Multistakeholder Input on a National Priority: Improving Population Health by Working with Communities—Action Guide 3.0

May 2016 DRAFT

This third version of the Action Guide incorporates input from a range of groups working to improve population health who field tested earlier versions of this Guide. This report is funded by the Department of Health and Human Services under contract HHSM-500-2012-00009I Task Order HHSM-500-T0004.

Why Focus on Improving Population Health?

The United States has relatively poor overall health outcomes compared to many other developed nations, faces unsustainable healthcare costs, and continues to grapple with significant disparities in health status. To address these needs, the National Quality Strategy (NQS) is driving action across the country focused on creating healthier people and communities, better healthcare and more affordable care. The NQS recognizes that improving population health through collaborative efforts is an important part of the solution. The health of individuals, communities, and the total population cannot be effectively addressed by only one type of organization. Public health agencies, the vast healthcare sector, and many other contributors are all critically important, as health is the result of a number of complex determinants and requires coordination and partnership among many stakeholders.

Many factors influence health and need to be addressed in a coordinated way across multiple sectors. Working together, much more can be accomplished than any one person or organization can do alone.

The ways in which partners come together to improve health can take many forms, such as a local coalition involving leaders from businesses, community service organizations, healthcare institutions, health plans, and a public health department; diverse governmental agencies working more closely toward mutual objectives; or a large multistakeholder group taking action across counties or a state. There is no “one size fits all” solution, but there are lessons to be learned from research and experience.

Many people think of healthcare services when talking about how to improve health; however, medical care has a relatively small influence on overall health when compared with behaviors such as smoking and poor diet, physical environmental hazards such as polluted air and unsafe roadways, and social factors like unemployment, low educational achievement, and poverty. Because the issues are wide-ranging and the pressure to improve health and reduce healthcare costs is tremendous, sustained population health improvement requires coordinated efforts.

Public health professionals have focused on population health improvement for many years at the tribal, local, state, and national levels. In the public health system, there are different levels of capacities and resources, skill sets, and coordination with partner organizations. The potential for accreditation is an important development to advance the effectiveness of public health agencies in fulfilling their mission. For example, of the 11 areas in which accredited public health agencies are currently held accountable, at least four get to the heart of population health improvement: monitor health status and understand health issues; protect people from health problems and health hazards; give people information they need to make healthy choices; and engage the community to identify and solve health problems.

Healthcare providers, health systems, and health plans also have a responsibility to improve health outcomes. As value-based purchasing, performance measurement and other incentives drive the move from “volume to value,” healthcare providers are increasingly taking an active role in promoting and improving healthy populations, rather than simply engaging with individuals when they are injured or...
sick. Making this shift is almost countercultural for some in the healthcare system, as American society tends to value personal independence and responsibility, and can be skeptical about coordinated efforts involving public and private organizations. But the pressure to move in this direction is increasing. Fortunately, many hospitals, provider groups, health plans, and other healthcare stakeholders have a history and mission of responding to the broader needs of communities and vulnerable populations, and can share lessons learned from their experiences.

Beyond the healthcare and public health systems, the concept of “health in all policies” suggests that even those whose work is not directly related to healthcare — such as employers, community advocates, housing organizations, schools, universities, prisons, military bases, transit systems, land developers, and the like — make decisions and create environments that can help or hinder good health for the overall population or for a specific subpopulation. A few examples include:

- **Business leaders and purchasers in the public and private sectors** deal with the direct and indirect impact of poor health of their employees and family members every day. This results in higher direct healthcare costs. For example, according to the Centers for Disease Control and Prevention (CDC), chronic disease such as heart disease, stroke, and diabetes accounts for 75 percent of the $2 trillion spent on medical care. In addition, the CDC estimates that the indirect cost of employee absenteeism, turnover, short-term disability, workers compensation, and reduced work output may be several times higher than direct medical costs. The gradual shift to more sedentary types of jobs is likely a contributing factor in weight gain and obesity among workers. Over the past five decades, average calories burned for jobs have decreased; however, well-designed workplace physical activity promotion programs can be effective. Beyond striving for a healthier workforce, many businesses also recognize the value of supporting healthier communities through activities such as volunteering time and financial donations to housing projects, educational mentoring, and neighborhood safety initiatives.

- **Parents and other family members** are at the center of influence on the current and future health of children. Children’s behaviors, such as eating and activity habits, can be affected both intentionally and unintentionally by the people around them. Certain negative life events or Adverse Childhood Experiences (ACEs) can have a lasting impact on well-being. These ACEs include verbal abuse, living with a problem drinker, separation or divorce of a parent, mental illness in the household, and physical abuse. For people younger than 18, these experiences can cause toxic levels of stress or trauma, increasing the likelihood of poor physical and mental health, in addition to lower educational achievement, lower economic success, and impaired social success in adulthood. When families and their larger social support systems help minimize the exposure of children to ACEs — and teach kids resiliency and other coping skills — this can positively affect the health and well-being of the next generation.

- **Schools** are where children spend many hours of their day for much of the year. Not only is education an important influence on long-term health, but schools can serve as a hub for many more health-promotion activities. For example, the Green Strides initiative of the U.S. Department of Education promotes sharing best practices and resources related to health and the environment, addressing issues such as air quality near schools and asthma.
There is also a financial impact to consider. The cost of poor health is staggering, but there is evidence that certain efforts to improve health can save money. Some examples:

- Investing in “community building” — such as advocacy to support low-income or affordable housing, economic and workforce development, environmental improvements, and educational opportunities, among others — is an effective strategy for improving population health, and there can be a financial return on investment. For example, early quality child care and education have been found to have long-term positive effects, with every dollar invested saving taxpayers up to $13 in future costs.9

- Health-promoting policies can save money in multiple ways. For example, researchers estimated that prohibiting smoking in all U.S. subsidized housing could potentially save approximately $341 million in healthcare costs related to secondhand-smoke exposure, as well as millions more in avoided renovation expenses and fire damage due to smoking.10

- In Camden, NJ, leaders recognized that a relatively small number of people who frequently used hospital services were generating about 90 percent of the hospital costs. One patient had come to the emergency department 113 times in a single year. Healthcare providers alone could not solve this problem. However, by taking a community-based team approach to addressing the social and personal needs of these patients — including housing, food, home visits, and social contact — they were able to stabilize the health of this subpopulation and head off medical issues that could cost millions of dollars to address. Their coordinated efforts resulted in a 40 percent reduction in emergency department visits and a 50 percent decrease in hospital costs.11

Figure 1 shows a clear example of how working on health improvement is much more effective than waiting until people get sick and need medical care. Within a population of 100,000 people ages 30-84, it was estimated that far more deaths could be prevented or postponed if everyone followed basic guidelines for good health when compared to the impact of consistently and appropriately using key heart-related medical interventions.12
A death prevented or postponed avoids the direct and indirect costs of illness and disease caused by poor health. Heart disease and death caused by smoking or obesity, for example, doesn’t happen quickly: the years of poor health result in much higher medical costs, plus the cost of absenteeism and reduced productivity at work.

Ideally these issues should be addressed as far upstream as possible, fostering a culture of health within communities and encouraging children to develop healthy habits. Behaviors established in childhood are often more likely to become lifelong activities, and attempting to adopt and promote new behaviors in adulthood can be particularly challenging for individuals and healthcare providers. Special consideration may also be needed for certain subpopulations — for example, Medicaid patients with asthma who have variability in both physiology and in influences from their social and physical environments.

*Above all, improving population health is about making life better for real people: our children and families, co-workers, neighbors, and ourselves. Preventing and postponing disease increases the odds that every child and adult has the opportunity to reach her or his full health potential.*

Pieces of the “population health improvement” puzzle are being developed and, in some areas, coming together to create a more complete and effective effort. For example, establishing Accountable Care Organizations that align goals and perspectives across certain healthcare organizations is one approach, but not the same as a comprehensive effort to improve population health. Another initiative from the Centers for Medicare and Medicaid Services Innovation Center (CMMI) is the Accountable Health
Communities model, bridging together clinical care and community services to identify the impact of health-related social needs on the total cost of care and healthcare quality. Creating clear incentives is certainly an essential part of the big picture. This is taking place in programs such as Medicare Shared Savings, the IRS community benefit rules for nonprofit hospitals, public health accreditation, and the growing use of health impact statements as part of public policy decisionmaking. However, certain pieces of the puzzle needed to achieve better population health at the local, state, and national levels are still missing or hard to find.

Even with a shared commitment to improving population health, this is challenging work. Coordinated collaboration is essential, but different individuals and groups may be motivated by competing incentives and interests that are not aligned. Capturing and sharing information can be difficult, not only because the technology involved may not be available or interconnected, but also because of differences in definitions, cultures, viewpoints, regulations, and available resources. Dedication to learning and applying best practices is needed to overcome these types of challenges.

**What is this Guide?**

This Guide is a handbook intended to be used by anyone who wants to improve health across a population, whether locally, in a broader region or state, or even nationally. Whether you are a community leader, public health professional, employer, healthcare provider, health plan administrator, policymaker, or consumer advocate interested in improving population health, this Guide contains recommendations, examples, and links to resources that can help you understand the issues and take action. It is organized in brief summaries of 10 elements important to consider during efforts to improve population health.

There are many reports, websites, tools and other resources for every aspect of population health improvement. While each item may be very helpful, the sheer volume can be overwhelming. *This Guide is intentionally short, with links to more information when details are needed. It takes a broad look at the issues, while attempting to avoid duplication of the great work already done by others.*

As an essential forum for driving improvements in health and healthcare, the National Quality Forum (NQF), with funding from the Department of Health and Human Services (HHS), brought together a multistakeholder Committee to develop earlier versions of this Guide through an open and iterative process. This Population Health Framework Committee (see Appendix G for the committee roster) includes population and community health experts, public health practitioners, healthcare providers, coordinators of home and community-based services, consumer advocates, employers, and others who influence population health. The committee membership and transparent process mirrors the multidisciplinary, collaborative nature of effective population health improvement.

This Guide is based on evidence and expert guidance about what works to improve population health. The final Action Guide, version 3.0, incorporates feedback from multisector collaborative groups working on population health improvement in various regions across the country. These “field-testing” groups, listed in Appendix H and each described in narratives in Appendix F, provided important input on ways to improve earlier versions of the Action Guide based on their practical experiences.
Population health improvement is not about starting a program with a short-term goal that, when reached, one can declare success, shut down the project, and go back to business as usual. Instead, think of population health as an ongoing journey that requires contributions from many types of groups in different sectors across a region and at multiple levels. It is a team effort in which people take actions that, in some cases, fundamentally change how things are done. In other words, this Guide describes approaches that can help make lasting improvements in population health.

**How to Use the Guide**

Like a handbook or “how-to” manual, the Guide suggests 10 useful steps toward building or refining initiatives to improve population health. The Guide offers ideas, examples, and links to resources that provide detailed content for your consideration. There is no one-size-fits-all approach, so the content in this Guide should be tailored to suit different situations.

**Standard Steps, Custom Approaches**

The elements presented in this guide are intended to highlight best practices and resources for key topics, but the best way to improve population health depends on where the work is being done. Many types of organizations and people, personal decisions, and social and environmental situations influence the health of individuals, subpopulations, and populations. The mix and degree of impact from these influential factors, or determinants of health, differ by location.

Individuals who are newer to this type of work may benefit from reviewing the entire Guide in detail. Others may want to focus only on certain elements, or share relevant sections with partners for whom it may be more applicable. How insights from this Guide are applied for a given region will differ depending on specific circumstances. Brief examples of how the elements apply to the various field testing groups mentioned above are also provided throughout the Guide.

**Start Where You Are**

Whether you are refining ongoing efforts or starting a new venture, this Guide can help. In many regions, there are long-standing programs to improve population health. This Guide can be used to assess and further refine or expand such work. In other regions, bringing organizations together to improve population health may be new, so this Guide can be used to identify essential parts of the process as you move forward. Ideas for using this Guide include:

- **Prepare to get started**: Drive initial thinking about the current situation in your region and what likely needs to be done to succeed.

- **Bring others on board**: Share the insights you gain and encourage others to come to the table and participate in the initiative.

- **Take a deeper dive**: Use the description of each of the 10 elements for a general overview, then follow the hyperlinks under the examples and resources to dig deeper, explore options, and find what is most useful to your region.
• **Stay on course:** Consider posting or distributing the checklist on page 13 as a quick reminder of the 10 elements and related questions.

**Important Words with Clear Definitions**

It’s no surprise that there are differences in the words people use to describe this type of work, given the many types of organizations and individuals involved. Clear communication is critical to avoid misunderstanding and keep everyone focused on shared goals.

Although many words associated with population health may come up in discussions, the terms listed below are among the most important for establishing a common understanding. These definitions are based on the work of experts and multistakeholder groups focused on population health, and are intended to reduce confusion due to different meanings for the same word, or different words used to mean the same thing.

1. **Population Health** – The health of a population, including the distribution of health outcomes and disparities in the population.  

2. **Population (also, Total Population)** – All individuals in a specified geopolitical area.

3. **Subpopulation** – A group of individuals that is a smaller part of a population. Subpopulations can be defined by geographic proximity, age, race, ethnicity, occupations, schools, health conditions, disabilities, interests, or any number of other shared characteristics.

4. **Health** – A state of complete physical, mental, and social well-being and not merely the absence of disease or infirmity.

5. **Determinants of Health** – Factors affecting the health of individuals in a population or subpopulation, such as the social and physical environment, behaviors, and healthcare.

6. **Health Disparities** – Differences in health status or health outcomes within a population.

7. **Health Equity** – The absence of systematic disparities in health or major social determinants of health between groups with different underlying social or economic advantages/disadvantages.

8. **Health Inequity** – Differences in health status between groups with varying social and economic advantage/disadvantage (e.g., socioeconomic status, gender, age, physical disability, sexual orientation and gender identity, race and ethnicity) that are caused by inequitable, systemic differences in social conditions (i.e., policies and circumstances that contribute to health determinants).

When thinking about these terms and discussing them with others, there are a number of important concepts to keep in mind. For example, the definition of population used in this Guide includes everyone...
in a geopolitical area in order to promote a focus on improving the health of all individuals in a region, regardless of other characteristics. Geopolitical areas or regions can be determined by zip code, precinct, ward, county, district, metropolitan statistical area, state, multistate region, nation, continent, or worldwide. In contrast, a geographic area might be less precise — such as along the coast or west of the mountains — and therefore may prove difficult in unexpected ways. Using boundaries that coincide with geopolitical designations may increase chances of finding useful data sources — for example, many population-based surveys use samples determined by geopolitical areas. Program funding and government regulation are often based on or defined within a geopolitical boundary, as well.

Subpopulations can be any group with shared characteristics, such as race, ethnicity, age, employment, educational status, medical condition, or disability, and so on. This can also include groups that might be relatively rare — such as people with “orphan conditions,” or people who are transgender — or some other defined group across long distances, especially because of the way technology and social networks enable people with shared characteristics to connect.

Using the definition of subpopulation is important for identifying inequities in health status (and related disparities in medical care, social services, and supports, etc.) among certain groups. The needs of relevant subpopulations should drive the goals and objectives for health improvement activities implemented by clinical care systems, public health agencies, and multisection collaborations. This promotes a “system within systems” approach where each of these sectors or organizations can work with a specific subpopulation (e.g., covered members, hospital referral area, or an at-risk group) in the context of a total population within a geopolitical area. This approach also accommodates the separate funding, implementation expectations, and data collection systems (often stand-alone) of the various sectors. Addressing the health inequities of subpopulations in greatest need can also potentially have a significant impact on health of the total population.

The term “community” is often used interchangeably with “population” or “subpopulation”; however, that can lead to misunderstandings because there are many possible meanings of “community.” The boundaries of what defines a community are evolving, particularly in the era of the Internet and social media. To avoid confusion, this Guide refers to populations or subpopulations more than communities and does not define “community health” as a separate concept. However, an important aspect of community is the power of relationships and the interconnectedness of people, organizations, and systems within a community. Such “system” thinking and focus on relationships are very important to population health improvement work.

The definition of health used here encompasses a complete state of wellness. The World Health Organization established this broader definition and has used it consistently since 1948. It can be helpful to recognize that this definition describes an aspirational state, and that resilience and maximizing well-being are important for a given set of circumstances. Understanding population health also requires noting the variation in health within subpopulations of people in the total population. It includes looking at patterns of health determinants, and the policies and interventions that link health determinants with health outcomes, both within and across populations.
Health is shaped by many factors, including individual biology, behaviors, and the physical and social environments where we live. Relationships with friends and family can have a considerable impact on health. These determinants combine to affect the health of individuals, subpopulations, and the total population. While access and use of healthcare services is often considered when thinking about health improvement, healthcare has less of an impact on population health compared to other factors like the social, economic, and physical environment, and a person’s individual behaviors.

Disparities in health usually refer to differences in health status or health outcomes when comparing groups within a subpopulation or the population overall. Health equity, simply put, is the absence of these differences in health status or outcomes among diverse groups of individuals. Groups that are most often considered when addressing disparities are defined by race or ethnicity, such as Blacks/African Americans, Hispanics/Latinos, Asians and Pacific Islanders, and Native Americans/Alaska Natives, in addition to persons with limited English proficiency (LEP). This is an important first step; however, disparities should be assessed for all vulnerable groups—including people who are disabled, pregnant women, children, the elderly, and lesbian/gay/bisexual/transgender (LGBT) individuals.25
Quick View: Action Guide Key Elements

Ten elements important in successful collaborative approaches to improving population health are listed below. Consider these when starting a new project, or when refining existing programs. They do not need to be addressed in order; however, some are closely related activities or steps.

See the full Action Guide for details about each element, examples, and links to useful resources.
Ten Key Elements: Overview

A variety of factors are important for creating and sustaining successful approaches to improving population health. The elements in this Guide were identified based on research and assessments of existing resources and initiatives focused on improving population health. Many promising programs already include some or most of these elements. To improve the likelihood of long-term success, all 10 of the elements should be considered when starting a new project or when refining or coordinating programs already in place.

Each section below describes what the element is, why it is important, provides examples of how it can be done, and includes links to useful resources. The elements are numbered, but there is no specific order in which they must be addressed. That said, starting with the self-assessment may give you the best insight about your approach to the other elements.

Element 1: Collaborative Self-Assessment

What it is

Whether you are just getting started or working to refine existing population health improvement activities, taking the time to do a self-assessment can identify strengths and weaknesses during the planning or ongoing implementation of collaborative efforts. A self-assessment can be done using a formal process, an online tool, or just starting with a review of the elements in this Guide.

Why it is important

Completing a collaborative self-assessment creates a foundation for understanding the current situation and environment. The assessment can highlight the unique capabilities and limitations of different partners, and reveal where there is a need for more resources or attention. Results of a self-assessment are important for making informed decisions when identifying roles for different groups participating in the work, setting goals and objectives, developing strategies, creating plans, and taking steps to achieve the desired results.

The steps to take after the self-assessment depend on what you learn from it. For example, if the assessment indicates that there has been little or no collaboration in your region to improve health within or across the population, the next step might be to identify and bring together a small group of interested stakeholders to build trust and explore how to get started. In contrast, a self-assessment that reveals multiple existing population health improvement projects in the region could call for bringing the project leaders together to forge new or
stronger connections. The assessment may also inform decisions about which organizations are particularly well positioned to participate in a broader multistakeholder effort.

How it can be done

A self-assessment can be done informally, or by taking a more structured and resource-intensive approach. It may involve research, surveys or interviews of community members and key organizational partners, as well as other approaches to gather information. There are various tools and reports available to assist with self-assessments.

For each of the elements in this Guide, any number of questions might be explored during a self-assessment. Questions can help to generate ideas or hypotheses about how best to approach the work, including where to start. Exploring these questions in advance can also serve as an important reminder to ensure that sufficient resources, such as funding or time from key partners, will be allocated to each of the elements. The questions listed next to each element on page 13 can help kick-start the process.

The findings from a collaborative self-assessment should help identify the next steps to take. For example, the self-assessment may indicate that there is a lack of knowledge or agreement about the degree of collaboration already happening in a region, so a detailed mapping of community assets may help better identify existing population health improvement activities and partnerships. The results of the asset mapping could then inform next steps, such as determining what type of collaborative model may be most appropriate for the specific group of multisector partners (see the resource links below for more information).

After completing the self-assessment, the rest of the elements do not need to be followed in order. The elements should be addressed in a way that fits the regional situation. Certain elements do tend to flow together sequentially during implementation, while other elements are more relevant throughout the process. However, it is critical to consider each of the elements early, as mentioned above. For example, a plan for joint reporting of results should be considered at the start of a project to ensure prompt feedback on progress. The approach to addressing each of the elements may also need to be updated and adjusted at different times to adapt to changing conditions. Figure 2 shows one way to visualize the relationship among the various Action Guide elements.
Additional resources for more information:

- **CDC Partnership Evaluation Guidebook.** This report describes six steps for evaluating the strength of your partnership. Each step is described, with illustrations or examples from real programs, and includes a checklist of tasks and worksheets for applying the concepts to your specific evaluation, as well as a summary of tips. [http://www.cdc.gov/obesity/downloads/partnershipevaluation.pdf](http://www.cdc.gov/obesity/downloads/partnershipevaluation.pdf)

- **Community Tool Box.** This is a toolkit with a detailed outline of issues to consider, additional linked resources describing different approaches and models of collaboration, and specific examples. Multiple questions are listed that can help bring focus to what is needed for effective collaboration. [http://ctb.ku.edu/en/creating-and-maintaining-partnerships](http://ctb.ku.edu/en/creating-and-maintaining-partnerships)

- **Improving Community Health through Hospital-Public Health Collaboration.** Although this report focuses more on collaboration between hospitals and the public health sector, many of the insights are applicable for various other types of collaborative population health efforts. Appendix A of the report identifies “Core Characteristics of Successful Partnerships.”
Element 2: Leadership Across the Region and Within Organizations

What it is

Simply put, leadership is the ability to guide or influence people. It is particularly important when bringing individuals and organizations together to accomplish a common task. Leadership has been the subject of study for centuries; it was part of the teachings of Confucius and Aristotle, and even appeared in Sun Tzu’s The Art of War. While the exact definition is still studied and debated, there are certain leadership skills and abilities needed to be an effective, trusted convener. These include cultivating a shared and inspiring vision, thinking strategically, applying individual and collective intelligence, managing relationships and roles, demonstrating shared accountability and recognition, using effective social skills in different situations, and being resilient, adaptable, and able to manage change over time. Leadership is important within an organization and across participating groups, especially when creating a collaborative culture. Coalition leaders act as an integrator, playing the important role of a quarterback.

Improving population health requires leaders in several types of organizations and individuals to work together. At a minimum, this should include representatives from public health, healthcare, and other key stakeholders who are strongly invested in the affected population. The stakeholders who need to be involved may be diverse, such as consumer groups, local and state elected officials, tribal councils, Medicaid directors, employers and business leaders, educators, transportation officials, housing advocates, community service providers, health plans, the military, healthcare providers, corrections administrators, farmers, people with particular health conditions or disabilities, and faith communities. Each can bring important perspectives to the table, as well as unique experiences and skills.

In this type of work, leadership is more like putting together a complex puzzle, rather than directing the actions of others from the top of a pyramid.
Why it is important

Leadership is needed to bring this variety of groups together. Whether it is a single leader or a small group of people who inspire and guide others to get involved, creating this kind of momentum does not happen without one or more identified leaders at the helm. This requires skills in managing relationships and roles, strategy, and helping others understand the benefit that they will get from participating.

Organizations at the table will likely have differences in perspectives, internal culture, terminology, and the value that they see in the work. Leaders of population health improvement initiatives must be able to create a collaborative culture, in part by building bridges across groups to create shared values and goals, while tapping into the unique motivations of the different organizations and individuals. An effective leader will have interpersonal and strategic skills in handling conflicts and challenges, such as addressing turnover among participating partners, securing time from key people who are already involved in several projects, and getting competing groups to join forces for a common cause. Good leaders consistently recognize and attribute success to all participating partners. Such leadership may be best provided by a trusted broker who understands the importance of being an informed, yet neutral convener.

Stakeholder organizations who are widely supported in a region and are recognized for their effective internal leadership may be natural candidates for taking on a broader leadership role. The selection of an individual leader could be as simple as considering three key questions: Does the person “fit” the current (or desired) culture of the multistakeholder group? Is the person open to learning and adapting? Does the person have a track record of being an effective leader?

Leadership is important at many levels. For example, participating organizations and individuals show leadership when they choose to take part in this work. In addition to building common ground among different groups, a crucial aspect of leadership takes place inside each organization involved. In other words, successful health improvement efforts involve people able to lead inside their own organizations to create an inspiring vision, and sometimes modifying existing approaches to better align their efforts with those of others. Success depends on the engagement, commitment, involvement, and support (financial and otherwise) from each organization.

How it can be done

Listed below are examples of reports or initiatives that address this topic.

- **Collective Impact.** As highlighted in a series of articles in the *Stanford University Social Innovation Review*, collective impact is a process where groups from different sectors commit to a common agenda to solve a social problem. Conditions for success include identifying a “backbone organization” to help plan, manage, and provide ongoing support for an initiative. [http://www.ssireview.org/articles/entry/collective_impact](http://www.ssireview.org/articles/entry/collective_impact)

- **Common Table Health Alliance.** This collaborative leads multiple population health improvement projects and oversees partnerships with around 200 organizations. Stakeholders include consumers, schools, hospitals, physicians, nurses, nutritionists, dentists, and other healthcare providers, medical advocacy and support groups, health plans, quality improvement programs, and others.
organizations, universities, employers, government (including Medicaid), media, youth groups, faith-based organizations, health-, fitness-, and recreation-related affiliates, and nonprofit agencies and foundations. The Common Table Health Alliance serves as a convener, bringing disparate elements of the community together to take a comprehensive view of health.

http://commontablehealth.org/

- **Community Toolbox.** This resource contains information about building leadership with several components, including multiple descriptive sections that cover various aspects of leadership, a checklist of leadership issues to consider, and an example — [http://ctb.ku.edu/en/table-of-contents/leadership/leadership-ideas/plan-for-building-leadership/main](http://ctb.ku.edu/en/table-of-contents/leadership/leadership-ideas/plan-for-building-leadership/main). Additionally, there is content about identifying and analyzing stakeholders that may be useful for leaders — [http://ctb.ku.edu/en/table-of-contents/participation/encouraging-involvement/identify-stakeholders/main](http://ctb.ku.edu/en/table-of-contents/participation/encouraging-involvement/identify-stakeholders/main)

- **The YMCA’s Pioneering Healthier Communities (PHC).** PHC teams take a “shared leadership” approach with community partners, which led to the revision of YMCA directives and activities based on a broader view of health. One of the seven leading practices that came from these relationships is the need to “adapt to emerging opportunities.” [http://www.ymca.net/sites/default/files/pdf/phc-lessons-leading-practices.pdf](http://www.ymca.net/sites/default/files/pdf/phc-lessons-leading-practices.pdf)

**Element 3: Audience-Specific Strategic Communication**

**What it is**

Audience-specific strategic communication means customizing messages and approaches in ways that connect with the target audiences, including partner organizations, individual community members, and other stakeholders. Strategic communication is essential for all aspects of this work — across the active participants in the population health improvement work; with individuals and groups affected by it; and with others, such as elected officials and policymakers whose decisions affect health determinants, and news media members who raise awareness of activities and bring recognition to key partners. Although the vision and goals of the initiative should stay consistent, the content, style, and even the method of communication need to be adapted to speak to the values, priorities, and cultural filter of the intended audience. This requires cultural humility on the part of the communicator — understanding that what is intended may not always be what is heard. The goal of strategic communication is to understand the perspective of others and then communicate in ways that reflect that understanding.

**Why it is important**

Effective communication can make or break success. The wide range of organizations and individuals who have a role in improving health means that effective communication must take place in ways that span different cultures, terminology, literacy levels, goals, and values. Addressing differences across audiences requires culturally sensitive interaction, and is at the heart of strategic communication. This is essential for engaging and motivating individuals and organizational partners to work well together.
How it can be done

Many sectors use unique terminology that can be confusing, and this is especially true in healthcare and public health. Using words that are easy for everyone to understand, explaining commonly misunderstood terms, and avoiding acronyms are a few basic principles to follow. In addition, combining stories with meaningful data can help people emotionally connect with an essential message while also building credibility.

Field Testing the Action Guide: Oberlin Community Services and The Institute for eHealth Equity

Oberlin Community Services (OCS) is a nonprofit community services organization that has been operating in Oberlin, OH, for many years, initially as a food bank and then expanding to a fuller range of services. OCS is collaborating with The Institute for eHealth Equity (IeHE), which focuses on the use of technology to support individual decisions that lead to better health. One critical component of their partnership involves customizing messages to build trust and engagement among community members and leaders from local institutions, as well as making effective use of mobile communication technology.

http://www.oberlincommunityservices.org
http://www.iehealthequity.org

Communication that works for one group will not work for everyone. For example, some individuals and organizations are driven by business principles and will look for the value proposition and evidence of likely return on investment in any initiative. Understanding that time and financial resources are limited, and cost reduction is imperative, these groups will respond to discussions about improving health at the population level if there is a compelling business case. At the same time, some individuals and organizations engage in population health improvement because it reflects social values such as equity and fairness, dignity, and opportunity. In this case, discussing population health improvement using business-oriented perspectives and terminology may not be as effective.

Communication vehicles are also evolving population health improvement. Many individuals are increasingly accessing information via mobile devices and social media. Leveraging these platforms to communicate health-centered messaging, report the impact of local initiatives, and create space for cross-sector conversations can help bring stakeholders together to address population health improvement priorities.

Listed below are examples of reports or initiatives that address this topic.

- The Goodman Center. This is a resource devoted to helping organizations use stories to meet their goals. Effective stories help people remember, shape identity, and influence how they see the world. The tools on this site are focused on helping individuals and groups learn how to use stories in every aspect of internal and external communications.

http://www.thegoodmancenter.com/
• **Health in All Policies.** Exploring a collaborative approach to improving population health, “Health in All Policies” offers guidance for state and local governments on incorporating health considerations into diverse sectors of public policy. The glossary includes a comprehensive and generally applicable list of terms that spans health, business strategy, environmental planning, sociology, and policy. See specific communication guidance starting on page 101. [http://www.phi.org/resources/?resource=hiapguide](http://www.phi.org/resources/?resource=hiapguide)

• **White Earth Nation Tobacco Coalition.** This action plan to reduce commercial tobacco use in the tribal community of White Earth in Minnesota is a good example of how to create culturally relevant outreach materials and policy. Materials are aimed at individuals, healthcare providers, and community institutions, and include the use of language specific to the tribal community, such as use and explanation of the word “Asayma” to mean “sacred tobacco.” [http://www.whiteearth.com/programs/?page_id=405&program_id=4#Tobacco](http://www.whiteearth.com/programs/?page_id=405&program_id=4#Tobacco)

**Element 4: A Community Health Needs Assessment and Asset Mapping Process**

**What it is**

A community health needs assessment and asset mapping process is a way to take a comprehensive look at the health-related gaps or needs of a population, and potentially helpful resources or strengths. Needs assessments typically involve defining the geographic focus or the region of interest (e.g., zip code, county, state, service area), collecting and interpreting data (e.g., population characteristics or demographics, health status, access to services), and identifying and prioritizing the health needs in that region, in part by engaging and learning from members of the community itself.

Asset mapping is focused on the strengths or positive attributes of a region rather than deficiencies or needs. Assets can be tangible, such as financial strength, physical structures, businesses, or natural resources; or intangible, such as individual or organizational skills and capabilities, regional heritage, readiness for change that can lead to improvement, supportive public policy environment, resiliency and adaptability, or other special community characteristics or attributes.
While asset mapping and health needs assessments might be characterized as being separate and potentially at odds, they are complimentary and both need to be done. Health needs assessments and asset mapping processes should be combined to create a shared understanding based on a more complete view of the region. An important source of information for both is the members of a community itself: engaging the community to understand their perceptions and priorities. Both asset mapping and health needs assessments are important ways to listen and learn about what is already in place and what is needed.

Why it is important

Conducting a community health needs assessment (CHNA) and asset mapping helps ensure that the selected priority areas for population health improvement align with actual needs and make best use of resources. Doing this work as a larger collaborative of organizations, rather than developing competing reports, increases the likelihood of effectiveness, eliminates duplication of effort, reduces expenditures, and creates a shared understanding among all of the groups involved in the initiative. Learning from each other can be a powerful way to make more rapid progress.

Many groups have been conducting needs assessments for accountability and planning purposes. The use of community health needs assessments has been growing quickly and presents one of the most fertile opportunities for coordinated population health improvement efforts. Existing or new incentives to conduct health assessments include:

- National accreditation for public health departments
- Program requirements of Federally Qualified Health Centers
- USDA support for schools to provide healthy nutrition for children
- Regional Extension Centers’ need for assessments in rural areas
- Rules that govern nonprofit hospitals registered with the IRS as a 501(C)(3) organization

For example, there are nearly 3,000 nonprofit hospitals in the U.S., according to the American Hospital Association, and each hospital is affected by an IRS requirement passed into law as part of the Affordable Care Act (ACA). Nonprofit hospitals are instructed to conduct a community health needs assessment once every three years — in collaboration with public health entities and others — and to develop and annually update a related “implementation strategy,” which is an improvement plan with measurable goals and objectives. The plan must address the health needs of the community, defined by the IRS as including “not only the need to address financial and other barriers to care but also the need...
to prevent illness, to ensure adequate nutrition, or the need to address social, behavioral, and environmental factors that influence health in the community.\textsuperscript{27} Hospitals must conduct these assessments and implement related improvement plans or pay a sizeable fine. While market competition may be a factor when there is more than one hospital in the same region, the IRS regulations require a nonprofit hospital to consult with public health organizations and encourage collaboration with others in the same community, including other hospitals and medical systems.

In addition, the IRS has adopted a standardized nationwide reporting system (Schedule H filed with nonprofit hospitals’ annual Form 990) that captures more complete information about the community benefit activities of each hospital, and includes a standard definition of “community benefit.” Based on the IRS definition, nonprofit hospitals must engage in activities that include “community health improvement” provided directly by the hospital or through hospital support to community-based organizations. Community benefit may include “community building” activities that have a direct connection to promoting the health of the population served by the hospital. Examples of activities that might qualify include physical improvements and housing; economic development; environmental investments; leadership development and training for community members; coalition building; community health improvement advocacy; and workforce development.\textsuperscript{28}

Given the requirement that nonprofit hospitals must engage in community health needs assessments and annual improvement plans, report their population health improvement or community building activities, and demonstrate measurable impact from those activities, there is the potential for greater coordination of — and investment in — population health improvement aimed at meeting the specific needs of a region. It is also important to emphasize that other stakeholders such as health departments and community coalitions can play a crucial role in the ultimate success of community benefit activities.

How it can be done

Listed below are examples of reports, tools, or initiatives that address this topic:

- **Assessing and Addressing Community Health Needs.** This resource was developed to help not-for-profit healthcare organizations strengthen their assessment and community benefit planning processes. The book offers practical advice on how hospitals can work with community and public health partners to assess health needs and develop effective strategies for improving health in their community. It also includes ideas for data sources to understand the preferences and priorities of community members.
  

- **Community Commons – Community Health Needs Assessment Toolkit.** This toolkit is a free web-based platform designed to assist hospitals and organizations to understand the needs and assets of their communities, and work together to make measurable improvement in health in the community. [http://assessment.communitycommons.org/CHNA/](http://assessment.communitycommons.org/CHNA/)

- **DC Health Matters.** This is a community-driven, interactive web portal providing local health data, resources, best practices, and information about local events to help community
organizations and researchers understand and act upon health issues affecting DC communities. The database is a collaborative effort and a “living” project that continues to evolve as users contribute and share the information, which can be used to assess population health needs and assets. The website provides demographic, economic, and health data for the communities of the DC area and includes report creation tools. This is a good example of a collaborative resource useful for needs assessment and asset mapping: http://www.dchealthmatters.org. (Note: more than 100 communities have similar websites, based on the technology developed by the Healthy Communities Institute, which support continuous health improvement. Other examples include http://www.healthysonoma.org and http://www.sfhip.org)

- Vermont Blueprint for Health. As part of the implementation of the Blueprint, various workgroups and teams are created, including a Community Health Team and an Integrated Health Services workgroup, to assess specific needs and coordinate efforts within the community and in the clinical care field. http://blueprintforhealth.vermont.gov/

**Element 5: An Organizational Planning and Priority-Setting Process**

**What it is**

An organizational planning and priority-setting process is a clearly defined approach taken to define the goals and objectives of a population health improvement initiative — both within an organization and across organizations or groups that will collaborate. This is not simply an acknowledgement that planning and priority setting will happen, but rather a deliberate step to define when and what planning will be done and how the participating individuals and groups will identify priorities. Other elements described in this Guide should be factored into the planning and priority-setting process.

The process should include planning for evaluation from the outset. Determining — up front — how you will assess, measure, and learn from the progress of the work over time will help define the path forward, and then guide decisionmaking and refinements along the way. Using clear approaches or models can inform how the evaluation is designed and implemented. This can include evaluating an overall initiative, measuring the success of key processes, assessing the impact of certain interventions, and tracking changes in health outcomes over time. These issues are
discussed further under Element 7.

**Why it is important**

Given the need to build and maintain trust with participating organizations, being transparent about *how* decisions are made is a necessary foundation. Holding open meetings is one way to do this. In addition, establishing a unifying vision for the different participants helps promote enthusiasm for collaboration. But achieving results is what really motivates most people — that is, fostering healthier individuals, families, and populations, along with the related benefits of better health such as improved or sustained quality of life, lower healthcare costs, improved school readiness, less absenteeism, better productivity, and so on. Targeting at least some actions that can yield early successes provides incentive for continued work on longer-term goals.

Some may want to jump into getting the work done to achieve better outcomes, rather than spending time up front defining processes. However, taking a systematic, stepwise approach to planning and priority-setting and clearly communicating how that process is being followed can help prevent confusion, as well as enhance understanding of what is working well or not so well. It is important to recognize and address the goals and motivations of each group during the planning process so that all participants feel invested in the work. Over time, modifications to the process being used are likely to be needed as the initiative matures and adapts to changing circumstances.

In addition, evaluation is too often treated as an afterthought; this increases the likelihood of losing important information because it is not being captured while it is happening (or soon afterward). Incorporating evaluation into the process from the beginning also creates the opportunity to gather important information that will be useful for learning in real time to adapt and improve, and for making a compelling case to current and potential partners and funders.

**How it can be done**

Several models are available to use when defining and communicating the process that will be used for planning and setting priorities. For example, the table below offers criteria that can be applied when prioritizing population health problems, in addition to criteria to help choose actions to address the problem(s).
<table>
<thead>
<tr>
<th>Criteria to Identify Top Priority Population Health Need(s)</th>
<th>Criteria to Identify Intervention(s) for Health Need(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Impact of problem</td>
<td>• Expertise to implement the solution</td>
</tr>
<tr>
<td>• Availability of effective, evidence-based solutions</td>
<td>• Return on investment</td>
</tr>
<tr>
<td>• Cost and/or return on investment</td>
<td>• Effectiveness of the solution</td>
</tr>
<tr>
<td>• Availability of resources (staff, time, money, equipment) to solve problem</td>
<td>• Ease of implementation or maintenance</td>
</tr>
<tr>
<td>• Urgency of solving problem</td>
<td>• Potential negative consequences</td>
</tr>
<tr>
<td>• Size of problem (e.g., number of individuals affected)</td>
<td>• Legal considerations</td>
</tr>
<tr>
<td></td>
<td>• Impact on systems or health</td>
</tr>
<tr>
<td></td>
<td>• Feasibility of the intervention</td>
</tr>
<tr>
<td></td>
<td>• Ability to influence private and public policies (for example, through monetary incentives) that can sustain the intended impact</td>
</tr>
</tbody>
</table>

Other examples of prioritization approaches include: the multi-voting technique; use of strategy grids; the nominal group technique; the Hanlon Method; and creating a prioritization matrix. These are all described in detail in a brief developed by the National Association of County and City Health Officials (NACCHO). The brief includes step-by-step instructions on how to use these approaches, with examples and templates. There is no right or wrong method for prioritization. What works best should be tailored to fit the situation.

Part of this process should involve the review of national priorities, as there is clear emphasis being placed on promoting health in all policies and creating regulatory and financial incentives that reward those who improve individual and population health. Top national priority areas, based on assessments of health needs across the country, are addressed in Healthy People 2020 and the National Quality Strategy. To achieve the greatest possible impact and maximize the potential benefits from alignment, consider where there are connections between the priority topics identified through the needs assessments, asset mapping, and national priorities for health improvement.

Once prioritization has taken place, the next step is to plan solutions drawn from evidence-based interventions and recommendations, such as those offered in the Guide to Community Preventive Services and National Prevention Strategy. Most planning models are cyclical, recognizing that these are not one-time activities but an ongoing process that should be designed to learn from what has already occurred and then adapted to improve the likelihood of success. Feedback loops are a key feature, deliberately seeking out information or input, then using it to improve. A helpful model is the “Plan-Do-Study-Act” process, illustrated in Figure 3 below.
In each of the segments in the Plan-Do-Study-Act model, there are steps that require more detailed thinking. For example, under the Plan step, when determining goals and changes that might be useful to improve health in your region, there are various ways to think about what actually impacts or drives health.

As mentioned above, a specific example of planning and priority setting can be seen in the approach of Priority Spokane. This effort involved defining a specific plan, which included prioritization and strategic components, followed by implementation and evaluation, and a feedback loop that informs further priority-setting. Figure 4 below illustrates the process, showing the various steps and their relationships.
Listed below are additional initiatives and resources that address this topic:

- **Family Wellness Warriors Initiative.** This initiative includes one-on-one work with Alaska-native communities to plan, implement, and assess a three-year-model aimed at reducing domestic violence, abuse, and neglect. The three-year model and curriculum were developed by a steering committee of Alaska-native people and mental health professionals, who worked on adaptation and development for two years by analyzing research-based evidence and projects from around the world. [http://www.fwwi.org/index.cfm](http://www.fwwi.org/index.cfm)

- **Mobilizing for Action through Planning and Partnerships (MAPP).** This is a community-driven strategic planning process for improving population health. It is a framework used by public health leaders and others to apply strategic thinking to prioritize public health issues and
identify resources to address them.
http://www.naccho.org/topics/infrastructure/MAPP/index.cfm

- **National Prevention Strategy.** This strategy envisions a prevention-oriented society where all sectors contribute to the health of individuals, families, and communities. It identifies federal actions and provides evidence-based recommendations for a variety of partners (e.g., state and local governments, employers, healthcare systems and insurers, educational institutions, and community, nonprofit, and faith-based organizations) to promote health across multiple settings. Priorities span clinical care delivery, community environments, and health behaviors, including: tobacco-free living, preventing drug abuse and excessive alcohol use, healthy eating, active living, injury and violence-free living, reproductive and sexual health, and mental and emotional well-being.
http://www.surgeongeneral.gov/priorities/prevention/strategy/

**Element 6: An Agreed-Upon, Prioritized Set of Health Improvement Activities**

**What it is**
An agreed-upon, prioritized set of health improvement activities is a list of strategies and actions that will be taken by organizations or individuals involved in population health improvement initiatives. This requires identifying the needs (see Element 4), agreeing what the focus areas will be, then defining the specific “ask” for each of the participants, such as commitment of staff time, financial resources, changes in private sector approaches or public policy, communications, etc. Be clear about what each group is being asked to do, and what the benefit or value proposition will be for each group in return for participating. Together, the organizations identify one or a few high priority topics for which they will lead health improvement activities in the region. The priority topic or topics are identified as a result of shared planning, assessment, and decisionmaking. These priorities will drive the activities that each organization commits to doing with the people in the population or subpopulation(s) with whom they interact.

**Why it is important**
With so many factors that can influence health, even the best efforts of a solo project or program are at risk of having little impact. Population health is complex, involving multiple drivers and determinants, making it difficult for one organization alone to make a measurable difference. This can lead to a sense that the problem is too big to solve and that improving individual health and the health of the population overall is beyond the control of any single organization or type of group.
Organizations can accomplish far more together than a single one could ever do alone. By collectively identifying one or a few top priority focus areas, and individually committing to engage in specific activities that promote improved health related to the focus, the collective initiative is much more likely to make a lasting impact and see measurable improvement. This alignment also helps to create a shared awareness about the importance of the particular priority issue — whether that be reducing domestic violence or adverse childhood experiences, addressing depression and other mental health needs, reducing obesity, promoting stronger social and family connections that are important to overall well-being, or any other topic.

How it can be done

After drawing insights from the community health needs assessment and asset mapping process (Element 4), and identifying top priority focus areas, actions to address the priority topics or needs should then be considered in more detail. For example, an initiative called ReThink Health has developed a simulation model that can help groups predict the likely long-term effects of different activities, policy changes, financing, and other strategies on health outcomes, healthcare delivery, and costs. Using this tool can bring different options to life, spurring discussions about the value and impact of different interventions to address high priority needs.

Another way to identify potential actions is to identify contributing factors and likely causes for a given need or problem, and then use this information to drive potential solutions. This can be done using a “root cause map” like the one shown below in Figure 5 that was developed for obesity.31
Each outcome stems from causal factors, which can be traced to basic or root causes. Certain causes — stemming from genetics or biology, for example — may be difficult to address. On the other hand, root causes such as unsafe neighborhoods, poor access to affordable and healthy food options, a community ethic that tolerates unhealthy behavior, and so on, might illuminate possible actions or changes that can disrupt or eliminate a root cause of the poor health outcome. Maps like this can also spur discussion about other root causes to consider, especially when looking even further upstream — such as breastfeeding of infants. As touched on previously, sometimes efforts to address difficult problems need to start with small steps or a manageable “win” in order to build trust and a sense of shared accomplishment, enabling groups to take on more challenging issues over time.

Building on this example, if there is agreement that reducing obesity is a top priority for a collaborative effort, a variety of activities could be identified for different organizations to commit to doing based on the root causes like those illustrated above. Such actions might include:

- **Employers** — *including public, private, and the military* — ensuring that salads and other nutritious foods are offered in the cafeteria and are more affordable than unhealthy options;

- **City planners and schools** working together to make neighborhoods around schools safer for biking and walking;
• **Hospitals, doctors, and nurses** measuring the body mass index (BMI) and discussing physical activity and better nutrition for all patients, since patients may be malnourished regardless of BMI;

• **Grocery stores** highlighting healthy food options in each aisle and offering cooking demonstrations of healthy recipes;

• **Community groups** starting a Saturday market where local farmers can sell fresh fruits and vegetables in underserved areas;

• **Churches and others in faith communities** organizing weight loss support groups through parish nurses and addressing obesity in the context of spiritual health;

    And so on.

The agreed-upon activities are part of a connected process that relates to the findings from the needs assessment and asset mapping (Element 4), directly supports the priority focus areas (Element 5), and has the potential to result in improvement that will be measured (Element 7). Insights from the results can then be factored into future planning and priority-setting for greater improvement over time.

Listed below are examples of reports or initiatives that address this topic.

• **Blue Zones Project.** The Blue Zones Project is an example of a community well-being improvement initiative designed to make healthy choices easier through permanent changes to the environment, policy, and social networks. The guiding principles are based on international research that identified nine healthy living principles in communities whose populations have achieved a high level of well-being and longevity. The project provides a framework for engaging public agencies, local business communities, schools, and a wide range of civic organizations in setting priorities and taking concrete actions to achieve a common goal of improving the well-being of the community.

  [http://www.bluezonesproject.com](http://www.bluezonesproject.com)

• **CDC Community Health Improvement Navigator.** This resource contains a database of effective interventions that can be applied by community organizations, health systems, public health agencies, and others who are working together to improve health in a community.

  [http://www.cdc.gov/chinav](http://www.cdc.gov/chinav)

• **Operation Live Well.** This DoD initiative supported the National Prevention Strategy of improving health and well-being using a prevention-oriented approach. While the pilot program has been completed, through efforts at military bases, DoD implements and supports demonstration of research that supports fitness across the U.S. military forces.

• **Healthy Communities Institute (HCI).** This organization provides customizable, web-based information systems to visualize local data through indicator dashboards and GIS maps. They also provide access to a national database of promising community-level interventions, and help
establish connections among community members, experts, and resources.
http://www.healthycommunitiesinstitute.com/

- Institute for Clinical Systems Improvement (ICSI). This organization has been involved in efforts across the country to promote Accountable Health Communities, and offers reports and ideas for effective approaches.

- Let’s Move. Let’s Move! is an executive initiative dedicated to solving the problem of childhood obesity. The program emphasizes that everyone has a role to play in reducing childhood obesity, and provides "5 simple steps" guides for parents, schools, community leaders, chefs, children, elected officials, and healthcare providers that give tips and strategies for adopting healthier lifestyles.
  http://www.letsmove.gov/

**Element 7: Selection and Use of Measures and Performance Targets**

**What it is**

Selecting and using measures and performance targets starts with identifying goals and measurable objectives that are relevant to priority topics and selected health improvement activities. Part of the process should involve identifying measures already in use by participating groups, even those required for other purposes. For selected new measures, data sources must also be identified. Some regions may choose to set a rate of improvement as a performance target, or set a specific performance level such as achieving a score of at least 90 percent. Others seek to exceed benchmarks, such as a statewide average rate or the national top 10 percent.

**Why it is important**

The purpose of this work is to improve health across a population. Measuring progress, ideally against performance targets, provides a way to know whether an initiative is on track. Assessment of progress toward a given target can also reveal when it is time to modify the approach to achieve better results. For these reasons, measurement is an important part of evaluation activities.

Public- and private-sector leaders are increasingly using measures to hold certain organizations accountable for improving health outcomes, including public health agencies, healthcare organizations, and health plans. Accountability is also expanding into other sectors. “Health in all policies” approaches recognize that health outcomes are affected by decisions and actions of organizations and individuals in a range of sectors. To meet accountability expectations, measurement helps gauge whether health outcomes are improving.
The state of available measures and data sources is an interesting mix of abundance and gaps, with a vast array of existing measures and data that do not always meet practical needs. Many organizations feel overburdened with measurement requirements, while others may be “drowning in raw data” but are not able to apply those data for measurement and decisionmaking.

Using many of the available data sources requires specialized skill and sufficient time to address challenges such as finding a relevant data source, unlocking data that are available only in a “raw” format, and creating meaning from that data through analysis and visual presentation of the results in engaging and insightful ways. Using several data sources is common; yet not all data sources apply the same approaches, such as modes of collection, timeframes, population definitions, levels of analysis, etc. Making sense of the differences among data sources can be a tremendous challenge: an expedient solution may be to acknowledge the variations rather than attempt to reconcile them. Ultimately, data sources and measure results must be translated into “actionable” information so that leaders in public health, healthcare, and other sectors can assess these data and improve population health.

The National Quality Forum (NQF) has a strong interest in population-level measures that are appropriate for assessing shared accountability across a variety of sectors and organizations and has endorsed a number of measures related to population health, across varying levels of analysis, including healthcare providers and communities. These measures address: health-related behaviors (e.g., smoking, diet) and practices that promote healthy living, community-level indicators of health and disease (e.g., incidence and prevalence) and community interventions (e.g., mass screening), and primary prevention and screening (e.g., influenza immunization).

However, significant gaps persist for measures that focus on the social determinants of health. NQF’s Health and Well-being Standing Committee is encouraging measure development in built environments, especially those that assess children’s health within schools. This Committee is also encouraging measures that assess patient and population outcomes that can be linked to public health activities like improvements in functional status, assessments of community interventions to prevent elderly falls, and measures that focus on counseling for physical activity and nutrition in younger and middle-aged adults (18-65 years).

Additionally, several FTGs specially expressed the need for more measures that incorporate social determinants of health, such as exposure to safe living environments, access to transportation, graduation attainment and literacy, and employment access. Many FTGs are navigating through these
challenges by collecting and analyzing social services data like local police data, nationally collected metrics about crime, transportation, and employment, and linking those with health data.

Work is being done on a number of fronts to fill those gaps. For example, CMS is currently working with Arbor Research Collaborative for Health to develop a strategic framework and measure development plan for assessing population health in CMS programs. The goal is to bridge clinical care with multi-sectorial approaches to transform the healthcare system. Stakeholders will provide input to measure developers during the measure development process.

The NQF Measure Incubator is a new, multistakeholder endeavor to assist measure development and testing by creating collaborative partnerships. This effort will address critical measurement gaps by bringing together measure developers, data sets, and financial and technical resources. Population-level measures, specifically those tied to outcomes, can be difficult to construct and the Measure Incubator offers the opportunity to create and test these measures, while standardizing best practices.

Variation in measures is one reason why standardization of measurement is critical to making accurate comparisons and assessing performance. The proliferation of measures that have been changed for and used in various reporting programs creates significant misalignment across reporting programs and organizations. This makes it challenging to compare performance across entities; confusing those being measured, those using measures, and consumers; and increases the data collection burden.

Standardized, evidence-based performance measurement is essential to assess quality improvement and population health improvement. These principles are at the core of NQF’s work. The NQF rigorous process for evaluating and endorsing measures helps to standardize performance measures, preferred practices, and conceptual frameworks. By doing so, these standards can be used to reliably compare performance, ensure accountability is accurately applied, and support quality improvement activities.

How it can be done

There is no universally recommended, practical set of population health measures for which there are widely available data sources. The availability of certain measures should not dictate priorities. Instead, the organizational planning and priority setting process (Element 5) should drive the measure selection. A shared framework for measurement can also be used as a way to build consensus.

In 2015, three new measure resources were announced, each of which provide a useful framework for deciding how to approach population health measurement:

- **The Institute of Medicine** issued the Vital Signs report, which includes a set of core metrics for assessing health and healthcare progress. The recommendations contained in this report promote measurement of a broad array of health determinants and outcomes, while also emphasizing the importance of improving measure alignment. [http://www.iom.edu/Reports/2015/Vital-Signs-Core-Metrics.aspx](http://www.iom.edu/Reports/2015/Vital-Signs-Core-Metrics.aspx)

- **The Robert Wood Johnson Foundation** developed a set of metrics for their Culture of Health initiative, which takes a holistic view of health. The underlying framework may be useful for
consideration in other population health measurement efforts. The report called “Measuring What Matters” was released in November 2015.

- **100 Million Healthier Lives**, convened by the Institute for Healthcare Improvement, seeks to fundamentally transform the way the world thinks and acts to improve health, well-being and equity to get to breakthrough results.
  http://www.100mlives.org/

In 2011, the Assistant Secretary of Health and Human Services prioritized community-level core measurement and sought the insight of the National Center on Vital Health Statistics (NCVHS) Population Health Subcommittee. This initiative focuses on identifying metrics that have health as the primary focus, extend beyond healthcare, and address social determinants of health. The Subcommittee recognizes the utility of a broad framework, the importance for allowing local-level selection, and the challenge facing communities attempting to manage the amount of data needed for this work. Finalized recommendations from the Subcommittee are forthcoming, but show national-level commitment to support population health improvement measurement.

Groups working on population health improvement need data sources that are relevant to their region. Often this will include a mix of data from the local, state, and/or national levels. Ideally, the data are granular enough to allow the group to measure performance in ways that inform their specific activities. The following is a partial list of data sources that is being used by multistakeholder groups to assess their progress in improving population health.

- **Air Quality System Data Mart** (Environmental Protection Agency)
- **American Community Survey** (Census Bureau)
- **Behavioral Risk Factor Surveillance System** (BRFSS / CDC)
- **Bureau of Labor Statistics**
- **Census Data** (variety of topics)
- **County Health Rankings and Roadmaps**
- **Department of Justice Open Data**
- **Fatality Analysis Reporting System** (National Highway Traffic Safety Administration)
- **Food Atlas (US Department of Agriculture)**
- **Food & Drug Administration Data Sets**
- **Kids Count Data Center (Annie E. Casey Foundation)**
- **Maternal & Child Health Bureau** (HRSA)
- **National Center for Education Statistics** (Department of Education)
- **National Survey on Drug Use and Health** (SAMHSA)
In addition, organizations looking for useful data sources might consider contacting local or state public health departments and/or schools and programs of public health; State Medicaid programs; school districts and/or colleges and universities; health plans or health insurance marketplaces; police departments; healthcare systems that use electronic medical records; and other organizational partners that may have access to unique data sets related to population health.

Appendix D contains additional resources for finding data that may be useful for population health assessment and improvement.

One particular resource that addresses a number of issues around data and measurement for community improvement is:

- **What Counts – Harnessing Data for America’s Communities.** This report highlights a wide variety of related topics, including how to transform data into information that is relevant for policy; data access and transparency; and strategic practices for using data. A number of real-life examples are also provided demonstrating how communities have made practical use of data to improve the health and well-being of their populations. [http://www.whatcountsforamerica.org/](http://www.whatcountsforamerica.org/)

Data sources will continue to expand, in part due to increased reporting requirements and public and private support for transparency. Advances in technology have enabled collection and sharing of de-identified data. New data sources are also appearing, such as consumer-generated data drawn from social media.

Given the dependence on available data and other differences among regions, an initial approach may be to choose a focused set of measures that address priorities and for which there are available data, then expand or refine the approach over time. In other words, adopt a phased approach.

Consider using disparities-sensitive measures to assess differences in health status or outcomes for ethnic or racial groups, and other vulnerable populations. These measures can detect differences in health status or quality across healthcare settings or in relation to certain benchmarks, and identify differences among subpopulations or social groupings based on race, ethnicity, language, and other characteristics.

Drawing from a previous assessment of 26 reports that evaluate population health improvement, the following chart lists the most common measures and indicators that were used, grouped by topic or domain.34
### Table 1. Example of Population Health Measures by Topic

<table>
<thead>
<tr>
<th>Topic/Domain</th>
<th>Measures/Indicators</th>
</tr>
</thead>
</table>
| Health status/health related quality of life (total population level) | • Life expectancy  
  • Healthy life expectancy  
  • Years of potential life lost  
  • Healthy days (physically, mentally)  
  • Self-assessed health status  
  • Expected years with activity limitations  
  • Expected years with chronic disease |
| Health outcomes Ultimate/final (total population level) | • Mortality (death rates)  
  • Morbidity (e.g., disease or injury rates, obesity rates, mental health)  
  • Pregnancy and birth rates  
  • Health status and health-related quality of life |
| Health outcomes Intermediate (total population level) | • Levels of risk behaviors (e.g., diet, physical activity, tobacco use, alcohol/drug use)  
  • Rates of access to, use of, and coverage of preventive services (e.g., cancer screening, immunizations, weight loss intervention, smoking cessation)  
  • Physiologic measures (e.g., controlled blood pressure or cholesterol levels) |
| Determinants of health (total population level) | • Poverty level  
  • High school graduation rates  
  • Exposure to crime and violence, neighborhood safety  
  • Affordable and adequate housing |
| Social environment | • Built environment (transportation options, availability of healthy foods, recreational facilities and parks, neighborhood walkability)  
  • Exposure to environmental hazards (air, water, food safety)  
  • Natural environment (e.g., access to green space, protection from natural disasters) |
| Physical environment | • Access to healthcare services and insurance coverage  
  • Unmet health needs or delayed care |
| Clinical care | • Rates of tobacco use, alcohol misuse, physical inactivity, and unhealthy diet |

Taking a practical approach is necessary. Identify measures already in use, any new measures needed to fill gaps, and the data available for the region. Consideration of program funding, alignment with state initiatives, local health system reporting requirements, and stakeholder priorities may also impact measure selection. For data, use sources that are high-quality, relevant, understandable, and timely, if possible. Over time, what may start as a short list of population health measures will undoubtedly become more robust as the field evolves.

Eventually, for each measure used, groups set expectations or targets for future performance. To increase buy-in, an initial target may simply be to see improvement over time. Other options for targets include using comparison benchmarks, such as performing better than a state or national average. In some cases, data regarding percentiles are available, allowing for a stretch goal to be in the top 10 percent or higher. The most appropriate performance target will be influenced by factors such as level of trust among the collaborative partners, available data, the current level of performance, and the likelihood of significant improvement within the measurement timeframe.

**Element 8: Joint Reporting on Progress Toward Achieving Intended Results**

**What it is**

Joint reporting on progress toward achieving intended results is a way for groups and organizations in a partnership to share information on successes and problem areas. This could relate to various elements...
described earlier in the Guide, such as the needs assessment and asset mapping, evaluation of activities, and use of measures and performance targets. Sharing of information is important for collaborating groups, but ideally with the larger community as well.

**Why it is important**

Joint reporting establishes the accountability of each organization to the others in an initiative. In addition, pulling together the results of health improvement activities (described in Element 6) and sharing that information with all participants keeps everyone informed about the progress of the work and creates common ground for shared learning. It also helps to identify where greater collaboration might be needed to improve results. This reporting should align with the areas of evaluation that are part of the planning and priority-setting process (Element 5), to reinforce the shared commitment to achieving the intended results at a variety of levels.

**How it can be done**

Building trust among participating organizations is an essential precursor to joint reporting, as it requires strong alignment among partner groups and engaged stakeholders. For more about this, see the section on leadership (Element 2). In addition to reporting on health outcomes, the content of reports might address impact on social values or perceptions about health, return on investment, and elements that indicate the progress of the overall initiative. Such reporting might typically begin as private sharing of results among participating organizations, either reported individually or developed as a single report about the collaborative and individual efforts. Given the importance of transparency and accountability, the ultimate goal is to share the progress reports with the general public.

Listed below are examples of reports or initiatives that address this topic.

- **HealthLandscape.** An interactive mapping tool, this online resource is intended for use by a variety of stakeholders interested in analyzing and displaying information about health and health determinants. Maps can be created from publicly available data sources related to education, healthcare, criminal justice, etc. [http://www.healthlandscape.org/](http://www.healthlandscape.org/)

- **National Health Service Care Data.** While the National Health Service (NHS) in the United Kingdom has collected and used hospital data for the last few decades as part of its national database, a new initiative aims to expand the amount of information available to patients, clinicians, researchers, and planners. The NHS claims that “better information means better care” and will ensure consistency in quality and safety, and highlight areas where more investment is needed. [http://www.england.nhs.uk/ourwork/tsd/care-data/](http://www.england.nhs.uk/ourwork/tsd/care-data/)

---

Field Testing the Action Guide: The Colorado Cross-Agency Collaborative

Several state agencies in Colorado came together to collaborate and develop a statewide strategy to improve population health. The agencies have a particular interest in sharing data and jointly reporting results of key metrics. By making this concerted effort to better align resources, the agencies can be more efficient and more readily track progress on policies and programs that affect the health of all residents of Colorado. [https://www.colorado.gov/pacific/hcpf/colorado-cross-agency-collaborative-reports](https://www.colorado.gov/pacific/hcpf/colorado-cross-agency-collaborative-reports)
• **Primary Care and Public Health – Exploring Integration to Improve Population Health.** The Institute of Medicine identifies a set of core principles derived from successful integration efforts that involve the community in defining and addressing needs for population health improvement. The framework emphasizes that the collection and use of data to assess needs and progress is important to the integration process, and that sharing data appears to be a natural way in which primary care and public health can work together. 
http://www.iom.edu/Reports/2012/Primary-Care-and-Public-Health.aspx

**Element 9: Indications of Scalability**

**What it is**
Scalability relates to the potential for an initiative to expand, either by becoming more deeply involved in a region — for example, increasing the number of participating organizations or taking on new priority topics and related health improvement activities — or by sharing the lessons learned with others to motivate spread to additional regions. The latter can happen either as the initiative grows geographically, or when a new group learns from the work and decides to take a similar approach.

Scalability or expansion of initiatives to new areas is not guaranteed and does not always happen even when the evidence is clear that a program has achieved intended, positive results.

**Why it is important**
Poor health is a problem everywhere in the United States. To the degree that existing health improvement efforts are refined and new successful initiatives started from which others can learn and adopt in their own region, this expands the possibility for achieving better health for more people. That being said, achieving traction in other regions may not always be possible, especially if the population health improvement work relies on assets or characteristics that are unique to a region.

**How it can be done**
During the planning process (Element 5), consider and emphasize activities that can be easily expanded or adopted by others. At the same time, during the asset mapping process (Element 4) consider which assets might be unique to either one subpopulation or to a smaller geographic part of the whole geopolitical area. These unique assets may limit the ability to spread the initiative across the entire population and/or geopolitical region.
Listed below are examples of reports or initiatives that address this topic.

- **Camden Care Management Program and Cross-Site Learning.** This program was developed by the Camden Coalition of Healthcare Providers started in Camden, New Jersey, using data to target and coordinate care for patients who lack consistent primary care and often suffer from chronic illness, mental illness, and substance use disorders. The Cross-Site Learning program is now being implemented in 10 cities. [http://www.camdenhealth.org/cross-site-learning/](http://www.camdenhealth.org/cross-site-learning/)

- **ENACT.** This is a database of local policies from the Strategic Alliance to Promote Healthy Food and Activity Environments. The information in this database can be used to spread programs to additional areas, and change the policy infrastructure in ways that support long-term sustainability of population health improvement programs. [http://eatbettermovemore.org/sa/policies](http://eatbettermovemore.org/sa/policies)

- **Healthy Communities Institute (HCI).** This organization provides customizable, web-based information systems to help communities create custom websites — with far less overhead and time required than starting from scratch — that draw from the best-available local data to show indicator dashboards and GIS maps. The Healthy People 2020 Tracker helps evaluate the effectiveness of the local group’s programs and the health of the community compared to national goals. HCI websites have been replicated by many communities across the country. [http://www.healthycommunitiesinstitute.com/](http://www.healthycommunitiesinstitute.com/)

- **Help Me Grow.** This program provides a system to assist states in identifying at-risk children, and then helps link families with existing community-based programs and services. A national center serves as a resource to support the replication of Help Me Grow systems throughout the country. Nearly half of the states in the country are Help Me Grow affiliates. [http://www.helpmegrownational.org/](http://www.helpmegrownational.org/)

- **State Innovation Models Initiative.** This initiative led by the Centers for Medicare & Medicaid Services (CMS) is intended to foster the testing and development of state-based models for improving health system performance through multipayer payment reform and other system changes. The projects are broad-based and focused on enrollees of Medicare, Medicaid, and the Children’s Health Insurance Program (CHIP). The initiative is exploring models that could form a foundation for expansion into larger health system transformation. [http://innovation.cms.gov/initiatives/state-innovations/](http://innovation.cms.gov/initiatives/state-innovations/)

**Element 10: A Plan for Sustainability**

**What it is**

Sustainability is the ability to continue operating, funding the work, and remain productive over time. In addition to developing a sustainable business model, adaptability and resilience are key characteristics of sustainable initiatives.
Why it is important
In the current policy environment, health improvement has gained new relevance: poor health outcomes are widely understood as a major problem, coupled with unsustainable healthcare costs. Population health improvement is a complex field, and although public health agencies and others have been working to improve population health for years, the only way to achieve a lasting positive impact is through multifaceted, sustainable approaches that address health improvement in activities across multiple determinants of health over the long term.

How it can be done
Developing and implementing a sustainability plan or a business plan based on a sustainable model is an effective approach. Knowing what approaches can be continued over the long run, with appropriate support and financial stability, is not easy.

Receiving a multiyear grant or being funded through a government project is no substitute for a solid sustainability plan, as even multiyear grants and government programs eventually come to an end. However, options to secure financial support do exist, including social investment funds, social venture capital, or engaging payers as investors. In each of these cases, it will be important to make the case for the expected return on investment for any funding provided to the population health improvement work.

Opportunities exist given the rapidly changing health policy environment. When engaging in population health improvement, the ability to motivate structural changes can increase the likelihood that the change will be sustained. Examples include new or revised commitments (e.g., public or private policy or contract provisions that incentivize better health or incorporate health in all policies), new patterns of care and coordination among different organizations, and linking medical and public health information systems. Examples of new policy opportunities include structures being developed or implemented such as Accountable Care Organizations, Accountable Health Communities, Patient Centered Medical Homes, community health improvement requirements for nonprofit hospitals (see Element 4), and public health department accreditation.

Field Testing the Action Guide: Michigan Health Improvement Alliance
The Michigan Health Improvement Alliance (MiHIA) is a multistakeholder, not-for-profit organization with a mission to improve the health of the population in a 14-county region in central Michigan through effective use of information and collaboration. MiHIA has focused on sustainability by leveraging multiple assets crucial for their ongoing work, such as convening power, an engaged Board, passionate participants, a comprehensive health dashboard, and a strong track record of successes.
http://www.mihia.org
While activities that encourage changes in public or private policy sometimes involve political advocacy, this is not always the case. An example of a private-sector policy change is to support employers in encouraging employees to make use of covered preventive services and smoking cessation programs. Employers could also begin assessing and reporting (Element 8) the degree to which their employee population is using such benefits.

Listed below are examples of reports or initiatives that have successfully addressed this topic:

- **A Healthier America 2013: Strategies to Move from Sick Care to Health Care in Four Years.** This guide for improving the nation’s health system focuses on various strategies and priorities for achieving sustainability, in addition to recommendations for shifts in governmental funding. Suggested policies include ensuring sufficient and stable funding for public health departments, with recommendations to explore new funding models based on supporting basic capabilities. [http://healthyamericans.org/report/104/](http://healthyamericans.org/report/104/)

- **Health in All Policies.** The Health in All Policies guide for state and local governments defines sustainability as “the need of society to create and maintain conditions so that humans can fulfill social, economic, and other requirements of the present without compromising the ability of future generations to meet their own needs.” The document focuses on environmental sustainability as an essential part of ensuring the longevity of health improvement plans, with examples referenced throughout. [http://www.phi.org/resources/?resource=hiapguide](http://www.phi.org/resources/?resource=hiapguide)

- **HICCUP.** As part of work for the Health Initiative Coordinating Council, an assessment of financing opportunities for communities working on population health initiatives was completed.
and highlighted in an online document.

https://d3aencwbm6zmht.cloudfront.net/asset/486425/KIN_Challenge_HICup_6-9-14.pdf

Conclusion

This final version of the Action Guide, version 3.0, is a handbook describing 10 key elements to consider when attempting to improve population health. It takes a broad look at a variety of important issues and provides links to information and useful resources for more detail.

Endnotes

14 Eggleston EM, Finkelstein JA. Finding the role of health care in population health. JAMA. 2014;311(8):797-798

27 Hilltop Institute “Hospital Community Benefits after the ACA: Leveraging Hospital Community Benefit Policy to Improve Community Health.” Issue Brief, June 2015.

Appendix A: Methodological Approach

The first two versions of this Action Guide were developed under the guidance of the project committee, and insights from 10 field testing groups, with input from the general public. The field testing groups are engaged in population health improvement, and they volunteered to review, apply, and help refine the Guide. The project team regularly interacted with these field testing groups to learn from their implementation activities associated with the Guide, then used the input to make the Guide more specific and practical. As a result of the continued support of this work by the Department of Health and Human Services, this final version of the Action Guide includes a deeper focus on the measures and data sources particularly informed by the real world experiences of the 10 field testing groups.

This Action Guide reflects and builds on insights from the following sources:

- Input from 10 field testing groups working on population health improvement. See Appendix H.
- NQF Population Health Framework Committee, a multistakeholder group of experts providing guidance regarding the development of the Guide. For a list of committee members and a summary of their activities, go to http://www.qualityforum.org/projects/population_health_framework.
- Multistakeholder Input on a National Priority: Working with Communities to Improve Population Health. Environmental Scan and Analysis to Inform the Action Guide, developed by a project team at NQF in 2013. This paper assessed key elements in a wide variety of existing conceptual frameworks, in addition to core aspects of programs being implemented at the local, state, or national levels, to identify insights regarding potential content for the Action Guide.¹
- An Environmental Scan of Integrated Approaches for Defining and Measuring Total Population Health,² commissioned by NQF in 2012. Jacobson and Teutsch established definitions for key concepts and a list of recommendations that provided a starting point for the environmental scan, including criteria that were used to assist with selection of the frameworks and initiatives addressed in this report. Given the tremendous amount of research and thousands of programs focused on population health improvement, this report was designed to gather a representative range of examples that present a strong cross-section of insights.

Appendix B: Links to Helpful Resources

Listed below are the 10 elements and links to sources of additional information, tools, and other resources that relate to each topic. These may change over time, but many were identified as useful by the project Committee and/or field testing groups.

Element 1: Resources for Collaborative Self-Assessment

- **County Health Ranking and Roadmaps – Tools and Resources.** This Robert Wood Johnson program provides a database and a large number of tools to help assess readiness and the resources and needs of your region.
  
  [http://www.countyhealthrankings.org/resources?f[0]=field_global_action_steps%3A18389](http://www.countyhealthrankings.org/resources?f[0]=field_global_action_steps%3A18389)

- **Are You Ready to Pursue the Triple Aim?** This is an online assessment provided by the Institute for Healthcare Improvement intended to help health-related organizations or systems, or coalitions of organizations working to improve health and healthcare, get ready to pursue the Triple Aim — including population health improvement.
  
  [http://www.ihi.org/Engage/Initiatives/TripleAim/Pages/TripleAimReady.aspx](http://www.ihi.org/Engage/Initiatives/TripleAim/Pages/TripleAimReady.aspx)

- **Community Commons – Community Health Needs Assessment Toolkit.** This toolkit is a free web-based platform designed to help hospitals and organizations understand the needs and assets of their communities, and work together to make measurable improvement in population health.
  

- **Collective Impact Forum:** This is a site for groups practicing collective impact, with information, tools, discussion, and other resources that may be helpful during planning and priority-setting.
  

Element 2: Resources for Leadership Across the Region and Within Organizations

- **Pioneering Healthier Communities: Lessons and Leading Practices.** This document shares the seven “leading practices” learned through YMCA initiatives and explains how other organizations can implement these principles.
  

- **Working Together, Moving Ahead: A Manual to Support Effective Community Health Coalitions.** This handbook is designed to support those who participate in coalitions, provide staff support to coalitions, provide funding or in-kind resources to coalitions, or require their grantees to organize and utilize coalitions in their work. It provides practical advice on common concerns and problems facing coalitions. The manual aims to get people thinking about why they have chosen to use coalitions in their work, about their assumptions in building coalitions, and about the structures and processes they are using with coalitions.
  
  [http://www.policyarchive.org/handle/10207/21720](http://www.policyarchive.org/handle/10207/21720)
• **Community How-To Guide on Coalition Building.** This guide from the National Highway Safety Transportation Administration provides guidance on bringing together a diverse group of people in pursuit of a common goal. The guide is part of a set to assist with underage drinking prevention efforts; however, the information is not topic-specific and can be applied to various population health improvement projects.  

• **County Health Rankings and Roadmaps.** The “Action Cycle” includes an interactive graphic exploring the various stakeholders that should be included in population health projects, along with guidance on how to connect and work together.  

**Element 3: Resources for Audience-Specific Strategic Communication**

• **County Health Rankings and Roadmaps.** The “Action Center” framework provides guidance on effective communication.  

• **Disseminating Relevant Health Information to Underserved Audiences: Implications of the Digital Divide Pilot Projects.** This paper examines the digital divide and its impact on health literacy and communication. The digital divide can be a significant impediment in health literacy and information dissemination.  
  [http://www.ncbi.nlm.nih.gov/pmc/articles/PMC1255755/](http://www.ncbi.nlm.nih.gov/pmc/articles/PMC1255755/)

• **Simply Put: A Guide for Creating Easy-to-Understand Materials.** This resource from the Centers for Disease Control and Prevention (CDC) offers insight on how to use plain language, visuals, clear formatting, and cultural sensitivity to communicate effectively with health-related materials.  

• **YMCA Pioneering Healthy Communities:** This is a practical toolkit that includes a useful framework for considering how to communicate effectively, using culturally respectful plain language.  
  [http://www.ymca.net/healthier-communities](http://www.ymca.net/healthier-communities)

**Element 4: Resources for a Community Health Needs Assessment and Asset Mapping Process**

• **ACHI Community Health Assessment Toolkit.** The toolkit provides detailed guidance on six core steps of a suggested assessment framework, including, but not limited to, data collection.  

• **Asset Mapping from the Southern Rural Development Center.** This article explains a process for mapping the assets of a community and provides guidance on collaborating with various organizations and individuals with the goal of community development and enhancement. The article offers an overview of the needs assessment process and then a step-by-step work plan for...
each element of the model.
http://www.nebhands.nebraska.edu/files/227_asset_mapping.pdf

- **County Health Rankings and Roadmaps.** The “Assess Needs and Resources” section of the “Roadmaps” framework provides guidance on taking stock of your community’s needs, resources, strengths, and assets.
  http://www.countyhealthrankings.org/roadmaps/action-center/assess-needs-resources

- **Practical Playbook.** The “Stages of Integration” framework encourages public health entities to analyze the most recent community health needs assessment to identify population health projects. The framework also offers guidance on the prioritization process and how various entities can work together to identify needs in the community.
  https://practicalplaybook.org/stages-integration

- **Regional Equity Atlas 2.0 and Action Agenda.** This population health improvement tool maps the intersection of chronic disease prevalence data and data on the social, economic, and physical determinants of health for the Portland metro region, providing insight into key findings. As a resource, the Regional Equity Atlas has been used by various Aligning Forces for Quality (AF4Q) projects to identify target areas for health improvement in specific geographic areas.
  http://clfuture.org/equity-atlas

- **Community Commons – Community Health Needs Assessment Toolkit.** This toolkit is a free web-based platform designed to assist hospitals and organizations to understand the needs and assets of their communities, and work together to make measurable improvement in health in the community.
  http://assessment.communitycommons.org/CHNA/

- **Resources for Implementing the Community Health Needs Assessment Process.** This set of resources from the CDC helps to translate the requirements of the Affordable Care Act, with the intent to encourage active engagement between hospitals and public health.
  http://www.cdc.gov/policy/chna/

**Element 5: Resources for an Organizational Planning and Priority-Setting Process**

- **Guide to Measuring the Triple Aim: Population Health, Experience of Care, and Per Capita Cost.** This 2013 white paper from the Institute for Healthcare Improvement offers a useful logic model for considering drivers of health, with related examples for measuring population health.
  http://www.ihi.org/resources/Pages/IHIWhitePapers/AGuidetoMeasuringTripleAim.aspx

- **Practical Playbook.** The “Stages of Integration” framework encourages organizational planning and offers guidance on the process.
  https://practicalplaybook.org/stages-integration

- **County Health Rankings and Roadmaps.** The “Roadmaps” framework provides guidance on the organizational planning process and how to determine priorities.
  http://www.countyhealthrankings.org/roadmaps/action-center/focus-whats-important

- **Plan, Do, Study, Act (PDSA).** The PDSA model has been utilized by the National Health Service in the United Kingdom to encourage trials of new policies before implementation. The model consists of four recommended steps to test an idea and assess its impact: planning the change to be tested or
implemented (Plan); carrying out the test or change (Do); studying data from before and after the change and reflecting on what was learned (Study); and planning the next change cycle or full implementation (Act).

http://www.institute.nhs.uk/quality_and_service_improvement_tools/quality_and_service_improvement_tools/plan_do_study_act.html

- **ReThink Health.** This suite of interactive tools opens up new ways of looking at population health improvement. The intention is to guide leaders in considering the impacts of different policies and interventions and make better and more creative decisions about redesign.
  
  http://www.rethinkhealth.org/

**Element 6: Resources for an Agreed-Upon, Prioritized Set of Health Improvement Activities**

- **The Guide to Community Preventive Services.** The Community Preventive Services Task Force (Task Force) was created by the Department of Health and Human Services to determine which interventions work for improving population health in various settings. Recommendations of the Task Force are available in the Guide to Community Preventive Services, a free resource to help identify programs and policies to improve health and prevent disease in the community. Systematic reviews are used to explore program and policy interventions, effective interventions for specific communities, and the cost and potential return on investment of interventions.
  
  http://www.thecommunityguide.org/index.html

- **CDC Community Health Improvement Navigator.** This resource contains information, tools, and a database of effective interventions that can be applied by community organizations, health systems, public health agencies, and others who are working together to improve health in a community.
  
  http://www.cdc.gov/chinav

- **A Compendium of Proven Community Based Prevention Programs.** This report from The Trust for America’s Health and the New York Academy of Medicine highlights nearly 80 evidence-based prevention programs that have been proven to improve health and save lives. Topics addressed include tobacco use reduction, asthma, injuries, sexually transmitted infections, alcohol abuse, physical activity, and eating habits.
  

- **County Health Rankings and Roadmaps.** The “What Works for Health” database includes health improvement activities from the Guide to Community Preventive Services as well as other population health topics.
  
  http://www.countyhealthrankings.org/roadmaps/what-works-for-health

- **Institute for Clinical Systems Improvement (ICSI).** This organization has been involved in efforts across the country to promote Accountable Health Communities, and offers a number of reports and ideas for effective approaches.
  
Element 7: Resources for Selection and Use of Measures and Performance Targets

- **Population Health Measures Endorsed by NQF.** This list or portfolio of measures contains measures which have been identified by the National Quality Forum as being relevant for population health measurement.

- **Disparities-Sensitive Measures Endorsed by NQF.** This subset of measures includes those which have been identified by the National Quality Forum as being appropriate for assessing disparities, within the population health measure portfolio.

- **Health Indicator Warehouse.** This online library provides access to national, state, and community health indicators. It serves as the data hub for the HHS Community Health Data Initiative and is a collaboration of various agencies within the department. The Health Indicator Warehouse is referenced by the County Health Rankings and Roadmaps program as a resource for those working on population health projects.
  http://healthindicators.gov/

Element 8: Resources for Joint Reporting on Progress Toward Achieving Intended Results

- **County Health Ranking and Roadmaps.** This resource shows results for a number of measures and indicators by county across the United States, and clearly describes their methods for developing the rankings that are reported.
  http://www.countyhealthrankings.org/Our-Approach

- **The Network for Public Health Law: Checklist of Information Needed to Address Proposed Data Collection, Access and Sharing.** This tool provides a checklist to assist public health practitioners in providing relevant factual information to address issues of legality, privacy, and ethics.
  https://www.networkforphl.org/resources_collection/2014/01/07/400/tool_checklist_of_information_needed_to_address_proposed_data_collection_access_and_sharing

Element 9: Resources for Indications of Scalability

- **Let’s Move Initiative.** This national initiative focused on reducing childhood obesity uses its website as a tool for sharing best practices and promotional material that others can use. The initiative has encouraged “Let’s Move Meetup” programs in more than 400 cities nationwide, where community members get together to share success stories and discuss ways to tackle childhood obesity. Let’s Move also uses its Facebook page as a connector for communities to share tips and news from across the country.
  http://www.letsmove.gov/

- **Practical Playbook.** This resource for public health and primary care groups features an interactive tool that guides users through the stages of integration for population health improvement projects.
Information on how to scale up efforts is included.
http://www.practicalplaybook.org/

Element 10: Resources for a Plan for Sustainability

- **Healthier Worksite Initiative.** This resource from the CDC addresses workforce health promotion and offers information, resources, and step-by-step toolkits to help worksite health promotion planners in the public and private sectors improve the health of employees.
  http://www.cdc.gov/nccdphp/dnpao/hwi/

- **A Sustainability Planning Guide for Healthy Communities.** The CDC’s Healthy Communities Program has worked with more than 300 community coalitions to help create a culture of healthy living while building national networks for sustainable change. The Sustainability Planning Guide provides evidence-based insights to help coalitions, public health professionals, and other community stakeholders develop, implement, and evaluate a successful sustainability plan.
Appendix C: Measures

Development of a Measures Chart. In the process of working with the field testing groups to refine the Action Guide, each group identified the measures they use to help them assess and improve population health status in their region. Differences in the measures used by each group can be attributed to a number of factors, such as varying levels of experience, diverse areas of focus, and how readily they could draw from existing measurement efforts. For example, many groups are using measures that are part of one or more Community Health Needs Assessments conducted in their region.

The measures, metrics, and indicators that the field testing groups identified were compiled into a draft measures chart. Each group provided additional information about their measures — such as the levels of analysis, data sources, and how results are being applied — which is included in the chart. Initial topic categories were assigned to measures to begin assessing where there may be measure alignment across field testing groups and with key national measure sets (such as Healthy People 2020 Leading Health Indicators, the County Health Rankings measures, and the Public Health Accreditation Board measures). During the third year of the project, the draft measures chart will be refined by working with the field testing groups to update the content and format. The goal is to produce a useful tool for entities working on population health improvement at any level.

Listed below are some existing resources that identify measures which may be useful for population health assessment:

Healthy People 2020 — Measure Domains
This national project defines four areas of health measures used to monitor progress toward promoting health, preventing disease and disability, eliminating disparities, and improving quality of life. These broad, cross-cutting areas of measurement include general health status; health-related quality of life and well-being; determinants of health; and disparities.
http://www.healthypeople.gov/2020/about/tracking.aspx

Healthy People 2020 — Leading Indicators of Health
Representing a smaller set of objectives for high-priority health issues, the 26 Leading Health Indicators have baseline and target levels specified, as well as data sources included for each.
http://www.healthypeople.gov/2020/Leading-Health-Indicators

Kids Count Data Center
A comprehensive source for data on child and family well-being in the United States, with hundreds of measures, plus downloadable data and the ability to generate reports and graphics specific to your region of interest.
http://datacenter.kidscount.org/

County Health Rankings and Roadmaps
The County Health Rankings score communities according to a variety of health measures based on health outcomes and health factors, which are broken down into eight composite areas and then into subcomponent areas.
A Healthier America 2013: Strategies to Move from Sick Care to Health Care in Four Years
This strategic paper suggests Public Health Accreditation Board (PHAB) accreditation standards in 12 domains: 10 essential public health services; management and administration; and governance. See page 10 of the report.
http://healthyamericans.org/report/104/

Clinical-Community Relationships Measures Atlas
This measurement framework lists existing measures for clinical-community relationships and explores ways to define, measure, and evaluate programs that are based on such relationships for the delivery of clinical preventive services. The list of existing measures includes detailed information on each measure's purpose, format, and data source, validation and testing, applications, and key sources. The Master Measure Mapping Table provides an overview of domains and the relationships involved. See page 10 of the report.

Early Education Readiness Using a Results-Based Accountability Framework
A collaborative of parents and child-serving organizations in Los Angeles County worked together to establish a set of school readiness indicators. The workgroup used the National Education Goals Panel’s (NEGP’s) working definition of school readiness: children’s readiness for school, school’s readiness for children, family and community supports, and services that contribute to children’s readiness for school success. Indicators were also chosen to reflect the five outcomes adopted by Los Angeles County: good health; safety and survival; economic well-being; social and emotional well-being; and education/workforce readiness.

Guide to Measuring the Triple Aim: Population Health, Experience of Care, and Per Capita Cost
This 2013 white paper from the Institute for Healthcare Improvement suggests measures for the three dimensions of the Triple Aim, accompanied by data sources and examples, with descriptions of how the measures might be used.
http://www.ihi.org/resources/pages/ihiwhitepapers/aguidetomeasuringtripleaim.aspx

Healthy Communities Data and Indicators Project (HCI)
To serve a goal of enhancing public health, this project includes the development of a standardized set of statistical measures for use in community health planning and assessment. A core list of indicators was developed in 2014 and more than 50 indicators were vetted and constructed, with information on the impact, evidence, data sources, bibliographic references, and methods and limitations of each. A How-To Manual is available, in addition to the project information.
http://www.cdph.ca.gov/programs/Pages/HealthyCommunityIndicators.aspx
http://www.cdph.ca.gov/programs/Documents/Healthy_Community_Indicators_Core_list10-17-14Table1-5.pdf
HHS Action Plan to Reduce Racial and Ethnic Disparities
The action plan is based on national goals and objectives for addressing health disparities identified by Healthy People 2020 and focuses on evidence-based programs and best practices. Stakeholders include HHS public and private partners, plus other federal partners working together on the initiative, including the Departments of Agriculture (USDA), Commerce (DOC), Education (ED), Housing and Urban Development (HUD), Labor (DOL), Transportation (DOT), and the Environmental Protection Agency (EPA). See Appendix C, page 44 for measures.

Regional Equity Atlas 2.0 and Action Agenda
This population health improvement tool maps the intersection of chronic disease prevalence data and data on the social, economic, and physical determinants of health for the Portland metro region, providing insight into key findings. The tool covers a set of domains that includes measures spanning clinical care, demographics, environment, and social characteristics.
http://regionalequityatlas.org/toolkit/equity-atlas-toolkit-overview

Toward Quality Measures for Population Health and Leading Health Indicators
Measurement domains include 26 leading health indicators outlined in Healthy People 2020 as well as 12 additional topics: access to health services; clinical preventive services; environmental quality; injury and violence; maternal, infant, and child health; mental health; nutrition, physical activity, and obesity; oral health; reproductive and sexual health; social determinants; substance abuse; and tobacco. See page 15 of the report.

The Institute of Medicine Vital Signs report
Includes a set of core metrics for assessing health and healthcare progress:

The Robert Wood Johnson Foundation Culture of Health
RWJF is coordinating development of a set of metrics for their Culture of Health initiative, which takes a more holistic view of health. The measures are anticipated to be announced in 2015.
http://cultureofhealth.org
Appendix D: Data Sources

Listed below are examples of resources that provide data useful for population health measurement and improvement:

**Center for Vital Statistics Health Data Interactive**
This resource presents tables with national health statistics for infants, children, adolescents, adults, and older adults. Tables can be customized by age, gender, race/ethnicity, and geographic location to explore different trends and patterns.
[http://www.cdc.gov/nchs/hdi.htm#tutorials](http://www.cdc.gov/nchs/hdi.htm#tutorials)

**Behavioral Risk Factor Surveillance System (BRFSS)**
BRFSS is an on-going telephone health survey system focused on collecting behavioral health risk data. The annual survey data is published online and used by the Centers for Disease Control and Prevention (CDC) and other federal agencies.
[http://www.cdc.gov/brfss/about/index.htm](http://www.cdc.gov/brfss/about/index.htm)

**Correctional Health Outcomes and Records Data Set (CHORDS)**
CHORDS is a clinical outcomes data sharing system being designed for correctional healthcare settings. Data is supplied by jails and other correctional facilities.
[http://www.ncchc.org/NRI-CHORDS](http://www.ncchc.org/NRI-CHORDS)

**County Health Rankings and Roadmaps**
The County Health Rankings score communities according to a variety of health measures based on health outcomes and health factors, which are broken down into eight composite areas and then into subcomponent areas.
[http://www.countyhealthrankings.org/app/home](http://www.countyhealthrankings.org/app/home)

**Data.Gov**
The U.S. government’s data portal provides access to federal, state and local data, as well as tools, research resources, and more. The “Health” section includes 1,125 data sets, tools, and applications related to health and healthcare and can be used as a resource for groups or individuals looking for examples of data or actual data sets for reporting purposes.
[https://www.data.gov/health/](https://www.data.gov/health/)

**Data.CDC.Gov**
This online database provides access to data sources from the Centers for Disease Control and Prevention (CDC).
[https://data.cdc.gov/](https://data.cdc.gov/)
**Gallup-Healthways Well-Being Index**

The Gallup-Healthways Well-Being Index is a measure derived from an empiric database of real-time changes in factors that drive well-being. The database captures perceptions on topics such as physical and emotional health, healthy behaviors, work environment, social and community factors, financial security, and access to necessities such as food, shelter, and healthcare. Gallup conducts 500 telephone interviews a day with Americans to gather their perceptions of well-being, for a resulting sample that represents an estimated 95 percent of all U.S. households.

**National Institutes of Health (NIH) Data Sharing Repository**

The National Library of Medicine (NLM) website provides a table of NIH-supported data repositories that accept submissions of appropriate data from NIH-funded investigators (and others). Also included are resources that aggregate information about biomedical data and information sharing systems.

**University of Minnesota Bio-Medical Library: Health Statistics and Data Sources**

The University of Minnesota Health Sciences Library maintains a webpage that gathers a robust list of available metasites, national statistics, state, county, and metropolitan level statistics, and even international statistics, then lists data sites according to disease, condition, or special topic area.

Appendix E: General Resources/Tools

Listed below are examples of resources that can be used as tools for population health measurement and improvement:

**ACHI Community Health Assessment Toolkit**
The ACHI Community Health Assessment Toolkit is a guide for planning, leading, and using community health needs assessments to better understand and improve the health of communities. Tools include checklists, budgets, and timeline guides and templates for each of the six steps in the framework, with specific guidance on skills needed, budget drivers, time drivers, and a task checklist.  

**The Blue Zones Project**
The Blue Zones Project focuses on encouraging individuals and community members to aspire to healthy lifestyle ideals, which are based on research into communities around the world with the highest number of centenarians. An online community provides guidance and tips ranging from healthy eating to stress management, and the project also includes “policy pledge actions” for schools, workplaces, local government entities, and communities pertaining to the physical environment, food, and smoking.  
[https://www.bluezonesproject.com/](https://www.bluezonesproject.com/)

**Camden Care Management Program and Cross-Site Learning**
This program through the Camden Coalition of Healthcare Providers includes development of a database to analyze and quantify the utilization of hospitals by Camden, New Jersey residents. This tool relies on data from the Camden’s Health Information Exchange (HIE) to target and coordinate care for patients who lack consistent primary care and often suffer from chronic illness, mental illness, and substance abuse. The Cross-Site Learning program is being implemented in 10 cities. Tools, planning guides, and other materials are being provided to expand “hot spotting” to other locations.  
[http://www.camdenhealth.org/cross-site-learning/](http://www.camdenhealth.org/cross-site-learning/)

**County Health Rankings and Roadmaps**
The Roadmaps to Health Action Center provides an interactive framework (“The Action Cycle”) for organizing and planning initiatives, projects, and collaborative actions aimed at population health improvement. The County Health Rankings is a tool providing information about the health of populations by county, including health outcomes and a broad set of health determinants. The website provides access to all of the data underlying the rankings and a guide to evidence-based policies, programs and system changes (“What Works for Health”) and a “Tools & Resources” page with external links to educational materials and additional tools.  

**Family Wellness Warriors Initiative**
This Alaska-based antidomestic violence initiative holds multiday trainings to educate “natural helpers” and community members on how to work with people affected by violence, reduce abuse in the community, and implement the program’s antiviolence curriculum. The program’s website also includes a map with localized resources, such as counseling centers, for violence and abuse prevention.  
[http://www.fwwi.org/index.cfm](http://www.fwwi.org/index.cfm)
Green Strides
This is a U.S. Department of Education initiative aimed at making all schools healthier, safer, and more sustainable. Resources include a webinar series, blog, and social networking to facilitate sharing of best practices and resources. The resources page lists tools for schools, teachers, parents, and students to use in planning and execution of improvement strategies, such as reducing environmental impact and cost, promoting health and wellness, and learning about environmental sustainability.
http://www.greenstrides.org/

The Guide to Community Preventive Services
The Guide to Community Preventive Services is a free resource to help identify programs and policies to improve health and prevent disease in the community, based on recommendations from the Community Preventive Services Task Force.
http://www.thecommunityguide.org/index.html

Healthy Communities Institute (HCI)
The Healthy Communities Institute provides customizable, web-based information systems to visualize the best-available local data through indicator dashboards and GIS maps. Supporting tools include Indicator Trackers for evaluation, a database of more than 2000 best practices, and collaboration tools to support ongoing collective work. The database includes more than 100 quality-of-life indicators for any community and the ability to add custom indicators locally. The Healthy People 2020 Tracker helps evaluate the effectiveness of the local group’s programs and the health of the community compared to national goals, and custom trackers can be locally created to track local priorities and progress towards locally defined targets.
http://www.healthycommunitiesinstitute.com/

Health in All Policies: A Guide for State and Local Governments
The Health in All Policies guide includes “Food for Thought” questions in each section that leaders of a Health in All Policies initiative are encouraged to consider. The guide also includes tips for identifying new partners, building meaningful collaborative relationships across sectors, and maintaining those partnerships over time, as well as more than 50 annotated resources for additional support.
http://www.phi.org/resources/?resource=hiapguide

Let’s Move
Online resources from the Let’s Move initiative include “5 simple steps” guides for parents, schools, community leaders, chefs, children, elected officials, and healthcare providers on how to play a role in preventing and reducing childhood obesity and living and promoting healthier lifestyles. The website also includes educational materials for printing and distribution within communities.
http://www.letsmove.gov/action

Moving Healthy
This overview of the health-related strategies being explored by the U.S. Department of Transportation Federal Highway Administration (FHWA) references tools and resources to help transportation professionals and health practitioners identify and address the health impacts of transportation.
https://www.fhwa.dot.gov/planning/health_in_transportation/resources/moving_healthy.cfm
The National Prevention Strategy
The Surgeon General’s website for this national initiative features resources related to the National Prevention Strategy, including fact sheets, infographics, implementation, and scientific resources. [http://www.surgeongeneral.gov/priorities/prevention/strategy/](http://www.surgeongeneral.gov/priorities/prevention/strategy/)

One in 21 Muskegon County
This is the umbrella program for local initiatives like “Project Healthy Grad” and includes educational information, links to farmers’ markets and other local resources for Muskegon County, Michigan. [http://1in21.org/resources](http://1in21.org/resources)

Operation Live Well
This initiative — aimed at improving the health of military personnel and their families — includes resources related to key focus areas and preventive health, plus a list of health tools from various organizations. [http://www.health.mil/livewell](http://www.health.mil/livewell)

Practical Playbook
This resource for public health and primary care groups features an interactive tool that guides users through the stages of integration for population health improvement projects. [http://www.practicalplaybook.org/](http://www.practicalplaybook.org/)

Regional Equity Atlas 2.0 and Action Agenda
This project includes maps of the Portland, Oregon region using data on chronic disease prevalence and social, economic, and physical determinants of health, and provides key findings. A mapping tool allows for customized creation of maps on issues affecting the region. [http://regionalequityatlas.org/programs/regional-equity-atlas/about-regional-equity-atlas-project/original-equity-atlas/original-12](http://regionalequityatlas.org/programs/regional-equity-atlas/about-regional-equity-atlas-project/original-equity-atlas/original-12)

Shaping the Future Report
This report presents school readiness goals and indicators to guide planning and accountability around children’s readiness for school in Los Angeles County. The tool was created to engage community stakeholders, monitor trends, and implement a results-based accountability framework. [http://www.first5la.org/files/ShapingtheFutureReport.pdf](http://www.first5la.org/files/ShapingtheFutureReport.pdf)

The Substance Abuse and Mental Health Services Administration (SAMHSA)
SAMHSA provides resources and guidance on substance abuse, mental illness, trauma and justice, health reform, health information technology, public awareness and support, outcomes and quality, and recovery support. This includes access to tools, materials, and links to external organizations. [http://www.samhsa.gov/](http://www.samhsa.gov/)

Vermont Blueprint for Health
This is a state-led initiative aimed at transforming the way that healthcare and health services are delivered in Vermont by providing the community with a continuum of seamless, effective, and preventive health services, while reducing medical costs. Tools include healthier living and tobacco cessation workshops, plus educational materials and guidance on how to implement the Blueprint.
YMCA Healthier Communities Initiatives
The YMCA provides resources for promoting healthier communities, including a guide on linking policy and environmental strategies to health outcomes and the Community Health Living Index (CHLI), which contains self-assessments and provides best practices to promote improvement.
http://www.ymca.net/healthier-communities
Appendix F: Population Health Field Testing Group Profiles

Profiles for each Field Testing Group (FTG) are outlined in the pages below. Each profile provides a brief background about the FTG, their approach to population health improvement work, and the metrics and data used or being sought for use to measure the impact of their work.
Colorado Cross-Agency Collaborative

Colorado State agencies have leveraged reporting of measure results by setting priorities for all state-level population health improvement efforts. The intent is to improve collaboration while increasing the impact of targeted interventions to improve the health of Coloradans. The Collaborative is dedicated to a statewide strategy to improve population health. Data alignment and sharing of information across agencies will reduce duplicative data collection and integrate strategies, consistent with a long-term vision of cross-agency measurement and evaluation of policies and programs.

Goals and Approach
The Colorado Cross-Agency Collaborative (CCAC) comprises the Department of Human Services, the Department of Public Health and Environment, and the Department of Health Care Policy and Financing, partnering under a 2013 initiative to “build a comprehensive and person-centered statewide system that addresses a broad range of health needs, delivers the best care at the best value, and helps Coloradans achieve the best health possible.”¹ The CCAC produces annual reports focused on specific health issues in Colorado, using cross-agency data to identify trends, develop aligned initiatives and set standardized performance benchmarks and targets. Focus areas have included behavioral health (2014), child health (2015), and health in adults 65 and over (2016).

In this aligned data strategy, the CCAC considers metrics for collaborative projects and statewide programs like the Colorado Opportunity Project, a pilot program with the goal “to deliver proven interventions that create opportunities for all Coloradans to reach middle class by middle age.” This program has been implemented in six regions across the state to encourage aligned use of a set of core metrics that span life stages and determinants of health. The core metrics include evidence-based milestones for predicting success in life, defined as an income in adulthood that is 300 percent above the federal poverty level. The indicators include being born at a healthy weight, being prepared for school, graduating from high school, being sustainably employed and maintaining good mental and physical health. Indicators for older and elderly adult life stages are also being developed.

To further improve program efficiency and promote shared resources, the CCAC aims to expand its scope by partnering with other state agencies, such as the Department of Education and the Office of Information Technology, creating a wider data pool that allows for community, state and national comparisons. The long-term goal is the creation of statewide programs with a shared strategy for improving the health of Coloradans at every population level.

Measure and Data Source Use
Because measure alignment is a relatively new initiative for Colorado state agencies, improvement in outcomes has yet to be identified. However, collaboration around data and metrics via the CCAC has

¹ The State of Health: Colorado’s Commitment to Become the Healthiest State, Office of Governor John Hickenlooper (April 2013)
resulted in a significant reduction in duplicative efforts, with state agencies working together to impact the same health disparities through joint initiatives that capture data for sub-populations at risk of being overlooked in broader population health improvement strategies.

For example, the HCP, a program for children and youth with special health care needs, partnered with one of the state’s Regional Care Collaborative Organizations to more efficiently provide care coordination for this sub-population. Duplicative efforts were identified for metrics on child birth, with HCP using its own claims data while the Colorado Department of Public Health and Environment tracked more detailed information from birth certificates. Through the CCAC, there is now a monthly data stream that allows a more comprehensive understanding of newborn trends. The state also recently implemented surveys using the National Core Indicators to capture quality of life and experience of care metrics for elderly, blind and disabled populations. Additionally, alignment is underway to define recidivism at the community level and drive better quality of care for individuals post incarceration.

Colorado’s collaborating agencies are using existing data sources, such as electronic health records, that can be extracted and combined with other data to allow for enhanced clinical outcomes tracking. Colorado was awarded a State Innovation Model (SIM) Test Award in 2015 to focus on “integrated physical and behavioral health care services in coordinated community systems, with value-based payment structures, for 80 percent of Colorado residents by 2019.”² The project will enable further improvement in data sharing and transparency in the state, and provide the opportunity to evaluate collaborative efforts and the impact on health outcomes. The newly formed Office of eHealth Innovation will support Colorado’s health information technology infrastructure and assist with the secure exchange of health data and coordinate care. However, the CCAC recognizes that measures are always evolving. As agencies dig deeper into certain measures, effectiveness and impact will be re-evaluated as circumstances change around cost, reliability, validity and political climate. Funding can also greatly affect which measures are chosen as a focus for collaborative initiatives.

---

Colorado Opportunity Project Measures:

**Family Formation (positive circumstances at birth):** A planned pregnancy, born at healthy birth weight, to a dual parent household without maternal depression.

**Early Childhood (ages 0-5):** School readiness, healthy social emotional skills and the families access to affordable, nutritious food.

**Middle Childhood (ages 6–11):** Math/Reading Skills and healthy social emotional skills.

**Adolescence (ages 12–17):** Graduates from high school on time, has developed healthy social emotional skills and has not been convicted of a crime, nor become a teen parent.

**Transition to Adulthood (ages 18 – 29):** Currently sustainably employed having attended post-secondary education and has good physical/mental health.

**Adulthood (ages 30 – 40):** Employment status, has good physical/mental health and is a middle class household (300% FPL)
Designing a Strong and Healthy NY (DASH-NY)

Designing a Strong and Healthy New York (DASH-NY) brings together partners from multiple sectors to develop sustainable, crosscutting strategies to prevent chronic disease and promote well-being across New York State. It serves as a chronic disease prevention coalition and policy center at The New York Academy of Medicine. DASH-NY was launched in 2010 with support from the New York State Department of Health to address obesity and chronic disease prevention through policy, systems, and environmental changes.

Goals and Approach

The DASH-NY coalition adopted a set of nine policy priorities to address in 2016, focusing on active communities, food policy, healthy schools and childcare, economic and community development, and clinical and community linkages. The priorities were selected by a workgroup in each of the five topic areas, and were chosen as relevant, actionable ways to impact chronic disease and well-being statewide. The coalition uses the definition of “well-being” created by the Centers for Disease Control and Prevention (CDC), which describes “well-being” as “the presence of positive emotions and moods (e.g., contentment, happiness), the absence of negative emotions (e.g., depression, anxiety), satisfaction with life, fulfillment and positive functioning,”³ and recognizes that chronic disease is radial to well-being.

To combat chronic disease, DASH-NY is focused on addressing obesity, diabetes, heart disease and addiction. Budget priorities for 2016 - 2017 include the United States Department of Agriculture’s Food Insecurity Nutrition Incentive program, Health and Human Services’ Healthy Food Financing Initiative, and New York’s Creating Healthy Schools and Communities initiative. DASH-NY is seeking the shared use of school facilities, accountability for physical education, and licensure for nutritionists and dieticians, among other legislative priorities. As part of these priority initiatives, the Coalition is also actively working on building relationships with potential new members who understand the complexity of mental health issues and their effects on food and school policy.

Measure and Data Source Use

After changes in State funding priorities took place in 2015, DASH-NY began exploring options for sustainability and organizational priority setting, which was the focus of their measurement efforts as an Field Testing Group (FTG) working with NQF. An evaluation at the end of the first five-year funding cycle in 2015 revealed key insights that DASH-NY then began using to leverage the efforts of additional stakeholders and advocacy work.

To inform organizational priorities, DASH-NY is using a set of measures for program evaluation and evaluating outcomes related to the impact on policy and budget. Participating as an FTG encouraged the coalition to adopt the *Wilder Collaborative Factors Inventory* tool, which is listed in the Action Guide as a resource for self-assessment. DASH-NY is committed to implementing an annual assessment to gauge progress and refine their objectives, with the goal of spurring improvement within a year to eighteen months. The measure topics for self-assessment are listed below.

Within these topics, DASH-NY has identified an array of specific measures that they will use, with the intention to be able to show improvement within the relatively short timeframe. Being able to illustrate progress through the use of these assessment metrics is seen as essential as DASH-NY shifts from policy work to being more directly involved in advocacy initiatives.

Empire Health Foundation

Empire Health Foundation (EHF) is a private foundation focused on improving population health in the eastern part of Washington state. EHF helps to convene public and private-sector partners to address community needs and priorities. For example, EHF contributed to Priority Spokane, a collaborative effort that included a formal planning process to improve high school graduation rates in the region. EHF’s organizational structure allows them to meet the evolving needs of the community and culture, while supporting innovative ideas. EHF incubated the formation of three subsidiary organizations, the Family Impact Network to improve overall wellbeing for children in the welfare system, Better Health Together as a collaborative focused on innovative action for health improvement, and Spokane Teaching Health Consortium to grow the area’s supply of primary care providers.

Goals and Approach

The primary focus of EHF is improving community health and child welfare in the seven-county region. This includes EHF allocating $86 million in grants to fund initiatives and organizations around this shared aim. Each year, EHF adapts its goals and initiatives; previous priority areas included exploring the relationship between social determinants of health and high school graduation rates and grades.

EHF’s current focus is combating pre-homelessness and the impact of homelessness on the well-being of school-age children. In this priority area, EHF’s subsidiary Better Health Together aims to advance the goals of the triple aim – better health, better care and reduced cost – by addressing the social determinants of health. The organization is collaborating with Volunteers of America and the City of Spokane on the Health, Housing, and Homelessness (H3) program, to provide supportive housing to medically vulnerable homeless people who frequent Spokane County emergency departments. The goal is to reduce hospital readmissions and improve the health outcomes of the people involved.

EHF’s other subsidiary, the Family Impact Network, is focused on preventing and mitigating Adverse Childhood Experiences (ACES) to improve community health. This includes a partnership with Washington State Children’s Administration to implement Performance Based Contracting in the child welfare system in eight counties, aiming for a 50 percent reduction in the number of children in the foster care system by 2018. The new system will provide more flexibility, support, and data to social workers and providers, while incentivizing positive outcomes for children.

Measure and Data Source Use

The EHF board sets goals each year and adapts its measures as priorities evolve, using broader population health data to identify target improvement areas and sub-population or community data to evaluate programs and adopt specific initiatives. While the broader population health data is more generally available, EHF has found the need to assist with data collection for the community-based metrics and continues to grapple with challenges that include propriety barriers, personal privacy issues, lack of granularity, and small sample sizes.
Sharing the results of its measures helps the organization attract additional investment to EHF programs, advocate for policy change and expand its collaborative partnerships. For example, through the Better Health Together (BHT) initiative, schools implemented “scratch cooking” with fresh ingredients and saw a reduced obesity rate as a result, encouraging other districts to join the program. EHF aims to use the position of Better Health Together as neutral convener to drive greater alignment around measurement.

Additionally, EHF is exploring measures that better capture the impact of social determinants of health and their relationship to clinical outcomes. In 2015, BHT became an Accountable Community of Health through a State Innovation Model (SIM) grant and adopted the SIM measure set addressing the triple aim. EHF determined these measures are highly clinically oriented and continues to seek more comprehensive measures that align with local initiatives to address well-being and community factors that contribute to overall health. This is an evolving and slow-paced process, as EHF identifies data sources, selects measures and determines which of its community-based initiatives are making an impact.

For EHF’s Rural Aging Services initiative, which aims to improve quality of life for older adults living in rural communities, the organization chose to use data from Insignia Health’s Patient Activation Measure (PAM) survey to best capture the diversity of health characteristics and inform long term health outcomes.

Where Empire Health Foundation is Seeking Adequate Measures:

- Access to Providers
- Number of Mental Health Providers
- Number Without Health Insurance
- Care Coordination/Management
- Avoidable Hospital Admissions
- Obesity
- Substance Abuse
- Number of Supportive Housing Units

Current Measures in Use:

- Number Without Health Insurance
- Minutes of Physical Activity
- Nutritional Content of School Meals
- Sodium Intake
- Population Density
- Asthma
- Avoidable Hospital Admissions
- Patient Activation Measure Scores
- Mean BMI Percentile
- Percent of Students Overweight or Obese
- Average Annual Wage
- Bachelor’s Degree or Above
- K-12 Educational Attainment
- Number of Medical Residency Slots in Region
- Number of Children in Foster Care in Region

---

Geneva Tower Health Collaborative

Geneva Tower is an apartment complex in Cedar Rapids, Iowa, which houses low-income elderly adults, the majority of whom have a disability. Mercy Medical Center and Abbe Center for Community Mental Health, both of which provide programs and services to many of the individuals living at the residence, collaborated with the Affordable Housing Network, Aging Services and Linn County Public Health to provide additional support for the community and improve health and well-being. By providing services and support on site, the Collaborative reduces barriers to care, including a lack of transportation and financial resources.

Goals and Approach

Through analysis of population health data, the Collaborative identified Geneva Tower’s zip code as showing disparities in access to care and above-average use of emergency department services. In addition, calls to the police department from Geneva Tower residents included a high proportion of medically related issues. The majority of Geneva Tower’s residents are overweight or obese, based on documented BMI scores. Many are diabetic and many are smokers. In response, the Collaborative is focused on social determinants of health, obesity, diabetes and tobacco cessation. Linn County received funding through a State Innovation Model (SIM) grant which includes an overarching goal that will reduce barriers and better connect care to improve health outcomes of high needs, low resource residents. This grant will likely impact the Geneva Tower residents.

Health improvement activities have included events to help residents understand their Medicaid benefits, an unused prescription drop-off program in partnership with local police, and a partnership with Quitline Iowa, the state’s tobacco cessation program. Following the assessment of initial health-related outreach efforts, the Collaborative discovered that residents had several competing priorities that
impede the resident’s interest in participating in health improvement activities and healthcare. For example a struggle to meet basic needs like consistent access to food and sufficient clothing. Engaging residents has continued to be a challenge, but the Collaborative is exploring different approaches to address this issue, including fostering trust with residents by appointing a resident representative to its board and launching a health and wellness resident committee. This committee is helping to prepare certain individuals to become champions within their own resident community and garner support among their peers and neighbors for health-related initiatives.

Measure and Data Source Use

The Collaborative is currently collecting baseline data through resident surveys. However, the Coalition recognizes the challenges of this method: the surveys are self-administered, which makes information difficult to obtain due to issues recruiting participants, and data may carry inherent biases where residents are reluctant to report accurate information on certain topics.

Because the Collaborative is focusing on a sub-population defined by a common residence, the value of geographically defined data sources is limited. The resident turnover rate at Geneva Tower also makes it difficult to compare rates over time to the baseline data, because the individuals involved fluctuate from one period to the next.

While Geneva Tower has partnered with Medicaid managed care plans to analyze integrated health home data, this only captures information for about half of the resident population. The clinical data provided by Mercy Medical Center also has limited relevance, since not all Geneva Tower residents are patients of that particular hospital system. Attempts to aggregate data across providers have not been successful due to issues with access to electronic health records.

The Coalition is hopeful, however, that regional data access and measure alignment will improve: Linn County’s recent Community Health Assessment and Community Health Improvement Plan has prioritized data sharing and effective use of technology among the local public health system in order to identify and address emerging health trends.
Kanawha Coalition for Community Health Improvement

The Kanawha Coalition for Community Health Improvement (KCCHI) identifies and evaluates health risks, while coordinating resources for measurable health improvements in Kanawha County, West Virginia. Founded in 1994, KCCHI represents the county’s hospitals, behavioral health facility, federally qualified health center, United Way, health department, school system, business alliance, State Wellness Council and Bureau for Public Health. The Coalition’s triennial Community Health Needs Assessment (CHNA) guides its work, and KCCHI workgroups facilitate solutions around priority issues. Its CHNA informs other organizations’ strategic planning and grant writing efforts, as well as the research efforts of medical and public health students.

Goals and Approach

West Virginia ranks among the lowest states on numerous health issues, but KCCHI is committed to promoting transparency of the population health status in order to motivate improvement efforts. The Coalition’s CHNA is conducted every three years and includes a survey of key leaders in the community, a telephone survey among randomly selected households in Kanawha County, and analysis of existing research and data on county health statistics as compared to West Virginia and the country. In response, KCCHI prepares fact sheets on eight to ten priority areas, and workgroups are formed to address those topics.

The top focus areas through 2017 are obesity and nutrition, substance abuse, and physical activity, with new priorities identified around end-of-life issues, palliative care, and hospice care. Kanawha County has a higher-than-average percentage of individuals dying in local hospitals; KCCHI plans to address this issue by educating community members about proactively talking with doctors and other providers about end-of-life treatment options, hospice care, advanced directives, and Physician’s Orders for Life Sustaining Treatment (POLST) forms. KCCHI is currently working on

Data Sources Used by KCCHI

- **American Community Survey**: U.S. Census Bureau

- **Behavioral Risk Factor Surveillance System**: Centers for Disease Control
- **CARDIAC Project**: Coronary Artery Risk Detection In Appalachian Communities
- **County Health Rankings**: Robert Wood Johnson Foundation
- **Current Population Survey**: U.S. Census Bureau
- **Fatality Analysis Reporting System**: National Highway Traffic Safety Administration
- **Food Environment Atlas**: U.S. Department of Agriculture
- **Kids Count**: Annie E. Casey Foundation
- **National Survey on Drug Use and Health**: U.S. Department of Health and Human Services
- **School Nurse Needs Assessment**: West Virginia Department of Education
- **State Cancer Profiles**: Centers for Disease Control
- **West Virginia STD Surveillance**: West Virginia Department of Health and Human Resources
- **West Virginia Vital Statistics**: West Virginia Department of Health and Human Resources
- **Youth Risk Behavior Survey**: Centers for Disease Control
expanding membership and encouraging stakeholders to take greater responsibility for health improvement initiatives by contributing resources and expertise and taking ownership over certain elements of the strategic plan. The Coalition is exploring funding opportunities for this stakeholder activity.

**Measure and Data Source Use**

Measures are determined every three years based on available data. Since measure choice is tied to data availability, measures are not always reflective of what the Coalition would consider most effective for its initiatives. Accessing up-to-date data has been a challenge for the Coalition, since many data sources lag and do not reflect pivotal policy changes. Also, the availability of local data sources is limited to county- or state-wide profiles rather than zip code or census track, hindering more accurate localization of initiatives and interventions. Measure results are published by the Coalition and its member hospitals and used by stakeholders to inform economic development planning, fund allocation, and more.
Michigan Health Improvement Alliance

The Michigan Health Improvement Alliance (MiHIA) is a non-profit, multi-stakeholder organization serving a 14-county region with a population of nearly 800,000 in central Michigan. The Alliance aims to improve health through information sharing and collaboration, focusing on the facets of the Three Aims: population health, patient experience and cost of care. Serving as a convener, assessor and grant-seeker, MiHIA facilitates and supports projects and initiatives with a shared directive. As such, the organization has been recognized by the U.S. Department of Health and Human Services as a Chartered Value Exchange (CVE) and also awarded the John J. Mahoney Award for Community Health Value. Central to MiHIA’s mission is the belief that health and healthcare improvement strategies can be found and designed at the regional level, accelerating local competitive advantage and promoting sustainability. The Alliance keeps its service region large enough to have statistical significance, yet small enough for the practical implementation and impact of initiatives.

Goals and Approach

MiHIA is focused on a single long-term goal: for all 14 of its counties to rank in the first quartile of the County Health Rankings and Roadmap, an annual snapshot of community health, supported by funding from the Robert Wood Johnson Foundation. To achieve this goal, the Alliance develops a strategic plan for key priorities and its Population Health Strategy Team creates and implements regional health activities.

The current strategic plan prioritizes six grant programs — totaling over $2 million — to support key projects in the region, including the national Choosing Wisely campaign promoting patient-physician conversations about unnecessary medical tests and procedures. The Population Health Team is focused on disseminating targeted health messages to community groups through a “call to action” speaker series, running a health excellence award program to recognize health improvement efforts in the region, and conducting a regional Community Health Needs Assessment (CHNA), among other top priorities. The Alliance is also focused on prevention initiatives for pre-diabetes, preparing for a potential State Innovation Model test, and integrating the consumer voice into MiHIA’s strategic planning by establishing a consumer council.

MiHIA Metrics of Success:

**Population Health:**
- All 14 MiHIA counties to be ranked in the top half of the state county health rankings

**Patient Experience:**
- For the region to be ranked in the first quartile by the Commonwealth Foundation
- To improve areas currently ranking in the third and fourth quartile (hospitalizations for heart failure and pneumonia for patients that received the recommended care, percent of adult diabetics that receive the recommended preventive care, number of avoidable emergency department visits among Medicare beneficiaries and the percent of adults that have a Body Mass Index (BMI) of >=30)

**Cost of Care:**
- Cost of Care inflation trend for the MiHIA region will not exceed the Consumer Price Index (CPI)
Measure and Data Source Use

MiHIA uses the County Health Rankings as its primary measurement tool and shares regional results through the MiHIA Health Dashboard, an online reporting and monitoring tool designed to help partner organizations and the public track key health outcome measures by county. Each of the 14 counties in MiHIA’s scope has unique composition attributes and health disparities, which pose a challenge for identifying regional priorities that impact all 14 counties. The Alliance aims to develop a standardized regional CHNA by streamlining data sources and formats for compatibility with each of the 14 counties within MiHIA. This will improve data comparison abilities, which has been a difficulty for the Alliance, as has identifying consistent data sources. MiHIA continues to explore the various surveys that are being employed in the region and opportunities to improve data sharing for local organizations.
Oberlin Community Services and The Institute for eHealth Equity

Oberlin Community Services (OCS) is a nonprofit community services organization that has been operating in Oberlin, Ohio, for 60 years, initially serving as a food bank and then expanding to a larger range of services to residents and groups who need help meeting basic needs within Oberlin and southern Lorain County. OCS is collaborating with The Institute for eHealth Equity (IeHE), which focuses on the use of mobile technology to support individual decisions that lead to better health. A critical component of this partnership involves customizing messages to build trust and engagement among community members and leaders from local institutions, as well as making effective use of other aspects of mobile communication technology.

Goals and Approach

Food security and nutrition has been a central focus for OCS since its inception. This continues to be a top priority, given that Ohio ranks among the worst states for food insecurity. OCS is also expanding its focus areas to include chronic disease prevention and management, with a focus on diabetes. This includes partnering with the YMCA to develop a diabetes prevention program focusing on healthy lifestyle choices. The organization is utilizing IeHE’s Text4Wellness program, which is a two-way text messaging campaign reaching members of local faith communities, to share information on exercise, wellness, disease prevention and lifestyle-change. The program is tailored to the culture and needs of the local African American community, a target population in which one out of every three people is pre-diabetic. OCS aims to refine the questions in the platform to focus on social determinants of health and increase the value of information shared with various stakeholders, such as managed care plans and hospitals.

Measure and Data Source Use

OCS uses the Lorain County Community Health Needs Assessment and its own Healthy Community Survey to identify priorities and assess progress. These

measures focus on social determinants of health and health-related behaviors, centering on the organization’s goals to address nutrition and diabetes. Sharing measure results has helped OCS foster productive partnerships with IeHE, Mercy Allen Hospital, the Lorain County Health and Dentistry (a Federally Qualified Health Center), the College of Oberlin, and the Food Bank Network, among others, and galvanize efforts to address the prevalence of diabetes in Oberlin.

OCS is tracking Ohio’s national rank in such areas as the ability to feed families and the elderly and the infant mortality rate. By doing so, OCS can select measures that align their foci of providing nutritious food and impacting chronic illnesses with state health improvement initiatives. To help assess OCS’ impact, data are collected with each client interaction. Monthly statistics are gathered and submitted to funders. OCS hopes that a shared focus on measurement can continue motivating stakeholders and assist in obtaining grants and other funding opportunities for priority improvement areas.
**Trenton Health Team, Inc.**

The Trenton Health Team, Inc. (THT) is a community-based health improvement collaborative serving Trenton, New Jersey. The collaborative comprises two hospitals and 29 community and social service agencies and recently became an Accountable Care Organization (ACO). THT is a data-driven organization and launched its own Health Information Exchange (HIE) in 2014. The organization’s priorities are based on a Community Health Needs Assessment (CHNA) conducted in 2013, which identified priority areas critical to health improvement.

The THT collaborative efforts center on behavioral health, safety and crime, and chronic disease, with a focus on cancer, diabetes, and hypertension/cardiovascular disease. THT has identified health literacy and transportation as significant barriers to care and contributing factors to chronic disease. By matching these priorities with the strengths and experience of partners such as the Children’s Home Society, the American Diabetes Association, the New Jersey Partnership for Healthy Kids-Healthy Corner Store Initiative, and the Henry J. Austin Health Center (a Federally-Qualified Health Center), THT has been able to maximize existing assets and address collaborative health improvement goals.

**Goals and Approach**

THT has five strategic priorities: expanding access to primary care, improving care coordination and care management, operating its HIE to provide real-time access to shared patient data, engaging the community to increase knowledge and overcome obstacles to care, and functioning as one of three certified Medicaid Accountable Care Organizations (ACO) in the State of New Jersey’s Demonstration Project. THT’s aim is to reform healthcare in Trenton by creating a holistic model, using data to pinpoint gaps and barriers to service and establishing collaboration between health and community groups.

Part of THT’s strategy is establishing task forces to address particular goals. THT’s community-wide Clinical Care Coordination Team brings together medical and behavioral health providers from across the city to review particular cases, issues, and strategies for achieving improved patient experience, better health outcomes, and lower cost. The Care Management Team facilitates care coordination, and the Community Advisory Board led the 2013 CHNA, which involved conducting 30 forums and 300 one-on-one interviews.

**Measure and Data Source Use**

THT has adopted measure sets for each of its programs, based on grantor requirements and voluntary measures chosen by the THT Community Advisory Board and internal teams. THT uses the CHNA and real-time data to identify priority areas, possible useful analytics, and appropriate measures for the organization and its goals.
Following its ACO designation in 2015, THT assumed responsibility for quality measures covering all Medicaid beneficiaries in the region, totaling approximately 38,000 people. The new measurement obligation has redoubled efforts for improved outcomes and motivated stakeholder engagement through clinical partnership and participation on the THT Community Advisory Board.

THT has already seen individual improvements in outcomes from specific programs, including pediatric weight loss, fewer emergency department visits, and reduced rates of hypertension.

Tracking more measures and using more data has proved challenging for the interpretation and analysis of results. By incorporating clinical data with historic claims data through its regional HIE, THT is able to track more sensitive metrics and make adjustments in real time. The resulting abundance of metrics has prompted the re-examination of processes to ensure that measurement and metrics are focused on one or two priority areas. THT is also sensitive about conveying the context of measure results, especially where individual measures tell an incomplete story or data sets appear inconsistent, and works with physician leaders and others who help with analysis of the clinical and population health data.

Community Service Council

The Community Service Council (CSC) is based in Tulsa, Oklahoma, and provides leadership for programs and initiatives that improve the lives of thousands of Oklahomans each day. Since 1941, CSC has been bringing people together to research, plan, coordinate and mobilize action, and assess progress towards addressing the most critical social service, health, education and civic challenges. There are many programs, partnerships, and initiatives under the CSC umbrella. All are part of the Council’s overall strategy to focus on prevention and invest in people across the lifespan.

Goals and Approach

The CSC was originally formed to collaborate on child care, homelessness, prenatal care, mental health, substance abuse, child abuse, HIV/AIDS, early childhood development, transportation for persons with disabilities, long term care, emergency shelter and financial aid. As a trusted convener, CSC operates as a think tank for Tulsa and the surrounding region, focused on prevention to achieve “critical health, education, employment, financial and other outcomes essential to success and quality of life.” This includes programs like the Family Health Coalition, established in 1987 to address access to prenatal care and poor birth outcomes.

Measure and Data Source Use

Although the Family Health Coalition has been data-driven since its inception, participating organizations collected data individually at the programmatic level, rather than in a standardized way. During participation as an FTG, the Coalition encouraged its members to begin thinking on a population health level and discovered that many of the participating organizations were unclear on the meaning and implications of the word “measurement.” NQF’s guide, The ABCs of Measurement, was used as the basis for a common language and understanding of measurement, resulting in improved confidence when using the term and a foundation for strategic discussion around shared measurement and joint reporting.

Through the Family Health Coalition, CSC is aligning 32 programs and 26 organizations on 18 benchmark measures focusing on uninsured, underinsured and Medicaid (see the next page for the list of measures). The initiative spans four care coordination programs that cover nearly 15 percent of Tulsa County births. Eleven of the Coalition’s organizations began joint reporting results of the 18 measures and implemented targeted care coordination efforts to reduce cost and improve outcomes. The Coalition uses this aggregated data alongside data from the Maternal and Child Health Bureau (MCHB) for shared measurement points. In the future, they will consider adding measurement priorities around breastfeeding, pediatric dental care, prenatal dental care, transportation referrals, and health literacy.

---

Data sharing has been robust due to the use of Health Information Exchange; however, it is not without challenges. Some providers hesitate to share data, and data sharing can be disrupted when community service providers are not ‘covered entities’ under the Health Insurance Portability and Accountability Act (HIPAA). CSC is exploring the option of becoming a healthcare data clearinghouse to assist in information transmission for such non-covered entities. This would permit for an easier exchange of information, specifically between traditional healthcare providers, behavioral health providers, and other community services providers.

### CSC’s Family Health Coalition Benchmark Measures

- Degree to which Maternal and Child Health Bureau (MCHB)-funded programs ensure family/youth/consumer participation in program and policy activities
- Degree to which MCHB-funded programs have incorporated cultural and linguistic competence elements into their policies, guidelines, contracts and training.
- Percentage of all children 0-18 participating in MCHB-funded programs who receive coordinated, ongoing, comprehensive care within a medical home
- Percentage of women participating in MCHB-funded programs who have an ongoing source of primary and preventive care services for women
- Percentage of women participating in MCHB-funded programs who have a completed referral among those that receive a referral
- Degree to which MCHB-funded programs facilitate health providers' screening of women participants for risk factors
- Degree to which MCHB-supported initiatives contribute to the implementation of the 10 MCH Essential Services and Core Public Health Program Functions of assessment, policy, development, and assurance
- Degree to which MCHB grantees are planning and implementing strategies to sustain their programs once initial MCHB funding ends
- Degree to which States and communities have implemented comprehensive systems for women's health services
- Percentage of pregnant participants in MCHB funded programs receiving prenatal care beginning in the first trimester
- Percentage of completed referrals among women in MCHB-funded programs
- Percentage of women participating in MCHB-funded programs who smoke in the last three months of pregnancy
- Percent of very low birth weight infants among all live births to program participants
- Percent of live singleton births weighing less than 2,500 grams among all singleton births to program participants
- Infant mortality rate per 1,000 births
- Neonatal mortality rate per 1,000 live births
- Post-neonatal mortality rate per 1,000 live births
- Perinatal mortality rate per 1,000 live births plus fetal deaths
The University of Chicago Medicine Population Health Management Transformation

The University of Chicago Medicine (UCM) is spurring collaboration with various community partners to improve population health in the city, particularly for residents on the South Side of Chicago. One of the mechanisms being explored as part of this three-year strategy is the use of data and measurement to track the care for individuals across different organizations. The aim is to provide a clearer picture of overall health and healthcare services in the region and provide the strategic basis for an integrated care delivery network.

Goals and Approach

As a healthcare system with a prominent role in the community, UCM leverages its unique position as a convener to prioritize health needs and organize resources around initiatives that improve health outcomes and reduce hospital readmissions. UCM conducts a Community Health Needs Assessment (CHNA) every three years as a regulatory requirement of its 501(c)(3) status, and uses the data to identify priorities as well as program-level goals, strategies and metrics for each focal area. The UCM Community Benefit program provides grant opportunities to community partners that target its CHNA focal areas.

By sharing measures with community stakeholder and partners, UCM is able to prioritize initiatives that meet the needs of the community. For example, the 2013 CHNA revealed that the South Side of Chicago has one of the highest burdens of pediatric asthma in the nation. The corresponding data was shared with UCM’s community partners, and UCM provided a grant to a local community hospital to fund a specially trained patient advocate who could provide education to pediatric asthma patients. As a result, the number of hospital emergency room visits for asthma has declined. UCM is working with pediatric healthcare providers to establish an asthma center that would serve as a hub for research, community education, and a standard clinical care delivery model.

UCM develops an annual Community Benefit Report that demonstrates how its work and partnerships in the community are aligning and improving care for patients in the target region, which comprises approximately 640,000 residents.

Measure and Data Source Use

UCM tracks four main measure sets: CHNA measures to align with local needs and Healthy 2020 goals; Post-Acute Care (PAC) measures to track the continuum of care through partnerships; population health management measures as part of UCM’s Medical Home and Specialty Care Connection Program (MHSCCP); and, HEDIS measures to fulfill contract requirements with health insurance plans. Each measure set relies on varied data sources, including those from external organizations.
The varied data sources has posed a challenge for UCM due to inconsistent data collection methods. A tactic of UCM’s Community Benefit strategy is to connect community partners with UCM researchers and faculty to strengthen data collection methods and tools. UCM is also working with partner organizations to mutually develop a data collection methodology for more effective analysis and measurement of health impacts.

Care coordination is a major component of UCM’s strategy to improve health and healthcare through its collaborative programs. Partner organizations like the South Side Healthcare Collaborative (SSHC) — a network of over 30 federally qualified health centers (FQHC), free clinics and community hospitals — are vital in helping to control hospital readmissions, patient satisfaction and healthcare costs. UCM uses post-acute care measures to monitor relationship effectiveness, patient throughput, and patient care quality, while MMSCCP measures are used to track patient follow-up appointments.

The mutual responsibility between partners to coordinate care requires open and frequent communication and data sharing between organizations, which UCM facilitates through regular review meetings to monitor measures and report challenges.

**A Sample of UCM’s Post-Acute Care Measures:**

- Length of stay at post-acute care facility
- Discharge disposition from facility
- Readmissions to any hospital
- Readmissions to UCM
- Principal Diagnosis
- Functional independence measure at facility discharge
- Functional independence measure efficiency
- Case mix index
- Catheter-associated urinary tract infection cases per 1,000 patient days
- Pneumonia - New (developed at facility) & Existing (present at admission)
- Decubitus ulcer development - New (developed at facility) & Existing (present at admission)
- MRSA - New (developed at facility) & Existing (present at admission)
- Clostridium difficile (cases per 1,000 patient days) - New (developed at facility) & Existing (present at admission)
- Falls (cases per 1,000 patient days) - Injured falls (cases per 1,000 patient days)
- Patient satisfaction - Likelihood to recommend/refer score, other
