WESTERN DISTRICT:

Chronic Diseases

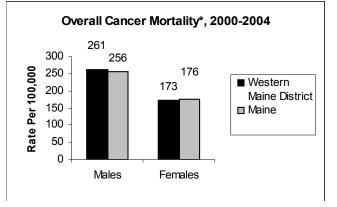

<u>Cancer</u>

Cancers are caused by modifiable risk factors, by genes, and influenced by environmental factors. Four cancers account for the majority of new cancer diagnoses: lung, colorectal, female breast, and in men, prostate. It is the second leading cause of death in Maine.

Data are collected and analyzed by the Maine CDC's certified Maine Cancer Registry to monitor trends and investigate possible cancer clusters. The Maine Comprehensive Cancer Program supports strategic planning in partnership with its nonprofit partners and provides targeted prevention activities if there are gaps as identified in the Maine Cancer Plan. The Maine Breast and Cervical Cancer Program reduces disparities in health by supporting outreach and screening for breast and cervical cancer in women at risk who cannot afford them.

Cancer Screening

Screening tests for breast, colorectal, and cervical cancer have contributed to declines in death due to these cancers. Colonoscopies and pap smears have preventive aspects critical to early detection and treatment.

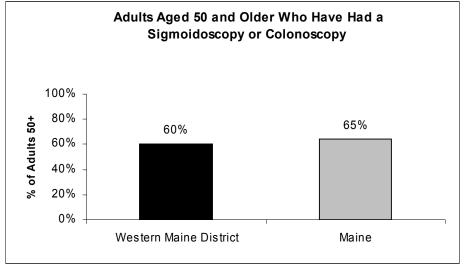

The early detection of cancer is the most effective way to improve the chances of a positive outcome through treatment. Additional information on cancer screening can be obtained from Maine CDC's Comprehensive Cancer Control Program at: www.maine.gov/dhhs/boh/ccc.html.
