

Cryptosporidiosis

Report to the Maine CDC at 1-800-821-5821

Definition	Role of the School Nurse
Signs and Symptoms	Exclusions
Transmission	Reporting
Diagnosis/Treatment	Resources

Definition

Cryptosporidiosis is caused by a parasite called *Cryptosporidium*.

Signs and symptoms

The main symptom is watery diarrhea and may also include stomach pain, fever, nausea, and vomiting. Symptoms can last for 1 to 2 weeks.

Transmission

Cryptosporidiosis is primarily transmitted to a person through swallowing the parasite from an item contaminated with feces. Illness may result from consumption of contaminated food, unpasteurized juices or (raw) milk, water that has not been disinfected, or contact with the feces of infected people or animals.

Diagnosis

Cryptosporidiosis is diagnosed through laboratory testing of a stool sample for the presence of the *Cryptosporidium* parasite.

Treatment Recommendations

- If symptoms are noted, the child should be referred to their healthcare provider
- Most people get better without any treatment, exceptions are made for the immunocompromised
- Non-specific supportive therapy, including hydration, is important

Role of the School Nurse

Prevention

- Provide education to students and staff regarding good hand washing with soap and water
- Promote good hand washing when visiting farms, or having contact with animals
- Avoid swallowing water when swimming or playing in lakes, ponds, streams, swimming pools and backyard “kiddie” pools
- Exclude symptomatic students and staff from school and school trips, especially swimming, while diarrhea persists and for 2 weeks after symptoms resolve
- Provide education on good food safety practices

Exclusions

- Students should be excluded from school while symptomatic with diarrhea
- Educational modifications may be warranted in children with a positive diagnosis
- See Maine Food Code for exclusions for staff handling food

Reporting Requirements

- Cryptosporidiosis is a reportable disease – report to Maine CDC at 1-800-821-5821
