ratio exceeding 3:1.For nocturnal migrants, although impacts are not anticipated to be unique relative to other projects in the state, Downeast has proposed a science-based

mitigation plan that protects land containing a diversity of valuable breeding and stopover habitat for songbirds at a compensation ratio of 10:1. Downeast appreciates the feedback provided by MDIFW, which has helped create the current Project layout. Downeast recognizes the importance of Maine's coastal plain region for resident and migratory shorebirds and migratory songbirds. As such, Downeast believes the avoidance and minimization measures in concert with the mitigation actions proposed in this report will address Project effects and result in a conservation benefit to the MDIFW identified species of concern.

In summary, Downeast reiterates that:

- A review of data from wind energy projects in similar habitats (including blueberry barrens) and species' biology and behavior combined with implementation of Project avoidance and minimization measures indicates the Project will have low to no direct take of upland sandpipers or whimbrels. Nonetheless, Downeast will mitigate loss of grassland habitat for upland sandpiper through a conservation via deed restriction as part of the songbird mitigation parcel which contains blueberry barren habitat that will be maintained at a compensation ratio exceeding 3:1.

- A review of data from wind energy projects in Maine and across North America indicates the Project will not cause adverse population-level impacts to nocturnal migrants (i.e., passerines). Nonetheless, Downeast will mitigate Project effects to these species through protection of 977 acres of nearby forested and open habitat via conservation deed restrictions.

- The Project plans to minimize the take of bats by employing an adaptive conservation management strategy of baseline curtailment combined with a robust study to evaluate potential use of "smart" curtailment and other available technology to meet or exceed the results of current recommendations by MDIFW. Finally, land protection of 977 acres of nearby forested, riparian, and open field habitat will provide additional foraging and roosting areas for Maine's bat species.

Executive Summary

Wind developers are required to conduct pre-construction assessments of bird and bat activity at proposed wind farms. Directly measuring the distribution, abundance, and activity levels of birds and bats through pre-construction surveys is presumed to provide a basis for evaluating the mortality risk of a site. However, for pre-construction bird and bat activity to be a useful predictor of post-construction bird and bat mortality, there must be a strong and consistent relationship between the two. Stantec tested the relationship between pre-construction bird and bat survey results and post-construction mortality estimates from commercial wind farms in Maine, specifically evaluating whether variation in estimated bird and bat mortality rates was correlated with variation in corresponding pre-construction survey results. Our results showed no strong or consistent relationship between bird and bat activity measured prior to construction and post-construction mortality rates. The results in Maine are similar to others conducted at broader regional scales, challenging the assumption that pre-construction surveys are a meaningful predictor of risk. Wind projects have been operating in Maine since 2006. Stantec compiled all publicly available pre-construction and post-construction bird and bat survey results for proposed and operating wind projects in the state. Pre-construction data included 682 nights of radar surveys at 14 proposed sites, 442 raptor survey days at 13 proposed sites, and 10,644 detector-nights of acoustic bat surveys at 12 proposed sites. Post-construction bird and bat mortality estimates were available from 11 sites, 10 of which also had corresponding pre-construction data. Where both pre- and post-construction data are available, we assessed relationships between pre-construction bird and bat activity and post-construction mortality rates at the site level (overall and yearly), evaluating radar, bat acoustic, and raptor data separately.

Pre-construction bird, bat, and raptor activity levels and bird and bat mortality rates varied among sites, suggesting differing levels of risk. However, based on evaluation of multiple pairings of variables there is no consistent relationship between pre-construction activity levels and annual mortality estimates at the sites. Of all available pairings of pre-construction and post-construction results we compared, only one showed a statistically significant positive correlation. As such, existing data representing most operating wind projects in Maine fail to support the assumption that pre-construction bird and bat activity provides a reliable indicator of mortality rates during operation.

Similar attempts to compare pre-construction activity versus post-construction mortality rates in other states and on a national level have also failed to support this assumption. Despite some overall seasonal trends, which have been consistently demonstrated in pre-construction and post-construction surveys throughout North America, variation in overall pre-construction bird and bat activity appears to have no consistent relationship with mortality. Our understanding of other factors (e.g., weather, lighting) influencing mortality at wind projects and other projects (e.g., buildings, communication towers) suggest that risk to birds and bats is anything but static, and is instead influenced by a variety of seasonal, behavioral, and conditions-based factors.

This report was initially drafted in 2017 and updated in August 2018 to include results of post-construction studies conducted at 3 sites (Hancock, Bingham, and Oakfield) in 2017. We have updated all analyses and figures to reflect these updates and modified text to account for any changes in the results of statistical tests. Overall, the inclusion of data from sites monitored in 2017 did not change the results or Stantec's conclusions based on our analysis.

1.0 INTRODUCTION

The reality that commercial wind turbines can kill birds and bats has prompted a substantial effort to identify factors that predict the magnitude of risk for proposed project sites and explain why bird and bat mortality rates are higher at some wind farms than others. Pre-construction bird and bat surveys have been used in and outside of Maine to document distribution, abundance, species composition, and temporal/seasonal activity patterns of birds and bats at proposed wind power sites, and the results of such surveys have been used to evaluate the risks that development of such a site might present. However, for pre-construction bird and bat activity to be a meaningful predictor of risk at wind projects in Maine, the relationship between activity and post-construction mortality rates should be relatively strong and consistent.

Stantec analyzed the relationship between publicly available pre-construction bird and bat survey results and post-construction mortality estimates from commercial wind farms in Maine. We tested whether variation in estimated bird and bat mortality rates was correlated with variation in corresponding pre-construction survey results using straightforward linear regressions at the site level. This report summarizes the methods and results of our analyses, compares our results to similar efforts conducted in other states, and provides a regional context for the variation in mortality rates documented at wind projects in Maine. The results showed inconsistent relationships between bird and bat activity measured prior to construction and post-construction mortality rates. The results in Maine are aligned with those of similar analyses based on projects outside of Maine and challenge the assumption that pre-construction surveys are a meaningful predictor of risk.

2.0 METHODS

2.1 PRE-CONSTRUCTION AND POST-CONSTRUCTION DATA SUMMARY AND ANALYSIS

Stantec first compiled publicly available pre-construction bird, raptor, and bat survey results for commercial wind projects in Maine. These included results from projects that have gone through permitting and pre-construction survey results are therefore part of the public record. Because the level of effort and survey methods varied among sites[1], we derived a set of standardized metrics for each survey type based on the raw daily/nightly data to improve comparability of data among sites (Table 1).

We next obtained post-construction mortality estimates from all publicly available survey reports, tracking the survey interval, mortality estimator used, turbine characteristics, and operational parameters. To improve comparability of mortality estimates among sites, we converted per-

[1] For example, in collecting pre-construction data, 13 of the projects analyzed used an X-band radar system and 1 used the MERLIN™ radar system.

turbine bird and bat fatality estimates to per-megawatt (MW) estimates. To account for varying survey lengths among studies, we also adjusted each estimate based on the ratio of the survey period compared to the mean survey period of all projects in Maine. When present, we combined separate seasonal estimates (e.g., spring, summer, fall) and size-specific estimates for birds (e.g., small bird, medium bird, large bird) to generate annual[2] bird and bat mortality estimates. In cases where multiple mortality estimates existed for a given site/year (e.g., based on different search intervals), we calculated a mean mortality estimate for each year. We also generated a per-site overall average for birds and bats for sites with more than 1 year of post-construction monitoring (Table 1). The intent of calculating these summary statistics was to improve comparability of results among projects.

We plotted post-construction mortality versus pre-construction bird and bat activity rates at the site level and used linear regression to determine whether there were correlations between mortality estimates and pre-construction results. We used separate linear regressions for each pairing of pre-construction and post-construction data, analyzing annual mortality estimates and site-level mean mortality estimates separately. We conducted separate analyses of bat mortality datasets with and without 3 Maine projects (Bull Hill, Oakfield, and Passadumkeag) operating under curtailment; curtailment reduces bat mortality rates and could therefore affect results. Finally, to provide a regional context for bird and bat mortality documented at Maine wind projects, we compared magnitude of bird and bat mortality estimates from Maine projects to those from nearby states. We implemented all data summary, graphing, and analysis using statistical software and reported adjusted R^2 values for all regressions (R Core Team 2014).

[2] Mortality surveys in Maine typically occur between April/May and October and, therefore, do not necessarily reflect the full year, although they cover much of the period during which bats and songbirds are active and are generally presented as annual estimates in the reports.

Table 1. Description of raw data and derived metrics from typical pre- and post-construction bird and bat surveys conducted at wind projects in Maine.

Survey Type	Raw Data	Calculated Metric(s)
Acoustic bat survey	• Nightly passes per detector-night, grouped by detector and species/species guild	• Mean/median passes per detector-night, grouped by detector type • Percent of surveyed nights with bat activity • Overall species composition by detector type
Nocturnal radar survey	• Nightly passage rate • Nightly flight height • Percent targets below turbine height • Flight path direction	• Mean/median passage rate • Mean/median flight height • Mean/median percent targets below turbine height
Raptor migration surveys	• Raptors observed per species per day • Flight height and behavior • Flight path direction	• Mean raptors observed per day
Post-construction mortality surveys	• Estimated bird/bat carcasses per turbine per season • Bird/bat carcasses (by species) found per turbine search	• Estimated bird/bat carcasses per MW, adjusted for length of survey period (annual and overall per site) • Mean monthly bird/bat carcasses found per search

2.2 REGIONAL CONTEXT

To put the Maine results in context, we also compiled data from publicly available post-construction mortality monitoring reports for wind projects in 6 northeastern states (Maine, New Hampshire, Vermont, New York, Pennsylvania, and West Virginia). For the regional comparison, we excluded mortality estimates from sites implementing curtailment to minimize variation due to factors other than siting. We did not have access to original raw data used to calculate bias estimates and correction factors in all cases. In order to compare similarly reported projects, our regional analyses only include reported estimates that incorporated bias and correction factors such as searcher efficiency and carcass removal. In most cases, estimates had also been adjusted to account for areas not surveyed. We combined separate seasonal and size-class estimates into overall annual bird and bat estimates, as described above. We converted per-turbine estimates to per-MW estimates and incorporated the same scaling factor mentioned above to account for variable survey lengths. If multiple estimates were reported for a site during a year, based on different search intervals or calculation methods, we calculated the mean bird and bat mortality rates for that year to ensure each site/year combination was represented only once in the dataset.

3.0 RESULTS

Stantec obtained pre-construction and/or post-construction survey results from 15 proposed or operating wind projects in Maine including nocturnal radar data (14 sites), raptor migration data (13 sites), bat acoustic data (12 sites), and post-construction bird and bat mortality data (11 sites) (Appendix A Table 1). Ten of those sites had both pre-construction and post-construction data readily available. Because analysis focused on site-level relationships, we considered data from multiphase projects (e.g., Stetson I and II) as representative of one site.

3.1 PRE-CONSTRUCTION BIRD AND BAT ACTIVITY SURVEYS

3.1.1 Radar Surveys

Radar surveys and analytical approaches used in Maine have followed consistent methods since the mid-2000s[3]. All except one radar survey we analyzed were conducted using the same radar technology (x-band 12 kilowatt marine radar operated in horizontal and vertical modes) and using the same analysis methods (randomly selected subsamples of data analyzed by hand to quantify passage rates, flight directions, and flight height). One other survey was conducted using the MERLIN™ radar system, which uses horizontal and vertical radars simultaneously to automatically and continuously record bird and bat activity. The pre-construction radar survey dataset consisted of 682 nights of radar surveys from 14 sites (Appendix B).

We report radar survey results in terms of "passage rates", which represent the number of "targets" flying through the airspace sampled by the radar in horizontal mode, and the "percent of targets below turbine height" based on vertical operation. "Below turbine height" includes targets at or below the maximum height of the turbines. Among the 14 Maine projects with nocturnal radar data, mean passage rates ranged from 310.5 – 746.2 targets/kilometer/hour, with an overall mean of 438.0 (Figure 3-1). The mean percent of targets below turbine height ranged from 11% to 33% with an overall mean of 23% (Figure 3-2).

[3] The first nocturnal radar surveys in Maine occurred in the mid-1990s and used 25 kilowatt marine radars.

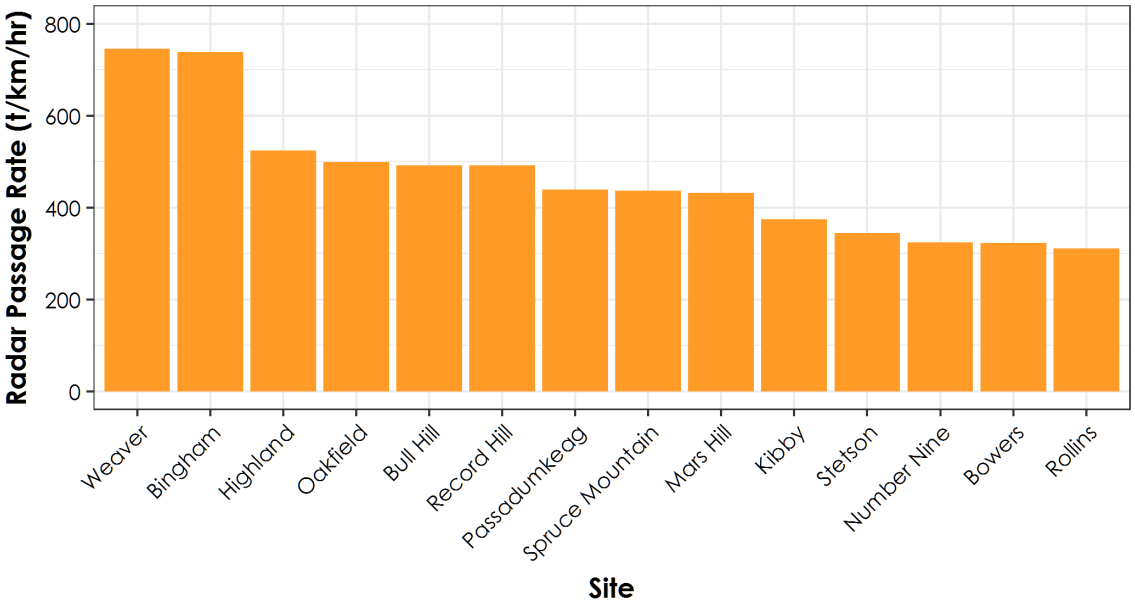

Figure 3-1. Mean radar passage rates from pre-construction surveys at Maine wind projects (proposed and existing).

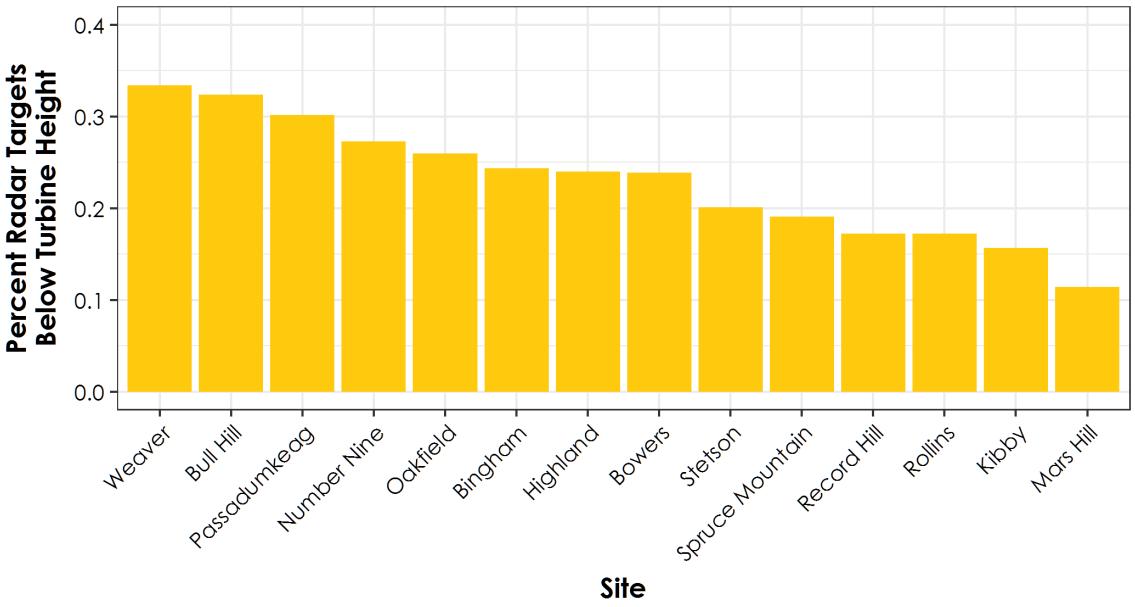

Figure 3-2. Mean percent of radar targets below turbine height from pre-construction surveys at Maine wind projects (proposed and existing).

3.1.2 Raptor Surveys

Raptor surveys followed consistent methods among sites, based on visual surveys conducted by a single observer equipped with binoculars and spotting scope. Pre-construction raptor survey results were available for 442 survey days from 13 sites, observing more than 4,053 raptors during the project area surveys. The mean number of raptors observed per survey day ranged from 5.1 to 18.7 raptors/day among sites (mean = 10.3; Figure 3-3).

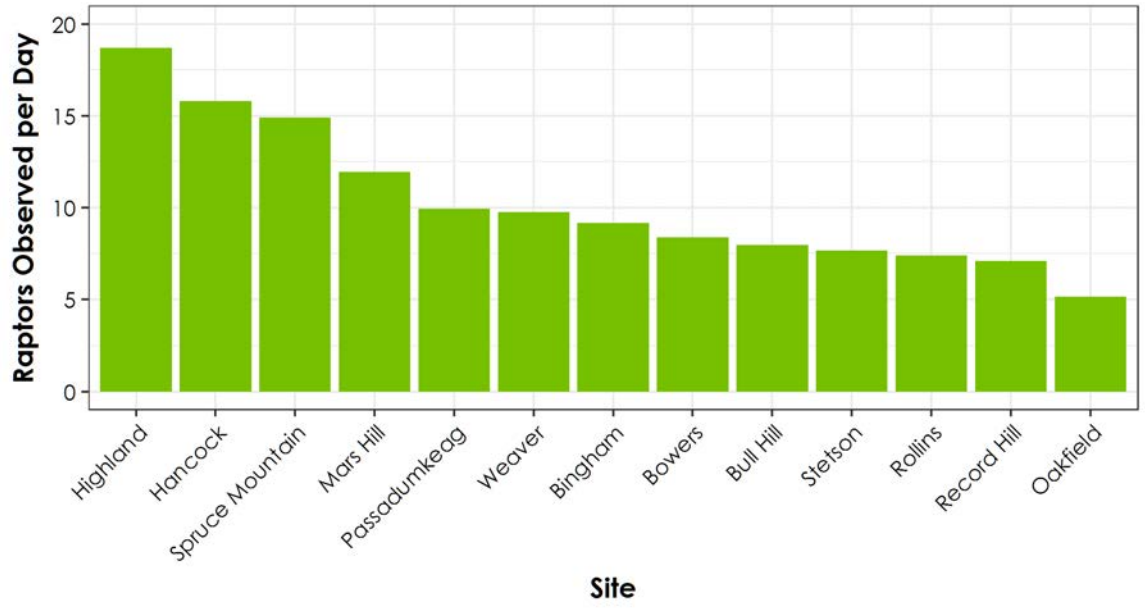

Figure 3-3. Mean number of raptors observed per survey day from pre-construction surveys at Maine wind projects (proposed and existing).

3.1.3 Acoustic Bat Surveys

Acoustic bat surveys can vary widely in scope and methods, although most pre-construction surveys in Maine have involved deploying "Met High" (>20 m above ground level [agl] in meteorological [met] towers), "Met Low" (~10 – 20 m agl in met towers), or "Tree" detectors (~2 m agl) in trees. Because multiple detectors may be at different heights each night, the results are tracked as "detector nights" (DN), rather than just nights (i.e., 3 detectors during 1 calendar night equals 3 DN per night). We analyzed nightly pre-construction bat acoustic data to Tree detectors (n = 5,346 DN), Met High detectors (n = 2,676 DN), and Met Low detectors (n = 2,622 DN), resulting in a dataset representing 10,644 detector nights from 121 sites over 9 years (2006–2014). In cases where multiple detectors were deployed, we calculated mean nightly activity levels for each detector type (hereafter referring to position as Met High, Met Low, or Tree).

Because mean rate of passes per DN calculated per site varied significantly among detector types ($R^2 = 0.53$, $p < 0.001$, $F(2,26) = 16.66$), we plotted and analyzed results separately for each detector type. Mean bat passes per night ranged from 0.10 to 1.96 at Met High detectors (mean = 0.67), from 0.25 to 3.60 at Met Low detectors (mean = 1.12), and from 4.3 to 68.45 (mean = 29.48) for Tree detectors (Figure 3-4).

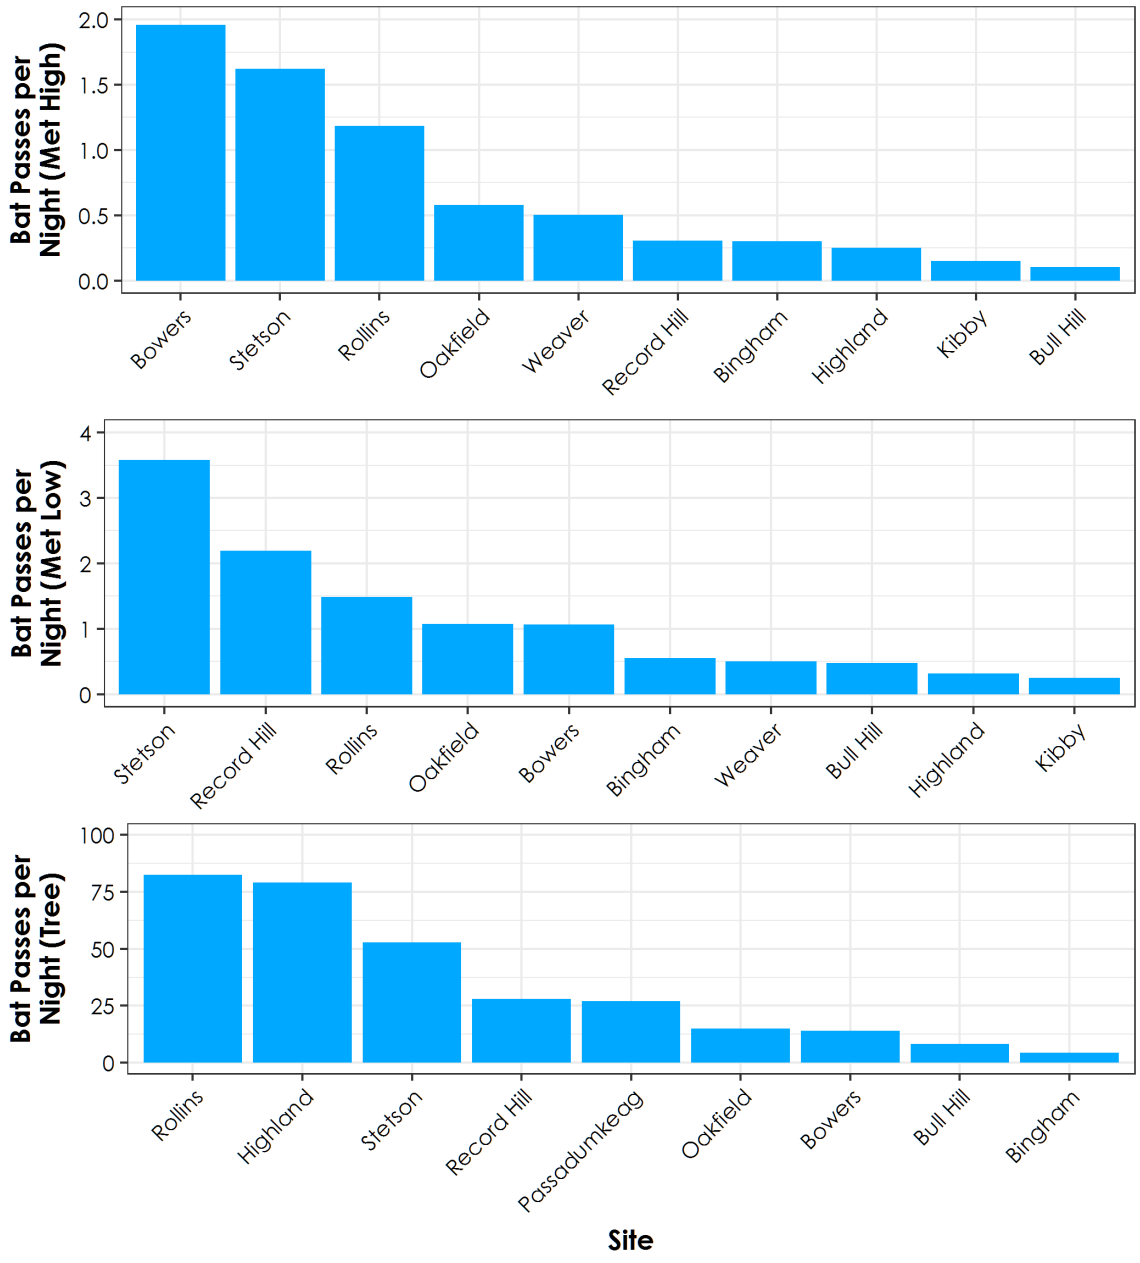

Figure 3-4. Mean number of bat passes per detector night by detector type from pre-construction surveys at Maine wind projects (proposed and existing). Note the varying y-axis scale for each detector type and the differing detector heights among the 12 sites.

3.2 POST-CONSTRUCTION MORTALITY ESTIMATES

Bird and bat mortality estimates are based on standardized counts of carcasses found by trained observers walking regularly spaced transects within the cleared turbine pad. Because the number of days between turbine searches (search interval), the size of searchable area, the ability of searchers to see carcasses (searcher efficiency), and the rate at which carcasses are removed by scavengers (scavenging rate) vary among sites and years, the total number of carcasses is adjusted upwards by correction factors to generate a cumulative, per-turbine estimate representing the entire survey period (usually encompassing spring, summer, and fall).

Several methods exist to adjust estimates based on search interval, searcher efficiency, carcass removal, and search area. The most commonly applied methods in Maine have been the "Huso" estimator (Huso 2010, Huso et al. 2012), the "Jain" estimator (Jain et al. 2009), and the "Shoenfeld" estimator (Shoenfeld 2004). Each of these estimators results in an annual per-turbine estimate (separate for birds and bats) and associated confidence intervals, although the methods have different biases and would not yield the same results if used on the same dataset. Although this introduces a source of variation when comparing mortality rates, we did not have access to the raw data necessary to recalculate mortality estimates using a common estimator. Our analyses are, therefore, based on reported estimates. In cases where multiple estimates exist, based on different search intervals or estimators, we calculated mean estimated values.

Bird and bat mortality rates have been estimated for 11 operating wind projects in Maine. Estimates of bat and bird mortality rates and associated confidence intervals varied widely among sites and among years for individual sites. Mean annual bat mortality estimates ranged from 0.12 to 2.95 bats/MW (mean = 0.76;

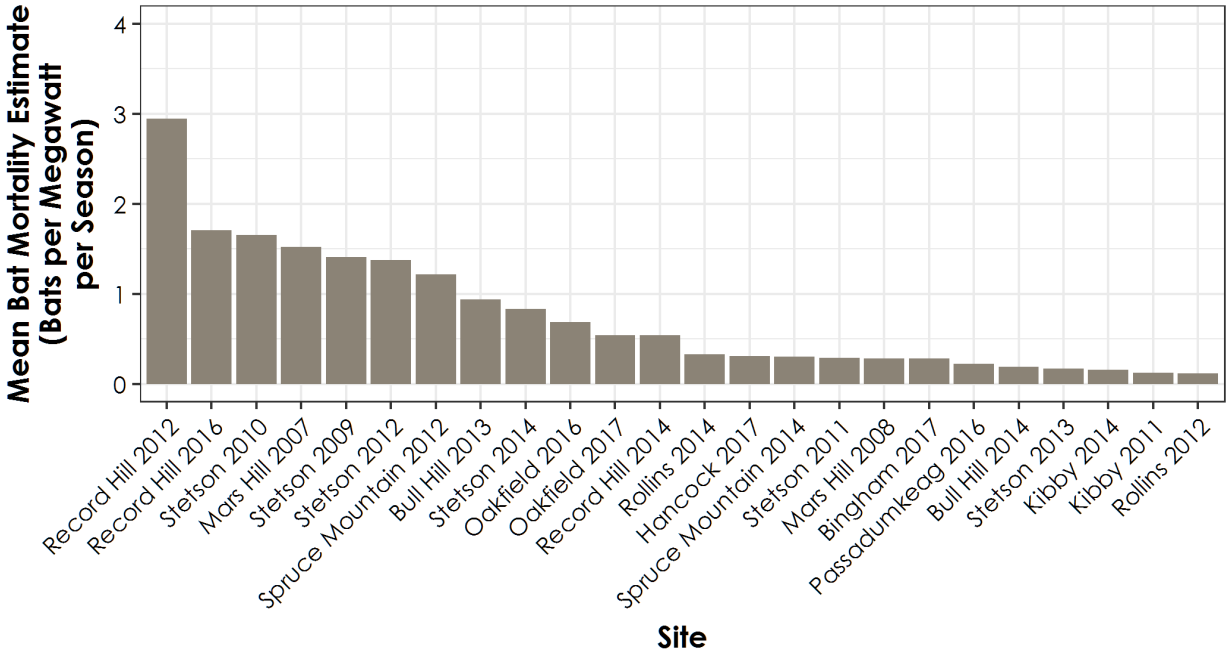

Figure 3-5) and estimated annual bird mortality ranged from 0.54 to 6.95 birds/MW (mean = 2.78; Figure 3-6) per site. Of the 11 sites from which mortality estimates were available, 5 sites (Bingham, Bull Hill, Hancock, Oakfield, and Passadumkeag) were implementing feathering below an increased cut-in speeds ranging from 5.0 to 6.0 m/s during certain times of year and the remaining 6 sites were operating turbines according to manufactured standard cut-in speed. Appendix C contains site-level post-construction bird and bat estimates on which the plotted mean values were based.

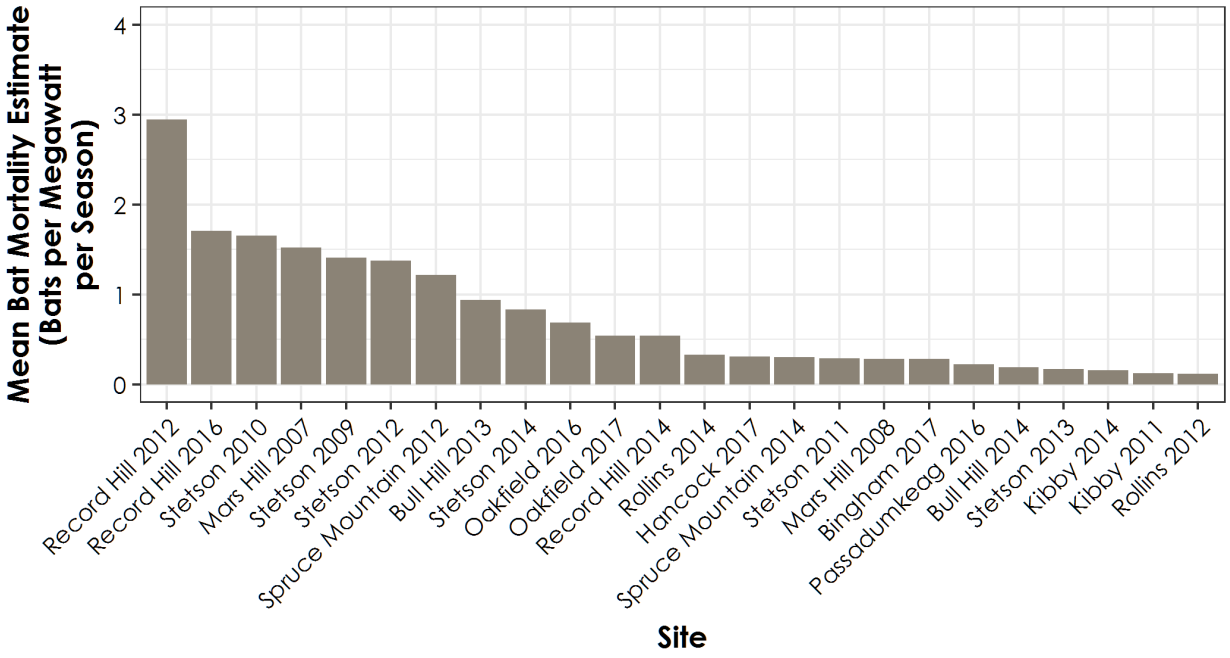

Figure 3-5. Mean bat mortality estimates by year from Maine wind projects by year.

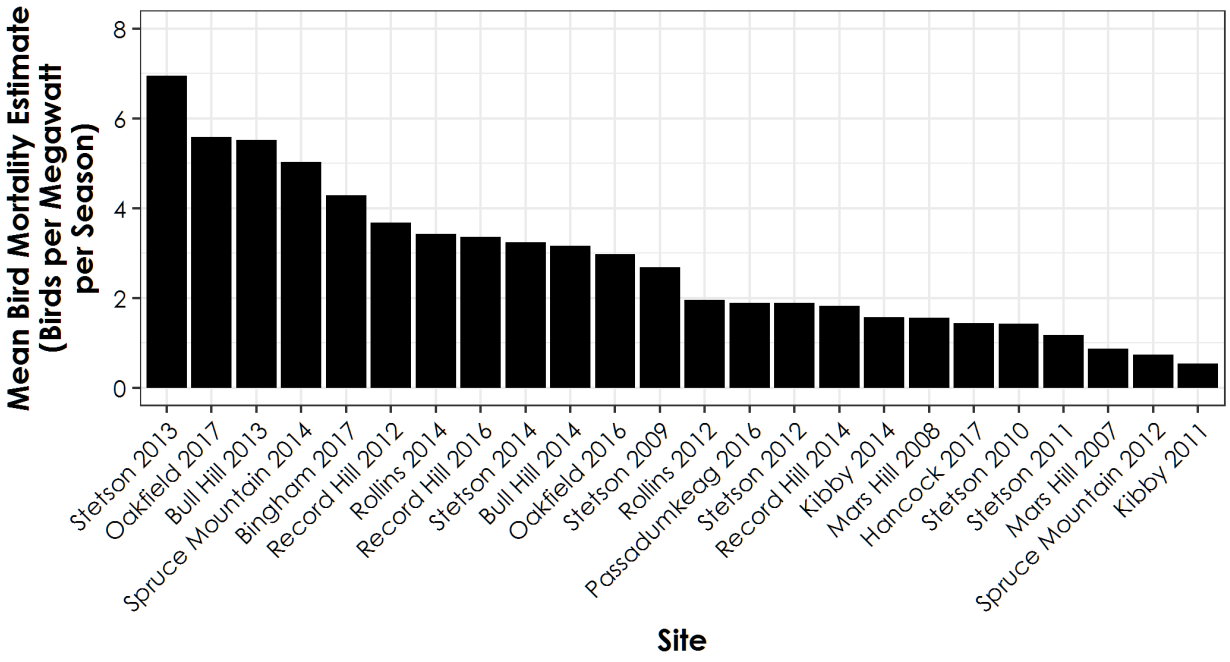

Figure 3-6. Mean bird mortality estimates by year from Maine wind projects.

3.3 COMPARING PRE-CONSTRUCTION AND POST-CONSTRUCTION RESULTS

Paired pre-construction survey results and post-construction mortality estimates were available for 10 sites in Maine.

3.3.1 Radar Surveys

Estimated bat mortality rates (adjusted to account for variable survey periods) showed no apparent trends with pre-construction radar passage rates (Figure 3-7) or the percent of radar targets below turbine height (Figure 3-8)). Linear models comparing estimated bat mortality versus pre-construction radar data indicated that no significant relationships existed between these variables at the site level whether analyses were done using overall averages or annual mortality data (Appendix D Figures 1 and 2). Shown are figures that include 5 sites using curtailment (Bingham, Bull Hill, Hancock, Oakfield, and Passadumkeag); excluding these sites did not affect the results of the analysis. Some of the highest radar passage rates were associated with the lowest estimated mortality rates, contributing to a low correlation coefficient (R^2) and non-significant *P*-value (see equations inset in Appendix D figures).

Comparisons of radar passage rates with bird mortality at the site level using annual mortality estimates suggested a slight trend towards higher mortality rates at sites with higher passage

rates (Figure 3-9). Although linear regression suggested a slight positive correlation, this relationship was not statistically significant whether using annual or site-level average mortality estimates (Appendix D Figure 3). Sites with higher estimated rates of bird mortality appeared to also have higher percentages of radar targets below turbine height in pre-construction surveys (Figure 3-10), although linear regression indicated that this trend was marginally significant only when using site-level annual estimates (Appendix D Figure 4).

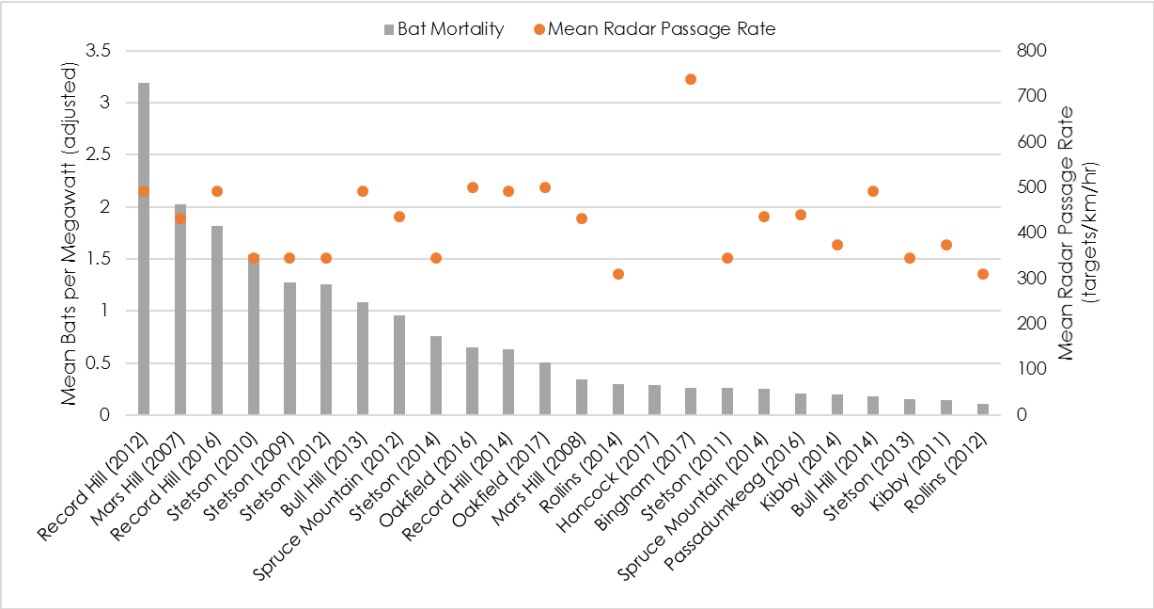

Figure 3-7. Mean adjusted annual bat mortality rates (gray columns) plotted with radar passage rate (orange dots) for commercial wind projects in Maine.

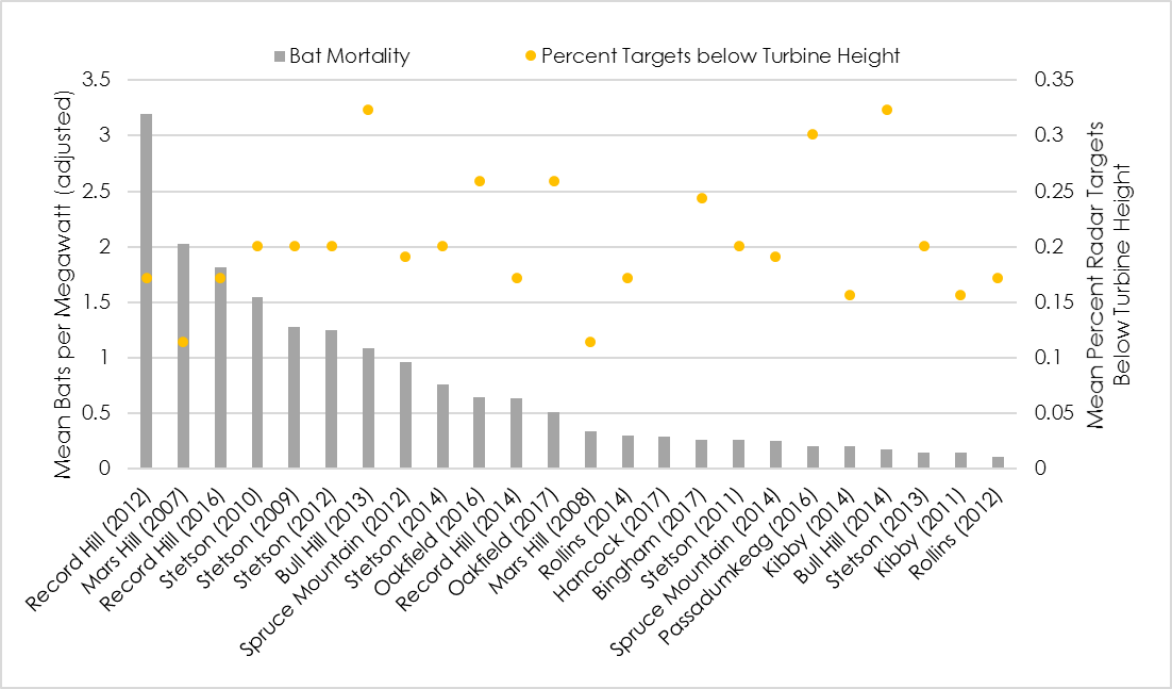

Figure 3-8. Mean adjusted annual bat mortality rates (gray columns) plotted with percent radar targets below turbine height (yellow dots) for commercial wind projects in Maine.

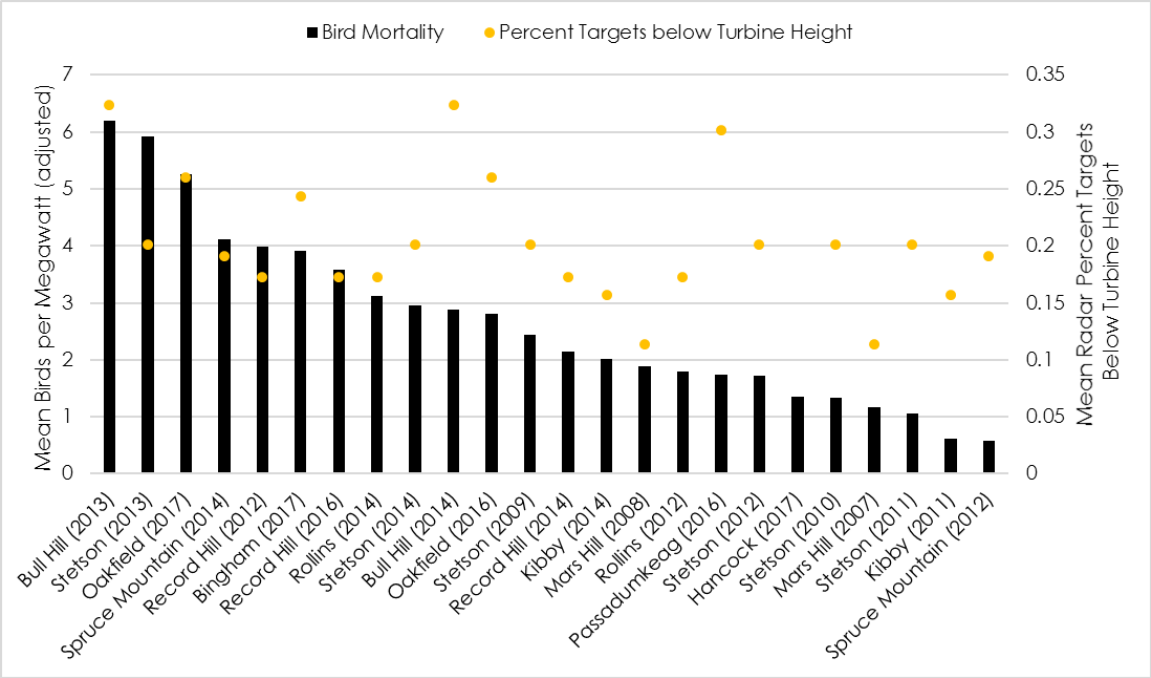

Figure 3-10. Mean adjusted annual bird mortality rates (black columns) plotted with percent radar targets below turbine height (yellow dots) for commercial wind projects in Maine.

3.3.2 Acoustic Surveys

Pre-construction bat acoustic activity rates, whether measured at Met High, Met Low, or Tree detectors, showed no discernable relationship with post-construction bat mortality estimates (Figure 3-11). Linear regression of bat mortality estimates as a function of pre-construction bat activity based on annual data (Appendix D Figure 5) or site-level averages (Appendix D Figure 6) also demonstrated no consistent or statistically significant relationships. As with radar data, the results were similar whether including or excluding the 5 sites implementing curtailment.

Figure 3-11. Mean adjusted annual bat mortality rates (gray columns) plotted with acoustic bat activity levels (blue dots) by detector type for commercial wind projects in Maine. Note different secondary y-axis scales for each detector type.

3.3.3 Raptor Surveys

Although raptors are abundant, raptor mortality at wind projects in Maine has been infrequent, preventing calculation of raptor mortality rates and a comparison to pre-construction raptor survey results.

In summary, only one pair of pre-construction and post-construction data had a statistically significant relationship (percent of radar targets below turbine height was positively correlated with estimated bird mortality rates), whether analyzed at the site level or using annual mortality estimates. Considered together, statistical analyses based on both bird and bat pre-construction surveys demonstrate weak relationships (dots in scatterplots do not fall close to a line) and inconsistent relationships (slopes of linear regressions were not all positive or negative). Although only 10 datapoints were available for site-level analyses after combining survey years, 10 points could sufficiently demonstrate a linear relationship where a strong relationship is present.

3.4 REGIONAL MORTALITY PATTERNS

To provide context for the Maine results, Stantec also compiled 132 empirical bat and bird mortality estimates from 46 wind projects in the Northeast to identify consistency or variation. After removing results from sites with curtailment, as explained above, the dataset included 75 mortality studies conducted at 37 total sites; including 17 studies at 6 sites in Maine, 6 studies at 3 sites in New Hampshire, 22 studies at 12 sites in New York, 24 studies at 12 sites in Pennsylvania, and 6 studies at 4 sites in West Virginia (Appendix E).

Mean adjusted bat mortality rates summarized at the state level increased steadily from a low in Maine (mean = 0.9 bats/MW) to a high in West Virginia (mean = 17.3 bats/MW). Bird mortality rates, on the other hand, were less variable among states, ranging from 1.4 birds/MW in Pennsylvania to 3.1 birds/MW in West Virginia (Figure 3-12).

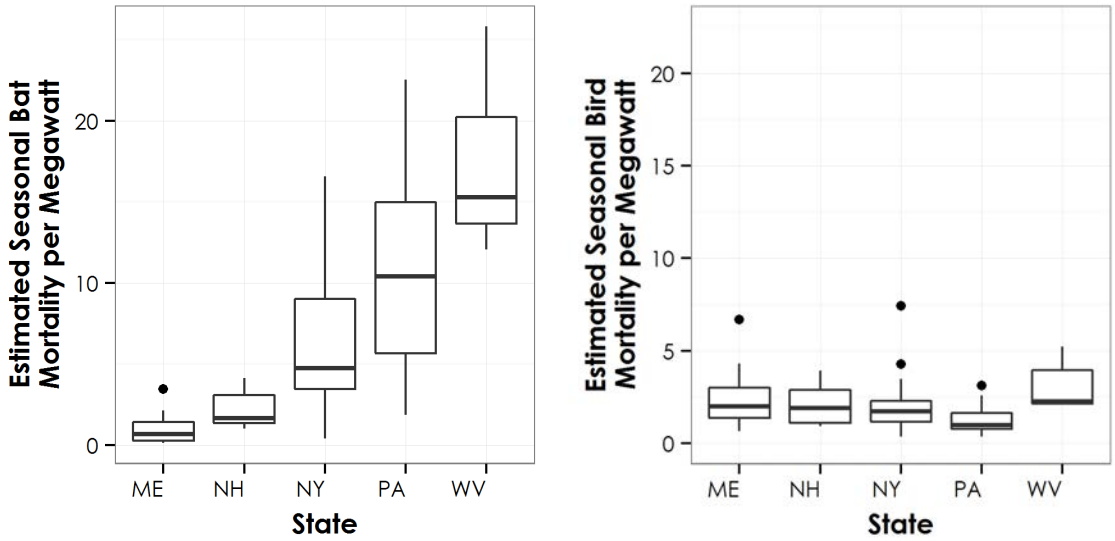

Figure 3-12. Bat (left) and bird (right) mortality estimates from publicly available post-construction studies at commercial wind farms operating without curtailment in the Northeast.

4.0 DISCUSSION

Predicting bird and bat mortality rates based on pre-construction bird and bat activity levels requires a strong link between presence/abundance of birds and bats with the magnitude of mortality. Overall, despite weak positive relationships between bird mortality rates and pre-construction radar survey results, the data from Maine fails to support such a link. Although only 10 paired pre-construction and post-construction datasets exist in Maine (corresponding to the 10 projects for which mortality estimates and pre-construction data are publicly available), the sample size would be sufficient where a strong and consistent relationship would exist between any paired variables. Because we tested each paired dataset using mortality estimates averaged at the site level (which reduces some of the scatter among years) and treating annual mortality estimates from each site as independent datapoints, our analysis was comprehensive yet straightforward. Of all relationships we tested, only the relationship between the percent of targets below turbine height was positively correlated with bird mortality rates when using annual data.

Overall, bird and bat mortality rates at Maine wind projects showed no consistent relationship to bird and bat activity levels measured before construction. Whether based on mean mortality estimates per site (averaged over multiple years at a site) or separate annual estimates, variation in pre-construction bird and bat activity explained little if any of the variation in mortality rates. The correlation coefficients for linear regressions (labeled as R^2 in figures in Appendix D), which indicates the strength of the relationship between two variables and typically ranges from 0 (indicating no relationship) to 1 (indicating a very strong relationship),

was less than or equal to 0.3 in all relationships we tested. This indicates that variation in pre-construction bird and bat activity explained less than 30% of the variation in mortality rates among sites. In other words, variation in mortality attributable to variation in pre-construction data could not be distinguished from random variation. The 4 raptor mortalities documented in 23 publicly available Maine post-construction studies involving more than 13,000 turbine searches indicates low magnitude of risk to raptors even at sites with higher pre-construction raptor activity levels.

The lack of strong correlations between pre-construction and post-construction surveys is not unique to Maine. A recently published study comparing rankings of perceived pre-construction risk to bats and post-construction mortality rates from 29 European wind projects documented a marginally significant relationship and concluded that the substantial effort and cost associated with pre-construction assessments was largely unjustified by their analyses (Lintott et al. 2016). Similarly, a study comparing pre-construction raptor abundance at 20 wind projects in Spain documented significant differences among sites in terms of predicted risk but found no relationship between pre-construction bird activity and post-construction mortality rates (Ferrer et al. 2012). Analysis of results from 12 North American wind projects with pre-construction and post-construction data documented a weak positive relationship between bat activity and bat mortality, although the relationship explained only a small portion of variation in mortality (Hein et al. 2013). The Pennsylvania Game Commission concluded that raptor abundance measured pre-construction at 12 wind farms in Pennsylvania showed no correlation with post-construction mortality rates and indicated that data from the same 12 wind farms with paired data were insufficient for establishing relationships between pre-construction bat activity and bat mortality rates (Taucher et al. 2012). This study further detected no correlation between raptor activity and mortality rates measured concurrently based on post-construction raptor activity surveys.

Several factors could explain the lack of correlation between pre-construction bird and bat activity and mortality rates at wind farms in Maine and elsewhere. Pre-construction metrics do not necessarily reflect the abundance of birds and bats in an area. For example, acoustic bat surveys cannot distinguish individual bats or determine whether individuals are detected more than once (Hayes 1997) and radar cannot reliably and consistently differentiate between individual species or even birds from bats. In addition to characteristics of the data themselves, numerous factors beyond the abundance of birds and bats may affect mortality rates observed at wind projects including turbine characteristics (e.g., height, size of rotor-swept area, lighting arrangements, algorithms controlling turbine operation and startup/shutdown conditions), site conditions (e.g., topography, elevation, habitat types), or behavioral processes (e.g., attraction, avoidance, migratory strategies, species-specific risk factors)(Marques et al. 2014; Cryan and Barclay 2009; Kunz et al. 2007). The presence of the turbines themselves may further manipulate the distribution and behavior of birds and bats, affecting the predictive power of pre-construction surveys.

Since current pre-construction measures of bird and bat activity are not strong predictors of risk, factors such as weather conditions (e.g., temperature and wind speed), the presence of

lighting, and details of turbine operation (which can be modified through curtailment) appear to have greater influence on mortality rates.

It is important to evaluate the data in the context of a broader region when evaluating whether the observed variation in mortality, both among Maine wind projects and in total, is ecologically significant. The difference between the highest and lowest bat mortality estimates in Maine was 3.3 bats/MW (based on site-level average adjusted mortality estimates for sites without curtailment). To put that in a regional context, the highest adjusted annual bat mortality rate documented at any Maine project was lower than the statewide average bat mortality rate for West Virginia, Pennsylvania, and New York. Statewide bat mortality estimates diminish steadily northward from West Virginia to Maine and is likely tied to regional abundance and extended periods of activity in more southern areas. Although this trend has been noted previously, there have been no clear associations between mortality rates and landscape or habitat features in the Northeast (Hein and Schirmacher 2016).

The same geographic trend was not apparent for birds. Mean bird mortality rates and ranges among projects in each state were similar in Northeast states. Comparing mortality rates among states compounds issues related to survey methods, as states often recommend varying levels of effort or use of different mortality estimators (Arnett et al. 2013). Nevertheless, the distinct trend observed for bat mortality estimates among 5 northeastern states is noteworthy, particularly because no such trend existed for bird mortality. Since bird and bat mortality estimates are almost always generated in pairs using the same search and analysis methods, the contrast between the trends is strengthened.

Despite the growing number of paired pre- and post-construction datasets across regions, efforts to link these datasets have not revealed strong relationships. The lack of a clear and consistent relationship between the pre-construction bird and bat activity and mortality rates in our results as well as those of other studies in the U.S. and abroad warrants a re-evaluation of how pre-construction survey data are used in project siting decisions.

Approaching project siting with the idea of differentiating “high” and “low” risk sites based on pre-construction bird and bat activity levels may fail to accomplish the stated goals of avoiding and reducing risk. Our understanding of the factors influencing mortality patterns suggest that risk to birds and bats is dynamic, and is influenced by a variety of seasonal, site-specific, behavioral, and conditions-based factors. Additionally, the relationship between activity and risk may vary dramatically between these two very different taxa and is likely governed by numerous interacting factors. If our current methods do not provide a meaningful tool for evaluating collision risk, more meaningful data may be collected through alternative methods.

Diverting resources away from pre-construction metrics that have shown little utility in predicting bird and bat mortality (e.g., raptor migration surveys, tree-level bat acoustic surveys, extensive radar surveys) and towards efforts to better identify high risk conditions or develop mitigation (e.g., nacelle-mounted acoustic surveys to document wind speed and temperature conditions during which bats are present in the rotor zone; correlate weather conditions with avian

mortality; clean up roadkill to reduce vehicle collisions with raptors and eagles; gate known hibernacula; provide research funding for MDIFW or others to mist net for bats and find maternity roosts) would help wind developers and resource agencies better predict and manage impacts. Comparing the extent of high-risk conditions among potential projects would be far more effective at reducing mortality than knowing that pre-construction bat activity was 50% higher at one site versus another. Accurate characterization of high-risk conditions would in turn enable predictions of how frequently such conditions occur and the cost and effectiveness of appropriate management actions.

Although typical pre-construction survey methods do not predict the magnitude of turbine-related impacts, methods could be revised to focus not only on habitat-related impacts but also determining the relative frequency of high-risk conditions linked to bird and bat mortality. This approach would provide a more comprehensive understanding of the types of impacts expected for a proposed project and could help project developers evaluate and design site-specific adaptive management measures (e.g., threshold wind speeds, temperatures, and seasons where curtailment would be most effective at reducing bat mortality while minimizing the cost of lost power generation). Traditional meteorological measurements and GIS-based landscape/habitat analyses could play a far greater role in such assessments, supplemented by field surveys to document rare species presence and/or sensitive habitats that could be affected by construction of the projects.

True adaptive management requires a better understanding of not only the relationship between risk and conditions but also the efficacy of varying levels of operational management, which could be achieved through simultaneous comparison of multiple management strategies. Ultimately, the cost of operational management actions could be reduced and effectiveness improved if such measures are focused on the demonstrated periods of highest risk.

Appendix A INVENTORY OF PRE- AND POST-CONSTRUCTION DATA

Appendix A Table 1. Inventory of pre-construction and post-construction data compiled for proposed and existing commercial wind projects in Maine.

Site (Region) Bold=pre and post data	Megawatts (# Turbines)	Year	Data (sample size)	Reference
Bingham (Western)	250 (119)	2010	• Bat acoustic data from Tree (n = 602 DN), Met High (n = 390 DN) and Met Low detectors (n = 517 DN) • Nocturnal radar data (n = 40 nights) • Raptor migration data (n = 19 days)	Stantec Consulting Services Inc. 2012. Spring 2010 Avian and Bat Survey Report for the Bingham Wind Project. Prepared for Blue Sky East Wind, LLC. Stantec Consulting Services Inc. 2012. Fall 2010 Avian and Bat Survey Report for the Bingham Wind Project. Prepared for Blue Sky East Wind, LLC.
		2011	• Nocturnal radar data (n = 12 nights)	Stantec Consulting Services Inc. 2012. Fall 2011 Radar Survey Results and Comparison to Fall 2010 Results at the Bingham Wind Project. Memo to Blue Sky East Wind, LLC.
		2017	• Mortality monitoring (33 turbines, survey period = 184 days, interval = 3-day, Huso, Shoenfeld, and Smallwood estimators).	TRC. 2017. Bingham Wind Project Post-construction Bird and Bat Fatality Monitoring Report Year 1 (2017).
Bowers (Central)	Proposed	2009	• Bat acoustic data from Tree detectors (n = 342 DN) • Nocturnal radar data (n = 22 nights) • Raptor migration data (n = 15 days)	Stantec Consulting Services Inc. 2010. Fall 2009 Avian and Bat Surveys for the Bowers Wind Project. Prepared for Champlain Wind Energy, LLC.
		2010	• Bat acoustic data from Tree (n = 498 DN), Met High (n = 143 DN), and Met Low detectors (n = 143 DN) • Nocturnal radar data (n = 20 nights) • Raptor migration data (n = 12 days)	Stantec Consulting Services Inc. 2010. 2010 Spring Avian and Spring/Summer Bat Surveys for the Bowers Wind Project. Prepared for Champlain Wind Energy LLC.
Bull Hill (Coastal Plain)	34.2 (19)	2009	• Bat acoustic data from Tree (n = 426 DN), Met High (n = 94 DN), and Met Low detectors (n = 114 DN) • Nocturnal radar data (n = 20 nights) • Raptor migration data (n = 18 days)	Stantec Consulting Services Inc. 2010. Summer and Fall 2009 Avian and Bat Survey Report for the Bull Hill Project. Prepared for Blue Sky East Wind, LLC.
		2010	• Bat acoustic data from Tree (n = 307 DN), Met High (n = 81), and Met Low detectors (n = 79 DN) • Nocturnal radar data (n = 20 nights) • Raptor migration data (n = 25 days)	Stantec Consulting Services Inc. 2010. Spring 2010 Avian and Bat Survey Report for the Bull Hill Wind Project. Prepared for Blue Sky East Wind LLC.
		2011	• Nocturnal radar data (n = 20 nights)	Stantec Consulting Services Inc. 2011. Fall 2011 Radar Survey Results and Comparison to Fall 2009 Radar Results: Memo for the Bull Hill Wind Project. Prepared for Blue Sky East Wind, LLC.
		2013	• Bat acoustic data from turbine base detectors (n = 102 DN) • Mortality data (19 turbines, survey period = 130 days (daily) & 177 days (weekly), interval = daily/weekly by season, Huso estimator)	Stantec Consulting Services Inc. 2014. Bull Hill Year 1 Post-Construction Wildlife Monitoring Report, 2013. Prepared for First Wind, LLC.
		2014	• Bat acoustic data from Tree (n = 217 DN) and turbine base detectors (n = 500 DN) • Mortality data (19 turbines, survey period = 184 days, interval = daily/3-day by season, Huso estimator & Shoenfeld estimator)	Stantec Consulting Services Inc. 2015. Bull Hill Wind Project Year 2 Post-Construction Wildlife Monitoring Report, 2014. Prepared for First Wind, LLC.

COMPARISON OF PRE-CONSTRUCTION BIRD/BAT ACTIVITY AND POST-CONSTRUCTION MORTALITY AT COMMERCIAL WIND PROJECTS IN MAINE

Site (Region) Bold=pre and post data	Megawatts (# Turbines)	Year	Data (sample size)	Reference
Hancock (Coastal Plain)	51 (17)	2012	• Raptor migration data (n = 10 days)	Stantec Consulting Services Inc. 2012. Results of Fall 2012 Raptor Surveys: Memo for the Hancock Wind Project. Prepared for First Wind, LLC.
		2017	• Mortality data (17 turbines, survey period = 180 days, interval = 3.5 days (twice weekly), Huso, Shoenfeld, and Smallwood estimators)	TRC. 2017. Hancock Wind Project Post-construction Bird and Bat Fatality Monitoring Report Year 1 (2017).
Highland (Western)	Proposed	2008	• Bat acoustic data from Tree (n = 146, Met High (n = 144 DN) and Met Low detectors (n = 142 DN) • Nocturnal radar data (n = 20 nights) • Raptor migration data (n = 15 days)	Stantec Consulting Services. 2009. Fall 2008 Bird and Bat Migration Survey Report: Radar and Acoustic Avian and Bat Surveys for the Highland Wind Project Highland Plantation, Maine. Prepared for Highland Wind LLC.
		2009	• Bat acoustic data from Met High (n = 300 DN) and Met Low detectors (n = 254 DN) • Nocturnal radar data (n = 40 nights) • Raptor migration data (n = 15 days)	Stantec Consulting Services. 2009. Spring 2009 Ecological Surveys for the Highland Wind Project Highland Plantation, Maine. Prepared for Highland Wind LLC.
Kibby (Western)	132 (44)	2005	• Nocturnal radar data (n = 24 nights)	Woodlot Alternatives, Inc. 2006. A Fall 2005 Survey of Bird and Bat Migration at the Proposed Kibby Wind Power Project in Kibby and Skinner Townships, Maine. Prepared for TransCanada Maine.
		2006	• Bat acoustic data from Met High (n = 145 DN) and Met Low detectors (n = 126 DN) • Nocturnal radar data (n = 25 nights	Woodlot Alternatives, Inc. 2006. Summer/Fall 2006 Survey of Bat Activity at the Proposed Kibby Wind Power Project in Kibby and Skinner Townships, Maine. Prepared for TransCanada Maine Wind Development Inc.
		2011	• Mortality data (22 turbines, survey period = 146 days, interval ~5 days, Shoenfeld estimator)	Stantec Consulting Services Inc. 2011. 2011 Post-Construction Monitoring Report Kibby Wind Power Project, Franklin County, Maine. Prepared for TransCanada Hydro Northeast, Inc.
		2014	• Mortality data (10 turbines, survey period = 122 days, interval = daily [5 days/week], Huso estimator)	TRC. 2015. Post-Construction Avian and Bat Mortality Survey Report for the Kibby Wind Power Project. Prepared for TransCanada Energy Ltd.
Mars Hill (Northern)	42 (28)	2005	• Nocturnal radar data (n = 18 nights) • Raptor migration data (n = 8 days)	Woodlot Alternatives, Inc. 2005. A Fall 2005 Radar, Visual, and Acoustic Survey of Bird and Bat Migration at the Proposed Mars Hill Wind Project in Mars Hill, Maine. Prepared for UPC Wind Management, LLC.
		2006	• Nocturnal radar data (n = 15 nights) • Raptor migration data (n = 7 days)	Woodlot Alternatives, Inc. 2006. A Spring 2006 Radar, Visual, and Acoustic Survey of Bird Migration at the Mars Hill Wind Farm in Mars Hill, Maine. Prepared for Evergreen Windpower, LLC.
		2007	• Mortality data (28 turbines, survey period = 113 days, interval = 2 daily/26 weekly, Jain estimator)	Stantec Consulting Services Inc. 2008. Spring, Summer, and Fall Post-construction Bird and Bat Mortality Study at the Mars Hill Wind Farm, Maine. Unpublished report prepared for UPC Wind Management, LLC.
		2008	• Mortality data (28 turbines, survey period = 135 days, interval = weekly, Jain estimator)	Stantec Consulting Services Inc. 2009. Post-construction Monitoring at the Mars Hill Wind Farm, Maine – Year 2. Unpublished report prepared for First Wind Management, LLC.

COMPARISON OF PRE-CONSTRUCTION BIRD/BAT ACTIVITY AND POST-CONSTRUCTION MORTALITY AT COMMERCIAL WIND PROJECTS IN MAINE

Site (Region) Bold=pre and post data	Megawatts (# Turbines)	Year	Data (sample size)	Reference
Number Nine (Northern)	Proposed	2014	• Nocturnal radar data (n = 40 nights)	Stantec Consulting Services Inc. 2015. 2014 Nocturnal Radar Survey Report. Prepared for Number Nine Wind Farm LLC.
Oakfield (Northern)	148 (48)	2007	• Bat acoustic data from Tree (n = 228 DN) and Met High detectors (n = 37 DN)	Stantec Consulting Services Inc. 2008. Fall 2007 Bat Migration Survey Report. Prepared for UPC Wind Management, LLC.
		2008	• Bat acoustic data from Tree (n = 278 DN), Met High (n = 148 DN), and Met Low detectors (n = 141 DN) • Nocturnal radar data (n = 40 nights) • Raptor migration data (n = 23 days)	Stantec Consulting Services Inc. 2009. Spring and Summer 2008 Bird and Bat Migration Survey Report: Visual, Radar, and Acoustic Bat Surveys for the Oakfield Wind Project in Oakfield, Maine. Prepared for First Wind Management, LLC.
		2016	• Mortality data (29 turbines, survey period = 179 days, interval = 3 days, Huso, Shoenfield, Smallwood estimators)	Stantec Consulting Services Inc. 2016. Year 1 Post Construction Bird and Bat Fatality Monitoring Report.
		2017	• Mortality data (29 turbines, survey period = 179 days, interval = 2 days, Huso, Shoenfeld, Smallwood estimators)	TRC. 2017. Oakfield Wind Project Post-construction Bird and Bat Fatality Monitoring Report Year 2 (2017)
Passadumkeag (Central)	40 (13)	2011	• Bat acoustic data from Tree detectors (n = 691 DN) • Nocturnal radar data (n = 40 nights) • Raptor migration data (n = 24 days)	Stantec Consulting Services Inc. 2011. Summer and Fall 2011 Avian and Bat Survey Report for the Passadumkeag Wind Project in Grand Falls Township, Maine. Prepared for Passadumkeag Windpark LLC.
Record Hill (Western)	50.6 (22)	2007	• Bat acoustic data from Tree (n = 43 DN), Met High (n = 90 DN), and Met Low detectors (n = 107 DN) • Nocturnal radar data (n = 40 nights) • Raptor migration data (n = 14 days)	Stantec Consulting Services Inc. 2007. Fall 2007 Migration Report: Visual, Acoustic and Radar Surveys of Bird and Bat Migration Conducted at the Proposed Record Hill Wind Project in Roxbury, Maine. Prepared for Independence Wind, LLC.
		2008	• Bat acoustic data from Tree (n = 41 DN), Met High (n = 90 DN), and Met Low detectors (n = 84 DN) • Raptor migration data (n = 15 days)	Stantec Consulting Services Inc. 2008. Spring 2009 Bird and Bat Migration Survey Report: Breeding Bird, Raptor, and Acoustic Bat Surveys for the Record Hill Wind Project, Roxbury, Maine. Prepared for Record Hill Wind, LLC.
		2012	• Bat acoustic data from Tree detectors (n = 639 DN) • Raptor migration data (n = 23 days) • Mortality data (22 turbines, survey period = 155 days, interval ~ 5 days, Huso estimator)	Stantec Consulting Services Inc. 2012. Record Hill Wind Project Post-Construction Monitoring Report, 2012. Prepared for Record Hill Wind, LLC.
		2014	• Raptor migration data (n = 35 days) • Mortality data (10 turbines, survey period = 139 days, interval = daily [5 days/week], Huso estimator)	Stantec Consulting Services Inc. 2015. Record Hill Wind Project Year 2 Post-Construction Wildlife Monitoring Report. Prepared for Record Hill Wind, LLC.
		2016	• Mortality data (10 turbines, survey period = 158 days, interval = daily [5 days/week], Huso estimator & Smallwood estimator)	Stantec Consulting Services Inc. 2017. Final Post-Construction Monitoring Report, Year 3, Record Hill Wind Project. Prepared for Record Hill Wind LLC and Wagner Forest Management, Ltd.
Rollins (Central)	60 (40)	2007	• Bat acoustic data from Tree (n = 274 DN), Met High (n = 95 DN), and Met Low detectors (n = 106 DN) • Nocturnal radar data (n = 21 nights) • Raptor migration data (n = 12 days)	Stantec Consulting Services Inc. 2007. Fall 2007 Bird and Bat Migration Survey Report: Visual, Radar and Acoustic Bat Surveys for the Rollins Wind Project. Prepared for First Wind Management, LLC.
		2008	• Bat acoustic data from Tree (n = 50 DN), Met High (n = 128 DN), and Met Low detectors (n = 99 DN) • Nocturnal radar data (n = 21 nights) • Raptor migration data (n = 15 days)	Stantec Consulting Services Inc. 2008. Spring 2008 Bird and Bat Migration Survey Report: Visual, Radar and Acoustic Bat Surveys for the Rollins Wind Project. Prepared for First Wind Management, LLC.

COMPARISON OF PRE-CONSTRUCTION BIRD/BAT ACTIVITY AND POST-CONSTRUCTION MORTALITY AT COMMERCIAL WIND PROJECTS IN MAINE

Site (Region) Bold=pre and post data	Megawatts (# Turbines)	Year	Data (sample size)	Reference
		2012	• Raptor migration data (n = 38 days) • Mortality data (20 turbines, survey period = 184 days, interval = weekly, Huso estimator)	Stantec Consulting Services Inc. 2012. Rollins Wind Project Post-Construction Monitoring Report, 2012. Prepared for First Wind, LLC.
		2013	• Raptor migration data (n = 25 days)	Stantec Consulting Services Inc. 2014. Rollins Wind Project Year 2 Post-Construction Eagle Monitoring Report. Prepared for First Wind, LLC.

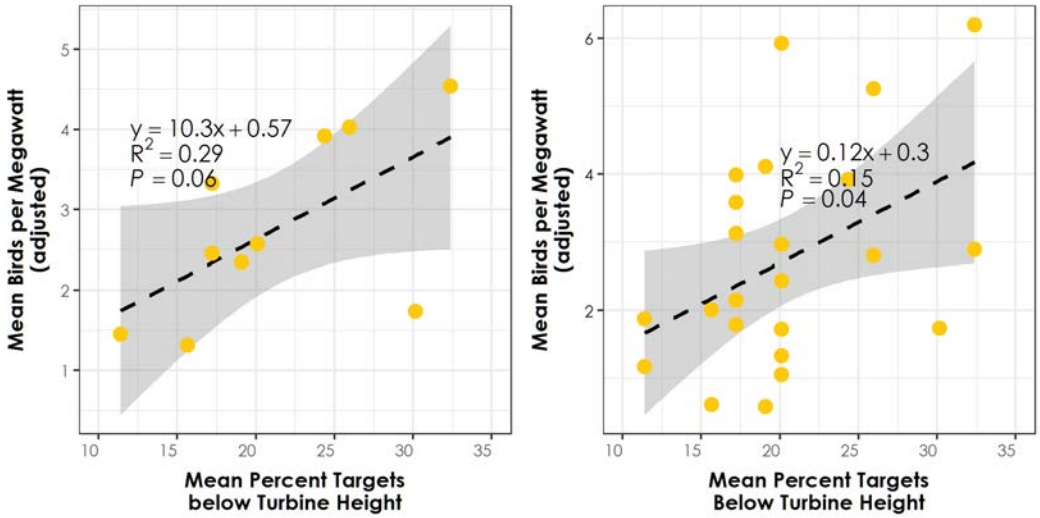
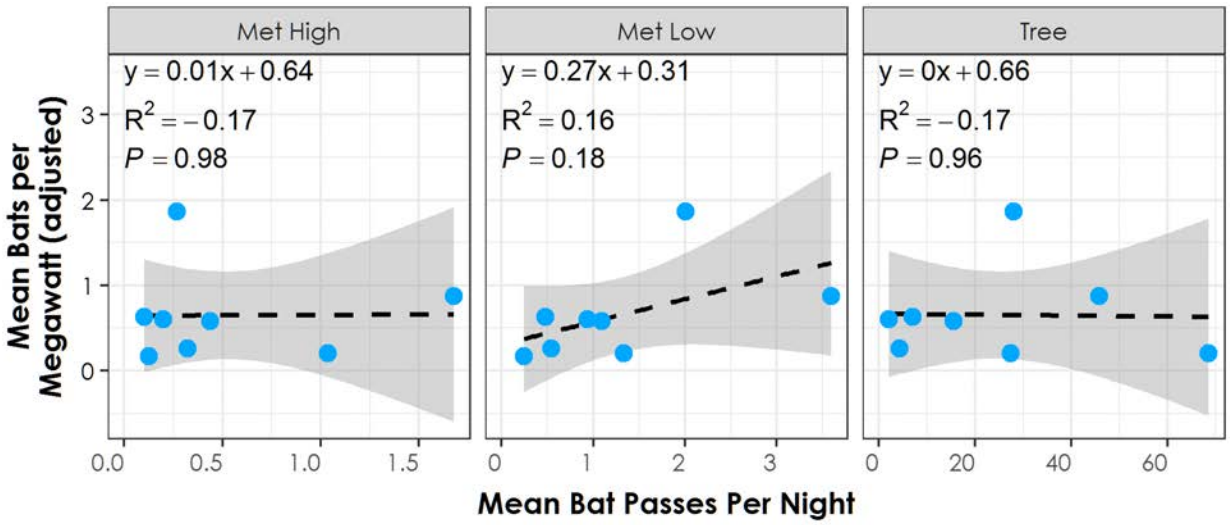
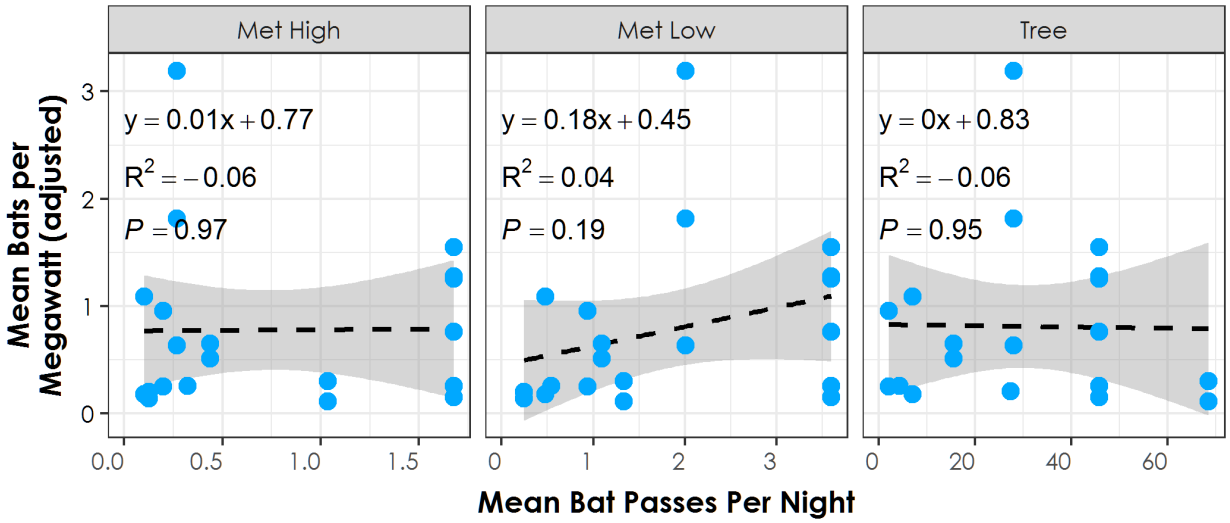
Appendix D LINEAR MODEL RESULTS



Appendix D Figure 1. Estimated bat mortality rates versus pre-construciton rardar passage rate based on site-level averages (left) and annual mortality estimates (right) for commercial wind projects in Maine. Shown are regressions including sites with curtailment.



Appendix D Figure 2. Estimated bat mortality rates versus pre-construction percent radar targets below turbine height based on site-level averages (left) and annual mortality estimates (right) for commercial wind projects in Maine. Shown are regressions including sites with curtailment.



Appendix D Figure 3. Estimated bird mortality rates versus pre-construction radar passage rate based on site-level averages (left) and annual mortality estimates (right) for commercial wind projects in Maine.

Appendix D Figure 4. Estimated bird mortality rates versus pre-construction percent radar targets below turbine based on site-level averages (left) and annual mortality estimates (right) for commercial wind projects in Maine.

Appendix D Figure 5. Estimated bat mortality versus pre-construction bat activity levels based on site-level averages.

Appendix D Figure 6. Estimated bat mortality versus pre-construction bat activity levels on annual mortality estimates by detector type.

Appendix E BIRD AND BAT MORTALITY ESTIMATES FROM NORTHEAST STATES

Appendix E Table 1. Bird and bat mortality estimates from publicly available mortality survey reports for wind projects in New Hampshire, New York, Pennsylvania, and West Virginia used to compare statewide mortality rates.
