Watershed Description

This TMDL assessment summary applies to the 1.4-mile Unnamed Tributary to the Androscoggin River (draining Topsham Fair Mall), located in the Town of Topsham, Maine. The northern edge of the watershed is bordered by Interstate 295 to the west and Route 201 to the east. The impaired stream begins in a heavily developed area near the northern border of the watershed. The stream then flows south, crossing Route 196, flowing parallel to Topsham Fair Mall Road. The stream continues south, crossing Maine Central Springfield Terminal Railroad, and empties into the Androscoggin River near Waterview Point. The watershed covers 320 acres in the Town of Topsham, Maine.

- Stormwater runoff from **impervious cover (IC)** is likely the largest source of pollution to this impaired stream. Stormwater falling on IC in developed areas flows quickly off impervious surfaces, carrying pollutants, and sending high volumes of flow to the nearest section of the stream.

- The Unnamed Tributary to the Androscoggin River (draining Topsham Fair Mall) watershed is predominately developed (71%).

- Woodland areas, such as those in the southern portion of the watershed, absorb and filter some stormwater pollutants and help protect both water quality in the stream and stream channel stability.

- This stream is on Maine’s list of Urban Impaired Streams (DEP, 2010).

Waterbody Facts

- **Segment ID:** ME0104000210_420R05
- **City:** Topsham, ME
- **County:** Sagadahoc
- **Impaired Segment Length:** 1.4 miles
- **Classification:** Class B
- **Direct Watershed:** 0.5 mi² (320 acres)
- **Watershed Impervious Cover:** 30%
- **Major Drainage Basin:** Lower Androscoggin River Watershed

Definitions

- **TMDL** is an acronym for **Total Maximum Daily Load**, representing the total amount of a pollutant that a water body can receive and still meet water quality standards.

- **Impervious cover** refers to landscape surfaces (e.g., roads, sidewalks, driveways, parking lots, and rooftops) that no longer absorb rain and may direct large volumes of stormwater runoff into the stream.
**Why is a TMDL Assessment Needed?**

The Unnamed Tributary to the Androscoggin River (draining Topsham Fair Mall), a Class B freshwater stream, has been assessed by DEP as not meeting water quality standards for aquatic life use and has been listed on the 303(d) list of impaired waters. The Clean Water Act requires that all 303(d)-listed waters undergo a TMDL assessment that describes the impairments and establishes a target to guide the measures needed to restore water quality. The goal is for all waterbodies to comply with state water quality standards.

The impervious cover TMDL assessment for the Unnamed Tributary to the Androscoggin River (draining Topsham Fair Mall) addresses the water quality impairments to aquatic life use (benthic-macroinvertebrate assessments). These impairments are associated with a variety of pollutants in urban stormwater as well as erosion, habitat loss and unstable stream banks caused by excessive amounts of runoff.

**Sampling Results & Pollutant Sources**

DEP makes aquatic life use determinations using a statistical model that incorporates 30 variables of data collected from rivers and streams, including the richness and abundance of streambed organisms, to determine the probability of a sample meeting Class A, B, or C conditions. Biologists use the model results and supporting information to determine if samples comply with standards of the class assigned to the stream or river (Davies and Tsomides, 2002).

This impairment is based on data collected by Maine DEP in 2008 at a sampling station located near the Target store (S-634). The most recent data collected at this station indicate Class B Unnamed Tributary to the Androscoggin River (draining Topsham Fair Mall) is “non attaining” (NA), meaning it does not meet Class A, B, or C conditions.

**Impervious Cover Analysis**

Increasing the percentage of impervious cover (%IC) in a watershed is linked to decreasing stream health (CWP, 2003). Because the impairment is not caused by a single pollutant, %IC is used for this TMDL to represent the mix of pollutants and other impacts associated with excessive stormwater runoff. The Unnamed Tributary to the Androscoggin River (draining Topsham Fair Mall) watershed has an impervious surface area of 30% (Figure 1). DEP has found that in order to support Class B aquatic life use, the Unnamed Tributary watershed may require the characteristics of a watershed with 8% impervious cover. This WLA & LA target is intended to guide the application of Best Management Practices (BMP) and Low Impact Development (LID) techniques to reduce the impact of associated pollutants when compared to existing pollutant loads.

**Impervious Cover GIS Calculations**

The Impervious Cover Calculations are based on analysis of GIS coverage’s presented in Figure 1. These maps were derived from a detailed field assessment conducted by DEP Staff, as described in the TMDL.
impervious surfaces. Ultimate success of the TMDL will be the Unnamed Tributary’s compliance with Maine’s water quality criteria for aquatic life.

**Next Steps**

Because Unnamed Tributary to the Androscoggin River (draining Topsham Fair Mall) is an impaired water, specific sources of stormwater runoff in the watershed should be considered during the development of a watershed management plan to:

- Encourage greater citizen involvement through the development of a watershed coalition to ensure the long term protection of the Unnamed Tributary to the Androscoggin River;
- Address existing stormwater problems in the Unnamed Tributary to the Androscoggin River watershed by installing structural and applying non-structural best management practices (BMPs); and
- Prevent future degradation of the Unnamed Tributary to the Androscoggin River through the development and/or strengthening of local stormwater control ordinances.
