

1. The deer travel corridors labeled 1 through 8 will be managed as softwood stands and will allow for the maximum tree height that can practically be maintained without encroaching into the conductor safety zone of the transmission line or into the necessary scrub/shrub area adjacent to each structure. The tree heights in these areas will vary based on structure height, conductor sag, and topography, but will range from 25 to 35 feet.
2. Corridors 9 and 10 will be retained as full height vegetation.
3. In areas outside of the depicted deer travel corridors, vegetation will be managed per CMP's standard vegetation management practices.
