

# NECAP Mathematics Grade-Level Expectations For Grade 7

The New England Common Assessment Program (NECAP) Mathematics GLEs have been developed as a means to identify the concepts and skills expected of all students for large-scale assessment of mathematics in grades 3–8; they are not intended to represent the full mathematics curriculum at each grade level, but are meant to capture concepts and skills related to “big ideas” of mathematics that can be assessed in an on-demand setting that focus the curriculum, but do not narrow the curriculum. Each partner state intends to develop a set of local GLEs to accompany these GLEs for local assessment purposes that includes the concepts and skills not easily assessable in an on-demand setting, and therefore not included in this set of GLEs.

The NECAP GLEs in this document can be interpreted as describing grade-level expectations for the end of the grade identified, or in the beginning of the next grade.

As you review the NECAP Mathematics Grade-Level Expectations the following are important to understand.

- 1) The NECAP GLEs are organized into four content strands: Number and Operations; Functions and Algebra; Data, Statistics, and Probability; and Geometry and Measurement.
- 2) Problem solving, reasoning, connections, and communication are embedded throughout this set of GLEs instead of as separate strands.
- 3) Each GLE includes a **bolded** statement called the “stem.” Each “stem” is the same or similar across the grades for a given GLE, and is meant to communicate the main curriculum and instructional focus of the GLE across the grades.
- 4) The unbolded text within a GLE indicates how the GLE is specified at a given grade level.
- 5) At each grade level differences from previous grades are underlined. (Note: Sometimes nothing is underlined within a GLE. In these situations examine other GLEs across the strand to identify the differences.)
- 6) Each GLE is coded for the content strand, grade level, and the GLE “stem” number (e.g., M(F&A)–6–3: The “M” stands for mathematics, the “F&A” stands for the functions and algebra strand, the “6” stands for grade 6, and the “3” stands for stem 3).
- 7) An empty cell means that the GLE “stem” will not be assessed at that grade on the state-level on-demand assessment, but is reserved for local curriculum and assessment.
- 8) Unless otherwise specified the number parameters for a given grade in M(N&O)–X–1 apply to all GLEs at that grade level.
- 9) Only number concepts identified at a grade level in the NECAP Numbers and Operations strand will be assessed and reported. However, all number concepts acquired up to a grade can be used in other content strands unless otherwise specified.
- 10) All the concepts and skills identified at a given grade level are “fair game” for assessment purposes. However, conjunctions in this document have specific meaning. The conjunction “and” separates parts of a GLE that will be assessed every year (to the extent possible), while the conjunction “or” separates parts of the GLE that may be assessed each year, but will be more likely to be assessed over several years. In some situations “or<sup>sc</sup>” is used. While students will have choices on strategies they use or methods to communicate their thinking throughout the assessment, there are special cases that the New England partners thought it was necessary to communicate to the test developer that students should not be required to use a specific method (e.g., “...writes in words or<sup>sc</sup> symbols...”).

# NECAP Mathematics Grade-Level Expectations For Grade 7

<b>Number and Operations</b>
<b>Grade 7</b>
M(N&O)–7–1 <b>Demonstrates conceptual understanding of rational numbers with respect to percents</b> as a means of comparing the same or different parts of the whole when the wholes vary in magnitude (e.g., 8 girls in a classroom of 16 students compared to 8 girls in a classroom of 20 students, or 20% of 400 compared to 50% of 100); and <b>percents as a way of expressing multiples of a number</b> (e.g., 200% of 50) <b>using models, explanations, or other representations*</b> .
<b>*Specifications for area, set, and linear models for grades 5 – 8: Fractions:</b> The number of parts in the whole are equal to the denominator, a multiple of the denominator, or a factor of the denominator. <b>Percents:</b> The number of parts in the whole is equal to 100, a multiple of 100, or a factor of 100 (for grade 5); the number of parts in the whole is a multiple or a factor of the numeric value representing the whole (for grades 6-8). <b>Decimals (including powers of ten):</b> The number of parts in the whole is equal to the denominator of the fractional equivalent of the decimal, a multiple of the denominator of the fractional equivalent of the decimal, or a factor of the denominator of the fractional equivalent of the decimal.
M(N&O)–7–2 <b>Demonstrates understanding of the relative magnitude of numbers</b> by ordering, comparing, or identifying equivalent rational numbers across number formats, numbers with whole number bases and whole number exponents (e.g., $3^3$ , $4^3$ ), integers, absolute values, or numbers represented in scientific notation using number lines or equality and inequality symbols.
M(N&O)–7–4 <b>Accurately solves problems involving proportional reasoning; percents involving discounts, tax, or tips; and rates.</b>
(IMPORTANT: Applies the conventions of order of operations including parentheses, brackets, or exponents.)
<b>Geometry and Measurement</b>
M(G&M)–7–1 <b>Uses properties of angle relationships</b> resulting from two or three intersecting lines (adjacent angles, vertical angles, straight angles, or angle relationships formed by two non-parallel lines cut by a transversal), or two parallel lines cut by a transversal to solve problems.
M(G&M)–7–2 <b>Applies theorems or relationships</b> (triangle inequality or sum of the measures of interior angles of regular polygons) to solve problems.
M(G&M)–7–4 <b>Applies the concepts of congruency</b> by solving problems on a coordinate plane involving reflections, translations, or rotations.
M(G&M)–7–5 <b>Applies concepts of similarity</b> by solving problems involving scaling up or down and their impact on angle measures, linear dimensions and areas of polygons, and circles when the linear dimensions are multiplied by a constant factor. Describes effects using models or <sup>sc</sup> explanations.
M(G&M)–7–6 <b>Demonstrates conceptual understanding of the area of circles or the area or perimeter of composite figures</b> (quadrilaterals, triangles, or parts of circles), <b>and the surface area of rectangular prisms, or volume of rectangular prisms, triangular prisms, or cylinders</b> using models, formulas, or by solving related problems. Expresses all measures using appropriate units.
<b>Functions and Algebra</b>
M(F&A)–7–1 <b>Identifies and extends to specific cases a variety of patterns</b> (linear and nonlinear) represented in models, tables, sequences, graphs, or in problem situations; <b>and generalizes a linear relationship</b> using words and symbols; <b>generalizes a linear relationship to find a specific case; or writes an expression or<sup>sc</sup> equation using words or symbols to express the generalization of a nonlinear relationship.</b>
M(F&A)–7–2 <b>Demonstrates conceptual understanding of linear relationships</b> ( $y = kx$ ; $y = mx + b$ ) <b>as a constant rate of change</b> by solving problems involving the relationship between slope and rate of change, by describing the meaning of slope in concrete situations, or informally determining the slope of a line from a table or graph; <b>and distinguishes between constant and varying rates of change in concrete situations represented in tables or graphs; or describes how change in the value of one variable relates to change in the value of a second variable</b> in problem situations with constant rates of change.
M(F&A)–7–3 <b>Demonstrates conceptual understanding of algebraic expressions</b> by using letters to represent unknown quantities to write algebraic expressions (including those with whole number exponents or more than one variable); or by evaluating algebraic expressions (including those with whole number exponents or more than one variable); or by evaluating an expression within an equation (e.g., determine the value of $y$ when $x = 4$ given $y = 5x^3 - 2$ ).
M(F&A)–7–4 <b>Demonstrates conceptual understanding of equality</b> by showing equivalence between two expressions (expressions consistent with the parameters of the left- and right-hand sides of the equations being solved at this grade level) using models or different representations of the expressions, solving multi-step linear equations of

# NECAP Mathematics Grade-Level Expectations For Grade 7

the form  $ax \pm b = c$  with  $a \neq 0$ ,  $ax \pm b = cx \pm d$  with  $a, c \neq 0$ , and  $(x/a) \pm b = c$  with  $a \neq 0$ , where  $a, b, c$  and  $d$  are whole numbers; or by translating a problem-solving situation into an equation consistent with the parameters of the type of equations being solved for this grade level.

## Data, Statistics, and Probability

M(DSP)–7–1 **Interprets a given representation** (circle graphs, scatter plots that represent discrete linear relationships, or histograms) to analyze the data to formulate or justify conclusions, to make predictions, or to solve problems.

(IMPORTANT: Analyzes data consistent with concepts and skills in M(DSP)–7–2.)

M(DSP)–7–2 **Analyzes patterns, trends, or distributions in data in a variety of contexts by solving problems using** measures of central tendency (mean, median, or mode), dispersion (range or variation), or outliers to analyze situations to determine their effect on mean, median, or mode; and evaluates the sample from which the statistics were developed (bias).

M(DSP)–7–3 **Identifies or describes representations or elements of representations that best display a given set of data or situation,** consistent with the representations required in M(DSP)–7–1.

M(DSP)–7–5 **For a probability event in which the sample space may or may not contain equally likely outcomes, determines** the experimental or theoretical probability of an event in a problem-solving situation.

## Appendix B: Measurement Benchmarks

The following is a list of the measurement benchmarks and equivalences that *can be used* in problems across the content strands at each grade level to address the expectations in M(G&M)–X–7 for the NECAP Assessment.

M(G&M)–X–7 **Uses units of measures appropriately and consistently, and makes conversions within systems when solving problems** across the content strands.

The type of measure (e.g., length, time, etc.), the unit (e.g., inches, feet, etc.), the degree of accuracy where appropriate (e.g.,  $\frac{1}{2}$  inch); and equivalences (e.g., 12 inches in a foot) are identified for grades 2 – 8. In addition to measurement benchmarks identified below students will be expected to use the appropriate units when solving problems involving area, volume, surface area, conversions, and rates (e.g., miles per hour, price per pound, pounds per square inch) on the NECAP Assessment.

Measures	Grade 7
Length	<p><b>Units (accuracy):</b> Inch (to <math>\frac{1}{16}</math> inch); Foot; Centimeter (to <math>\frac{1}{10}</math> centimeter); Meter (to <math>\frac{1}{100}</math> meter); Yard; Mile (use in scale and rate questions); Kilometer (use in scale and rate questions)</p> <p><b>Equivalencies:</b> 12 inches in 1 foot; 100 centimeters in 1 meter; 3 feet in 1 yard; 36 inches in 1 yard; 10 millimeters in 1 centimeter; 1000 millimeters in 1 meter</p>
Time	<p><b>Unit (accuracy):</b> Hour (to 1 minute); Day; Year</p> <p><b>Equivalencies:</b> 24 hours in 1 day; 7 days in 1 week; 365 days in 1 year; 60 seconds in 1 minute; 60 minutes in 1 hour</p>
Temperature	<p><b>Unit (accuracy):</b> C° and F° (to 1 degree)</p>
Capacity	<p><b>Unit (accuracy):</b> Quarts (to 1 ounce); Gallon; Pint; Liter</p> <p><b>Equivalencies:</b></p>

## NECAP Mathematics Grade-Level Expectations For Grade 7

	32 ounces in 1 quart; 4 quarts in 1 gallon; 2 pints in 1 quart; 1000 milliliters in 1 liter
<b>Mass</b>	<b>Unit (accuracy):</b> Kilogram; Gram (to 1/10 gram)
<b>Weight</b>	<b>Unit (accuracy):</b> Pound (to 1 ounce) <b>Equivalencies:</b> 16 ounces in 1 pound
<b>Angles and Rotation</b>	<b>Unit (accuracy):</b> Degree (to 2 degrees) <b>Equivalencies:</b> 360° in 1 circle; 90° in 1 right angle
