Smallmouth bass	Pumpkinseed sunfish
Largemouth bass	Redbreast sunfish
White perch	American eel
Yellow perch	Landlocked alewife
Chain pickerel	

Physical characteristics

Area - 224 acres

Temperatures:

Maximum depth - 43 feet

Surface - 77°F

38 feet - 51°F

Principal fisheries: Brown trout, largemouth bass, brook trout

Kennebunk Pond is a heavily developed water that provides a popular brown trout fishery for both summer and winter anglers. Brown trout weighing a pound or two are commonly caught, and fish exceeding five pounds are not uncommon.

This water is stocked on an annual basis, because it lacks sufficient spawning habitat for salmonids. Water quality is good for brown trout, but deeper water develops an oxygen deficiency during the summer. In the early 1980's, landlocked alewives were introduced by the Maine Department of Inland Fisheries and Wildlife. Brown trout have responded to this new forage, and are doing well in spite of heavy competition from abundant warmwater fish populations. Large spring yearling brook trout are also stocked annually to provide anglers with a fish that is less difficult to catch than brown trout.

A shallow water, dirt access area is located next to the public beach on Kennebunk Pond Road Parking in the town lot across from the beach is not permitted, but limited parking is available along the shoulder of the road.
