Marten habitat suitability

High
 Moderate
 Intermediate
 Low

Areas with High habitat suitability for American Marten were mature, intact forest ca. 2018. Partially-harvested forest is considered Moderate suitability. Areas with Intermediate suitability are older (1970s-1980s) regenerating clearcuts. Areas with Low suitability are younger (1990s-2018) regenerating clearcuts. Marten buffer width is a total of 6000 ft, corresponding to the width of an average home range size for a female marten in Maine (650 ac), assuming a circular home range.
